LU07880	LU07880 M.C.S. ENTRIES = ++PTF (LU07880) REWORK(2023006) DB00141I EXTEND OF IXX SHOWS 'EXTE' AND WRONG IXXAREA= VALUE PROBLEM DESCRIPTION: Message DB00141I contains a truncated function name 'EXTE' instead of 'EXTEND' for a DBUTLTY EXTEND of an IXX. For example: DB00141I - DBUTLTY START EXTE dbid IXX If the DBUTLTY EXTEND specifies IXXAREA for the name of a Multi Dataset Index (MDI) the message also incorrectly contains "IXX" instead of the Inn MDI name, for example I01. This message is issued in the Datacom/DB Multi-User Facility (MUF) LOG, not in the DBUTLTY LOG. SYMPTOMS: The MUF LOG contains an incorrect value of 'EXTE' instead of 'EXTEND' in DB00141I messages that involve extending an IXX. For an MDI specified via IXXAREA in the EXTEND parameters, the message also does not display the correct MDI name, for example I01. "IXX" is displayed instead. IMPACT: The MUF LOG does not contain the full 'EXTEND' word in message DB00141I when an EXTEND of an IXX is performed. EXTEND of an IXXAREA also does not report the correct MDI name. The error is only cosmetic without any impact on the functionality of the EXTEND. CIRCUMVENTION: NONE. LU08004	LU08004 M.C.S. ENTRIES = ++PTF (LU08004) REWORK(2023003) MUF DIAGOPTION A HEADING ERRORS FIXED PROBLEM DESCRIPTION: Most customers are probably not aware of the MUF parameter DIAGOPTION A. It produces the SQL Optimization Execution-Time Report for all queries that exceed the specified number of rows read and rejected. This scan-and-reject activity is called index or data scanning, and is the primary source of query inefficiency. So this provides a way to log inefficient queries. In some cases the timestamp in the heading above the report by table of the number of rows read and accepted (rejected being the difference) would be wrong, and sometimes the entire heading would not be printed. Also, an abend is prevented in the rare case of tracing a statement using LOB columns. SYMPTOMS: The entire heading is missing, or the timestamp is wrong. Also a MUF abend in the rare tracing and LOB condition. IMPACT: This missing information makes it difficult to relate the statistics back to to query. CIRCUMVENTION: None. LU08300	LU08300 M.C.S. ENTRIES = ++PTF (LU08300) REWORK(2023012) SLOW EXECUTION AFTER LU01216 PROBLEM DESCRIPTION: This solution fixes the following problems after PTF LU01216 is applied and the traversal index for the inner table of a join is not restricted on its first column. In this case, before LU01216 a sortmerge join was used, and after applying LU01216 normally a hash join is used. But in two cases a nested-loop join is used, which is very slow: 1. When the cardinality of this first unrestricted column is low, then Skip-sequential processing makes this key almost as efficient as if the column is restricted. However, if the table has predicates using OR, then Skip-sequential processing is not used. The SQL Optimizer did not take this into account and would use the nested loop join, which is very slow in this case. 2. When the FROM clause uses comma-separated table syntax, sometimes a hash join would not be used. This fix uses a sortmerge join when HASH_MUF_MEMLIMIT is zero, or a hash join if it is not zero. SYMPTOMS: Queries with no good key on the inner table of a join run much slower. IMPACT: Performance can be unacceptably slow. CIRCUMVENTION: Turn hashing on and force a hash join with this predicate in the ON clause: DATACOM_OPTIMIZATION = 'USE HASH JOIN'. Prior to this change, Presspack appeared in the SCRT report as soon as the Datacom/DB Multi-User Facility (MUF) became enabled, if PRESSPACK was specified on the "DATACOM" MUF Startup Option. Datacom Presspack will now appear on this report based on actual usage, when a table is opened which uses Presspack compression. This provides more clarity in the SCRT report. For older Datadictionaries it has been discovered that no valid default type exists, and so SQLCODE -999 (DFLTVALS=0) is issued when this condition exists. This solution assumes a missing default type to imply the column must be nullable, which will issue SQLCODE -86 in this case. SYMPTOMS: INSERT VALUES with no default on not-nullable column is rejected with an SQLCODE that is incorrect. IMPACT: It is not easy to understand why the INSERT is rejected with the wrong SQLCODE.
