LU02019	LU02019 M.C.S. ENTRIES = ++PTF (LU02019) FIX GLOBAL VARIABLE ACCESS DATE FOR OPGVBK REXX AND OPSVALUE PROBLEM DESCRIPTION: 1. Three action options 0, N, and F of the OPSVALUE function are not updating the access date of a global variable. Since they retrieve the value of a global variable, they should be considered as access actions. This PTF corrects these action options to update the access date, which is displayed in the Accessed field when using the line command B on a global variable in OPSVIEW option 4.8. 2. When using the OPGVBK REXX program to back up global variables, the access dates of all global variables being backed up are updated since the program uses action option 0 of the OPSVALUE function. This PTF introduces a new action option W, which obtains the value of a global variable but does not update the access date, and is used exclusively for global variable backup. The OPGVBK REXX program is updated accordingly. SYMPTOMS: 1. Access date is not updated by OPSVALUE function action 0, F, or N. 2. Access date is updated by the OPGVBK REXX program. IMPACT: Access date information does not reflect the actual access history of a global variable. CIRCUMVENTION: None. SYMPTOMS: When the resource is inserted into the SSM table on the desired system, the CHKPOINT_STATE has a default value of UNKNOWN. IMPACT: If OPS/MVS is recycled or a change in STATEMAN modes causes the SSMBEGIN rule to fire and option 4 (Use previous desired state) is selected, the DESIRED_STATE of the moved resource will be set to UNKNOWN.
