| Service                           | Details  |                                   |              |                                   |              |
|-----------------------------------|--|-----------------------------------|--------------|-----------------------------------|--------------|
| LU01276                           | <p>LU01276 M.C.S. ENTRIES = ++PTF (LU01276)</p> <p>IMS VSAM/OSAM HIT RATIO INCORRECT / IMSOSAM STORAGE LEAK</p> <p><b>PROBLEM DESCRIPTION:</b></p> <p>The following problems have been reported in SYSVIEW 16.0 related to IMS displays and storage usage.</p> <p>1. Viewing the READ hit ratio on the IMSVSAM, IMSVSUM, IMSOSAM and IMSOSUM commands, the percentage value may show &gt; 100% when the total requests (READS + Lookaside READ Hits) overflows.</p> <p>The IMSSPOC display will also show the case of an overflow situation. You can issue an IMSSPOC command similar to the following:</p> <pre>IMSSPOC IMSPLEX PLEXB ROUTE IMSA /DISPLAY POOL DBAS</pre> <p>and locate the FOUND entry showing OVERFLOW. The OVERFLOW is shown because the IBM reporting is also limited to a 4 byte field.</p> <p>2. Each time the IMSOSAM command is issued it allocates a control block but fails to free it at command termination. The storage is allocated by module GSVPIMSR in E-PVT Subpool 0 Key 8 with a length of 128K. The storage area begins with an eyecatcher of GDBB.</p> <p>Note that hitting Enter to refresh an existing IMSOSAM command display does not contribute to the problem. The problem only occurs when IMSOSAM is entered from a menu or another command display.</p> <p>The storage will get freed when the user's SYSVIEW session ends.</p> <p><b>SYMPTOMS:</b></p> <p>1. As a result of the total hit requests exceeding 4gig, percentages shown in the above displays may exceed 100%.</p> <p>2. Repeated invocations of the IMSOSAM command in a long running SYSVIEW session can cause a buildup of these areas in E-PVT storage. This could potentially lead to storage problems in the issuing address space.</p> <p><b>IMPACT:</b></p> <p>1. Invalid statistics for hit ratio.</p> <p>2. Possible S878 or S80A abends in the user's address space if storage becomes exhausted.</p> <p><b>CIRCUMVENTION:</b></p> <p>None.</p> <p><b>PRODUCT(S) AFFECTED:</b></p> <table> <tr> <td>CA SYSVIEW PERFORMANCE MANAGEMENT</td> <td>Version 15.0</td> </tr> <tr> <td>CA SYSVIEW PERFORMANCE MANAGEMENT</td> <td>Version 16.0</td> </tr> </table> <p><b>Related Problem:</b></p> <p>SYSVW 13603</p> <p>Copyright (C) 2021 CA. | LU01501                           | <p>LU01501 M.C.S. ENTRIES = ++PTF (LU01501)</p> <p>ABEND SOC1 SOC4-04 IN HEALTH CHECK EXIT</p> <p><b>PROBLEM DESCRIPTION:</b></p> <p>SYSVIEW provides several health checks that are run by the IBM Health Checker, HZSPROC. These health checks run as subtasks under the SYSVIEW user address space (SYSVUSER).</p> <p>In a particular case, it is possible for the SYSVIEW health checks to unexpectedly abend. In the issue that first reported these abends, the user experienced SOC1 and SOC4-04 abends amongst the various SYSVIEW health checks. In the user's case, the abends were a result of the IBM Health Checker job, HZSPROC, being started and subsequently cancelled by automation several times in a short time period.</p> <p><b>SYMPTOMS:</b></p> <p>Abends occur in the SYSVIEW user address space. Look for the following messages in the SYSVIEW user job log:</p> <p>GSVX451E (HCKX.GSVHHCKX) Abend SOC1-01 in Health check exit<br/>     GSVX451E (HCKX.GSVHHCKX) Abend SOC4-04 in Health check exit</p> <p>On the USERS command, the GSVHHCKX entries are the SYSVIEW health checks. You can view the health check's log by using the Listlog line command. In the reported case, GSVH006I for INIT_CHECK was seen two times in a row with no intervening GSVH006I for TERM_CHECK in between before the abend occurred. The following show examples of different versions of GSVH006I:</p> <p>GSVH006I Module GSVHHCKX called for INIT_CHECK<br/>     GSVH006I Module GSVHHCKX called for TERM_CHECK</p> <p><b>IMPACT:</b></p> <p>SYSVIEW health checks fail to run.</p> <p><b>CIRCUMVENTION:</b></p> <p>Restart the HCHECK task running under the SYSVIEW user address space.</p> <p><b>PRODUCT(S) AFFECTED:</b></p> <table> <tr> <td>CA SYSVIEW PERFORMANCE MANAGEMENT</td> <td>Version 15.0</td> </tr> <tr> <td>CA SYSVIEW PERFORMANCE MANAGEMENT</td> <td>Version 16.0</td> </tr> </table> <p><b>Related Problem:</b></p> <p>SYSVW 13858</p> <p>Copyright (C) 2021 CA. | LU01511 | <p>LU01511 M.C.S. ENTRIES = ++PTF (LU01511)</p> <p>PVT E-PVT USR STORAGE USAGE MAY BE INCORRECT</p> <p><b>PROBLEM DESCRIPTION:</b></p> <p>CA SYSVIEW's reporting of PVT / E-PVT USR storage usage can be incorrect in some cases. Several command displays and metrics show private storage limits, usage and amount of free/unallocated storage for an address space.</p> <p>The usage shown may be misleadingly low if the SYS / E-SYS regions of an address space's PVT / E-PVT have grown enough that the amount left available for USR / E-USR is well below the specified limits.</p> <p>The calculation for these values is being changed to reflect the amount of USR / E-USR storage allocated in relation to the actual amount of PVT / E-PVT that is currently available, or the limit, whichever is smaller.</p> <p>Also, two new fields are being added to the PVTUSAGE command display to show the new 'adjusted' limits that will be used in the calculation:</p> <p>LimA - Private storage adjusted user limit.</p> <p>This is the current amount of storage available for allocation to the USR region in PVT.</p> <p>ELimA - E-Private storage adjusted user limit.</p> <p>This is the current amount of storage available for allocation to the E-USR region in E-PVT.</p> <p><b>SYMPTOMS:</b></p> <p>In the reported case an address space had exhausted all E-PVT storage but the JOBEPVT% threshold did not trigger because the majority of the storage was allocated to E-SYS and not E-USR.</p> <p>The following command display fields may be incorrect:</p> <p>ACTJOB - Current field for JOBPVT%, JOBEPVT%, JOBPVTF, JOBEPVTF</p> <p>ACTSUM - Pvt%, EPvt%, PvtUnAl, EPvtUnAl</p> <p>CDSAS - PctL and Limit information fields</p> <p>CICSLIST - PVTL%, PVTLIM, EPVTL%, EPVTLIM</p> <p>PVTUSAGE - Pvt%, EPvt%, UAllo, EUAllo</p> <p>CSYSDATA - Storage Information Free, PctL, Limit</p> <p>The following data collection metrics may be incorrect:</p> <p>CICS - PVT%LIM, PVTLIM, PVTFREE, EPVT%LIM, EPVTLIM, EPVTFREE</p> <p>MVS - JOBPVT%, JOBEPVT%, JOBPVTF, JOBEPVTF</p> <p><b>IMPACT:</b></p> <p>Incorrect displays and thresholds may not trigger as intended.</p> <p><b>CIRCUMVENTION:</b></p> <p>None.</p> <p><b>PRODUCT(S) AFFECTED:</b></p> <p>CA SYSVIEW PERFORMANCE MANAGEMENT</p> <p>Version 16.0</p> <p>Related Problem:</p> <p>SYSVW 13299</p> <p>Copyright (C) 2021 CA. | LU01773 | <p>LU01773 M.C.S. ENTRIES = ++PTF (LU01773)</p> <p>PROCINFO XSDATA DISPLAYING INVALID DATA</p> <p><b>PROBLEM DESCRIPTION:</b></p> <p>By default, the PROCINFO command will display a list of all possible processors. PROCINFO accepts a HOME parameter that will only display one row that contains the processor in use. Cross-system mode is supported for PROCINFO. When executing in cross-system mode, the HOME option is automatically set so that only one row will be displayed for each of the connected systems containing the processor in use by each respective system.</p> <p>To execute PROCINFO in cross-system mode, either the XSDATA parameter can be passed to the command or the PROCINFO XSDATA profile value can be set. Currently, if the PROCINFO XSDATA profile value is set to YES, the PROCINFO command will not correctly set the HOME option when executing in cross-system mode and invalid data will be displayed.</p> <p><b>SYMPTOMS:</b></p> <p>When PROCINFO is executed in cross-system mode, it should display one row per system indicating the processor used by the system. The symptoms of this bug include multiple rows containing invalid data displayed for all systems.</p> <p><b>IMPACT:</b></p> <p>Unable to view PROCINFO data in cross-system mode.</p> <p><b>CIRCUMVENTION:</b></p> <p>To execute PROCINFO in cross-system mode, pass the XSDATA parameter to the PROCINFO command.</p> <p><b>PRODUCT(S) AFFECTED:</b></p> <p>CA SYSVIEW PERFORMANCE MANAGEMENT Version 16.0</p> <p>Related Problem:</p> <p>SYSVW 14032</p> <p>Copyright (C) 2021 CA. | LU01855 | <p>LU01855 M.C.S. ENTRIES = ++PTF (LU01855)</p> <p>JVM AGENT GPF CRASH CAUSED BY MONZCNREQ DISABLED</p> <p><b>PROBLEM DESCRIPTION:</b></p> <p>The SYSVIEW JVM Data Collector Agent supports monitoring z/OS Connect Enterprise Edition servers. To enable z/OS Connect monitoring, the monzcn option can be passed to the JVM agent. To provide additional, real-time statistics, the JVM agent will install SYSVIEW-owned interceptors into the z/OS Connect server. In order to control whether SYSVIEW will attempt to install the interceptors is controlled by the monzcnreq option that can be passed to the JVM agent.</p> <p>If the monzcn option is ENABLED and the monzcnreq option is either DISABLED or is not passed to the agent at all, the JVM agent will crash when attempting to navigate to either the ZCNLIST or ZCNAPIS displays. This crash will lead to the z/OS Connect server also shutting down.</p> <p>Prior to this fix, the following message could be seen when the JVM agent was going through its initialization process regardless if monzcnreq was enabled or not:</p> <p>GSV1048I z/OS Connect interceptors for CA SYSVIEW installation started<br/>This message is misleading if monzcnreq is disabled as the SYSVIEW interceptors will not get installed. This message is now replaced with the following message:</p> <p>GSV1050I z/OS Connect Java classes for CA SYSVIEW loading started<br/>This message is now output when the initialization process ends:<br/>GSV1050I z/OS Connect Java classes for CA SYSVIEW loading completed.<br/>The message GSV1048I will still be output when monzcnreq is enabled and the SYSVIEW interceptors are being installed.</p> <p><b>SYMPTOMS:</b></p> <p>For a z/OS Connect server monitored by the SYSVIEW JVM Data Collector Agent with the monzcn option enabled and the monzcnreq option disabled, the z/OS Connect server will crash after navigating to the ZCNLIST or ZCNAPIS displays.</p> <p>In the z/OS Connect server job log, the following message will be seen:</p> <p>JVMDUMP039I Processing dump event "gpf", detail ""</p> <p><b>IMPACT:</b></p> <p>Unexpected shutdown of z/OS Connect server.</p> <p><b>CIRCUMVENTION:</b></p> <p>Set the monzcnreq option to ENABLE.</p> <p><b>PRODUCT(S) AFFECTED:</b></p> <p>CA SYSVIEW PERFORMANCE MANAGEMENT Version 16.0</p> <p>Related Problem:</p> <p>SYSVW 14073</p> <p>Copyright (C) 2021 CA. |         | <pre> REASON (RESTART)    DATE (21175) COMMENT ( +-----+        CA SYSVIEW PERFORMANCE MANAGEMENT          Version 16.0     +-----+  SEQUENCE   After Apply +-----+  PURPOSE    To implement the fix +-----+  USERS       AFFECTED   All users of SYSVIEW +-----+  KNOWLEDGE    REQUIRED    Product Administration +-----+  ACCESS       REQUIRED    Product libraries +-----+ *****<br/> * STEPS      TO      PERFORM * *****<br/> If you do not use the JVM component then this HOLD can be ignored.<br/> After applying this PTF, the JVM data collector agent run-time binaries<br/> will need to be deployed to your site's run-time environment, followed<br/> by a stop and start of your JVMs. Follow these steps to implement the<br/> change:<br/> 1. Deploy the agent run-time from the SMP/E managed directory<br/> "../cnm4g00/CNM4JVMD/" (DDDEF CNM4JVMD) to the run-time directory<br/> "../cnm4g00/runtime/".<br/> The deploy can be performed by running the install job<br/> sysviewhlq.SAMPJCL(INST0006).<br/> 2. Stop the JVMs configured to run the agent.<br/> Note that some address spaces such as CICS can have multiple JVMs.<br/> All JVMs in the address space must be stopped at the same time.<br/> 3. Start the JVMs configured to run the agent.<br/> Notes:<br/> 1. It is not required to immediately stop and start your JVMs to pick<br/> up the updated JVM data collector agent. A back-level agent will<br/> continue to communicate with a higher level SYSVIEW STC. It is<br/> recommended to keep the agent in sync with the SYSVIEW STC so the<br/> latest features and bug fixes are active in the agent.<br/> 2. The following SYSVIEW commands can be used to identify JVMs<br/> configured to run an agent that are currently running on a system:<br/> JVMARGS SYSTEM ; SELECT ARGUMENT CN -AGENTPATH<br/> Ensure all run-time directories are updated with the new binaries.<br/> ).<br/> BINARY<br/> LINK('..../libgsvsvoagt1.so')<br/> PARM(PATHMODE(0,7,7,5)) .<br/> BINARY<br/> LINK('..../libgsvsvoagt4.so')<br/> PARM(PATHMODE(0,7,7,5)) . </pre> |
