Understanding your Support

Review [support maintenance programs and offerings](#).

Registering for Support

Access the CA Support [online registration site](#) to register for product support.

Accessing Technical Support

For your convenience, CA Technologies provides easy access to "One Stop" support for all editions of [CA ERwin Data Modeler](#), and includes the following:

- Online and telephone contact information for technical assistance and customer services
- Information about user communities and forums
- Product and documentation downloads
- CA Support policies and guidelines
- Other helpful resources appropriate for your product

For information about other Home Office, Small Business, and Enterprise CA Technologies products, visit <http://ca.com/support>.

Provide Feedback

If you have comments or questions about CA Technologies product documentation, you can send a message to techpubs@ca.com.

If you would like to provide feedback about CA Technologies product documentation, complete our short [customer survey](#), which is also available on the CA Support website, found at <http://ca.com/docs>.

CA ERwin Data Modeler's Template Language (TLX) is the template/macro language publicly exposed with CA ERwin Data Modeler 7.3. It has been present in the product since CA ERwin Data Modeler r7.0.

TLX is employed in a number of places in the product using expansion. This includes templates used for forward engineering, metamodel dumps, and Model Explorer and Complete Compare object naming.

A number of macros make use of class names – the names of metadata objects. The section below describes a few notes on the use of class names; the full listing of all object classes and property classes is located in the document *ERwin Metamodel Reference.pdf*.

- Class names are always case-sensitive.
- Some object types represent an object in both the logical and the physical model. This is legacy behavior when CA ERwin Data Modeler had only logical/physical models. For these types of objects, display names seen in CA ERwin Data Modeler's user interface change based upon whether you are looking at the logical or physical side. However, class names do *not* change in a similar manner. Therefore, an entity in the logical model and a table in the physical model both have a class name of **Entity**.

The following list describes the class names that are included in this category:

- **Attribute**
 - **Default**
 - **Domain**
 - **Entity**
 - **Key_Group**
 - **Relationship**
 - **Validation_Rule**
- Local User-Defined Properties (UDPs) have three part class names. All UDPs available in the current release are classified as Local UDPs.

CA ERwin Data Modeler allows a given UDP name to be used on a variety of object types, and in both the logical and physical model, with differing data types, defaults, descriptions, and so on. For example, the UDP named "Color" might be a color name on the logical side of an entity, a red-green-blue integer on the physical side, and a Boolean value indicating if a view should be colored on reports.

To enable CA ERwin Data Modeler to understand exactly what is being referenced, the actual class name is comprised of: *<object type>.<model*

side>.<*name*>. For example, the three "Color" values mentioned would be: `Entity.Logical.Color`, `Entity.Physical.Color` and `View.Physical.Color`.

Future releases of CA ERwin Data Modeler may also support Global User-Defined Properties where the property has a single data type, default, and so on, no matter where it occurs. Those UDPs will follow the normal naming convention of built-in properties, having a single-part name.

The following sections provide a brief review of the TLX syntax.

Literals

Literal text is enclosed in double quotation marks. This includes literals intended for the final expanded output and literals used as parameters to macros. For example:

```
"This is a text literal"
```

```
Property("Name")
```

The valid characters for a literal include the printing characters (those higher than 32 decimal). Escape sequences are used for some characters; the following table shows those currently supported:

Escape Sequence	Meaning
<code>\n</code>	Carriage return.
<code>\t</code>	Horizontal tab character.
<code>\\</code>	Back slash.
<code>\"</code>	Double quote.

One advantage to explicitly-delimited literals is that the formatting of the source and the output can vary. Source text can be formatted exactly as needed because the output text is formatted based upon tabs, spaces, and carriage returns embedded in literals.

Macros

Any text not enclosed in double quote marks, and that does not start with an ampersand, is a macro name. For example:

```
MyMacro
```

If parameters are being passed to a macro, they will follow the macro name enclosed in parentheses. If more than one parameter is supplied, they are separated by commas. All parameters are string values.

```
MyMacro ("Parameter1", "Parameter2")
```

There are two general classes of macros: *substitution* and *iteration* macros.

Substitution Macros

Substitution macros evaluate to a string value. A substitution macro takes the form described in the previous section: a macro name and possibly a parameter list. For example:

```
Property ("Name")
```

The resulting string may be an empty value if the actual operations performed by the macro are the purpose of the macro. For example, a macro that writes data out to a file might evaluate to an empty string.

Iteration Macros

Iteration macros (usually) loop through objects in the model. Iteration macros do not evaluate to string values themselves.

An iteration macro may or may not have parameters, just like a substitution macro, but they are followed by curly braces denoting an iteration block.

```
ForEachOwnee ("Attribute")  
{  
    Property ("Name")  
}
```

The source text inside the iteration block is evaluated once for each time that the iterator increments.

Some iterator macros do not actually traverse objects. For example, they might traverse values on the object. Generally, this type of iterator macro will have special accessor macros that allow these values to be retrieved. The form of this type of iterator macro is identical. For example:

```
ForEachProperty  
{  
    ForEachProperty.Value  
}
```

Macro Return Codes

When a macro is evaluated, it returns a success code to the TLX template processor. If the macro succeeds, it returns 'true'; if it fails, it returns 'false'.

Note that, for a substitution macro, the return code and the string value it evaluates into are not the same thing—the macro may evaluate to an empty string and return 'true' to indicate a successful evaluation.

Iterator macros are invoked once before the iteration begins, and then once on each iteration. If the initial invocation fails, no iterations are performed. The looping continues until the macro returns 'false' from a request to increment.

Keywords

Unquoted text that starts with an ampersand indicates a keyword. Currently, TLX supports four keywords for conditional control: `@if`, `@ifnot`, `@elseif` and `@else`. These are not case-sensitive.

These conditional keywords are followed by a block enclosed with curly braces, much like an iteration macro. The code within the block is evaluated only if the condition is true.

```
@if ( Equal( Property("Name"), "Delaware" ) )
{
  "The first state."
}
}elseif( Equal( Property("Name"), "Hawaii" ) )
{
  "The last state."
}
@else
{
  "A state somewhere in the middle."
}
```

Conditional Blocks

The `@if`/`@elseif` keywords provide conditional evaluation. An alternate mechanism for conditional behavior is the *conditional block*. Source text enclosed in square brackets is in a conditional block. A conditional block is emitted only if all macros within it succeed. The block stops evaluating when it encounters a failure.

The choice of whether to use conditional blocks or `@if/@elseif` statements is up to the user—conditional blocks can provide a format that is easier to read than an embedded `@if` block in some situations. For example:

```
"CREATE TABLE " [Property("DB Owner" ".") Property("Physical Name")
```

Conditional blocks have no effect on enclosing blocks.

Propagating Blocks

Source text enclosed in angle brackets is in a *propagating block*. Propagating blocks essentially have a return code just like a macro does. They succeed if the text within them—after evaluation—is not empty; they fail otherwise.

In the following example, if we can find a first name or last name on the object, text will emit. If we can find neither, nothing will emit because the propagating block will cause a failure in the outer conditional block. If the propagating block was not used, the literal "My name is" would be emitted even if no name was present.

```
[ "My name is"  
  < [ " " Property("Name")] [ " " Property("Last Name") ] >  
]
```

Comments

Text that is enclosed in C-style comments is ignored by the TLX parser and does not become part of the final output.

```
/* This is a comment */
```

Context Stack

When macros are evaluating, they are generally operating on objects in the model. For example, the **Property** macro reads the value from a property on the "current" object. This current object is referred to as the *context object*. Objects become the current object by placing them on the *context stack*. This is an ordered list that operates in a Last In/First Out manner – objects are added to the list by *pushing* and removed from the list by *popping* them.

If you are familiar with CA ERwin Data Modeler's Macro Language, this concept has been present since the earliest days. For example, in CA ERwin Data Modeler r7.2 you could write **%ForEachEntity(E_1)**. This would establish 'E_1' as the current object for subsequent macro calls. Additionally, many macros such as **%JoinFKPK** or **%RelRI** would only operate inside certain iterators or editors. This was because they required a certain context stack to be in existence internally.

This concept is simply being exposed more fully now to provide you more control.

As an illustration, suppose the TLX parser is invoked with an **Attribute** as the starting object. The context stack would have one entry:

Now a macro is used that pushes the **Attribute** object's owning **Entity** onto the stack. The stack will now have two entries, with the **Entity** being the current object.

Now another macro is used that pops the last object from the stack. The stack now reverts to having only the **Attribute** in it and it is the current object.

Many macros operate upon the current context object. The **Property** macro is an example of this.

Other macros are capable of operating on objects deeper down the context stack. The **PropertyFrom** macro is an example of this type.

There are also a variety of macros that push objects onto the context stack and remove them. Macros with the words "Push" and "Pop" in their names are of this variety.

The bottommost (first) object on the stack is known as the *anchor object* and cannot be popped from the stack. This ensures that macros always have some object as the context. For example, assume that an **Entity** is the anchor object:

```
PushOwner          /* pushes the model onto the stack */
Pop                /* pops the model from the stack */
Pop                /* fails - entity is the anchor object */
```

An object can appear in the stack more than once. If the object happens to be the anchor object, only its earliest appearance cannot be popped – other appearances can be popped at will. For example, assume that an **Entity** is the anchor object:

```
PushOwner          /* pushes the model onto the stack */
Repush( "1" )     /* pushes entity a second time */
Pop                /* pops second occurrence of the entity */
Pop                /* pops the model from the stack */
Pop                /* fails - entity is the anchor object */
```

Iteration macros that operate on objects implicitly push the current iteration object onto the stack. This frees you from having to write explicit push and pop macro calls. For example, assume that an **Entity** is the anchor object:

```
Property("Name")          /* <- reads the entity name */
ForEachOwnnee("Attribute")
{
  Property("Name")        /* <- reads an attribute's name */
}
Property("Name")          /* <- back to reading the entity name */
```

Phantom Objects

In certain processes in CA ERwin Data Modeler, objects that are not actually in the model are simulated so that they can be used by macros. The most notable example of this situation is when evaluating a TLX template for generating an Alter Script. These objects are referred to as *phantom objects*. Generally, they can be treated exactly like a regular object. However, certain macros behave differently or do not function when the context object is a phantom object. These situations are noted in the macros' descriptions.

Each macro entry will contain the following sections describing the behavior of the macro and its usage.

Name

Macro names are always case-sensitive.

The following are some tips on macro names that make it easier to understand their purpose at a glance.

- Macros containing the words "Push" and "Pop" in their names alter the contents of the context stack, such as `PushOwner`.
- Macros with names ending in "From" will, if necessary, reach beyond the first object in the context stack to find an object of the desired type, such as `PropertyFrom`.
- Macros with names ending in "Through" will traverse a reference property on the current context object to find the necessary context object, such as `PropertyThrough`.
- Macros starting with a DBMS name followed by an underscore are designed to work only if the target server matches the DBMS name, such as `Access_Datatype`.
- Macros with a period in the middle of their name will operate only within the context of a specific iterator, such as `ForEachProperty.IsInherited`.
- Macros with a double colon in their name will operate only in certain processes in CA ERwin Data Modeler, such as `FE: :Bucket`.

Definition

This section will provide a description of the macro's behavior, plus any particular notes on using it.

Prototype Specification

The prototype specification of each macro will show the full syntax available. The first term is always the macro's name.

`MacroName`

Terms in italics represent parameters to the macro. These parameters are described in the table following the prototype signature.

Parameters are always enclosed in parentheses. The parentheses can be omitted if parameters are optional and none are being supplied. Parameters are always separated by commas. Unless otherwise specified, parameters to macros, other than type names, are *not* case-sensitive.

```
MacroName( Parameter1, Parameter2 )
```

Parameters enclosed in square brackets are optional.

```
MacroName( [OptionalParameter1 [, OptionalParameter2]] )
```

If a macro can take a variable length list of parameters, it will be indicated by an ellipsis.

```
MacroName( Value1[, Value2 [, ...]] )
```

Iterator macros are indicated by a trailing set of curly braces.

```
MacroName( Parameter1 ){} 
```

Result Specification

This subsection will list the conditions under which the macro will fail.

Deprecation Specification

As the software evolves, some macros may become deprecated. The deprecation specification indicates the level of deprecation at the time of documentation. The following table describes the possible values and their meaning:

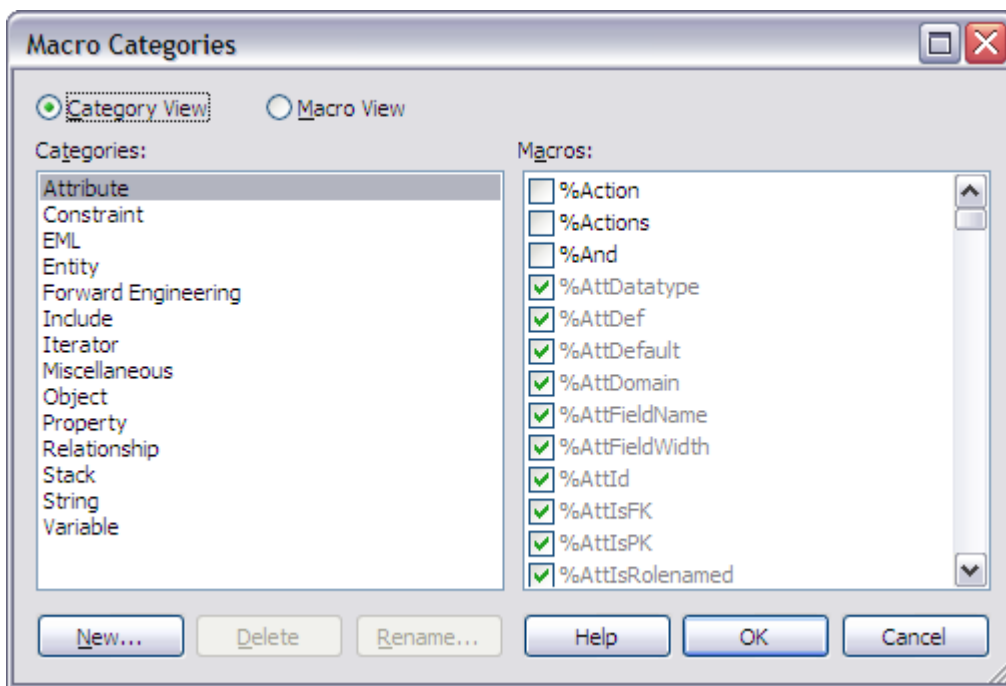

Deprecation Level	Meaning
Active	The macro is not deprecated in any way.
Discouraged	The macro has been replaced by an alternate macro. You may switch to the new syntax when editing new code in order to take advantage of new capabilities or faster performance. Macros in this status are fully supported and <i>there is no intention to remove them from the product</i> . However, they may not run as efficiently as other approaches and/or may not have the same features available.
Deprecated	The macro is deprecated and support for it will eventually be removed from the product.
Removed	The macro is no longer supported and will not function in the software.

Breaking Changes Specification

This section will describe ways in which the macro has changed from previous versions when that change would break existing code. Generally, breaking changes are adjusted by the post-load processors when a model is upgraded to a new version of the software. The description of the breaking change is provided so that you can adjust any new code you write.

Categories

This is the list of categories to which this macro is assigned by CA ERwin Data Modeler. You can add the macro to more categories, if you choose, by using the Macro Categories editor.

Sample

An example of using the macro will be provided in this subsection.

This set comprises the bulk of the new macros in CA ERwin Data Modeler. They are usable in all, or almost all, processes in the product.

Access_DatabaseName

Description

This macro evaluates to the database name for an Access target server.

Prototype

`Access_DatabaseName`

Result

This macro will fail in the following circumstances:

- The target database is not Access.

Deprecation Level

Active	Discouraged	Deprecated	Removed
✓			

Breaking Changes

None

Categories

- DBMS Specific Macros

Sample

Template
<pre>"Set ERwinDatabase = ERwinWorkspace.OpenDatabase(" Access_DatabaseName ")"</pre>
Result
<pre>Set ERwinDatabase = ERwinWorkspace.OpenDatabase("sERwinDatabase")</pre>

Access_Datatype

Description

This macro converts the CA ERwin Data Modeler data type to a constant usable by an Access database.

Prototype

`Access_Datatype`

Result

This macro will fail in the following circumstances:

- The target database is not Access.

Deprecation Level

Active	Discouraged	Deprecated	Removed
✓			

Breaking Changes

None

Categories

- DBMS Specific Macros

Sample

Assume the current context is the **Attribute** object E_1.a in the following illustration.

Template
<code>"Set ERwinField = ERwinTableDef.CreateField(" \"\" Property(\"Physical_Name\") \"\" , \" Access_Datatype ")"</code>
Result
<code>Set ERwinField = ERwinTableDef.CreateField("a", DB_INTEGER)</code>

AllowAlterDatatype

Description

This macro determines if a change in an attribute's data type can be handled via an alter script.

Prototype

`AllowAlterDatatype`

Result

This macro will fail in the following circumstances:

- The database does not support alter for the data type change.

Deprecation Level

Active	Discouraged	Deprecated	Removed
✓			

Breaking Changes

None

Categories

- Alter Macros

Sample

Assume the current context is an attribute whose datatype has been changed from `smallint` to `integer`.

Template
<pre>[AllowAlterDatatype "This can be altered"]</pre>
Result
<code>This can be altered</code>

AreAllOwnesCreated

Description

This macro determines if all objects of the specified type that are owned by the current context object have been created in the current session.

Prototype

`AreAllOwnesCreated(OwneeType [, Option1 [, OptionN [, ...]]])`

Parameter	Status	Description
<i>OwneeType</i>	Req	The type of owned object to test.
<i>Option1 - OptionN</i>	Opt	One or more option keywords. They can appear in any order and are not case-sensitive.

The options available are found in the following table.

Option	Meaning
"reverse"	If this option is present, the macro will fail if all ownnees of the specified type are created in the current session.

Result

This macro will fail in the following circumstances:

- The required parameters are not passed in.
- There exists an object of the specified type owned by the context object that was not created in the current session.
- All ownnees of the specified type were created in the current session and the "reverse" option was present.
- No objects of the specified type are owned by the context object.

Deprecation Level

Active	Discouraged	Deprecated	Removed
✓			

Breaking Changes

None

Categories

- Alter Macros

Sample

Assume the current context is a key group that had all members deleted.

Template
<pre>[/* This makes sure at least one was present before */ AreAllOwnneesCreated("Key Group Member", "reverse") /* This makes sure none are left */ AreAllOwnneesDeleted("Key Group Member") "Emit a DROP statement"]</pre>
Result
Emit a DROP statement

AreAllOwneesDeleted

Description

This macro determines if all objects of the specified type that are owned by the current model have been deleted in the current session.

Prototype

```
AreAllOwneesDeleted( OwneeType [, Option1 [, OptionN [,...]]] )
```

Parameter	Status	Description
<i>OwneeType</i>	Req	The type of owned object to test.
<i>Option1</i> - <i>OptionN</i>	Opt	One or more option keywords. They can appear in any order and are not case-sensitive.

The options available are found in the following table.

Option	Meaning
"reverse"	If this option is present, the macro will fail if all ownees of the specified type were deleted in the current session.

Result

This macro will fail in the following circumstances:

- The required parameters are not passed in.
- There exists an object of the specified type owned by the context object.
- At least one object of the specified type owned by the context object does not appear in the list of objects deleted in the current session.

Deprecation Level

Active	Discouraged	Deprecated	Removed
✓			

Breaking Changes

None

Categories

- Alter Macros

Sample

Assume the current context is a key group that had all members deleted.

Template
<pre>[/* This makes sure at least one was present before */ AreAllOwnesCreated("Key Group Member", "reverse") /* This makes sure none are left */ AreAllOwnesDeleted("Key Group Member") "Emit a DROP statement"]</pre>
Result
Emit a DROP statement

AreStringsEqual

Description

This determines if one string is equal to another.

Prototype

`AreStringsEqual(LeftString, RightString [, Option])`

Parameter	Status	Description
<i>LeftString</i>	Req	The left string in the test.
<i>RightString</i>	Req	The right string in the test.
<i>Option</i>	Opt	By default the comparison is case-sensitive. If this parameter is set to "NoCase" the comparison will be done in a case-insensitive manner. The word "NoCase" is not case sensitive.

Result

This macro will fail in the following circumstances:

- The required parameters are not passed in.
- The two strings are not equal.

Deprecation Level

Active	Discouraged	Deprecated	Removed
		✓	

The `Equal` macro should be used.

Breaking Changes

None

Categories

- String Macros

Sample

Template
<pre> Set("Value1", "aaa") Set("Value2", "bbb") @if(AreStringsEqual(Value("Value1"), Value("Value2"))) { "Yes" } %else { "No" } </pre>
Result
No

Choose

Description

This macro, in conjunction with the **Switch** and **Default** macros, tests a predicate against a range of values and executes a block when a match is found.

The block associated with this macro will be evaluated if the predicate matches and no previous **Choose** or **Default** blocks have evaluated successfully.

Prototype

```
Choose( Value ) {}
```

Parameter	Status	Description
<i>Value</i>	Req	The predicate of the Switch macro will be tested against this value.

Result

This macro will fail in the following circumstances:

- The required parameters are not passed in.

Deprecation Level

Active	Discouraged	Deprecated	Removed
✓			

Breaking Changes

None

Categories

- Miscellaneous Macros

Sample

Assume the context is the primary key of an entity.

Template
<pre>Switch(Left(Property("Key_Group_Type"), "2")) { Choose("PK") { "This is a primary key." } Choose("AK") { "This is an alternate key." } Default { "This is an inversion entry." } Choose("XX") { /* This block will never execute, because a preceding block will always evaluate successfully due to the presence of the Default macro. */ } }</pre>
Result
This is a primary key.

ClearAllGlobalFlags

Description

This clears all flags set with `SetGlobalFlag`.

Prototype

`ClearAllGlobalFlags`

Result

This macro always succeeds.

Deprecation Level

Active	Discouraged	Deprecated	Removed
✓			

Breaking Changes

None

Categories

- Stack Macros

Categories

- Alter Macros

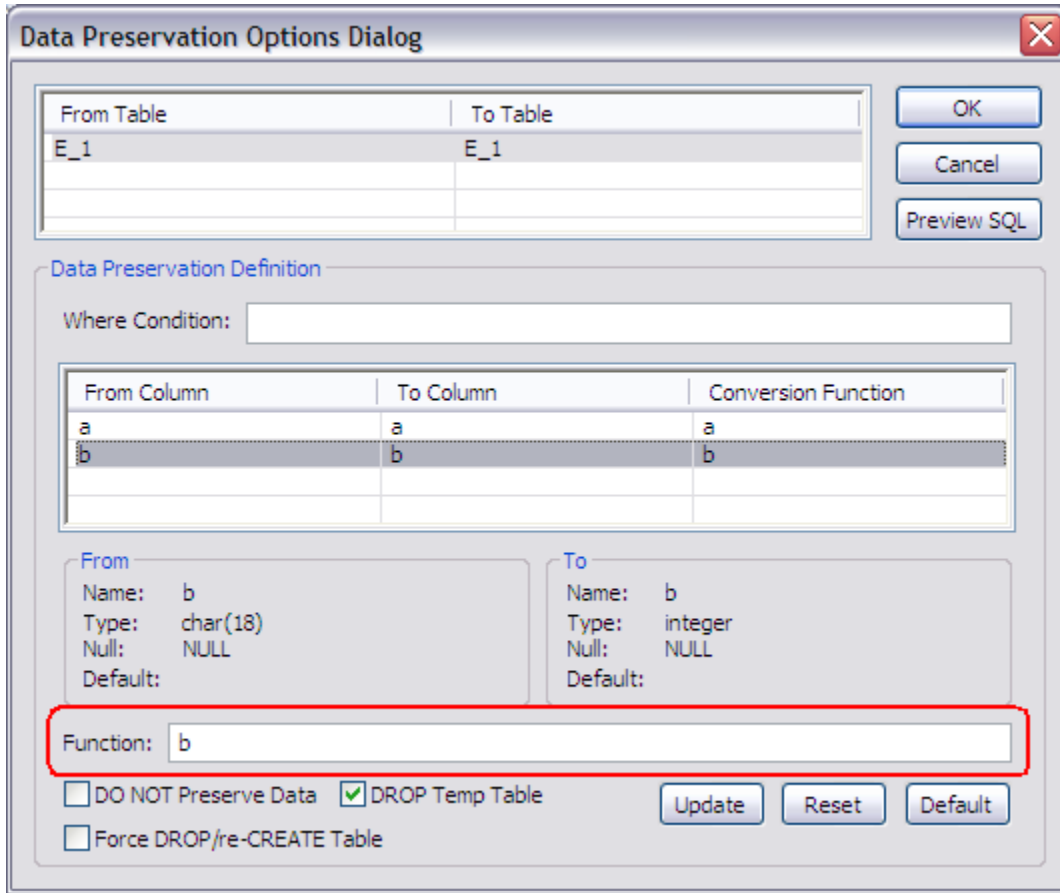

Sample

Assume that a table was modified from the left illustration to the right illustration.

If you ran the Alter Script process, pressed Preview and then Save Data, they would see a dialog something like the following.¹

¹ This dialog is just representational; the actual dialog may vary.

DatabaseConnection

Description

This evaluates to one of the connection information strings

Prototype

`DatabaseConnection(Option)`

Parameter	Status	Description
<i>Option</i>	Req	A keyword indicating the desired string.

The options available are found in the following table. These terms are not case-sensitive.

Option	Meaning
"database"	The database name.
"server"	The server name.
"user"	The user name.

Result

This macro will fail in the following circumstances:

- The required parameter is not supplied.

Deprecation Level

Sample

Template
<code>DatabaseConnection("user")</code>
Result
<code>my_user_name</code>

Date

Description

This evaluates to the current time stamp.

Prototype

```
Date( [Format] )
```

Parameter	Status	Description
<i>Format</i>	Opt	<p>This may be either a format string as specified in the table below or the word "System".</p> <p>If the latter is supplied, the format string held by the operating system for the current locale is used.</p> <p>If no parameter is supplied, the default string used is:</p> <p>"%d %b %Y %I:%M:%S %p"</p>

The format string consists of a series of specifiers that indicate a component of a full date/time value, plus the formatting for that value. For full documentation of all of the formatting options available, the documentation for the C Runtime function `strftime()` function should be consulted. This documentation can be located on the Web at a number of sites, one example of which is: <http://msdn2.microsoft.com/en-US/library/fe06s4ak.aspx>.

The following table provides an overview of some of the more common specifiers.

Code	Meaning
%a	Abbreviated weekday name.
%A	Full weekday name.
%b	Abbreviated month name.
%B	Full month name.
%c	Date and time representation appropriate for locale.
%#c	Long date and time representation, appropriate for current locale. For example: "Tuesday, March 14, 1995, 12:41:29".
%d	Day of month as a decimal number (01 - 31). If a # sign is inserted after the % sign, leading zeros are suppressed.
%H	Hour in 24-hour format (00 - 23). If a # sign is inserted after the % sign, leading zeros are suppressed.
%I	Hour in 12-hour format (01 - 12). If a # sign is inserted after the % sign, leading zeros are suppressed.
%j	Day of year as a decimal number (001 - 366). If a # sign is inserted after the % sign, leading zeros are suppressed.
%m	Month as a decimal number (01 - 12). If a # sign is inserted after the % sign, leading zeros are suppressed.
%M	Minute as a decimal number (00 - 59). If a # sign is inserted after the % sign, leading zeros are suppressed.
%p	Current locale's AM/PM indicator for a 12-hour clock.
%S	Second as decimal number (00 - 59). If a # sign is inserted after the % sign, leading zeros are suppressed.

Code	Meaning
%U	Week of year as decimal number, with Sunday as first day of week (00 - 53). If a # sign is inserted after the % sign, leading zeros are suppressed.
%w	Weekday as decimal number (0 - 6; Sunday is 0). If a # sign is inserted after the % sign, leading zeros are suppressed.
%W	Week of year as decimal number, with Monday as first day of week (00 - 53). If a # sign is inserted after the % sign, leading zeros are suppressed.
%x	Date representation for current locale.
%#x	Long date representation, appropriate to current locale. For example: "Tuesday, March 14, 1995".
%X	Time representation for current locale.
%y	Year without century as a decimal number (00 - 99). If a # sign is inserted after the % sign, leading zeros are suppressed.
%Y	Year with century as a decimal number. If a # sign is inserted after the % sign, leading zeros are suppressed.
%z, %Z	Either the time-zone name or time zone abbreviation, depending on registry settings. No characters if time zone is unknown.

Result

This macro always succeeds.

DBMSVersion

Description

This macro determines if the version of the database specified for the current model falls into a specific range. Version numbers should be specified in the format:

<Major Version Number>.<Minor Version Number>

If no minor version is specified, then it is assumed to be zero.

Prototype

`DBMSVersion(StartVersion [, StopVersion])`

Parameter	Status	Description
<i>StartVersion</i>	Req	This identifies the lowest acceptable version number.
<i>StopVersion</i>	Opt	This identifies the highest acceptable version number. If this value is not supplied, only the lower version is tested.

Result

This macro will fail in the following circumstances:

- The required parameters are not passed in.
- The model has not target database set.
- The specified parameters cannot be parsed.
- The version of the database on the model is outside the specified range.

Sample

Assume the context is an inversion entry of an entity.

Template
<pre>Switch(Left(Property("Key_Group_Type"), "2")) { Choose("PK") { "This is a primary key." } Choose("AK") { "This is an alternate key." } Default { "This is an inversion entry." } Choose("XX") { /* This block will never execute, because a preceding block will always evaluate successfully */ } } </pre>
Result
<pre>This is an inversion entry.</pre>

EnumProperty

Description

This is a lookup macro that evaluates to a specified string based upon a zero-based integer value contained in a property of the current context object. The integer values are assumed to be in a contiguous range starting at zero and positive in value.

Prototype

```
EnumProperty( Property, Value0 [, Value1 [, ...]] )
```

Parameter	Status	Description
<i>Property</i>	Req	The property to examine.
<i>Value0</i>	Req	The value to return if the property has the value of '0'.
<i>Value1 - ValueN</i>	Opt	The value(s) to return if the property has the value of '1' to 'N'.

Result

This macro will fail in the following circumstances:

- The required parameters are not passed in.
- The specified property does not exist or it has a null value.

- The list of replacement strings is not large enough to accommodate the value found in the property.

a: char(18) NOT NULL
b: char(18) NULL

Template
<pre>ForEachOwnee("Attribute") { EnumProperty("Null_Option_Type", "NULL", "NOT NULL") "\n" }</pre>
Result
<pre>NOT NULL NULL</pre>

EnumProperty2

Description

This is a lookup macro that evaluates to a specified string based upon a zero-based integer value contained in a property of the current context object. The values in the property are offset from zero by the amount specified in *Offset*. For example, if the value of *Offset* is '10', then the first string will correspond to a property value of '10', the second to the value '11' and so on. The integer values are assumed to be in a contiguous range and result in positive values once the offset is applied.

Prototype

```
EnumProperty2( Property, Offset, Value0 [, Value1 [, ...]] )
```

Parameter	Status	Description
<i>Property</i>	Req	The property to examine.
<i>Offset</i>	Req	The amount to offset the value in the property.
<i>Value0</i>	Req	The value to return if the property has the adjusted value of '0'.
<i>Value1 – ValueN</i>	Opt	The value(s) to return if the property has the adjusted value of '1' to 'N'.

Result

This macro will fail in the following circumstances:

- The required parameters are not passed in.
- The specified property does not exist or it has a null value.
- The list of replacement strings is not large enough to accommodate the value found in the property.

Logical/Physical

Equal

Description

This determines if one string is equal to another.

Prototype

`Equal(LeftString, RightString [, Option])`

Parameter	Status	Description
<i>LeftString</i>	Req	The left string in the test.
<i>RightString</i>	Req	The right string in the test.
<i>Option</i>	Opt	Option keyword.

The options available are found in the following table.

Option	Meaning
"no_case"	By default the comparison is case-sensitive. If this option is set the comparison will be done in a case-insensitive manner.

Result

This macro will fail in the following circumstances:

- The required parameters are not passed in.
- The two strings are not equal.

Deprecation Level

Active	Discouraged	Deprecated	Removed

Template
<pre> @if(Equal(Property("Name"), "e_1")) { "Name is exactly 'e_1'.\n" } @else { "Name is not exactly 'e_1'.\n" } @if(Equal(Property("Name"), "e_1", "no_case")) { "Name is case-insensitively like 'e_1'." } </pre>
Result
<pre> Name is not exactly 'e_1'. Name is case-insensitively like 'e_1'. </pre>

Execute

Description

This macro allows a piece of named template code to be reused. It will load a named template from a template file and expand it in the current context.

Note	
	<p>This macro will work only in processes that make use of named templates and template files. Currently, these are Schema Generation (Forward Engineering) and Alter Script Generation. More information on template files can be found in the document <i>Editing Forward Engineering Templates.pdf</i>.</p>

If the *FileName* parameter is not supplied, the macro looks for the template in the current template file. The current template file is the initial file bound to the TLX engine by the CA ERwin Data Modeler process being run.

If the *FileName* parameter is supplied, the macro looks for the template in the specified file.

Prototype

```
Execute( NamedTemplate [, FileName [, Param1 [, Param2 [, ...]]] ] )
```

Parameter	Status	Description
<i>NamedTemplate</i>	Req	This is the name of the template entry in the file.
<i>FileName</i>	Opt	This is the name of the template file containing the entry, if it is not the current file. An empty string also indicates the current file. If the specified file does not contain a path specification, the file is assumed to be in the same location as the current template file.
<i>Param1 – ParamN</i>	Opt	Parameters to the executed template. The template being invoked can contain replacement tokens – <i>Param1</i> will be substituted for '%1', <i>Param2</i> will be substituted for '%2', and so on.

Result

This macro will fail in the following circumstances:

- The required parameters are not passed in.
- The template cannot be located.
- The template cannot be evaluated.

Sample

The following illustrates a hypothetical template file for constructing very basic CREATE TABLE statements. Assume that the table in the following illustration is the current context the process is using.

Template
<pre> SPIItemBegin = Create Entity "CREATE TABLE " Property("Name") "\n" " (\n" ForEachOwnnee("Attribute") { ListSeparator(",\n") "\t" Execute("Clause: Column Properties") } ")" SPIItemEnd SPIItemBegin = Clause: Column Properties Property("Physical_Name") " " Property("Physical_Data_Type") SPIItemEnd </pre>
Result
<pre> CREATE TABLE E_1 (a INTEGER, b CHAR(18)) </pre>

ExecuteTest

Description

This macro allows a piece of named template code to be reused. It will load a named template from a template file and expand it in the current context. If the result expands to the text "Success", the macro will succeed. Otherwise, it will fail.

Note	
	<p>This macro will work only in processes that make use of named templates and template files. Currently, these are Schema Generation (Forward Engineering) and Alter Script Generation. More information on template files can be found in the document <i>Editing Forward Engineering Templates.pdf</i>.</p>

If the *FileName* parameter is not supplied, the macro looks for the template in the current template file. The current template file is the initial file bound to the TLX engine by the CA ERwin Data Modeler process being run.

If the *FileName* parameter is supplied, the macro looks for the template in the specified file.

Prototype

```
ExecuteTest( NamedTemplate [, FileName [, Param1 [, Param2 [, ...]]] )
```

Parameter	Status	Description
<i>NamedTemplate</i>	Req	This is the name of the template entry in the file.
<i>FileName</i>	Opt	This is the name of the template file containing the entry, if it is not the current file. An empty string also indicates the current file. If the specified file does not contain a path specification, the file is assumed to be in the same location as the current template file.
<i>Param1 – ParamN</i>	Opt	Parameters to the executed template. The template being invoked can contain replacement tokens – <i>Param1</i> will be substituted for '%1', <i>Param2</i> will be substituted for '%2', and so on.

Result

This macro will fail in the following circumstances:

- The required parameters are not passed in.

ForEachOfType

Description

This iterates across the instances of a specific type of object.

Prototype

```
ForEachOfType( TypeName [, Category] ){}
```

Parameter	Status	Description
<i>TypeName</i>	Req	The type of object to traverse.
<i>Category</i>	Opt	A filter on what type of objects should be returned. If this value is not specified, "active" is assumed.

The *Category* values available are found in the following table.

Option	Meaning
"active"	Only actual, non-phantom objects of the specified type are returned.
"deleted"	Only phantom objects representing deleted objects of the specified type are returned.
"modified"	Only phantom objects representing the pre-image of modified objects of the specified type are returned.
"phantom"	Only phantom objects, both deleted and modified, of the specified type are returned.
"all"	All phantom and non-phantom objects of the specified type are returned.

Result

This macro succeeds.

Sample

Assume a model that, when loaded, had three **Entity** objects: E_1, E_2 and E_3. Assume E_2 was deleted, E_3 was renamed to New_3, and E_4 was created.

Template
<pre>"Active entities: " ForEachOfType("Entity") { ListSeparator(", ") Property("Name") } "\nDeleted entities: " ForEachOfType("Entity", "deleted") { ListSeparator(", ") Property("Name") } "\nModified entities: " ForEachOfType("Entity", "modified") { ListSeparator(", ") Property("Name") }</pre>
Result
<pre>Active entities: E_1, New_3, E_4 Deleted entities: E_2 Modified entities: E_3</pre>

ForEachOwnee

Description

This iterates across the ownee list of the current context object.

When the current context object is a phantom object representing the old state of a modified object, the ownees reported will be those present in the old state, not the current set of ownees.

Prototype

```
ForEachOwnee( [TypeName [, SortBy [, Option1 [, Option2 [,...]]]] ){}  
}
```

Parameter	Status	Description
<i>TypeName</i>	Opt	If a type name is provided, the iteration will be filtered to pass only objects of that type. If this is not provided, all owned objects will be returned.
<i>SortProperty</i>	Opt	The property to use as the basis of sorting. If this is not provided or is an empty string, no sorting will take place and the objects will appear in whatever internal order is held in CA ERwin Data Modeler.
<i>Option1 - OptionN</i>	Opt	One or more option keywords. They can appear in any order and are not case-sensitive.

The options available are found in the following table.

Option	Meaning
"owner_sort"	If this option is present, <i>SortProperty</i> is assumed to be found on the owning (context) object and to be in the form of a vector of ownee ids. If the owning object does not have the specified property, no sorting will take place. If this is not present, the property is assumed to be found on the ownee objects and they will be sorted based upon its value.
"reverse_sort"	If this option is present, the sorting will be reversed.
"require_one"	If this option is present, at least one iteration must occur or the macro will fail.

Result

This macro always succeeds.

Assume the context is the table in the following illustration, which is shown in the Physical Order display level.

Template
<pre>ForEachOwnee("Attribute", "Physical_Columns_Order_Ref", "owner_sort") { Property("Physical_Name") "\n" } "\n" ForEachOwnee("Attribute", "Name") { Property("Physical_Name") "\n" }</pre>
Result
<pre>b a a b</pre>

ForEachOwneeFrom

Description

This iterates across the ownee list on the first object in the context stack with the specified type.

Prototype

```
ForEachOwneeFrom( ContextType [, TypeName [, SortBy [, Option1
  [, Option2 [,...]]]] ){}
```

Parameter	Status	Description
<i>ContextType</i>	Req	The type of object to locate on the context stack.
<i>TypeName</i>	Opt	If a type name is provided, the iteration will be filtered to pass only objects of that type. If this is not provided, all owned objects will be returned.
<i>SortProperty</i>	Opt	The property to use as the basis of sorting. If this is not provided or is an empty string, no sorting will take place.
<i>Option1 - OptionN</i>	Opt	One or more option keywords. They can appear in any order and are not case-sensitive.

The options available are found in the following table.

Option	Meaning
"owner_sort"	<p>If this option is present, <i>SortProperty</i> is assumed to be found on the owning (context) object and to be in the form of a vector of ownee ids. If the owning object does not have the specified property, no sorting will take place.</p> <p>If this is not present, the property is assumed to be found on the ownee objects and they will be sorted based upon its value.</p>
"reverse_sort"	If this option is present, the sorting will be reversed.
"require_one"	If this option is present, at least one iteration must occur or the macro will fail.

Result

This macro will fail in the following circumstances:

- The current object is a phantom object.
- An object of that type does not exist on the context stack.

Deprecation Level

Active	Discouraged	Deprecated	Removed
✓			

Breaking Changes

None

Categories

- Iterator Macros

Sample

To illustrate the difference between this and the **ForEachOwnee** macro, assume that context object is E_1 in the following illustration.

When the following template code is expanded, both loops produce the same result because an **Entity** object is current on the stack.

Template
<pre>ForEachOwnee ("Attribute") { Property ("Physical_Name") "\n" } "\n" ForEachOwneeFrom ("Entity", "Attribute") { Property ("Physical_Name") "\n" }</pre>
Result
<pre>a b a b</pre>

However, if we introduce other objects onto the context stack, the behavior of the two iterators changes. For example, if we introduce **Relationship** onto the stack above the **Entity**, using the **ForEachReference** macro, the stack will appear as follows.

Since **Relationship** objects don't own **Attribute** objects, the first iterator will not traverse any objects. The second iterator will still locate the **Entity** object and traverse its ownees.

Template
<pre> ForEachReference("Parent_Relationships_Ref") { ForEachOwnee("Attribute") { Property("Physical_Name") "\n" } "\n" ForEachOwneeFrom("Entity", "Attribute") { Property("Physical_Name") "\n" } } </pre>
Result
<pre> a b </pre>

ForEachOwneeThrough

Description

This iterates across the ownee list on the object pointed to by the specified scalar reference property on the current context object.

Prototype

```

ForEachOwneeThrough( ReferenceProperty [, TypeName [, SortBy
[, Option1 [, Option2 [,...]]]] ){}

```

Parameter	Status	Description
<i>ReferenceProperty</i>	Req	The reference property to use to locate the desired owning object.
<i>TypeName</i>	Opt	If a type name is provided, the iteration will be filtered to pass only objects of that type. If this is not provided, all owned objects will be returned.
<i>SortProperty</i>	Opt	The property to use as the basis of sorting. If this is not provided or is an empty string, no sorting will take place.
<i>Option1 - OptionN</i>	Opt	One or more option keywords. They can appear in any order and are not case-sensitive.

The options available are found in the following table.

Option	Meaning
"owner_sort"	<p>If this option is present, <i>SortProperty</i> is assumed to be found on the owning (context) object and to be in the form of a vector of ownee ids. If the owning object does not have the specified property, no sorting will take place.</p> <p>If this is not present, the property is assumed to be found on the ownee objects and they will be sorted based upon its value.</p>
"reverse_sort"	If this option is present, the sorting will be reversed.
"require_one"	If this option is present, at least one iteration must occur or the macro will fail.

Result

This macro will fail in the following circumstances:

- The current object is a phantom object.
- The reference property does not exist.

<pre>ForEachOwneeThrough("Parent_Entity_Ref", "Attribute") { Property("Physical_Name") "\n" }</pre>
Result
<pre>a b</pre>

ForEachProperty

Description

This is a special-purpose macro generally used in components that produce dumps of models. It will iterate across the properties of an object. Special sub-macros are then available to retrieve information about the property.

The context object is not changed by this iterator.

Prototype

```
ForEachProperty( [Option1 [, Option2 [, ...]] ] ) {}
```

Parameter	Status	Description
<i>Option1 – OptionN</i>	Opt	One or more option keywords. These can appear in any order.

The options available are found in the following table. These terms are not case-sensitive.

Option	Meaning
"type_sort"	The properties will be sorted by their type.
"all"	Pass all types of properties. This is the default setting and will override conflicting options.
"user_defined"	Pass only user-defined properties.
"built_in"	Pass only built-in properties.

Result

This macro will fail in the following circumstances:

- The context object is a phantom object.

ForEachProperty.Value

Description

This is a special-purpose macro that is usable only inside of a `ForEachProperty` iterator, and then only when the context object is an M1 (metadata) object.

It will evaluate to the value of the property.

This macro will fail if:

- It is not executed inside the proper containing iterator.

Prototype

```
ForEachProperty.Value( [NullString] )
```

Parameter	Status	Description
<i>NullString</i>	Opt	The string to emit if the property's value is a NULL. If this is not specified, an empty string will be emitted.

Result

This macro will fail in the following circumstances:

ForEachPropertyValue

Description

This iterates across the values present in the specified property on the current context object.

The context object is not changed by this iterator.

Prototype

```
ForEachProperty( Property [, Option1 [, ...]] ){} 
```

Parameter	Status	Description
Property	Req	The type name of the property.
Option1 - OptionN	Opt	One or more option keywords. These can appear in any order.

The options available are found in the following table. These terms are not case-sensitive.

Option	Meaning
"new_only"	On a modified object, only traverse the new values.
"old_only"	On a modified object, only traverse the old values.

Result

This macro will fail in the following circumstances:

- The required parameters are not supplied.
- The context object is a phantom object.

ForEachReference

Description

This iterates across the objects listed in the specified property on the current context object.

Prototype

```
ForEachReference( Property, [Option1 [, Option2 [, ...]] ] {}
```

Parameter	Status	Description
<i>Property</i>	Req	The type name of the property.
<i>Option1 - OptionN</i>	Opt	One or more option keywords. These can appear in any order.

The options available are found in the following table.

Option	Meaning
"name_sort"	The objects will be sorted according to the 'Name' property in ascending order.
"flatten"	When the context objects exist in the M1 (metadata) layer of the model this option will cause the values on parent objects to be pushed down to the child objects. Do not use this when the macro is employed in the context of an M0 (data) model as unpredictable results will occur.
"exact"	This will cause the vector of references to be traversed exactly as they are found. Normally, duplicates are suppressed; this changes that behavior. This option will cause the "name_sort" and "flatten" options to be ignored, if they are specified.

Result

This macro will fail in the following circumstances:

- The specified parameters are not provided.
- The specified property is not found on the context object.

Result
<pre>Model_owns_Domain</pre>

ForEachReferenceFrom

Description

This iterates across the objects listed in the specified property on the first object of the specified type found on the context stack.

Prototype

```
ForEachReferenceFrom( ContextType, Property, [Option1 [, Option2
  [, ...]] ] ) {}
```

Parameter	Status	Description
<i>ContextType</i>	Req	The type of object to locate on the context stack.
<i>Property</i>	Req	The type name of the property.
<i>Option1 - OptionN</i>	Opt	One or more option keywords. These can appear in any order.

The options available are found in the following table.

Option	Meaning
"name_sort"	The objects will be sorted according to the 'Name' property in ascending order.
"flatten"	When the context objects exist in the M1 (metadata) layer of the model this option will cause the values on parent objects to be pushed down to the child objects. Do not use this when the macro is employed in the context of an M0 (data) model as unpredictable results will occur.

Result

This macro will fail in the following circumstances:

Result
<pre>R_2 R_3</pre>

ForEachReferenceThrough

Description

This iterates across the objects listed in the specified property on the object pointed to by the specified scalar reference property on the current context object

Prototype

```
ForEachReferenceFrom( ReferenceProperty, Property, [Option1
[, Option2 [, ...]] ]){}
```

Parameter	Status	Description
<i>ReferenceProperty</i>	Req	The reference property to use to locate the desired owning object.
<i>Property</i>	Req	The type name of the property.
<i>Option1 - OptionN</i>	Opt	One or more option keywords. These can appear in any order.

The options available are found in the following table.

Option	Meaning
"name_sort"	The objects will be sorted according to the 'Name' property in ascending order.
"flatten"	When the context objects exist in the M1 (metadata) layer of the model this option will cause the values on parent objects to be pushed down to the child objects. Do not use this when the macro is employed in the context of an M0 (data) model as unpredictable results will occur.

Result

This macro will fail in the following circumstances:

- The specified parameters are not provided.
- There is no context object of the specified type.
- The specified property is not found on the context object.

ForEachUserDefinedProperty

Description

This will iterate across the user-defined properties of an object. Special sub-macros are then available to retrieve information about the property.

The context object is not changed by this iterator.

Prototype

```
ForEachUserProperty( [Option1 [, Option2 [, ...]] ] {})
```

Parameter	Status	Description
<i>Option1 - OptionN</i>	Opt	One or more option keywords. These can appear in any order.

The options available are found in the following table. These terms are not case-sensitive.

Option	Meaning
"all"	Pass all user-defined properties. This is the same as passing no parameter.
"database"	Pass user-defined properties having the <i>Is_Database_Property</i> tag set.
"logical"	Pass user-defined properties having the <i>Is_Logical</i> tag set.
"physical"	Pass user-defined properties having the <i>Is_Physical</i> tag set.

Result

This macro will fail in the following circumstances:

- The context object is a phantom object.

Sample

Assume that the current context is the *Model* with a UDP named "Foo" set on the logical side and a UDP named "Bar" set on the physical side.

Template
<pre>"All UDPs\n" ForEachUserDefinedProperty { "\t" ForEachUserDefinedProperty.Type "\n" } "\nLogical UDPs\n" ForEachUserDefinedProperty("logical") { "\t" ForEachUserDefinedProperty.Type "\n" }</pre>
Result
<pre>All UDPs Model.Logical.foo Model.Physical.bar Logical UDPs Model.Logical.foo</pre>

FormatProperty

Description

This macro evaluates to a formatted representation of the specified property on the current context object. A property is identified by its class name as defined in the metadata for CA ERwin Data Modeler.

Prototype

```
Property( PropertyName [, Option1 [, Option2 [, ...]]] )
```

Parameter	Status	Description
<i>PropertyName</i>	Req	The type name of the property.
<i>Option1</i> - <i>OptionN</i>	Opt	One or more option keywords. They can appear in any order and are not case-sensitive.

The options available are found in the following table.

Option	Meaning
-d:<value>	This specifies the delimiter that will be inserted between individual values in a vector property. If this option is not supplied, or <value> is empty, a comma will be used.
-b:<value>	This specifies the bracketing characters for each value in the property. If <value> is one character, it will be applied as an opening and closing bracket. If <value> is two characters, the first character will be applied as an opening bracket and the second character as a closing bracket.
-p:<value>	If the property is a reference property, this option will cause the property specified by <value> to be read on the referenced object. If this value is not supplied, or the property cannot be evaluated, the raw reference value will be used.
"no_load"	By default, properties with the data type of 'Resource' will load and the macro will evaluate to the loaded value. If this value is provided, properties with this data type will evaluate to the resource identifier string instead of the resource value.
"fail_if_empty"	If a parameter with the value of "fail_if_empty" is supplied, the macro will fail if the result is an empty string.

Result

This macro will fail in the following circumstances:

- The required parameters are not supplied.
- The "fail_if_empty" option is supplied and the result is an empty string.

Deprecation Level

Active	Discouraged	Deprecated	Removed

Sample

Assume the current context object is a subject area containing the tables in the following illustration.

Template
<pre> FormatProperty("Referenced_Entities_Ref", "d:", "b:\\"", "p:Name") /* Which would be the same as... */ "\n\n" ForEachReference("Referenced_Entities_Ref") { ListSeparator(",") "\"\" Property("Name") "\"\" } </pre>
Result
<pre> "E_1","E_2" "E_1","E_2" </pre>

Greater

Description

This determines if one value is greater than another.

If the values are being compared as numbers, it assumes that the parameters passed are numeric values. In these cases, the macro stops reading a parameter when it encounters a character it cannot convert. If no characters are converted, the value is assumed to be zero. For example (assuming "ascii" is not specified):

Input Value	Value for Comparison
"123"	123
"123Foo"	123
"Foo"	0

Prototype

```

Greater( LeftString, RightString [, Option1 [, Option2 [, ...]] ] )
    
```

Parameter	Status	Description
<i>LeftString</i>	Req	The left value in the test.
<i>RightString</i>	Req	The right value in the test.
<i>Option1 - OptionN</i>	Opt	One or more option keywords. They can appear in any order and are not case-sensitive.

The options available are found in the following table.

Option	Meaning
"ascii"	By default, the strings are compared as numeric values. For example, "11" would compare as greater than "9". If this parameter is set to "ascii " the strings are interpreted as case-sensitive literals (ASCII sort). This would cause "11" to compare as less than "9".
"no_case"	If this is set to "no_case" and the values are being compared in an ASCII sort, the strings are compared as strings in a case-insensitive manner. The default behavior is a case-sensitive comparison

Result

This macro will fail in the following circumstances:

- The required parameters are not passed in.
- The first string is not greater than the second.

Result
<pre> Greater on a numeric sort Not greater on an ASCII sort </pre>

GreaterOrEqual

Description

This determines if one value is greater than or equal to another.

If the values are being compared as numbers, it assumes that the parameters passed are numeric values. In these cases, the macro stops reading a parameter when it encounters a character it cannot convert. If no characters are converted, the value is assumed to be zero. For example (assuming "ascii" is not specified):

Input Value	Value for Comparison
"123"	123
"123Foo"	123
"Foo"	0

Prototype

```

GreaterOrEqual( LeftString, RightString
  [, Option1 [, Option2 [, ...]] ] )

```

Parameter	Status	Description
<i>LeftString</i>	Req	The left value in the test.
<i>RightString</i>	Req	The right value in the test.
<i>Option1 - OptionN</i>	Opt	One or more option keywords. They can appear in any order and are not case-sensitive.

The options available are found in the following table.

Option	Meaning
"ascii"	By default, the strings are compared as numeric values. For example, "11" would compare as greater than "9". If this parameter is set to "ascii " the strings are interpreted as case-sensitive literals (ASCII sort). This would cause "11" to compare as less than "9".
"no_case"	If this is set to "no_case" and the values are being compared in an ASCII sort, the strings are compared as strings in a case-insensitive manner. The default behavior is a case-sensitive comparison

HasPropertyCharacteristic

Description

This determines if the specified property on the current context object has the specified characteristic.

If this macro is invoked against a phantom object, the results are undefined.

Prototype

`HasPropertyCharacteristic(PropertyName, Characteristic)`

Parameter	Status	Description
<i>PropertyName</i>	Req	The type name of the property.
<i>Characteristic</i>	Req	The name of the characteristic that is to be checked. Currently supported values are found below.

The characteristics available are found in the following table. The names are not case-sensitive.

Characteristic	Meaning
"calculated" or "prefetch "	This characteristic is set when the property does not have a value of its own, but is calculated from other properties on the object.
"default "	This characteristic is set if the value in the property is a default value supplied by CA ERwin Data Modeler.
"hardened"	This characteristic is set if the value in the property has been hardened against change. Currently, this is supported only for certain name properties on logical/physical objects, so this only has meaning when applied to the Name and Physical_Name properties of an Attribute , Default , Domain , Entity , Key_Group , Relationship or Validation_Rule . Future releases of CA ERwin Data Modeler may extend hardening to more property types.
"autocalculated"	This characteristic is set when a property is in an auto-calculate state. Currently, this is supported only for the Cardinality property on the Relationship object. Future releases may extend this to other properties.

Result

This macro will fail in the following circumstances:

- The required parameters are not passed in.
- The characteristic is not set.

IncludeFile

Description

This loads the contents of a text file, then parses and evaluates it.

Note	
	The file is expected to contain only TLX code, and the entire contents will be evaluated in one pass. The contents are expected to contain macro block delimiters. Contrast this with the Execute macro, which works on a file containing multiple TLX entries and where the entries do not contain macro block delimiters.

Prototype

```
IncludeFile( FileName )
```

Parameter	Status	Description
<i>FileName</i>	Req	The name of the file. When specifying a path, remember that backslashes in literals must be escaped.

Result

This macro will fail in the following circumstances:

- The required parameters are not passed in.
- The specified source file is not found.

Result
<pre> Flag was set #1. Flag was set #3. </pre>

IsMatch

Description

This macro will succeed if the specified value matches any item in a list. The comparisons are not case sensitive.

Prototype

```
IsMatch( Value, MatchValue0 [, MatchValue1 [, ...] ] )
```

Parameter	Status	Description
<i>Value</i>	Req	The value to test for.
<i>MatchValue</i>	Req	The first value to compare against.
<i>MatchValue1</i> – <i>MatchValueN</i>	Opt	Other values to compare against.

Result

This macro will fail in the following circumstances:

- The required parameters are not supplied.
- The *Value* parameter is not equal to any of the *MatchValues*.

Assume the current context is a **View** object.

Template
<pre>[IsMatch(ObjectType, "Entity", "View", "Cached_View") "It's an entity-like object."]</pre>
Result
<pre>It's an entity-like object.</pre>

IsModified

Description

This macro will test whether the context object was modified during the current session.

If exception properties are supplied as parameters, they will be ignored in considering whether or not the object was modified.

Prototype

```
IsModified( [ExceptionProperty1 [, ExceptionProperty2 [, ...]] ] )
```

Parameter	Status	Description
<i>ExceptionProperty1</i> – <i>ExceptionPropertyN</i>	Opt	Properties to ignore when considering modification status.

Result

This macro will fail in the following circumstances:

- The context object was not modified during the current session.

Sample

Assume that table E_1 had its physical name modified.

Template
<pre>ForEachOfType ("Entity") { @if(IsModified) { "Property("Physical_Name") " was modified.\n" } }</pre>
Result
E_1 was modified.

IsNotInheritedFromUDD

Description

This macro determines if domain (user-defined datatype) inheritance is present for a constraint. If *Property* is specified, the macro checks if the specified property is inherited. If *Property* is not specified, it checks to see if the [Check_Constraint_Usage](#) object is inherited.

Since inherited constraints and some properties are not present in the database, this macro allows determinations to be made if DROP statements should be created.

Prototype

`IsNotInheritedFromUDD([Property])`

Parameter	Status	Description
<i>Property</i>	Opt	The type name of the property.

Result

This macro will fail in the following circumstances:

- The required parameters are not passed in.
- The domain inheritance is not present..

Sample

Template
<pre> /* If the column defines a default for itself, we need to do something. If it picks up the default from a user-defined datatype, we don't. */ [IsNotInheritedFromUDD "exec sp_bindefault " ...] </pre>
Result
The <code>sp_bindefault</code> will be emitted for columns that define their own defaults.

IsOwnerPropertyEqual

Description

This macro will succeed if the specified property has the specified value on the owning object of the current context object.

Prototype

`IsOwnerPropertyEqual(Property, Value [, NotFoundValue])`

Parameter	Status	Description
<i>Property</i>	Req	The type name of the property.
<i>Value</i>	Req	The value to test for.
<i>NotFoundValue</i>	Opt	This should be set to 'true' or 'false' to indicate the desired return value if the property is not found. If this is not supplied, the macro will fail in this situation.

Result

This macro will fail in the following circumstances:

- The property is found and does not have the specified value.
- The property is not found and *NotFoundValue* is not set to "true".
- The current context object does not have an owner object.

This macro will succeed if the value in the property is a Boolean value of 'false' on the owning object of the current context object. Missing Boolean properties are assumed to be 'false'; use the *NotFoundValue* if this behavior is not desired.

Prototype

`IsOwnerPropertyFalse(Property [, NotFoundValue])`

Parameter	Status	Description
<i>Property</i>	Req	The type name of the property.
<i>NotFoundValue</i>	Opt	If this is set to 'false' and the property does not exist, the macro will fail.

Result

This macro will fail in the following circumstances:

- The required parameters are not supplied.
- The property does not exist and *NotFoundValue* is set.
- The value in the property is not a Boolean.
- The value in the property is not 'false'.
- The current context object does not have an owner object.

Result
<code>null</code>

IsPropertyReordered

Description

This macro will succeed determine if the specified property has been modified such that its values are reordered.

NB: This macro will returns undefined results when either the old or the new copy of the property contains duplicate values.

Prototype

```
IsPropertyReordered( Property [, Option1 [, Option2 [, ...]] ] )
```

Parameter	Status	Description
<i>Property</i>	Req	The type name of the property.
<i>Option1 - OptionN</i>	Opt	One or more option keywords. They can appear in any order and are not case-sensitive.

The options available are found in the following table.

Option	Meaning
"existing_only"	By default, the presence of a new value or the deletion of an old value will cause the macro to fail. If this option is specified, then the macro will only check to make sure that the remaining elements are in the same order relative to each other.

Result

This macro will fail in the following circumstances:

- The required parameters are not supplied.
- The value of the property has not been modified.
- The value of the property has had new elements added or existing elements removed and "existing_only" is not specified.

Sample

Assume the context is the primary key of an **Entity** object.

Template
<pre>Switch(Left(Property("Key_Group_Type"), "2")) { Choose("PK") { "This is a primary key." } Choose("AK") { "This is an alternate key." } Default { "This is an inversion entry." } Choose("XX") { /* This block will never execute, because a preceding block will always evaluate successfully */ } }</pre>
Result
This is a primary key.

Less

Description

This determines if one value is less than another.

If the values are being compared as numbers, it assumes that the parameters passed are numeric values. In these cases, the macro stops reading a parameter when it encounters a character it cannot convert. If no characters are converted, the value is assumed to be zero. For example (assuming "ascii" is not specified):

Input Value	Value for Comparison
"123"	123
"123Foo"	123
"Foo"	0

Prototype

```
Less( LeftString, RightString [, Option1 [, Option2 [, ...]] ] )
```

Parameter	Status	Description
<i>LeftString</i>	Req	The left value in the test.
<i>RightString</i>	Req	The right value in the test.
<i>Option1 - OptionN</i>	Opt	One or more option keywords. They can appear in any order and are not case-sensitive.

The options available are found in the following table.

Option	Meaning
"ascii"	By default, the strings are compared as numeric values. For example, "11" would compare as greater than "9". If this parameter is set to "ascii " the strings are interpreted as case-sensitive literals (ASCII sort). This would cause "11" to compare as less than "9".
"no_case"	If this is set to "no_case" and the values are being compared in an ASCII sort, the strings are compared as strings in a case-insensitive manner. The default behavior is a case-sensitive comparison

Result

This macro will fail in the following circumstances:

- The required parameters are not passed in.
- The first string is not less than the second.

Result
<pre> Not less on a numeric sort Less on an ASCII sort </pre>

LessOrEqual

Description

This determines if one value is less than or equal to another.

If the values are being compared as numbers, it assumes that the parameters passed are numeric values. In these cases, the macro stops reading a parameter when it encounters a character it cannot convert. If no characters are converted, the value is assumed to be zero. For example (assuming "ascii" is not specified):

Input Value	Value for Comparison
"123"	123
"123Foo"	123
"Foo"	0

Prototype

```
LessOrEqual( LeftString, RightString [, Option1 [, Option2 [, ...]] ] )
```

Parameter	Status	Description
<i>LeftString</i>	Req	The left value in the test.
<i>RightString</i>	Req	The right value in the test.
<i>Option1 - OptionN</i>	Opt	One or more option keywords. They can appear in any order and are not case-sensitive.

The options available are found in the following table.

Option	Meaning
"ascii"	By default, the strings are compared as numeric values. For example, "11" would compare as greater than "9". If this parameter is set to "ascii " the strings are interpreted as case-sensitive literals (ASCII sort). This would cause "11" to compare as less than "9".
"no_case"	If this is set to "no_case" and the values are being compared in an ASCII sort, the strings are compared as strings in a case-insensitive manner. The default behavior is a case-sensitive comparison

<pre> Set("Value1", "11") Set("Value2", "9") @if(LessOrEqual(Value("Value1"), Value("Value2")) { "Less or equal on a numeric sort\n" } @else { "Greater on a numeric sort\n" } @if(Less(Value("Value1"), Value("Value2"), "ascii") { "Less or equal on an ASCII sort\n" } @else { "Greater on an ASCII sort\n" } </pre>
Result
<pre> Greater on a numeric sort Less or equal on an ASCII sort </pre>

ListSeparator

Description

This macro is used inside of an iterator block. It evaluates to an empty string on the first loop of iteration. It evaluates to the value specified in *String* on subsequent loops. Loops are counted only if the loop block evaluates successfully.

Prototype

`ListSeparator(String)`

Parameter	Status	Description
<i>String</i>	Req	The separator string.

Result

This macro will fail in the following circumstances:

- The required parameters are not passed in.

Deprecation Level

Active	Discouraged	Deprecated	Removed
✓			

Breaking Changes

Sample

Assume the current context is the **Entity** object in the following illustration.

Template
<pre>ForEachOwnee("Attribute") { ListSeparator(",\n") Property("Physical_Name") }</pre>
Result
<pre>a b c</pre>

Lookup

Description

This is a lookup macro that evaluates to a specified string based upon the value specified.

Replacement mappings are specified as value pairs in the parameter list. Values are compared case-insensitively.

Prototype

```
Lookup( Value [, Source0, Target0
  [, Source1, Target1 [,...]]] [, Default] )
```

Parameter	Status	Description
<i>Value</i>	Req	The value to examine.
<i>Source0</i>	Opt	The first actual value to compare.
<i>Target0</i>	Opt	The value to return if Source0 is matched.
<i>Source1 – SourceN</i>	Opt	Subsequent values to compare.
<i>Target1 – TargetN</i>	Opt	The values to return if Source1 through SourceN are matched.
<i>Default</i>	Opt	The value to return if no other match is found.

Result

This macro will fail in the following circumstances:

- Required parameters are not supplied.
- The value is not found in the list of values and no default value is provided.

Sample

Template
<code>Lookup(Property("Null_Option_Type"), "0", "Null", "1", "Not Null")</code>

LookupProperty

Description

This is a lookup macro that evaluates to a specified string based upon the value actually held in the specified property of the current context object.

Replacement mappings are specified as value pairs in the parameter list. Values are compared case-insensitively.

Prototype

```
LookupProperty( Property [, Source0, Target0
    [, Source1, Target1 [,...]] [, Default] )
```

Parameter	Status	Description
<i>Property</i>	Req	The property to examine.
<i>Source0</i>	Opt	The first actual value to compare.
<i>Target0</i>	Opt	The value to return if Source0 is matched.
<i>Source1 - SourceN</i>	Opt	Subsequent values to compare.
<i>Target1 - TargetN</i>	Opt	The values to return if Source1 through SourceN are matched.
<i>Default</i>	Opt	The value to return if no other match is found.

Result

This macro will fail in the following circumstances:

- Required parameters are not supplied.
- The specified property does not exist and no default value is provided.
- The actual value of the property is not found in the list of values and no default value is provided.

Sample

Assume the context object is E_1 in the following illustration.

Template
<code>LowerCase(Property("Name"))</code>
Result
<code>e_1</code>

Mid

Description

This macro evaluates to a substring of the specified source string.

Prototype

`Mid(SourceString, Start, Length)`

Parameter	Status	Description
<i>SourceString</i>	Req	The source string.
<i>Start</i>	Req	The zero-based starting position for the substring.
<i>Length</i>	Req	The length of the desired substring. If there are not enough characters in the source string to fulfill the <i>Length</i> specification, the macro will return the characters available. In non-Unicode versions of the product, the <i>Length</i> specification represents bytes. In other words, a character represented by a lead-byte and trail-byte would count as two.

Result

This macro will fail in the following circumstances:

- The required parameters are not passed in.

- The *Start* parameter is not '0' or greater, or the *Length* parameter is not '1' or greater.

Template
<code>Mid(Property("Physical_Name", "0", "3"))</code>
Result
CUS

Modulo

Description

This predicate tests the modulo value of two numbers. The modulo is the remainder when *Left* is divided by *Right*.

Prototype

```
Modulo( Left, Right [, Remainder] )
```

Parameter	Status	Description
<i>Left</i>	Req	The numerator of the division.
<i>Right</i>	Req	The denominator of the division.
<i>Remainder</i>	Opt	By default, the macro succeeds if the remainder is '0'. If this value is specified, the macro succeeds if it matches the remainder.

Result

This macro will fail in the following circumstances:

- The required parameters are not passed in.

Categories

- String Macros

Sample

In this sample, we want to insert a carriage return every three values. Since we placed the `ListSeparator` call before the output of the actual value (to avoid a trailing separator), we need to test based upon a modulo value of '1'...for example, "insert the carriage return *before* the fourth, seventh, and so on, value."

Template
<pre> SetGlobalFlag("Continue") Loop("Continue") { ListSeparator([Modulo(IterationCount, "3", "1") "\n"]) @if (Greater(IterationCount, "6")) { ClearGlobalFlag("Continue") } @else { IterationCount } } </pre>
Result
<pre> 123 456 </pre>

NotEqual

Description

This determines if one string is not equal to another.

Prototype

```
NotEqual( LeftString, RightString [, Option] )
```

Parameter	Status	Description
<i>LeftString</i>	Req	The left string in the test.
<i>RightString</i>	Req	The right string in the test.
<i>Option</i>	Opt	By default the comparison is case-sensitive. If this parameter is set to "no_case" the comparison will be done in a case-insensitive manner.

The options available are found in the following table.

Option	Meaning
"no_case"	By default the comparison is case-sensitive. If this option is set the comparison will be done in a case-insensitive manner.

Result

This macro will fail in the following circumstances:

- The required parameters are not passed in.
- The two strings are equal.

Sample

Assume the context is the following table:

Template
<pre> @if(NotEqual(Property("Name"), "e_1")) { "Name is not exactly 'e_1'.\n" } @else { "Name is exactly 'e_1'.\n" } @if(NotEqual(Property("Name"), "e_1", "no_case")) { "Name is not case-insensitively like 'e_1'." } </pre>
Result
Name is not exactly 'e_1'.

ObjectId

Description

This evaluates to the id of the current context object.

For M0 objects (data), this is just an integer that identifies it uniquely.

For M1 objects (metadata), the integer is also uniquely-identifying, but it is a packed combination of an identifier for the source of the metadata and a unique value for the object. For example, metadata defined by CA ERwin Data Modeler will generally have a value of '1' or '0', CA ERwin Data Modeler NSM metadata will have a value of '4', while UDPs will have a value of '9'.

Note	
	<p>The values for object ids are stable for a given session of CA ERwin Data Modeler. However, they can change between sessions. If you need an identifier that is stable across sessions, use the value retrieved by:</p> <pre>Property("Long Id")</pre>

Prototype

`ObjectId([Option])`

Parameter	Status	Description
<i>Option</i>	Req	By default the entire id is returned. A component of the id can be retrieved by using one of the values found below.

The options available are found in the following table.

Option	Meaning
"product "	Retrieve just the product identifier portion of the id for an M1 object. This has no effect for M0 objects.
"identifier"	Retrieve just the object identifier portion of the id for an M1 object. This has no effect for M0 objects.

Result

This macro will fail if:

- There is no context object.

<pre>This is an entity</pre>

OnceForObject

Description

This macro will attempt to set a global flag that is a concatenation of the *Label* parameter and the context object's id. The macro will fail if this flag is already set. This allows a template to test for a previous emission of a given template for the object.

Prototype

```
OnceForObject( Label [, Option] )
```

Parameter	Status	Description
<i>Label</i>	Req	A label that will be used to distinguish the particular flag being set.
<i>Option</i>	Opt	An option keyword. They can appear in any order and are not case-sensitive.

The options available are found in the following table.

Option	Meaning
"no_set"	If this is present, then only the test of the existence of the flag is performed, but the flag is not set if it is not present.

Result

This macro will fail in the following circumstances:

- There is no context object.
- The flag has been set previously.

OwnerProperty

Description

This macro evaluates to the string representation of the specified property on the object owning the current context object. A property is identified by its class name as defined in the metadata for CA ERwin Data Modeler.

Prototype

```
OwnerProperty( PropertyName [, Option1 [, Option2 [, ...]]] )
```

Parameter	Status	Description
<i>PropertyName</i>	Req	The type name of the property.
<i>Option1 - OptionN</i>	Opt	One or more option keywords. They can appear in any order and are not case-sensitive.

The options available are found in the following table.

Option	Meaning
"no_load"	By default, properties with the data type of 'Resource' will load and the macro will evaluate to the loaded value. If this value is provided, properties with this data type will evaluate to the resource identifier string instead of the resource value.
"no_translate"	By default, properties with a data type of 'Resource' will load and all other properties will be run through the default translator for their type. If this value is provided, the macro will evaluate to a raw value for the property. This is a superset of the "no_load" behavior.
"fail_if_empty"	If a parameter with the value of "fail_if_empty" is supplied, the macro will fail if the result is an empty string.

Result

This macro will fail in the following circumstances:

- The required parameters are not supplied.
- The "fail_if_empty" option is supplied and the result is an empty string.
- The current context object does not have an owning object.

customer_zip_code: varchar(20) NULL
email: varchar(50) NULL
```

Template
<code>OwnerQuotedName</code>
Result
<code>"CUSTOMER"</code>

Pad

Description

This macro evaluates to the source string padded to the specified length. The padding will be done by appending *Character* to the end of the string enough times to reach the desired length. If the source string is longer than the desired length, the entire source string will be returned.

Prototype

`Pad(SourceString, Length[, Character])`

Parameter	Status	Description
<i>SourceString</i>	Req	The source string.
<i>Length</i>	Req	The desired length of the string.
<i>Character</i>	Opt	The character used for padding. If this is not specified, a space will be used.

Property

Description

This macro evaluates to the string representation of the specified property on the current context object. A property is identified by its class name as defined in the metadata for CA ERwin Data Modeler.

Prototype

`Property(PropertyName [, Option1 [, Option2 [, ...]]])`

Parameter	Status	Description
<i>PropertyName</i>	Req	The type name of the property.
<i>Option1 - OptionN</i>	Opt	One or more option keywords. They can appear in any order and are not case-sensitive.

The options available are found in the following table.

Option	Meaning
"no_load"	By default, properties with the data type of 'Resource' will load and the macro will evaluate to the loaded value. If this value is provided, properties with this data type will evaluate to the resource identifier string instead of the resource value.
"no_translate"	By default, properties with a data type of 'Resource' will load and all other properties will be run through the default translator for their type. If this value is provided, the macro will evaluate to a raw value for the property. This is a superset of the "no_load" behavior.
"fail_if_empty"	If a parameter with the value of "fail_if_empty" is supplied, the macro will fail if the result is an empty string.

Result

This macro will fail in the following circumstances:

- The required parameters are not supplied.
- The "fail_if_empty" option is supplied and the result is an empty string.

Deprecation Level

Active	Discouraged	Deprecated	Removed
✓			

Breaking Changes

The default behavior of this macro has changed since the CA ERwin Data Modeler 7.1 release. The earlier version defaulted to 'no_translate' and 'no_load'.

Categories

- Property Macros

Sample

The difference in result when using the "no_translate" option is shown in the two example templates below. Assume that the CUSTOMER table in the following picture is the current context object.

CUSTOMER
customer_number: integer NOT NULL
customer_first_name: varchar(20) NULL
customer_last_name: varchar(20) NULL (IE1)
customer_address: varchar(20) NULL (AK1)
customer_city: varchar(20) NULL
customer_state: varchar(20) NULL
customer_zip_code: varchar(20) NULL
email: varchar(50) NULL

Template
<pre>ForEachOwnee("Attribute") { Property("Name") " is " Property("Null_Option_Type", "no_translate") "\n" } </pre>
Result
<pre>customer_number is 1 customer_first_name is 0 customer_last_name is 0 ...etc.</pre>

Template
<pre>ForEachOwnee("Attribute") { Property("Name") " is " Property("Null_Option_Type") "\n" } </pre>
Result
<pre>customer_number is NOT NULL customer_first_name is NULL customer_last_name is NULL ...etc.</pre>

PropertyFrom

Description

This macro evaluates to the string representation of the specified property on the first object in the context stack with the specified type. An object and a property are identified by their class names as defined in the metadata for CA ERwin Data Modeler.

Prototype

```
PropertyFrom( ObjectType, PropertyName [, Option1 [, Option2 [, ...]] ] )
```

Parameter	Status	Description
<i>ObjectType</i>	Req	The type of the object desired.
<i>PropertyName</i>	Req	The type name of the property.
<i>Option1 - OptionN</i>	Opt	One or more option keywords. They can appear in any order and are not case-sensitive.

The options available are found in the following table.

Option	Meaning
"no_load"	By default, properties with the data type of 'Resource' will load and the macro will evaluate to the loaded value. If this value is provided, properties with this data type will evaluate to the resource identifier string instead of the resource value.
"no_translate"	By default, properties with a data type of 'Resource' will load and all other properties will be run through the default translator for their type. If this value is provided, the macro will evaluate to a raw value for the property. This is a superset of the "no_load" behavior.
"fail_if_empty"	If a parameter with the value of "fail_if_empty" is supplied, the macro will fail if the result is an empty string.

Result

This macro will fail in the following circumstances:

- The required parameters are not supplied.
- An object of the specified type is not found on the context stack.
- The "fail_if_empty" option is supplied and the result is an empty string.

See the sample under the **Property** macro for an example of the use of the "no_translate" option.

Assume that the CUSTOMER table in the following picture is the current context object.

CUSTOMER
customer_number: integer NOT NULL
customer_first_name: varchar(20) NULL
customer_last_name: varchar(20) NULL (IE1)
customer_address: varchar(20) NULL (AK1)
customer_city: varchar(20) NULL
customer_state: varchar(20) NULL
customer_zip_code: varchar(20) NULL
email: varchar(50) NULL

Template
<pre>ForEachOwnee ("Attribute") { PropertyFrom("Entity", "Name") "." Property("Name") "\n" }</pre>
Result
<pre>CUSTOMER.customer_number CUSTOMER.customer_first_name CUSTOMER.customer_last_name ...etc.</pre>

PropertyThrough

Description

This macro evaluates to the string representation of the specified property on the object pointed to by the specified scalar reference property on the current context object. An object and a property are identified by their class names as defined in the metadata for CA ERwin Data Modeler.

Prototype

```
PropertyThrough( ReferenceProperty, PropertyName [, Option1 [, Option2
[, ...]] ] )
```

Parameter	Status	Description
<i>ReferenceProperty</i>	Req	The reference property to use to locate the desired owning object.
<i>PropertyName</i>	Req	The type name of the property.
<i>Option1 - OptionN</i>	Opt	One or more option keywords. They can appear in any order and are not case-sensitive.

The options available are found in the following table.

Option	Meaning
"no_load"	By default, properties with the data type of 'Resource' will load and the macro will evaluate to the loaded value. If this value is provided, properties with this data type will evaluate to the resource identifier string instead of the resource value.
"no_translate"	By default, properties with a data type of 'Resource' will load and all other properties will be run through the default translator for their type. If this value is provided, the macro will evaluate to a raw value for the property. This is a superset of the "no_load" behavior.
"fail_if_empty"	If a parameter with the value of "fail_if_empty" is supplied, the macro will fail if the result is an empty string.

Result

This macro will fail in the following circumstances:

- The required parameters are not supplied.
- The referenced object is not found.
- The "fail_if_empty" option is supplied and the result is an empty string.

3

PropertyWithDefault

Description

This macro evaluates to the string representation of the specified property on the current context object. If the property does not evaluate successfully, a default value is returned.

Prototype

`PropertyWithDefault(Property, Default [, Option1[, Option2 [, ...]]])`

Parameter	Status	Description
<i>Property</i>	Req	The type name of the property.
<i>Default</i>	Req	The default value.
<i>Option1- OptionN</i>	Opt	One or more option keywords. They can appear in any order.

The options available are found in the following table.

Option	Meaning
"no_load"	By default, properties with the data type of 'Resource' will load and the macro will evaluate to the loaded value. If this value is provided, properties with this data type will evaluate to a resource identifier string.
"no_translate"	By default, properties with a data type of 'Resource' will load and all other properties will be run through the default translator for their type. If this value is provided, the macro will evaluate to a raw value for the property. This overrides the "no_load" option.

Result

This macro will fail in the following circumstances:

- The required parameters are not supplied.

Deprecation Level

Active	Discouraged	Deprecated	Removed
✓			

Breaking Changes

The default behavior of this macro has changed since the CA ERwin Data Modeler r7.1 release. The earlier version defaulted to 'no_translate' and 'no_load'.

<pre> /* With these parameters, the ForEachOfType iterator will push the OLD image onto the context stack */ ForEachOfType("Entity", "modified") { "execute sp_rename '" Property("Physical_Name") "' , '" PushNewImage Property("Physical_Name") Pop "' , 'OBJECT'\ngo" } </pre>
Result
<pre> execute sp_rename 'CUSTOMER', 'CUST', 'OBJECT' go </pre>

PushOldImage

Description

This macro is used when processing objects modified in the model, for example, during Alter Script processing in CA ERwin Data Modeler. If the current object is a real object in the model (i.e., not a phantom object) this macro will push the previous image of the object onto the context stack.

Prototype

PushOldImage

Result

This macro will fail in the following circumstances:

- The current process does not supply the template engine a previous image of the model.
- The current context object is not a real object.
- The previous image of the model does not contain a previous image of the object.

Deprecation Level

Active	Discouraged	Deprecated	Removed

Sample

Assume the current context is an Entity object that was renamed from CUSTOMER to CUST during the session.

Template
<code>"execute sp_rename '" PushOldImage Property("Physical_Name") Pop "', '" Property("Physical_Name") "', 'OBJECT'\ngo"</code>
Result
<code>execute sp_rename 'CUSTOMER', 'CUST', 'OBJECT' go</code>

PushOwner

Description

This pushes the owner of the current context object onto the context stack.

Note: this refers to the owning object, not the value of the DB Owner property.

Prototype

`PushOwner`

Result

This macro will fail in the following circumstances:

- The current context object has no owner.

Deprecation Level

Active	Discouraged	Deprecated	Removed
✓			

Breaking Changes

None

Categories

- Stack Macros

Sample

Assume that the context object is E_1 in the following illustration.

```
PushOwner Property( "Name" ) Pop
```

Template
<pre>ForEachOwnee("Attribute") { ListSeparator("\n") [PushOwner Property("Name") "." Pop]Property("Name") } </pre>
Result
<pre>E_1.a E_1.b E_1.c</pre>

PushReference

Description

This pushes the object referenced by the specified property of the current context object onto the context stack.

Prototype

```
PushReference( Property )
```

Parameter	Status	Description
<i>Property</i>	Req	The type name of the property.

Result

This macro will fail in the following circumstances:

- The reference property does not exist.
- The referenced object does not exist.

Deprecation Level

Active	Discouraged	Deprecated	Removed
✓			

Breaking Changes

Categories

- Stack Macros

Sample

Assume the context object is the **Relationship** in the following illustration.

Template
<code>PushReference("Parent_Entity_Ref")</code>
<code>Property("Name")</code>
<code>Pop</code>
Result
<code>E_1</code>

PushTopLevelObject

Description

This macro will push the *top level object* for the current context object onto the stack. The top level object is defined as the object for which a CREATE statement would be executed in SQL.

Prototype

`PushTopLevelObject`

Result

This macro will fail in the following circumstances:

- The current context object is not represented in the database.

Deprecation Level

Active	Discouraged	Deprecated	Removed
✓			

Breaking Changes

None

Categories

- Stack Macros

Sample

Assume that the `Attribute` object 'a' is the current context object.

Template
<code>PushTopLevelObject</code> <code>Property("Name")</code>
Result
<code>"E_1"</code>

QuotedName

Description

This macro retrieves a name property from the current object and, based upon the current settings in the FE Option Set, quotes the name. For objects having both the 'Physical Name' and the 'Name' properties, the 'Physical Name' property will be read first. If that fails, the 'Name' property will be used. For all other objects, the 'Name' property will be used.

This macro is sensitive to the current FE Option Set. If quoting of names is disabled in the option set, the quotes will not be emitted.

Prototype

`QuotedName([QuoteCharacter])`

Parameter	Status	Description
<code>QuoteCharacter</code>	Opt	The quote character to be used. If this is not supplied, double quotes will be used.

Result

This macro always succeeds.

- Property Macros

Sample

Assume the context object is E_1 in the following illustration, and the current FE Option Set has quoted naming enabled.

Template
<code>QuotedName</code>
Result
<code>"E_1"</code>

QuotedNameThrough

Description

This macro retrieves a name property from the object pointed to by the specified scalar reference property on the current context object and, based upon the current settings in the FE Option Set, quotes the name. For objects having both the 'Physical Name' and the 'Name' properties, the 'Physical Name' property will be read first. If that fails, the 'Name' property will be used. For all other objects, the 'Name' property will be used.

This macro is sensitive to the current FE Option Set. If quoting of names is disabled in the option set, the quotes will not be emitted.

Prototype

`QuotedNameThrough(ReferenceProperty, [QuoteCharacter])`

Parameter	Status	Description
<i>ReferenceProperty</i>	Req	The reference property to use to locate the desired owning object.
<i>QuoteCharacter</i>	Opt	The quote character to be used. If this is not supplied, double quotes will be used.

Result

This macro always succeeds.

<code>QuotedNameThrough("Parent_Entity_Ref")</code>
Result
<code>"E_1"</code>

Remove

Description

This removes the specified variable.

Prototype

`Remove(VariableName)`

Parameter	Status	Description
<i>VariableName</i>	Req	The name of the previously defined variable.

Result

This macro will fail in the following circumstances:

- The specified variable does not exist.

Deprecation Level

Active	Discouraged	Deprecated	Removed

Sample

Template
<pre>SetString("MyValue", "One") ["The value is now: " String("MyValue")] RemoveInteger("MyValue") ["The value is now: " String("MyValue")]</pre>
Result
The value is now: One

Repush

Description

This pushes an object that already exists on the context stack onto the stack again.

Prototype

`Repush(Depth)`

Parameter	Status	Description
<i>Depth</i>	Req	<p>The zero-based depth of the object in the context stack. The value provided must be greater than zero (zero indicates the current context object) and less than the size of the stack.</p> <p>The special value of "anchor" indicates that the anchor object should be pushed regardless of the stack's depth.</p>

Result

This macro will fail in the following circumstances:

- The required parameters are not supplied.
- The *Depth* parameter does not evaluate to a number greater than or equal to '1' and is not the special value of "anchor".
- The depth specified by *Depth* is greater than the current size of the context stack.

Deprecation Level

Active	Discouraged	Deprecated	Removed
✓

Categories

- Stack Macros

Sample

Assume the context object is the **Relationship** object in the following illustration. For sake of simplicity in the example, the template assumes that there is only one relation coming into E_2.

Template
<pre> PushReference("Child_Entity_Ref") ForEachOwnee("Attribute") { ListSeparator("\n") @if(IsPropertyNull("Parent_Attribute_Ref") { Property("Name") " is owned." } @else { Property("Name") " is migrated by " Repush("2") Property("Name") Pop "." } } </pre>
Result
<pre> a is migrated by R_2. b is owned. </pre>

RepushType

Description

This pushes an object that already exists on the context stack onto the stack again based upon the class type.

Prototype

```
Repush( Type )
```

Parameter	Status	Description
<i>Type</i>	Req	The type name of the object desired.

Result

This macro will fail in the following circumstances:

- The required parameters are not supplied.
- An object of the specified type was not found on the context stack.

<pre> ForEachOwnee ("Key_Group") { ListSeparator ("\n") ForEachOwnee ("Key_Group_Member") { ListSeparator ("\n") Property ("Name") " participates in a key group in " RepushType ("Entity") Property ("Name") Pop } } </pre>
Result
<pre> a participates in a key group in E/1 b participates in a key group in E/1 </pre>

Right

Description

This macro evaluates to a substring comprised of the rightmost characters of the specified source string.

Prototype

```
Right( SourceString, Length )
```

Parameter	Status	Description
<i>SourceString</i>	Req	The source string.
<i>Length</i>	Req	The length of the desired substring.

Result

This macro will fail in the following circumstances:

- The required parameters are not passed in.
- The *Length* parameter cannot be evaluated to a number greater than '1'.

Separator

Description

This inserts the specified separator between a set of values. The separator will be inserted between any two values that are not empty strings.

Prototype

```
Separator( Separator, Value1 [, Value2 [,...]] )
```

Parameter	Status	Description
<i>Separator</i>	Req	The separator to insert.
<i>Value1</i>	Req	The first value in the set.
<i>Value2 – ValueN</i>	Opt	The second through N th value in the set.

Result

This will fail if:

- The required parameters are not supplied.

SetLocalFlag

Description

This macro will set a flag tied to the current context object. Flags are identified by a name and are not case-sensitive. When a context object is pushed down on the stack, its flags are not longer visible by the `IsLocalFlagSet` macro. When a context object is popped off the stack, its flags are discarded.

Prototype

`SetLocalFlag(Flag [, Depth])`

Parameter	Status	Description
<i>Flag</i>	Req	The name of the flag to set.
<i>Depth</i>	Opt	This will set the named local flag on the stack entry <i>Depth</i> levels above the current entry.

Result

This macro will fail in the following circumstances:

- The required parameters are not supplied.

<pre>One</pre>

ShouldGenerate

Description

This macro tests whether the current context object should generate, based upon both its properties and the current FE Option Set.

Prototype

`ShouldGenerate`

Result

This macro will fail in the following circumstances:

- The `Generate` property is associated with the object type by the metadata, but not set.
- The `Is_Logical_Only` property is set on the object.
- The object is built-in – the `Built_In_Id` property is set on the object.
- The object is filtered out by the current FE Option Set.

Substitute

Description

The macro evaluates to a string where one or more substrings are replaced with a new value.

Prototype

```
Substitute( SourceString, NewValue, OldValue1 [, OldValue2 [...]] )
```

Parameter	Status	Description
<i>SourceString</i>	Req	The source string.
<i>NewValue</i>	Req	The new value to place into the string.
<i>OldValue1</i>	Req	The first substring to replace.
<i>OldValue2-OldValueN</i>	Opt	Additional substrings to replace.

Result

This macro will fail in the following circumstances:

- The required parameters are not passed in.

Deprecation Level

Active	Discouraged	Deprecated	Removed

Sample

Assume the context object is E_1 in the following illustration.

Template
<code>/* Replace all spaces and tabs in the description with underscores */ Substitute(Property("Description"), "_", " ", "\t")</code>
Result
<code>The_first_entity_created.</code>

Switch

Description

This macro, in conjunction with the Choose and Default macros, tests a predicate against a range of values and executes a block when a match is found.

Prototype

```
Switch( Predicate ) {}
```

Parameter	Status	Description
<i>Predicate</i>	Req	This parameter evaluates to the value that is to be tested.

Result

This macro will fail in the following circumstances:

- The required parameters are not passed in.

Deprecation Level

Active	Discouraged	Deprecated	Removed
✓

FORWARD ENGINEERING MACROS

These macros are usable only in the context of the script generation in Forward Engineering and Alter Script.

FE::ActivateDataPreservation

Description

This macro registers an **Entity** or **Attribute** object for the Data Preservation mechanism. The context object is added in the Data Preservation objects list. For the context object, data is prepared in the background to be displayed in the Data Preservation Options dialog.

Prototype

FE::ActivateDataPreservation

Result

The macro will fail if:

- The context object is not an **Entity** or **Attribute**.

Deprecation Level

Active	Discouraged	Deprecated	Removed
✓			

Breaking Changes

None

Categories

- Forward Engineering Macros

Sample

Template
<pre>[IsAlterScriptX /* Add this entity in the data preservation list. */ [ActivateDataPreservation] ...]</pre>
Result
The entity's data will now be preserved across the alter process.

FE::Bucket

Description

This macro inserts a bucket identification token into the script. This token is interpreted by the script processing engine for sorting purposes and then removed. See the document, *Editing Forward Engineering Templates.pdf*, for a complete description of buckets.

Prototype

`FE::Bucket(BucketNumber)`

Parameter	Status	Description
<i>BucketNumber</i>	Req	The bucket number.

Result

This macro will fail if:

- The required parameters are not supplied.

Deprecation Level

Active	Discouraged	Deprecated	Removed
✓			

Breaking Changes

None

Categories

- Forward Engineering Macros

Sample

Template
<code>FE::Bucket("90")</code> ...
Result
There will be no visible effect in the script generated by the FE engine, as the bucket tokens are stripped out of the final output. If a template is expanded outside of the FE engine, the output will appear as follows, where '90' is the bucket number.
<code>@*B=90B*</code>

FE::DataPreservationOption

Description

This macro is used to get a specific user selection from the Data Preservation Options dialog. The Data Preservation is enabled when there is a drop and re-create of an entity for the Alter Scripts.

The list of options that can be tested is found in the following table.

Name	Description
WhereClause	Evaluates to the state of the user-specified "Where Condition".
DropTempTable	Evaluates to the state of the "Drop Temp Table" check box.
PreserveData	Evaluates to the inverse value of "Do NOT Preserve Data" check box.
IsDropRecreate	Evaluates to the value of "Force DROP/re-CREATE Table" check box.
IsAlterRequired	Evaluates to the inverse value of "Force DROP/re-CREATE Table" check box.
RegisterEntity	This option sets the template flag indicating that the query is generated to transfer the data from the temp table to the new modified table.

Prototype

`FE::DataPreservationOption(OptionName)`

Parameter	Status	Description
<i>OptionName</i>	Req	The name of the option.

Result

See the above table for explanations of return values.

Deprecation Level

Active	Discouraged	Deprecated	Removed
✓			

Breaking Changes

Sample

Template
<code>FE::EmitERwinGeneratedTriggers</code>
Result
<pre>create procedure erwin_raise_except(err int,msg varchar(255)) raise exception err,0,msg; end procedure; CREATE TRIGGER tD_E_1 DELETE ON E_1 ...etc.</pre>

FE::EndOfStatement

Description

This macro inserts an end-of-statement token into the script. This token is interpreted by the script processing engine and then removed. This should not be confused with macros like `%DBMSDeLim` that insert end of statement delimiters interpreted by the database.

Prototype

`FE::EndOfStatement`

Result

This macro always succeeds.

Deprecation Level

Active	Discouraged	Deprecated	Removed
✓			

Breaking Changes

None

Categories

- Forward Engineering Macros

Sample

Template
<code>FE::EndOfStatement</code>
Result
There will be no visible effect in the script generated by the FE engine, as the end of statement markers are stripped out of the final output. If a template is expanded outside of the FE engine, the output will appear as follows.
<code>@@*EOS*@@</code>

FE::IsAlterScriptGeneration

Description

This macro succeeds if the process running the script is Alter Script Generation.

Prototype

`FE::IsAlterScriptGeneration`

Result

This macro will fail in the following circumstances:

- The template is not being expanded as part of Alter Script.

Deprecation Level

Active	Discouraged	Deprecated	Removed
✓			

Breaking Changes

None

Categories

- Forward Engineering Macros

Sample

Template
<code>[FE:: IsAlterScriptGeneration /* Generate alter script-specific stuff */]</code>
Result
The Alter Script-specific template will be emitted.

FE::IsEntityInSubjectArea

Description

This macro succeeds if current context object is located in the `Referenced_Entities_Ref` property of the current `Subject_Area`.

Prototype

`FE::IsAlterScriptGeneration`

Result

This macro will fail in the following circumstances:

- The current context object is not located in the `Referenced_Entities_Ref` property of the current `Subject_Area`.

✓			

Breaking Changes

None

Categories

- Forward Engineering Macros

Sample

Template
<pre>[FE::IsEntityInSubjectArea /* Only do this if the entity is in the current subject area */]</pre>

FE::IsLastColumn

Description

This predicate is used by Alter Script processing to determine if the insertion of columns can be done with an ALTER statement, or if the table must be dropped and recreated.

It determines if new `Attribute` objects have been added to the `Entity` object owning the `Attribute` object that is the current context object during the current session.

If new **Attribute** objects were added, then the macro checks if subsequent **Attribute** objects were also newly added. The current FE Option Set is used to determine what ordering is being used.

If no **Attribute** objects were added, the macro returns tests if the current context is the last **Attribute** based on the settings of the current FE Option Set.

Prototype

FE::IsLastColumn

Result

This macro will fail in the following circumstances:

- **Attribute** objects were added, but there are **Attribute** objects later in the current sort order that were not newly added.
- No **Attribute** objects were added, but the current context object is not the last one.

Deprecation Level

Active	Discouraged	Deprecated	Removed
✓			

Breaking Changes

None

Categories

- Forward Engineering Macros

Sample

Template
<pre>[FE::IsLastColumn /* We can use ALTER, so emit construct the statement */ "ALTER TABLE " ...]</pre>
Result
This particular clause will be emitted.

FE::IsModified

Description

This macro succeeds functions as does the **IsModified** macro, except that properties not represented in the database are not considered when testing for modifications.

Prototype

`FE::IsModified`

Result

This macro will fail in the following circumstances:

- The current context object is not modified, or is only modified in properties that are not represented in the database.

Deprecation Level

Active	Discouraged	Deprecated	Removed
✓			

Breaking Changes

None

Categories

- Forward Engineering Macros

Sample

The following block will only execute if the object is modified in a database property other than comment.

Template
<code>FE::IsModified("Comment")</code>

FE::IsSchemaGeneration

Description

This macro succeeds if the process running the script is Schema Generation.

Prototype

`FE::IsSchemaGeneration`

Result

This macro will fail in the following circumstances:

- The template is not being expanded as part of Schema Generation.

Deprecation Level

Active	Discouraged	Deprecated	Removed
✓			

Breaking Changes

None

Categories

- Forward Engineering Macros

Template
<pre>[FE::IsSchemaGeneration /* Generate forward engineering script-specific stuff */]</pre>
Result
The Forward Engineering-specific template will be emitted.

FE::NextExistingColumn

Description

This macro is used by the Alter Script mechanism for databases that allow the creation of a column in the middle of a table. It evaluates to the name of the next pre-existing **Attribute** object after a newly-created **Attribute**. The current FE Option Set is used to determine the sort order.

Prototype

`FE::NextExistingColumn`

Result

This macro will fail in the following circumstances:

- There is not a succeeding pre-existing **Attribute** object.

Deprecation Level

Active	Discouraged	Deprecated	Removed
✓			

Breaking Changes

None

Categories

- Forward Engineering Macros

Sample

Template
<pre>... "ALTER TABLE " ... ["\r\n" "BEFORE " FE::NextExistingColumn] ...</pre>
Result
This particular clause will be emitted.

FE::Option

Description

This predicate tests whether the specified option is turned on in the current FE Option Set.

The list of options that can be tested is found in the following table. For a description of what these options control, consult the Help system for the Forward Engineering dialogs.

Prototype

FE::Option(*OptionName*)

Parameter	Status	Description
<i>OptionName</i>	Req	The name of the option.

Result

This macro will fail in the following circumstances:

- The option is not turned on.

Deprecation Level

Active	Discouraged	Deprecated	Removed
✓

Sample

Template
<pre> /* Are we generating in physical order? */ [OptionX("ColumnPhysicalOrder") ForEachReference("Physical_Columns_Order_Ref") { Execute("Column Properties") }] </pre>
Result
<p>The code for generating the columns in physical order will be emitted if you have selected this option.</p>

FE::OwnerOverride

Description

This macro evaluates to the appropriate Owner Override value specified in the Forward Engineering dialog.

Prototype

```
FE::OwnerOverride( [DefaultToModel [, OwnerLevels]] )
```

Parameter	Status	Description
<i>DefaultToModel</i>	Opt	If this value is set to 'true' and no owner override is specified in the Forward Engineering dialog, then the value found in the DB Owner property of the object will be used.
<i>OwnerLevels</i>	Opt	If this is specified, the value will be determined for the owning object this number of levels above the current context object.

Result

This macro will fail in the following circumstances:

- There is no owner override specified and *DefaultToModel* is not present.
- There is no owner override, *DefaultToModel* is present, but there is no value specified for the **Schema_Name** property on the object in the model.

- *OwenrLevels* is specified and the current context object is not that deep in the model ownership tree.

Deprecation Level

Active	Discouraged	Deprecated	Removed

Categories

- Forward Engineering Macros

Sample

Assume the following table is the current context object. The first example results show what would emit if an owner override of “sa2” was in place. The second example results show what would emit if no owner override was in place.

Template
<pre>[FE::OwnerOverride "."] Property("Physical_Name") "\n" [FE::OwnerOverride("true") "."] Property("Physical_Name") "\n" ForEachOwnee("Attribute") { ListSeparator("\n") FE::OwnerOverride("true", "1") "." OwnerProperty("Physical_Name") "." Property("Physical_Name") }</pre>
Result – Example #1
<pre>sa2.E_1 sa2.E_1 sa2.E_1.a sa2.E_1.b</pre>
Result – Example #2
<pre>E_1 sa.E_1 sa.E_1.a sa.E_1.b</pre>

FE::RecordAlter

Description

This macro inserts an FE Record Alter token into the script. This token is interpreted by the script processing engine when creating Alter scripts. Some changes to a model object can be handled by an ALTER statement, while other changes require the corresponding database object to be dropped and recreated. If a change of the first type is processed before a change of the second type, a redundant ALTER statement is generated. To counter this, all ALTER statements are tagged using this macro. When the FE engine processes the script, it examines the entire state of the object and, if another change forces the drop/recreate, eliminates the ALTER statement. These tags are removed from the final script.

Prototype

`FE::RecordAlter`

Result

This macro always succeeds.

Deprecation Level

Active	Discouraged	Deprecated	Removed
✓			

Breaking Changes

None

Categories

- Forward Engineering Macros

Sample

Template
<code>FE::RecordAlter</code> ...
Result
There will be no visible effect in the script generated by the FE engine, as the alter script tokens are stripped out of the final output. If a template is expanded outside of the FE engine, the output will appear as follows, where '189' is an object's id. <code>@@*A=189A*@@</code>

FE::RecordCreate

Description

This macro will attempt to set a global flag that is a concatenation of the context object's id, the label "Create" and the context object's type name. The macro will fail if this flag is already set. The flag indicates that the object has been created, which allows the post processing to test for and remove any alter statements which may have been generated for the object.

Prototype

FE::RecordCreate

Result

This macro will fail in the following circumstances:

- The flag is already set.

Deprecation Level

Active	Discouraged	Deprecated	Removed

Breaking Changes

None

Categories

- Forward Engineering Macros

Sample

Template
FE::RecordCreate ...
Result
No visible result.

FE::SchemaExecCommand

Description

This macro inserts an FE Execute Command token into the script. This token is interpreted by the script processing engine when working against a 4GL such as Access or FoxPro in order to construct the commands to modify the database objects via the 4GL's API.

Prototype

FE::SchemaExecCommand(*CommandString*)

Parameter	Status	Description
<i>CommandString</i>	Req	The command string to embed.

Result

This macro always succeeds.

Deprecation Level

Active	Discouraged	Deprecated	Removed
✓			

Breaking Changes

None

Categories

- Forward Engineering Macros

Sample

Template
FE::SchemaExecCommand ("Create Access Field Start")
Result
There will be no visible effect in the script generated by the FE engine, as the schema execution tokens are stripped out of the final output. If a template is expanded outside of the FE engine, the output will appear as follows.
@@*SE Create Access Field Start SE*@@

FE::TempTable

Description

This evaluates to the name of the temporary table that the Data Preservation option of Alter Script has created.

Prototype

FE::TempTable

Result

This macro will fail in the following circumstances:

- Alter Script has not constructed a temporary table.

Deprecation Level

Active	Discouraged	Deprecated	Removed
✓			

Breaking Changes

None

Categories
