LINK TO nvcid IS NOT ACTIVE.

Reason:

Informs NetView operators that there is no connection between NV-Connect nvcid and NetView.

System Action:

The system will try to establish connection at regular intervals.

User Action:

Determine the reason for connection unavailability.

N7A903

USERID uuuuuuuu SIGNON TIMED OUT.

Reason:

A NV-Connect operator tried to signon to NetView via ROF. However the operator autotask has not started within the allowed time frame.

System Action:

The system will reject ROF signon to NetView.

User Action:

Determine the reason for autotask start failure in NetView. Probable causes are: operator ID is not defined to NetView; operator logged on to NetView natively.

N7A904**THRESHOLD REACHED, number BUFFERS ON MESSAGE QUEUE OF NVCV TASK****Reason:**

A threshold limit of buffers on NVCV's public queue has been reached.

System Action:

NVCV subtask will deactivate itself until the message count drops to 75% of threshold limit, then it will reactivate itself. NetView exits attempting to queue messages to NVCV subtask, will not be able to do so while NVCV subtask is in INACTIVE state.

User Action:

Determine the reason for message rate flow and adjust OQLIM parameter for NVCV task if necessary.

N7AA01**UNABLE TO GET BUFFER STORAGE****Reason:**

A NetView operator issued a command destined for NV-Connect. The command processor was unable to acquire a buffer for delivery of the message to the NVCV subtask.

System Action:

The command is not delivered to NVCV subtask and is not executed.

User Action:

Investigate the storage usage by NetView; if necessary increase the region size.

N7AA02

UNABLE TO QUEUE BUFFER TO NVCV SUBTASK.

Reason:

A NetView operator issued a command destined for NV-Connect. The command processor tried to queue a command buffer to NVCV subtask but the DSIMQS macro returned a non-zero return code.

System Action:

The command is not delivered to NVCV subtask and is not executed.

User Action:

Ensure the NVCV subtask in NetView is active and reissue the command.

N7AG01

LINK linkname FAILED AND HAS BEEN FORCED INACTIVE.

Reason:

This message indicates that a serious error has occurred on the NVC-type link to the system known as linkname . The link is now unusable. NV-Connect will close all sessions on the link and the link will remain in FAILED status until a LINK START command is entered to restart it.

System Action:

The link is inactivated and put into FAILED status.

User Action:

Other messages will precede this message, indicating the cause of the original error. Refer to these messages to see what corrective action is necessary. When the error condition has been corrected, issue a LINK START command to reactivate the link.

N7AG03**PPI COMMUNICATIONS ERROR - LAST RC=rc****Reason:**

This message indicates that an NV-Connect sender was unable to send messages due to failure in PPI. rc indicates the last return code from a call to PPI.

System Action:

The link is deactivated.

User Action:

Refer to PPI documentation for an explanation of the PPI return code, correct the problem and restart the link.

N7AG04**DATA SENT TO LINK linkname IS LOST.****Reason:**

This message indicates that data destined for linkname has been lost due to communications failure.

System Action:

The link is deactivated.

User Action:

Determine the reason for communications failure based on messages preceding or following this message.

N7AG05**NVC RECEIVER receiverid IS NOT AVAILABLE - LAST RC=rc****Reason:**

This message indicates an error during PPI send processing to NetView receiver receiverid . rc indicates the last return code from PPI.

System Action:

The link is deactivated.

User Action:

Consult PPI documentation to determine the reason for failure based on rc .

N7AG06

SIGNON TO linkname LOST, RESTART PENDING LINK RECOVERY.

Reason:

Notifies a user that the ROF connection to remote NetView system linkname has been broken because the link to the remote system has been lost.

System Action:

The ROF connection is scheduled for re-establishment when the link becomes active again.

User Action:

None.

N7AG07

NVC RECEIVER receiverid INPUT QUEUE IS FULL - LAST RC=rc

Reason:

This message indicates that the NetView PPI receiver's queue is full. rc indicates the last return code from PPI.

System Action:

Messages will not be sent to NetView.

User Action:

Determine the reason for message build-up on the PPI queue and rectify the problem.

N7AG08**LINK TO linkname IS NOW INACTIVE.****Reason:**

The link to NetView system known as linkname is inactive.

System Action:

If the link has become inactive as a result of an earlier LINK STOP= linkname command, the link will remain inactive until a subsequent LINK START= linkname command. Otherwise the system will attempt to re- establish the link at regular intervals.

User Action:

Determine the cause of link deactivation if no LINK STOP= linkname was entered. Check whether the remote NetView system was terminated.

N7AH01**PPI COMMUNICATION ERROR - RC=rc****Reason:**

A NetView PPI receiver detected a PPI communication error. rc indicates the last return code from PPI.

System Action:

The system will retry connection to PPI at regular intervals.

User Action:

Consult PPI documentation for an explanation of rc to determine the reason for communications failure.

N7AH02**NETVIEW PPI RECEIVER receiverid IS INACTIVE.****Reason:**

A NetView PPI receiver is inactive due to registration failure with PPI.

System Action:

The system will retry PPI registration at regular intervals.

User Action:

Consult the PPI documentation for an explanation of the return codes issued in the preceding messages.

N7AH03

AUTOTASK START FOR OPID=opid HAS FAILED.

Reason:

Signon was attempted via ROF from NV-Connect but the NVCV subtask could not start operator autotask.

System Action:

ROF signon is rejected.

User Action:

The probable cause for error is that opid is not defined to NetView or opid is already active in NetView.

N7AH04

USERID opid SIGNON FAILED - STORAGE SHORTAGE.

Reason:

Signon was attempted via ROF from NV-Connect, but the NVCV subtask could not allocate the required storage.

System Action:

ROF signon is rejected.

User Action:

Investigate the reason for storage problems in NetView.

N7AH05

UNABLE TO QUEUE COMMAND TO opid TASK. DSIMQS RC=rc

Reason:

A ROF command arrived from NV-Connect, but the NVCV subtask could not queue it to the opid task. rc indicates the error code returned by the DSIMQS macro.

System Action:

Command is not executed.

User Action:

Investigate the reason for DSIMQS failure based on rc by consulting NetView documentation.

N7AH06**LINK FROM netviewid TO nv-connectid NOW INACTIVE.****Reason:**

The link from this NetView system to the NV-Connect system is inactive.

System Action:

The link has become inactive as a result of termination of the NVCV subtask in NetView. The link will remain inactive until the NVCV task is restarted. The system will attempt to re- establish the link at regular intervals.

User Action:

Determine the cause of link deactivation if NVCV task has not been terminated. Possible causes may be that the NV-Connect system was terminated or there was PPI communications error.

N7AH07**USERID opid IS SIGNED ON TO NETVIEW FROM ANOTHER SCREEN.****Reason:**

ROF signon was attempted by opid from NV-connect, but the user has already signed on to NetView from another NV-Connect screen.

System Action:

Signon is rejected.

User Action:

Use the original session, or terminate it and start the new one.

N7AH08**domain_id VERSION version1 DOES NOT MATCH NVCV VERSION version2****Reason:**

The SOLVE and NVCV versions are incompatible.

System Action:

The link from NetView to SOLVE is not established.

User Action:

Make sure that SOLVE & NVCV in NetView have been installed correctly and they are of the same release.

N7AI01

PPI COMMUNICATIONS ERROR - RC=rc.

Reason:

This message indicates that an NVCv sender was unable to send messages due to a failure in PPI. rc indicates the last return code from a call to PPI.

System Action:

The NVCV subtask in NetView will retry to contact PPI.

User Action:

Refer to PPI documentation for explanation of return code from PPI.

N7AI02

NVC RECEIVER P1 IS P2 - RC= P3

Reason:

This message indicates an error during PPI send processing to NV-Connect from NVCV. The variables are:

P1 is the NetView PPI Receiver ID.

P2 indicates the current status of the specified receiver. This can be *ACTIVE* or *INACTIVE*.

P3 indicates the return code from PPI.

System Action:

There is no communication between NV-Connect and NVCV.

User Action:

Consult PPI documentation to determine the reason for failure based on *P3*.

N7AI03**RECEIVER'S QUEUE FULL - DATA TO DOMAIN domid IS LOST.****Reason:**

This message indicates that NV-Connect's PPI receiver queue is now full.

System Action:

The data destined for domid domain is discarded.

User Action:

Determine the reason for message build-up on the PPI queue and rectify the problem.

N7AJ01**service CALL HAS FAILED, LAST RC=rc****Reason:**

This message indicates a call to NetView service service from the NVCV task has failed. rc contains the return call from the service call.

System Action:

NVCV will take the appropriate action, depending on the nature of service .

User Action:

Determine the reason for failure based on rc and service name.

N7AJ02**NVCV INITIALIZATION PARAMETERS IN ERROR.****Reason:**

This message indicates that NVCV's parameters specified in the initialization member of DSIPARM library are incorrect.

System Action:

NVCV subtask will not start.

User Action:

Correct initialization parameters.

N7AJ03

NVCV INITIALIZATION FAILED.

Reason:

This message indicates that NVCV subtask has failed to initialize.

System Action:

NVCV subtask will terminate.

User Action:

Determine the reason for failure based on the preceding messages.

N7AJ04

DSILOD FOR modname HAS FAILED, LAST RC=rc

Reason:

This message indicates that the call to DSILOD service in NetView has failed. modname is name of the module being loaded.

System Action:

NVCV subtask will terminate.

User Action:

Determine the reason for failure based on return code rc from DSILOD.

N7AK01

UNABLE TO DELIVER CNM/NMVT RC=rc

Reason:

This message indicates that the CNM/NMVT messages arriving from NV-Connect were not delivered to NetView. rc indicates the return code from the DSIMQS macro.

System Action:

The message is deleted.

User Action:

Determine the reason for failure based on the return code rc from DSIMQS.

N7AK02

INVALID RETURN FROM USER EXIT exitname R15=r15 R0=r0 - RC IS IGNORED.

Reason:

This message indicates that the user provided exit exitname has returned with invalid parameters. r15 is the contents of Register 15 and r0 is the contents of Register 0 that were returned by the user exit.

System Action:

The return code from user exits is returned.

User Action:

Consult documentation on coding user exits and correct the exit.

N7AK03

UNABLE TO QUEUE PPO MESSAGE TO ppttask - DSIMQS RC=rc

Reason:

This message indicates that a PPO message that arrived from NVC is not delivered to NetView's PPT task. rc indicates the return code from DSIMQS macro.

System Action:

The message is deleted.

User Action:

Determine the reason for failure based on return code rc from DSIMQS.

N7AN99

NVCV INTERNAL ABEND NM000xxx-rc OFFSET offset.

Reason:

An internal error has occurred in the module identified in the message. The reason code *rc* further clarifies the type of abend. A full list of internal abend codes (xxx-yy) can be displayed using the Common Application Services (CAS) message services.

System Action:

A formatted dump and a system dump are normally produced.

User Action:

Use the internal abend code to (xxx-yy) and examine the messages. If the problem cannot be easily diagnosed contact support. r

N7AS01

LINK DEFINITION FOR linkname RESET

Reason:

Confirms successful processing of an earlier LINK RESET= linkname command issued to delete the definition of the remote NetView system linkname .

System Action:

None.

User Action:

A LINK START command will have to be entered to redefine the remote system linkname before connection can be re-established.

N7AS02**LINK DEFINITION FOR linkname STILL ENABLED AND CANNOT BE RESET****Reason:**

A LINK RESET command was entered for link linkname but the link has not yet been de-activated by a LINK STOP command. Until this is done the link definition cannot be reset.

System Action:

The command is rejected.

User Action:

Issue a LINK STOP= linkname command if applicable, then re-issue the LINK RESET= linkname command.

N7C001**SOLVE AND SUBSYSTEM VERSIONS DO NOT MATCH****Reason:**

SOLVE and ASN1 subsystem are not compatible.

System Action:

ASN1 subsystem is not initialized.

User Action:

Make sure that the correct ASN1 compiler module is used by the SOLVE system.

N7C002**NO-ERRORS****Reason:**

This message is returned by ASN1COMP subsystem in response to &CALL SUBSYS=ASN1COMP READ ERROR request. It indicates that no errors were produced during compilation of ASN1 module.

System Action:

None.

User Action:

None.

N7C003

NO-WARNINGS

Reason:

This message is returned by ASN1COMP subsystem in response to &CALL SUBSYS=ASN1COMP READ WARNING request. It indicates that no warnings were produced during compilation of ASN1 module.

System Action:

None.

User Action:

None.

N7E301

STRUCTURED FIELD aaaa IN ERROR

Reason:

A SOLVE:Manage security structured field value was invalid.

System Action:

The value is ignored.

User Action:

Correct the security exit value returned and restart the exit. Check the processing for SF x'0530'.

N7E401

S:NM-TCP/IP INITIALIZATION FAILED: UNABLE TO START PROCEDURE P1

Reason:

The initialization process for the S:NM-TCP/IP feature has failed as the indicated procedure (*P1*) cannot be started due to insufficient storage.

System Action:

The feature initialization fails.

User Action:

Restart SOLVE in a larger region.

N8x Messages

N80001

NO xxxxxx ACB'S AVAILABLE**Reason:**

An MAILOGON command failed because all available MAI-OC APPL definitions are in use. xxxxxx is the MAI-OC APPL prefix NMMAV or as set by the installation via the SYSPARMS MAIOPREF= operand.

System Action:

The command is rejected.

User Action:

Wait for an MAI-OC APPL to become available or increase the number of APPL statements defined to VTAM.

N80002

LU NAME *luname* ALREADY IN USE**Reason:**

An MAILOGON command requested that an MAI-OC session be established using a particular MAI LUNAME, but the LUNAME is already in use on another MAI-OC session or by another application.

System Action:

The command is rejected.

User Action:

Use another available LUNAME.

N80003

LU NAME luname UNKNOWN TO VTAM

Reason:

An MAILOGON command requested that an MAI-OC session be established using a particular LUNAME, but the specified LUNAME is not known to VTAM as an APPL definition.

System Action:

The command is rejected.

User Action:

Use another available LUNAME.

N80004

VTAM ACB acbname OPEN FAILED - ACBERFLG = X'yy'

Reason:

MAI-OC was unable to open the VTAM ACB associated with the LUNAME to be used on the MAI-OC session.

System Action:

The MAI-OC session is not established.

User Action:

Determine the cause of the error from the appropriate VTAM Programming Manual.

N80005

VTAM SETLOGON FAILED

Reason:

A VTAM SETLOGON macro failed during MAI-OC session establishment. The meaning of the error codes displayed on the next line are documented in the appropriate VTAM Programming Manual.

System Action:

The MAI-OC session is not established.

User Action:

Determine the cause of failure.

N80006**REQUESTED APPL IS UNKNOWN TO VTAM OR CANNOT BE CONTACTED****Reason:**

An MAILOGON command could not complete because the target application with which a session is requested is either unknown to VTAM or cannot be contacted if in another domain.

System Action:

The command is rejected.

User Action:

Correct the application name. In the case of cross-domain logon the failure may be the result of appropriate cross domain resource definitions being unavailable.

N80007**REQUESTED APPL IS INACTIVE****Reason:**

An MAILOGON command could not complete because the target application with which a session is requested is not active.

System Action:

The command is rejected.

User Action:

Retry when the target application is available.

N80008**VTAM REQSESS FAILED****Reason:**

A VTAM REQSESS macro failed during MAI-OC session establishment. The meaning of the error codes displayed on the next line are documented in the appropriate VTAM Programming Manual.

System Action:

The MAI-OC session is not established.

User Action:

Determine the cause of the failure.

N80009

NSPE RU RECEIVED. SENSE=X'xxxx', REASON=X'yyyy'

Reason:

The VTAM NSEXIT was driven during establishment of an MAI-OC session, indicating a Network Services Procedure Error (NSPE).

System Action:

The MAI-OC session is terminated.

User Action:

Determine the cause of the failure. This error can occur when an application program rejects the MAI-OC session, for instance if the LUNAME being used has not been defined to the application.

N80010

VTAM OPNSEC FAILED

Reason:

A VTAM OPNSEC macro failed during MAI-OC session establishment. The meaning of the error codes displayed on the next line are documented in the appropriate VTAM Programming Manual.

System Action:

The MAI-OC session is not established.

User Action:

Determine the cause of failure.

N80011**UNACCEPTABLE BIND PARAMETERS RECEIVED - SESSION REFUSED****Reason:**

An MAILOGON request for a session with a target application could not be completed because the application returned BIND parameters which were unacceptable to MAI.

System Action:

The session attempt is terminated.

User Action:

Ensure that the BIND parameters associated with the MAI-OC LUNAME chosen for the failed session are correct and that the appropriate LOGMODE table is associated with the APPL definition. Also ensure that if the LUNAME is defined to the application with which the session was requested, the application has the LUNAME defined to it as an LU- TYPE 1.

N80012**SUPPLIED LOGMODE NAME IS NOT KNOWN TO VTAM****Reason:**

An MAILOGON command specified the name of a LOGMODE table entry name that is to be used on the requested session, but VTAM does not have the name defined to it.

System Action:

The session request is terminated.

User Action:

Correct the LOGMODE entry name and retry.

N80014

REQUESTED APPL IS UNAVAILABLE

Reason:

An MAILOGON command could not complete because the target application with which a session is requested is not available.

System Action:

The command is rejected.

User Action:

Retry when the target application is available.

N80050

FDBK/SENSE = X'xxxxxxxx'. R15=X'yy'. R0=X'zz'

Reason:

This message indicates the VTAM return code and feedback information associated with the failure of MAI-OC VTAM operations. This message will follow a message indicating the general error condition, eg: N80010.

System Action:

None.

User Action:

Refer to the appropriate VTAM Programming Manual for explanation of the error codes.

N80101

VTAM RECEIVE FAILED.

Reason:

A VTAM RECEIVE macro failed during MAI-OC session operation. The meaning of the error codes displayed on the next line are documented in the appropriate VTAM Programming Manual.

System Action:

The MAI-OC session is terminated.

User Action:

Determine the cause of the failure.

N80102**VTAM SEND FAILED.****Reason:**

A VTAM SEND macro failed during MAI-OC session operation. The meaning of the error codes displayed on the next line are documented in the appropriate VTAM Programming Manual.

System Action:

The MAI-OC session is terminated.

User Action:

Determine the cause of the failure.

N80103**SEND OF RESPONSE FAILED.****Reason:**

A VTAM SEND macro failed during MAI-OC session operation when a response was being returned to the target application. The meaning of the error codes displayed on the next line are documented in the appropriate VTAM Programming Manual.

System Action:

The MAI-OC session is terminated.

User Action:

Determine the cause of the failure.

N80150

FDBK/SENSE = X'xxxxxxxx'. R15=X'yy'. R0=X'zz'.

Reason:

This message indicates the VTAM return code and feedback information associated with the failure of MAI-OC VTAM operations. This message will follow a message indicating the general error condition, eg: N80103.

System Action:

None.

User Action:

Refer to the appropriate VTAM Programming Manual for explanation of the error codes.

N80201

VTAM SEND FAILED.

Reason:

A VTAM SEND macro failed during MAI-OC session operation. The meaning of the error codes displayed on the next line are documented in the appropriate VTAM Programming Manual.

System Action:

The MAI-OC session is terminated.

User Action:

Determine the cause of the failure.

N80202

VTAM TERMSESS FAILED.

Reason:

A VTAM TERMSESS macro failed during MAI-OC session establishment. The meaning of the error codes displayed on the next line are documented in the appropriate VTAM Programming Manual.

System Action:

The MAI-OC session is terminated.

User Action:

Determine the cause of the failure.

N80250

FDBK/SENSE = X'xxxxxxxx'. R15=X'yy'. R0=X'zz'.

Reason:

This message indicates the VTAM return code and feedback information associated with the failure of MAI-OC VTAM operations. This message will follow a message indicating the general error condition, eg: N80202.

System Action:

None.

User Action:

Refer to the appropriate VTAM Programming Manual for explanation of the error codes.

N80301

VTAM SEND FAILED.

Reason:

A VTAM SEND macro failed during MAI-OC session operation. The meaning of the error codes displayed on the next line are documented in the appropriate VTAM Programming Manual.

System Action:

The MAI-OC session is terminated.

User Action:

Determine the cause of the failure.

N80350

FDBK/SENSE = X'xxxxxxxx'. R15=X'yy'. R0=X'zz'.

Reason:

This message indicates the VTAM return code and feedback information associated with the failure of MAI-OC VTAM operations. This message will follow a message indicating the general error condition, eg: N80301.

System Action:

None.

User Action:

Refer to the appropriate VTAM Programming Manual for explanation of the error codes.

N80501

NO P1 ACBS AVAILABLE

Reason:

The logon request failed because all available MAI-FS APPL definitions are in use. *P1* is the MAI-FS APPL prefix in use. Where multiple pools are defined then *P1* is the prefix of the last pool used.

System Action:

The request is rejected.

User Action:

Notify your system administrator. Retry the session when an MAI-FS application is available.

As system administrator: Increase the number of APPL statements defined to VTAM for this prefix. If necessary define APPL statements to VTAM for a new pool prefix and add the prefix definition to the \$NM EXTAPPLPOOLS parameter group.

N80502**NODE NAME ~P1 ALREADY IN USE****Reason:**

A logon request specified that an MAI-FS session be established using a particular logical unit name (LU), but the name is already in use on another MAI-FS session or by another application.

System Action:

The request is rejected.

User Action:

Use another available NODENAME.

N80503**NODE NAME ~P1 UNKNOWN TO VTAM.****Reason:**

A logon request specified that an MAI-FS session be established using a particular logical unit name (LU), but the name is not known to VTAM.

System Action:

The request is rejected.

User Action:

Use another Node Name.

N80504**VTAM ACB ~P1 OPEN FAILED - ACBERFLG = X'~P2'****Reason:**

MAI-FS was unable to open the VTAM ACB associated with the NODENAME to be used on the MAI-FS session.

System Action:

The MAI-FS session is not established.

User Action:

Determine the cause of the error from the appropriate VTAM Programming Manual.

N80505

VTAM SETLOGON FAILED

Reason:

A VTAM SETLOGON macro failed during MAI-FS session establishment. The accompanying N51506 message contains the error code information. The error codes are documented in the VTAM Programming Manual.

System Action:

The MAI-FS session is not established.

User Action:

Determine the cause of failure.

N80506

REQUESTED APPL IS UNKNOWN TO VTAM OR CANNOT BE CONTACTED

Reason:

A logon request could not complete because the target application with which a session is requested is either unknown to VTAM or cannot be contacted if in another domain.

System Action:

The request is rejected.

User Action:

Correct the application name. In the case of cross-domain logon the failure may be the result of appropriate cross domain resource definitions being unavailable.

N80507

REQUESTED APPLICATION IS INACTIVE

Reason:

A logon request could not complete because the target application with which a session is requested is not active.

System Action:

The request is rejected.

User Action:

Retry when the target application is available.

N80508**VTAM REQSESS FAILED****Reason:**

A VTAM REQSESS macro failed during MAI-FS session establishment. The accompanying N51506 message contains the error codes. These are documented in the VTAM Programming Manual.

System Action:

The MAI-FS session is not established.

User Action:

Determine the cause of the failure.

N80509**SESSION FAILED. P1 SENSE=X' P2', REASON=X' P3'****Reason:**

The VTAM NSEXIT was driven during establishment of an MAI-FS session, indicating a Network Services Procedure Error (NSPE) or NOTIFY.

System Action:

The MAI-FS session is terminated.

User Action:

Determine the cause of the failure. This error can occur when an application program rejects the MAI-FS session, for instance if the LUNAME being used has not been defined to the application.

N80510**VTAM OPNSEC FAILED****Reason:**

A VTAM OPNSEC macro failed during MAI-FS session establishment. The accompanying N51506 contains the error codes. The codes are documented in the VTAM Programming Manual.

System Action:

The MAI-FS session is not established.

User Action:

Determine the cause of failure.

N80511

UNACCEPTABLE BIND PARAMETERS RECEIVED - SESSION REFUSED

Reason:

A logon request for a session with a target application could not be completed because the application returned BIND parameters which were unacceptable to MAI-FS.

System Action:

The session is terminated.

User Action:

Ensure that the BIND parameters associated with the MAI-FS Node Name (LU) for the failed session are correct and that the appropriate LOGMODE table is associated with the APPL definition. Also ensure that if the LU is defined to the target application, the application has the LU defined to it as an LU-TYPE 0 or 2.

N80512

LOGMODE NAME ~P1 IS NOT KNOWN TO VTAM

Reason:

The session request failed with a return code, feedback of X'144B'. The most likely cause is that the logon request specified the name of a LOGMODE table entry name that is not defined to VTAM. The error code is also used to indicate that cryptography is not supported.

System Action:

The session request is terminated.

User Action:

Correct the LOGMODE entry name and retry. If you did not enter a LOGMODE entry name, it is possible that MAI has not been installed correctly. If the logmode is valid then the node name used on the session request may be incorrectly defined. Contact your installation help desk.

N80513**BIND PARAMETERS SCREEN SIZE MISMATCH - SESSION REFUSED****Reason:**

A logon request for a session with a target application could not be completed because the application returned BIND parameters which contained screen dimension information which did not match those of the physical screen from which the session was invoked.

System Action:

The session is terminated.

User Action:

If you entered a specific LOGMODE table entry name when invoking the session, it is possible that the table was not compatible with the terminal model being used.

If you allowed MAI to choose its own LOGMODE table entry name, the LU being used by MAI-FS may be defined incorrectly to the application. Refer this error to your systems administrator.

N80514**REQUESTED APPLICATION IS UNAVAILABLE****Reason:**

A logon request could not complete because the target application with which a session is requested is not available.

System Action:

The request is rejected.

User Action:

Retry when the target application is available.

N80515

VTAM RECEIVE FAILED

Reason:

A VTAM RECEIVE macro failed during MAI-FS session operation. The accompanying N51506 message contains the error codes. The codes are documented in the VTAM Programming Manual.

System Action:

The MAI-FS session is terminated.

User Action:

Determine the cause of the failure.

N80516

NODE NAME P1 NOT DEFINED AS AN APPLICATION

Reason:

A logon request specified that an MAI-FS session be established using a particular MAI NODENAME, but the name, *P1*, is not defined to VTAM as an application.

System Action:

The request is rejected.

User Action:

Verify that either the specific nodename or MAI prefix being used is correct. If necessary contact your installation help desk. The node name in the message should be defined to VTAM according to the recommendation for MAI-FS APPLs.

N80517

SESSION RESET

Reason:

The session has been terminated by a VTAM command.

System Action:

None.

User Action:

None.

N80518**SESSION RESET BY OPERATOR****Reason:**

The session has been terminated by an operator command.

System Action:

None.

User Action:

None.

N80601**RECEIVE FAILED.****Reason:**

A VTAM RECEIVE macro failed during MAI-FS session operation. The meaning of the error codes displayed on the next line are documented in the appropriate VTAM Programming Manual.

System Action:

The MAI-FS session is terminated.

User Action:

Determine the cause of the failure.

N80602**SEND OF SHUTDOWN FAILED.****Reason:**

A VTAM SEND macro failed during MAI-FS session operation. The meaning of the error codes displayed on the next line are documented in the appropriate VTAM Programming Manual.

System Action:

The MAI-FS session is terminated.

User Action:

Use the sense information to determine the cause of the failure and if necessary report the problem to your product support representative.

N80603

SEND OF RESPONSE FAILED.

Reason:

A VTAM SEND macro failed during MAI-FS session operation when a response was being returned to the target application. The meaning of the error codes displayed on the next line are documented in the appropriate VTAM Programming Manual.

System Action:

The MAI-FS session is terminated.

User Action:

Determine the cause of the failure.

N80701

VTAM SEND FAILED.

Reason:

A VTAM SEND macro failed during MAI-FS session operation. The meaning of the error codes displayed on the next line are documented in the appropriate VTAM Programming Manual.

System Action:

The MAI-FS session is terminated.

User Action:

Determine the cause of the failure.

N80702

VTAM TERMSESS FAILED.

Reason:

A VTAM TERMSESS macro failed during MAI-FS session establishment. The meaning of the error codes displayed on the next line are documented in the appropriate VTAM Programming Manual.

System Action:

The MAI-FS session is terminated.

User Action:

Determine the cause of the failure.

N80703**MAI-FS SEND ERROR****Reason:**

An MAI session output request has failed.

System Action:

The session is terminated in error.

User Action:

Report the problem to your product support representative.

N80801**VTAM SEND FAILED.****Reason:**

A VTAM SEND macro failed during MAI-FS session operation. The meaning of the error codes displayed on the next line are documented in the appropriate VTAM Programming Manual.

System Action:

The MAI-FS session is terminated.

User Action:

Determine the cause of the failure.

N80917**VTAM RESETSR FAILED.****Reason:**

A VTAM RESETSR request has failed.

System Action:

The MAI session is terminated.

User Action:

Notify your product support representative.

N81101

SESSION REFUSED BY INSTALLATION EXIT.

Reason:

The MAI exit has refused the creation of this session, without providing an alternative error message.

System Action:

The session request is refused.

User Action:

Contact your systems administrator if the reason for the error is unclear.

N81201

text

Reason:

This indicates rejection of an MAI logon request by the installation- supplied MAI exit. The text of the message is supplied by the exit, or a default text can be inserted by MAI if the exit does not supply a message.

System Action:

The request is rejected.

User Action:

Contact your systems administrator if the reason for the error is unclear.

N81301

SESSION REFUSED BY INSTALLATION EXIT

Reason:

The MAI exit has refused the creation of this session.

System Action:

The session request is refused.

User Action:

Contact your systems administrator if the reason for the error is unclear.

N81302**SESSION REFUSED - INSTALLATION EXIT NOT YET INITIALISED****Reason:**

An attempt to start an MAI session has been refused, because MAIEX02 has not yet initialized.

System Action:

The session request is refused.

User Action:

Retry the request when the exit has completed initialization.

N81303**SESSION REFUSED - INSTALLATION EXIT INITIALIZATION WAS UNSUCCESSFUL****Reason:**

The installation MAI exit did not initialize successfully.

System Action:

MAI sessions will not be started until the error is corrected.

User Action:

Refer the problem to your systems administrator.

N81304**SESSION REFUSED - INSTALLATION EXIT NOT FOUND****Reason:**

The MAIEX02 system parameter named a module that could not be loaded.

System Action:

MAI sessions will not be started until the error is corrected.

User Action:

Refer the problem to your systems administrator.

N81401

SESSION REFUSED BY INSTALLATION EXIT.

Reason:

The MAI exit has refused the creation of this session, without providing an alternative error message.

System Action:

The session request is refused.

User Action:

Contact your systems administrator if the reason for the error is unclear.

N81402

SESSION REFUSED - INSTALLATION EXIT NOT YET INITIALIZED.

Reason:

An attempt to start an MAI session has been refused, because MAIEX02 has not yet initialized.

System Action:

None.

User Action:

Retry later.

N81403

SESSION REFUSED - INSTALLATION EXIT INITIALIZATION WAS UNSUCCESSFUL.

Reason:

The installation MAI exit did not initialize successfully.

System Action:

MAI sessions will not be started until the error is corrected.

User Action:

Refer the problem to your systems administrator.

N81404**SESSION REFUSED - INSTALLATION EXIT NOT FOUND.****Reason:**

The MAIEX02 entry address could not be found.

System Action:

MAI sessions will not be started until the error is corrected.

User Action:

Refer the problem to your systems administrator.

N83201**nnnnn AOM MESSAGES LOST IN GLOBAL/LOCAL QUEUE OVERFLOWS.****Reason:**

Overflows in the AOM/MVS queues have led to messages being lost. This message is sent to inform AOMPROC and Monitor Users of this occurrence.

System Action:

This message replaces the lost messages.

User Action:

Determine whether the AOM queues are large enough, using the SHOW AOMSTAT=TUNING command. If this occurs regularly, increase the size of the relevant queue using the SYSPARMS AOMGQSZ (global) or AOMPQSZ (private) commands.

N83205**S=source I=id A=action T=command text****Reason:**

This message records an MVS command, if SYSPARMS AOMLCMD is in effect. The source of the command, userid (if known), and screening action are shown, as well as the command text.

S=source The source of the command; values are:

INSTREAM - an instream JCL command

INTERNAL - an internal console

TSO - a TSO user (OPER command)

UNKNOWN - an unidentifiable source

CON## or CON### - a specific console (## is 01 to 99; ### is 100 to 255)

xxxxxxx - a named console (extended MCS) N/M - *this* SOLVE system

I=id The user ID of the command issuer, if known.

A=action The action taken by SOLVE command screening; values are:

NO-SCRN - No command screening done

ALLOW - Command was allowed

SUP-NMSG - Suppressed - no message

SUP-SMSG - Suppressed - standard message

SUP-UMSG - Suppressed - user message

REPLACE - Command replaced

REISSUE - Command reissued

T=command text The text of the command

System Action:

None

User Action:

As required.

N83302**AOM SHUTDOWN COMPLETE.****Reason:**

This message is issued after a successful AOM STOP or commencement of final system shutdown. It indicates that AOM has been terminated.

System Action:

AOM has terminated.

User Action:

None.

N83501

**REPLY/ISSUE # nnn LIMIT REACHED mmmmmmmdd-mm-
yyyyhh.mm.ss.**

Reason:

A REPLY or ISSUE statement in the active AOM screening table has been disabled, after being executed more than AOMRILC times in AOMRILT seconds (These are the relevant SYSPARM names). The relative number of the reply or issue from the front of the table is shown, as is the table name and date and time of compilation. In MVS, this message is issued via WTO. In VM, it is sent to monitor receivers.

'mmmmmmmm' is the member name of the screening table. 'dd-mm...' is the date and time the screening table was loaded.

System Action:

The indicated reply or issue statement is disabled until a new table is loaded.

User Action:

Determine why the statement was issued so frequently. If ok, adjust the AOMRILT and AOMRILC SYSPARM values.

N83510

EOT/EOM - AOM STOPPED.

Reason:

This message is produced by the AOM Subsystem Interface when AOM detected that the SOLVE system has terminated abnormally. It indicates that AOM will cease processing WTO/WTOR messages and commands.

System Action:

AOM Screening table action is stopped.

User Action:

Restart SOLVE.

N83511

EOT/EOM - AOM WILL CONTINUE.

Reason:

The AOM Subsystem Interface (SSI) has detected a SOLVE system abnormal termination. The current setting of the SYSPARMS AOMSTAY operand is YES. AOM will continue performing Screening Table actions.

System Action:

AOM Screening Table functions continue.

User Action:

Restart SOLVE.

N83520

xxxxx COMMAND SUPPRESSED BY AOM.

Reason:

This message is sent (WTO or TPUT) by the AOM command issuer when an MVS command is suppressed by a screening table SUPPRESS statement and the statement had MSG=STD specified (or defaulted).

System Action:

None.

User Action:

Contact your systems administrator.

N83550**AOM ABEND DETECTED. SSID=ssss CODE=cccccccc****Reason:**

This message is produced by the AOM Subsystem Interface when an ABEND occurs during AOM processing of a WTO/WTOR, DOM, or system comand. The SSID that AOM is processing under is displayed. The CODE field will be in one of the following formats:

SYS-xxx where xxx is the 3-digit hexadecimal system ABEND code. USR-nnnn where nnnn is a 4-digit decimal user ABEND code.

System Action:

AOM may take a system dump (SDUMP).
AOM processing continues.

User Action:

If the ABEND code is a system code, refer to the appropriate system codes manual. A system code of 'x22' (x being any non-zero hex digit), possibly indicates that the region issuing the WTO etc was cancelled whilst in AOM code. This is harmless.

If the ABEND code is a user code, then AOM probably captured an ABEND issued in an asynchronous exit invoked while AOM was processing. In this case the ABEND code must be looked up in the appropriate manuals for the program etc executing in the region that the ABEND occurred in.

N83801**SRB DISPATCHED TO UPDATE MPF COLOUR/HLITE/INTENS****Reason:**

AOM detected a change to the MPF tables (via SET MPF). An SRB has been dispatched to obtain the new MPF attributes.

System Action:

The SRB collects attribute information for the GLOB MPFATTR=YES screening statement.

User Action:

None.

N83902

CANNOT SHOW STATS, GETMAIN FAILED.

Reason:

A request for AOM statistics, or AOM abend information, failed due to a storage shortage.

System Action:

The request is not processed.

User Action:

Re-issue the SHOW AOMxxx command. If the problem persists, investigate the reasons for the storage shortage.

N83910

- GENERAL AOM INFORMATION:

Reason:

This is a header for a display of AOM statistics. This section will show general AOM information.

System Action:

Statistics follow.

User Action:

None.

N83911

STARTED ON yy/mm/dd hh:mm:ss

Reason:

This message tells the date and time that AOM was last started.

System Action:

None.

User Action:

None.

N83915**- SUMMARY INFORMATION.****Reason:**

This is a header for a display of AOM statistics. This section provides summary statistics.

System Action:

None.

User Action:

None.

N83916**TOT SEEN n TOT ACCEPT n LOST QOFLOW n****Reason:**

This line provides summary information about the local AOM message. It displays information such as the total number of messages, DOMs seen, the total number accepted for processing, and (for z/OS) the total number lost in queue overflows.

System Action:

None.

User Action:

If the overflow amount is non-zero, determine the reason.

N83917**TOT RCVD n****Reason:**

This line provides more summary information about the local AOM message, etc. delivery. The total number of messages, DOMs, etc. received is indicated.

System Action:

None.

User Action:

None.

N83920

- AOM STORAGE INFORMATION

Reason:

This is a header message for the display of AOM statistics. Storage usage statistics follow.

System Action:

None.

User Action:

None.

N83921

**POOL HEX ADDRESS HEX LENGTH DEC LENGTH SUBPOOL NUM
ENTRIES****Reason:**

This message provides column headers for the following lines of N83922 messages, that provide storage statistics for AOM. The headings are self-explanatory.

System Action:

None.

User Action:

None.

N83922

poolname hexaddr hexlength declength subpool numentries**Reason:**

This message provides details about the storage necessary for an AOM pool or queue. The following pools and queues are described (depending on the environment, options, and so on):

NCVT/CODE

In MVS, the CSA pool containing key AOM SSI control blocks and code.

GLOBAL Q

In MVS, the (E)CSA-resident global queue. This queue is not allocated if using AOM cross memory services.

SCREEN TABS

The storage allocated to the current and alternate screening tables. In MVS, this storage is in (E)CSA.

WORK POOL

The storage allocated to the AOM SSI work pool. This pool is used to avoid GETMAIN processing in the SSI code.

TOT CSA/SQA

The total MVS common storage used by AOM.

PRIVATE Q

The AOM private queue in storage. This queue is used in AOM/VM only.

NCVT, ETC

The total storage used in AOM/VM for critical AOM control blocks and queues.

System Action:

None.

User Action:

None.

N83923

TOT CSA/SQA hexlength declength

Reason:

This message totals all common storage for the N83922 messages.

System Action:

None.

User Action:

None.

N83930

- AOM TUNING INFORMATION AND STATISTICS:

Reason:

This is a heading message that indicates AOM tuning information and statistics follow.

System Action:

None.

User Action:

None.

N83931

WK STACK SZ nnnnnnnnn GETMAINS nnnnnnnnn

Reason:

This message shows the allocated size of the AOM work stack (work pool), and the number of times a GETMAIN was necessary because it was empty.

System Action:

None.

User Action:

None. If a large number of GETMAINS are shown, consider increasing the AOMWQSZ value.

N83932

**GLOB Q SIZE nnnnnnnnn TOT INSERTS nnnnnnnnn LOST OFLOW
nnnnnnnn**

Reason:

This message shows the size of the AOM global queue, the total number of entries queued through it, and the number of times an overflow occurred.

System Action:

None.

User Action:

None. If significant overflows occur, consider increasing the AOMQSZ value.

N83933

MAX DEPTH nnnnnnnnn NUM TIMES nnnnnnnnn AVG DEPTH nnnnnnnnn

Reason:

This message shows the maximum depth, number of times at the maximum, and average depth of the GLOBAL queue.

System Action:

None.

User Action:

None.

N83934

SRB1 SCHED nnnnnnnnn SRB1 RUN nnnnnnnnn SRB1 STEALS nnnnnnnnn

Reason:

This message displays the number of times a level 1 SRB was dispatched by AOM to perform work, the number of times it ran, and the number of global queue steals performed.

System Action:

None.

User Action:

None.

N83935

**SRB1 DEQ'D nnnnnnnn AVG ST/SRB1 nnnnnnnn AVG DQ/SRB1
nnnnnnnn**

Reason:

This message displays the total number of messages dequeued, the average number of global queue steals, and average number of messages dequeued by a level 1 SRB.

System Action:

None.

User Action:

None.

N83936

SRB2 SCHED nnnnnnnn SRB2 RUN nnnnnnnn NUM TCTL's nnnnnnnn

Reason:

This message displays the number of level 2 srbs dispatched, run, and the number of transfer of control instructions issued to CA NetMaster.

System Action:

None.

User Action:

None.

N83937

SRBX SCHED nnnnnnnn SRBX RUN nnnnnnnn NUM TCTL's nnnnnnnn

Reason:

This message documents the number of level 2 srbs dispatched, run, and the number of transfer of control instructions issued to CA NetMaster when AOM is using Cross- Memory-Services (XMS).

System Action:

None.

User Action:

None.

N83938

**PRIV Q SIZE nnnnnnnnn TOT INSERTS nnnnnnnnn LOST OFLOW
nnnnnnnnn**

Reason:

This message shows the size of the AOM private queue, the total number of inserts into it, and the total number lost through overflow.

System Action:

None.

User Action:

If messages are lost, consider increasing the private queue size.

N83939

MAX DEPTH nnnnnnnnn NUM TIMES nnnnnnnnn AVG DEPTH nnnnnnnnn

Reason:

This message shows the maximum private queue depth, the number of times at the maximum, and the average private queue depth. The average depth is useful as it gives an indication of the relative amount of message traffic in the system.

System Action:

None.

User Action:

None.

N83940

NUM POSTS nnnnnnnnn RECEIVE RUN nnnnnnnnn TOT DEQ'D nnnnnnnnn

Reason:

This message shows the number of times CA NetMaster was posted to receive AOM traffic, the number of times the receive task ran, the total amount of messages, and so on dequeued from the private queue.

System Action:

None.

User Action:

None.

N83941

NUM STEALS nnnnnnnnn DEQ'D RUN nnnnnnnnn STEALS/RUN nnnnnnnnn

Reason:

This message shows the number of times that the AOM receive task stole the current private queue, the average number of messages, etc dequeued per run, and the average number of private queue steals per receive run.

System Action:

None.

User Action:

None.

N83945

EVENTQ SIZE nnnnnnnnn GETMAINS nnnnnnnnn

Reason:

This message shows the allocated size of the AOM/VM event queue, and the number of times a GETMAIN was required when it was empty.

System Action:

None.

User Action:

None. If a large number of GETMAINS occur, increase the size of the AOMVEQSZ parameter.

N83950

- MESSAGE DELIVERY STATISTICS:

Reason:

This is a heading that indicates that AOM local interface message delivery statistics follow.

System Action:

None.

User Action:

None.

N83951**STAT / TYPE *TOTAL* type type type type****Reason:**

This message is a column heading for the following messages. It indicates the individual message types that will be displayed.

System Action:

None.

User Action:

None.

N83952**type type type type****Reason:**

This message is a further column heading, if required, for more message types. It corresponds to the second line of any particular statistic display that follows.

System Action:

None.

User Action:

None.

N83953**# RCVD GLOB nnnnnnnn nnnnnnnn nnnnnnnn nnnnnnnn nnnnnnnn****Reason:**

This message shows the number of messages of each record type that were received for processing by the AOM operating system interface. This number is the total number of each record type. For example, for WTO, it includes all MPF suppressed and hardcopy only messages.

System Action:

None.

User Action:

None.

N83954

REJ SCRNG nnnnnn nnnnnn

Reason:

This message shows the number of messages of each type that were rejected by the AOM screening table. Note that messages can be rejected automatically by the screening table. For example, automatic rejection of MPF-suppressed, hardcopy only and solicited messages.

System Action:

None.

User Action:

None.

N83955

DEL SCRNG nnnnnn nnnnnn

Reason:

This message shows the number of messages of each type that were flagged for MVS deletion by the AOM screening table.

System Action:

None.

User Action:

None.

N83956

ACC SCRNG nnnnnn nnnnnn

Reason:

This message shows the number of messages of each type that were flagged as to be routed to SOLVE by the AOM screening table. Note that for messages marked ROUTE=LOG they are still delivered to SOLVE even if SYSPARMS AOMLOG=NO is in effect (they are simply not logged when they arrive).

System Action:

None.

User Action:

None.

N83957

LOST GOFL nnnnnn nnnnnn nnnnnn nnnnnn nnnnnn

Reason:

This message shows the number of messages of each type that were lost because of AOM GLOBAL queue overflow.

System Action:

None.

User Action:

None.

N83960

ENQD GLOB nnnnnn nnnnnn nnnnnn nnnnnn nnnnnn

Reason:

N83990**- AOMPROC DELIVERY STATISTICS:****Reason:**

This message indicates that AOMPROC message delivery statistics follow.

System Action:

Statistics follow.

User Action:

None.

N83991**QUEUE LIMIT IIIIIII MAX DEPTH dddddddd TIMES nnnnnnnn****Reason:**

This message shows the current AOMPQLIM value, the maximum depth of the AOMPROC delivery queue, and the number of times that maximum has been reached.

System Action:

None.

User Action:

None.

N83992**TOTAL ENQD nnnnnnnn TIMES OFLOW nnnnnnnn MSGD OFLOW
nnnnnnnn****Reason:**

This message shows the total number of messages enqueued to AOMPROC (includes DOMs, even if AOMPROC does not want them), the number of times the queue overflowed, and the total number of messages removed and sent to AOM receivers due to overflow. Multi-line WTO messages count as one message when queued to AOMPROC.

System Action:

None.

User Action:

None.

N83993

**CUR DEPTH nnnnnnnnn MSGD NOT UP nnnnnnnnn LOST NOSTOR
nnnnnnnn**

Reason:

This message shows the current number of messages in the primary AOMPROC queue, the number of messages delivered to OCS because AOMPROC was not active, and the number lost due to storage shortages.

System Action:

None.

User Action:

None.

N83998

**REQUESTED AOM STATS OPTION NOT AVAILABLE UNDER THIS
OPERATING SYSTEM.**

Reason:

This message is produced when a SHOW AOMSTAT option that is not supported in the current environment is requested. It indicates that the option is unsupported.

System Action:

None.

User Action:

Re-enter the command with the correct options. Refer to the AOM guide.

N83999

END

Reason:

This line indicates the end of an AOM statistics display.

System Action:

None.

User Action:

None. This message can be used to indicate the end of an &INTREAD of an AOM statistics display.

N83A01**AOM DOM QUEUE LIMIT EXCEEDED, CURRENT QUEUE SIZE nnnnn****Reason:**

This message is issued at 30 second intervals when the AOM DOM queue exceeds the value of SYSPARMS AOMDQLIM and new entries are still being added.

System Action:

None.

User Action:

Investigate the reason for the DOM queue limit being exceeded (you can use the SHOW AOMDOMQ command to list entries on the queue) and increase the SYSPARMS AOMDQLIM value if feasible.

N83B01**OLD AOM GLOBAL STORAGE FREED.****Reason:**

AOM/MVS detected a previous execution of AOM that had not been terminated cleanly. Old CSA storage used will be freed.

System Action:

The storage is freed.

User Action:

None.

N83D01

AOM HAS ABENDED comp type code - hh.mm.ss yy/mm/dd MORE DETAILS ON LOG.

Reason:

A component of AOM/MVS has abended. Abend details are sent to all AOM and MON class receivers. The message indicates the AOM component (SSI or SRB), the abend type (SYS or USER), and abend code. The date and time is also shown. This message is Non-Roll-Delete and is deleted only when an AOM STOP command is issued. The activity log contains N83D10 to N83D12 messages with more information.

System Action:

The MVS AOM code is disabled.

User Action:

See the activity log for abend information. Contact Technical Support for more information.

N83D10

DET-MODULE xxxxxxxx ABEND type code

Reason:

This log message provides information about an AOM abend. The message indicates the detected module name (xxxxxxx), the type of ABEND (SYS or USER) and the ABEND code.

System Action:

AOM is disabled.

User Action:

Refer this message to your product support representative.

N83D11

PSW aaaaaaaaa bbbbbbbb ILC cccc IC dddd

Reason:

This log message provides more AOM abend information.

Reason:

This log message provides more AOM abend information.

System Action:

AOM is disabled.

User Action:

Refer this message to your product support representative.

N83D13

**Nxxx ssssssss eeeeeeee Nxxx ssssssss eeeeeeee Nxxx ssssssss
eeeeeeee**

Reason:

This log message provides more AOM abend information. The message identifies modules (Nxxx) and their start/end addresses (sssssss/ eeeeeeee) which can be useful at debugging.

System Action:

AOM is disabled.

User Action:

Refer this message to your product support representative.

N83F01

AOM/VM CONNECTED TO PROP IN MACHINE userid.

Reason:

This message informs that AOM/VM has successfully established an IUCV connection to PROP, which is running in the indicated virtual machine.

System Action:

AOM/VM is active.

User Action:

Commands may be issued using SYSCMD DEST=PROP.

N83F02

AOM/VM WILL RETRY IUCV CONNECT TO MACHINE userid IN nnn SECONDS.

Reason:

AOM/VM received a retrievable IUCV connect error. It will retry the connection as indicated.

System Action:

AOM/VM waits as indicated before retrying.

User Action:

Check the earlier connect fail reason and take corrective action if necessary. The AOM STOP, SYSPARMS AOMPROPI and SYSPARMS AOMPCRIN commands may be issued.

N83F03**AOM/VM type IUCVCOM CONNECT ERROR nnn TO MACHINE userid.****Reason:**

AOM/VM encountered a non-zero IUCV connect error code when attempting to establish a connection to PROP. Some of these are retrievable, and after a delay, AOM/VM will try again. Others are fatal, and only the AOM STOP command may be issued.

System Action:

AOM/VM will delay and try again, if a retrievable error is detected. For fatal errors, AOM/VM will become dormant, awaiting an AOM STOP command.

User Action:

Correct the error if possible. For a fatal error, issue an AOM STOP and AOM START after correcting the problem. For retrievable errors, just correct the problem if possible. AOM/VM will automatically retry.

N83F04**PROP IN MACHINE userid HAS SEVERED/REFUSED IUCV CONNECTION.****Reason:**

AOM/VM received an IUCV sever from PROP, either during AOM startup, or later on.

System Action:

AOM/VM will keep retrying an IUCV connect.

User Action:

Determine why PROP sent a SEVER. Possible causes include PROP being stopped, or the virtual machine being logged off.

N83F05

UNEXPECTED IUCV CONNECT RECEIVED FROM MACHINE userid.

Reason:

AOM/VM received an IUCV connect request from a machine other than the one identified by the SYSPARMS AOMPROPI= command.

System Action:

The connection is refused.

User Action:

If the machine is the correct one for PROP, issue a SYSPARMS AOMPROPI=userid command. Otherwise, determine why it issued the connect request.

N83F10

END

Reason:

This message follows SYSCMD responses received from PROP.

System Action:

Another SYSCMD request can be sent to PROP.

User Action:

None. All responses to SYSCMD are complete.

N83F11

SYSCMD DEST=PROP REQUEST REJECTED, reason.

Reason:

A SYSCMD DEST=PROP request has been rejected. The reason is indicated.

System Action:

None. The command will not be sent to PROP.

User Action:

Take corrective action based on the supplied reason. If too many commands are pending, PROP is possibly hung.

N83F12***WARNING* SYSCMD DEST=PROP RESPONSE TIMEOUT.****Reason:**

The current command being executed by PROP has taken longer than the time specified by SYSPARMS AOMCTO1, plus any DELAY specified on the SYSCMD command.

System Action:

This message is sent to the command issuer and all monitor receivers. No further action can be taken, as PROP is in a separate virtual machine.

User Action:

Determine the reason for the delay.

N83F20**AOM/VM IS NOW THE LOGICAL OPERATOR.****Reason:**

PROP has sent a positive response in reply to the AOM/VM LGLOPR RPL command.

System Action:

AOM/VM can now receive unsolicited console traffic.

User Action:

None.

N83F21

AOM/VM LGLOPR RPL REJECTED BY PROP. UNSOLICITED TRAFFIC NOT AVAILABLE.

Reason:

PROP did not accept the AOM/VM LGLOPR RPL command. AOM/VM will not be the logical operator. No unsolicited message traffic can be received.

System Action:

None.

User Action:

Determine why PROP rejected the LGLOPR RPL command. Possibly the PROP routing table does not authorize the AOM/VM userid (normally .AOMVUIL) for this command.

N83F22

AOM/VM LGLOPR STOLEN BY userid - WILL ATTEMPT TO RECOVER.

Reason:

Another VM virtual machine has issued a LGLOPR RPL command to PROP.

System Action:

AOM/VM will reissue the LGLOPR RPL in an attempt to reobtain the logical operator.

User Action:

Determine why another user issued the command. Take corrective action. PROP only allows one logical operator.

N83G01

AOM/VM CONNECTED TO *MSG.

Reason:

AOM/VM has successfully established a connection to the *MSG system service for the GCS machine that the region is executing under.

System Action:

SYSCMD DEST=GCS commands are now accepted.

User Action:

None.

N83G03***MSG IUCV CONNECT ERROR. R15 FROM IUCVCOM WAS rc.****Reason:**

AOM/VM received a non-zero IUCV connect return code when attempting to connect to the *MSG CP system service.

System Action:

AOM/VM will not connect to *MSG. SYSCMD DEST=GCS will be rejected.

User Action:

Determine why the connection failed and correct the problem.

N83G04***MSG HAS SEVERED/REFUSED AOM/VM IUCV CONNECTION.****Reason:**

AOM/VM received an IUCV SEVER from the *MSG service.

System Action:

SYSCMD DEST=GCS will not be accepted.

User Action:

Determine why the connection was severed. Another program in the same GCS machine may be connected.

N83G05**UNEXPECTED IUCV CONNECT RECEIVED FROM MACHINE userid.****Reason:**

AOM/VM received an unexpected IUCV connect request from another machine on it's *MSG connection path.

System Action:

AOM/VM refuses the connection.

User Action:

Determine why the connection was attempted.

N83G10

***END* response code**

Reason:

This is the last line received from a SYSCMD DEST=GCS command. It indicates that all responses have been received, and the return code. The return code can be RC WAS n, indicating the command was executed, with a return code of n, SYSTEM ABEND code or USER ABEND code, which indicates that the command abended with the indicated code.

System Action:

Another SYSCMD DEST=PROP command can be executed.

User Action:

The return code indicates the success or failure of the command.

N83G11

SYSCMD DEST=GCS REJECTED, reason.

Reason:

AOM/VM rejected the SYSCMD DEST=GCS command. The reason is shown.

System Action:

The command is not passed to GCS.

User Action:

The reason should be investigated. If it is TOO MANY COMMANDS PENDING, a long running GCS command may be executing.

N83G12***WARNING* SYSCMD DEST=GCS RESPONSE TIMEOUT****Reason:**

The current command being executed by GCS has taken longer than the time specified by SYSPARMS AOMCTO2, plus any DELAY specified on the SYSCMD command.

System Action:

This message is sent to the command issuer and all monitor receivers. No further action can be taken, as the GCS command task cannot be interrupted.

User Action:

Determine the reason for the delay.

N83G13**WARNING, SOME RESPONSES TO SYSCMD LOST.****Reason:**

AOM/VM has lost some responses to a SYSCMD DEST=GCS, due to IUCV queue overflows.

System Action:

This warning message is issued.

User Action:

Check whether the SYSPARMS AOMVEQSZ parameter is too small (use SHOW AOMSTAT=TUNING).

N83K01**AOM MESSAGES LOST DUE TO STORAGE SHORTAGE.****Reason:**

AOM was unable to queue a message to AOMPROC due to a storage shortage.

System Action:

This message is queued to AOMPROC to inform it of the problem.

User Action:

A larger region may be required, or AOMPROC processing is too slow.

N83K02

nnnnn MESSAGES LOST DUE TO AOMPROC QUEUE OVERFLOW.

Reason:

An AOMPROC queue has too many messages queued. The value of the AOMPQLIM sysparm was exceeded. The oldest message(s) are removed and delivered. This message is enqueued to AOMPROC informing it that messages have been lost.

System Action:

This message replaces the dropped messages.

User Action:

AOMPROC should recognize this message (AOMMSGID is set to N83K02) and take corrective action.

N83P01

REPLY/ISSUE # nnn LIMIT REACHED mmmmmmmdd-mm- yyyyhh.mm.ss.

Reason:

A REPLY or ISSUE statement in the active AOM screening table has been disabled, after being executed more than AOMRILC times in AOMRILT seconds (These are the relevant SYSPARM names). The relative number of the reply or issue from the front of the table is shown, as is the table name and date and time of compilation. In MVS, this message is issued via WTO. In VM, it is sent to monitor receivers.

'mmmmmmm' is the member name of the screening table. 'dd-mmm...' is the date and time the screening table was loaded.

System Action:

The indicated reply or issue statement is disabled until a new table is loaded.

User Action:

Determine why the statement was issued so frequently. If ok, adjust the AOMRILT and AOMRILC SYSPARM values.

N83T01

S=seq T=hhmmss TP=type ST=ss OD=odmn LD=ldmn OS=os os-specific-info

Reason:

This message is one of a set of messages produced for each AOM message when AOM tracing is active. The fields of the message are:

seq The last 3 digits of an AOM-provided sequence number. All trace messages for a *single* AOM message will be grouped under this sequence number.

hhmmss The original message time.

type The message type, either WTO, WTOR, MSG, or EVNT

ss The message subtype flags. This is a hex value. For an EVENT, displays as a dash. The value is the sum of the following bits: 80 Always on for any WTO or MSG, off if a WTOR. 40 On for a WTOR, else off. 20 On if a WTO is a single-line WTO or MSG. 10 On if a WTO is the major line of a multi-line WTO (MLWTO) 08 On if a WTO is a minor line of a MLWTO. 04 On if the message is force-delivered as it is destined for a SOLVE assigned console. 02 On if the message is force-routed by AOM tracing being active (always on in trace messages). 01 On if this WTOR (see 40 above) was replied to by a screening-table WTOR statement.

odmn The originating SOLVE domain that the message came from.

ldmn The last handing SOLVE domain that the message came from.

os The message source operating system, OS (MVS, etc.) or VM.

JN,JI For OS-sourced messages, the message JOBNAME and JOBID.

UI,UN For VM-sourced messages, the message USERID and USERNODE.

System Action:

None.

User Action:

None.

N83T02**seq S=sol L=lev DE=desc RC=routcde****Reason:**

This message is one of a set of messages produced for each AOM message when AOM tracing is active. This message is not displayed for an EVENT message trace. The fields of the message are:

seq displays the last 3 digits of an AOM-provided sequence number, which matches the number of the previous N83T01 message.

sol displays one of the following the message solicit types:

NO indicates unsolicited messages. NM indicates messages solicited by an AOM user. OT indicates messages solicited by other users.

lev displays the message severity level.

desc displays the message descriptor codes in hexadecimal format.

routcde displays the message routing codes in either hexadecimal or list format, depending on the value of the AOMTRCRC system parameter setting.

System Action:

None.

User Action:

None.

N83T03

***seq MCS=mcs MTYP=mtyp LTYP=ltyp CON=con NCON=ncon
CNAM=name***

Reason:

This message is one of a set of messages produced for each AOM message when AOM tracing is active. This message applies only to MVS sourced messages that are traced. The fields of the message are:

seq

The last 3 digits of an AOM-provided sequence number. This matches the number of the previous N83T01 message.

mcs

The message MCS flags, in hexadecimal.

mtyp

The message type flags, in hexadecimal.

ltyp

The message line type. For a single line WTO or a WTO, 'NO'. For a line of a Multi- Line WTO, it will be 'C' (Control), 'L' (Label), 'D' (Data), 'E' (End), or 'xE' when one of the previous (C/L/D) lines is also the last line.

con

The MVS console ID, or 0.

ncon

The JES console number, if applicable, or 0.

name

The Extended MCS console name, if applicable.

System Action:

None.

User Action:

None.

N83T04**seq IJ=jobname SN=sysname FC=conid****Reason:**

This message is one of a set of messages produced for each incoming WTO/R/EVENT message when AOM trace is active. It is only produced for MVS-sourced messages. The fields in the message are:

seq A 3-digit sequence number that allows matching up of all associated trace messages.

jobname The issuing jobname of the WTO/R/EVENT (That is, the jobname that the WTO/R was issued from)

sysname The system name, if known.

conid The Extended MCS fullword console id.

System Action:

None.

User Action:

None.

N83T05**seq MCLS=mcls SRC=src****Reason:**

This message is the third of a set of messages produced for each AOM message when AOM tracing is active. This message only applies to VM-sourced messages that are traced. The fields of the message are:

seq The last 3 digits of an AOM-provided sequence number. This will match the number of the previous N83T01 message.

mcls The IUCV message class, from 1 to 30.

src The message source, either PROP or GCS.

System Action:

None.

User Action:

None.

N83T11

**seq ID=xxxxxxxxxx R=rr D=d S=s A=a M=m N=n I=i H=h C=c
MC=mm U=uu R=rr**

Reason:

This is one of a set of messages produced by the AOM message tracing facility for each AOM message processed. The fields are:

seq The same sequence number as in the N83T01 message.

xxxxxxxxxx The screening table assigned ID= value.

rr The screening table assigned ROUTE= options. The first letter is the local route, the second the remote route. Values are: *F* Message failed global screening. *P* ROUTE=PROC assigned. *O* ROUTE=PROONLY assigned. *B* ROUTE=BOTH assigned. *M* ROUTE=MSG assigned. *L* ROUTE=LOG assigned. *N* ROUTE=NO assigned.

d The screening table assigned DELETE= option, Y or N.

s The screening table assigned SYSLOG= option, Y or N.

a The screening table assigned ALARM= option, Y or N.

m The screening table assigned MONITOR= option, Y or N.

n The screening table assigned NRD= option, Y or N.

i The screening table assigned INTENS= option, H or L.

h The screening table assigned HLIGHT=option. Values are: *N* None. *D* Default. *R* Reverse. *U* Uscore. *B* Blink.

c The screening table assigned COLOUR= option. Values are: *N* None. *D* Default. *B* Blue. *G* Green. *P* Pink. *R* Red. *T* Turquoise. *W* White. *Y* Yellow.

mm The screening table assigned MSGCODE= value (in hex).

uu The screening table assigned UFLAG1-8 values, in hex (UFLAG1 is the 80 bit, down to UFLAG8 being the 01 bit).

rr The screening table assigned RMTCLASS values, in hex (RMTCLASS=1 is the 80 bit, RMTCLASS=8 being the 01 bit).

System Action:

None. The message is logged.

User Action:

The message may be examined to determine any AOM screening table adjustments required.

N83T12

seq TL=III T=<text>

Reason:

This is one of a set of messages produced by the AOM message tracing facility for each AOM message processed. The fields are:

seq The same sequence number as in the N83T01 message.

III The length of the message text, or, for a MINOR line, the length of the major line of text.

text The message text, or, for a minor line, the major-line text (TEXT in the screening table).

System Action:

None.

User Action:

None.

N83T13

seq AL=III A=<minor-text>

Reason:

This is the seventh of several messages produced by the AOM message tracing facility for each AOM message processed. This message is only produced for a minor line of a multi-line WTO, to show the actual minor line text. The fields are:

seq The same sequence number as in the N83T01 message.

III The length of the minor line message text.

minor-text The minor line message text (ATEXT in the screening table).

System Action:

None.

User Action:

None.

N83T15**seq DI=domid SC=s TP=tp RC=routcd****Reason:**

This message is the second of a set of messages produced for each AOM EDSEVENT message when AOM tracing is active. The fields of the message are:

seq The last 3 digits of an AOM-provided sequence number. This will match the number of the previous N83T01 message.

domid The MVS DOMID.

s Identifies the scope of the EDSEVENT (System or Region).

tp Identifies the type of the EDSEVENT (APlication, Serviceability Utilisation, Configuration, ACcess and PRocedural).

routcd The routing code of the EDSEVENT request in hexadecimal or in bitlist format depending on the SYSPARMS AOMTRCRC definition.

System Action:

None.

User Action:

None.

N83T16**seq text****Reason:**

This message is the fourth of a set of messages produced for each AOM EDSEVENT message when AOM tracing is active.

seq The same sequence number as in the N83T01 message.

text Describes the defined keywords/value of the AOM EDSEVENT. Following mnemonics are used :

- *NAM*= ... for *NAME*= ...,
- *OBJ*= ... for *OBJECT*= ...,
- *RES*= ... for *RESOURCE*= ...,
- *REF*= ... for *REFERENCE*= ...,
- *DAT*= ... for *DATA*=

The text contains only the keywords specified on the EDSEVENT Screening Table statement.

System Action:

None.

User Action:

None.

N83T18**seq MI=msgid DI=domid CL=class****Reason:**

This message is one of a set of messages produced for each AOM message when AOM tracing is active. The fields of the message are:

seq The last 3 digits of an AOM-provided sequence number. This will match the number of the previous N83T01 message.

msgid The MSGID value.

domid The MVS DOMID.

class If this is an EVENT message, the event class.

System Action:

None.

User Action:

None.

N83T20**AOM TRACE LIMIT REACHED, TRACE SUSPENDED.****Reason:**

The number of local messages indicated by the SYSPARMS AOMTRLIM value has been reached. AOM trace is suspended.

System Action:

AOM tracing of locally sourced messages stops.

User Action:

Restart trace if necessary.

N83T21**AOM REMOTE TRACE LIMIT REACHED, TRACE SUSPENDED.****Reason:**

The number of remote messages indicated by the SYSPARMS AOMTRLIM value has been reached. AOM trace is suspended.

System Action:

AOM tracing of remote sourced messages stops.

User Action:

Restart trace if necessary.

N83X01**XMS SETUP LXRES ABEND, SDWAABCC=abendcd, R15=rc.****Reason:**

While attempting to reserve a system linkage index, an ABEND occurred.

System Action:

AOM does not start.

User Action:

Determine the reason for the abend. The most common is a shortage of system linkage indexes (abends SYS-053 rc 111/112). AOM can be started in non-XMS mode in the meantime (use SYSPARMS AOMXMS=NO;AOM START). Contact your product support representative.

N84001

CANNOT COMPILE, AOMSTDDN OR AOMSTMEM INVALID.

Reason:

The AOM screening table compiler has found that the current value of the AOM SYSPARMS AOMSTDDN (ddname), or AOMSTMEM (member name) were invalid or blank. Thus no compile was possible.

System Action:

The screening table compile is cancelled.

User Action:

Select new parameter values for the SYSPARMS AOMSTDDN or SYSPARMS AOMSTMEM commands. The AOMSTDDN value may only be altered by the NMINIT or NMREADY NCL procedures.

N84002

COMPILE OF MEMBER memname ON DDNAME dddddddd STARTING.

Reason:

The AOM screening table compiler has commenced compiling the nominated member, from the nominated library.

System Action:

The compile continues.

User Action:

None.

N84003

**COMPILE ENDED, nnnnn ERRORS DETECTED. C=aaaa L=bbbb
T=cccc/mmmm X=xxxx/yyyy.**

Reason:

The AOM screening table compiler has completed a compilation. The number of errors detected is shown. The size of the generated code (in hex) is shown by `C=aaaa'. The size of the generated literal pool (in hex) is shown by `L=bbbb'. The total (code + literal + other overheads) size (in hex) is shown by `T=cccc'. The maximum available size the compiler is configured for is shown (in hex) by `mmmm'. The usage and available size of the extended literal pool is shown (in hex) by `X=xxxx/yyyy'.

System Action:

The compile has ended.

User Action:

If the number of errors is not zero, review the accompanying error messages.

N84004

NEW TABLE SWAPPED IN AND IS NOW ACTIVE.

Reason:

The AOM screening table compiler successfully compiled the table, and has swapped in the compiled version, thus making it active.

System Action:

The new table is now being used by AOM.

User Action:

None.

N84005

TABLE SWAPIN FAILED, OLD TABLE IN USE.

Reason:

The AOM screening table compiler tried unsuccessfully to swap in the new table after a successful compile. The old table was 'in use' each time it tried. The compiler tries 10 times before this message is produced.

System Action:

The compiled table is discarded.

User Action:

Rerun the compile. If heavy message traffic constantly causes this message to be generated, use AOM STOP/AOM START to load the new table.

N84011

CANNOT COMPILE, AOMSTFTY OR AOMSTMEM INVALID.

Reason:

The AOM screening table compiler has found that the current value of the AOM SYSPARMS AOMSTFTY (filetype), or AOMSTMEM (file name) were invalid or blank. Thus no compile was possible.

System Action:

The screening table compile is cancelled.

User Action:

Select new parameter values for the SYSPARMS AOMSTFTY or SYSPARMS AOMSTMEM commands. The AOMSTFTY value may only be altered by the NMINIT or NMREADY NCL procedures.

N84012**COMPILE OF FILE `name type disk' STARTING.****Reason:**

The AOM screening table compiler has commenced compiling the nominated CMS filename, filetype on the indicated disk.

System Action:

The compile continues.

User Action:

None.

N84101**GETMAIN FOR WORKING STORAGE OF LENGTH nnnnnn FAILED.****Reason:**

The AOM screening table compiler was unable to obtain the necessary working storage to run.

System Action:

The compile is aborted.

User Action:

Rerun the compile. If this message is constantly occurring, investigate the reason for the acute storage shortage in SOLVE. This storage is obtained above the 16M line in MVS/XA or MVS/ESA.

N84201

error-location UNKNOWN STATEMENT TYPE `keyword'.

Reason:

The AOM screening table compiler has found an unrecognized statement. The displayed keyword is not a valid statement keyword (eg GLOBAL, WTOR, etc).

System Action:

The compile continues, for error checking purposes only.

User Action:

Use the error information in the message to find and correct the error. This message can occur if a member of a library that is not a screening table is accidentally nominated for a compile, or if a statement keyword is misspelled, or if a continuation character (+) is accidentally left off of a previous line.

N84202

error-location stmtname STATEMENT NOT VALID ON IF/ELSE.

Reason:

The indicated statement cannot be coded after an IF or ELSE statement. token is not a keyword.

System Action:

The compile continues, for error checking purposes only.

User Action:

Use the error information in the message to find and correct the error. Refer to message N84201 for possible causes.

N84203

error-location stmtname STATEMENT ONLY VALID ON IF/ELSE.

Reason:

The indicated statement may only be coded after an IF or ELSE statement, or within a DO group that commenced on an IF or ELSE statement. second global statement was encountered.

System Action:

The compile continues, for error checking purposes only.

User Action:

Use the error information in the message to find and correct the error.

N84204

error-location stmtname STATEMENT NOT VALID WITHIN IF/ELSE OR IN A DO GR

Reason:

The indicated statement cannot be coded after an IF or ELSE statement, or within a DO group. For example, a GLOBAL statement. WTOR statements must follow the GLOBAL statement (if present), and precede all other screening statements.

System Action:

The compile continues, for error checking purposes only.

User Action:

Use the error information in the message to find and correct the error.

N84205

error-location UNEXPECTED KEYWORD keyword.

Reason:

The AOM screening table compiler has encountered an unexpected keyword. statements. The second cannot therefore be reached by any messages, and this is regarded as an error.

System Action:

The compile continues, for error checking purposes only.

User Action:

Use the error information in the message to find and correct the error.

N84206

error-location UNEXPECTED END OF STATEMENT.

Reason:

The AOM screening table compiler found the end of a statement when more information was expected. This could be due to a missing continuation.

System Action:

The compile continues, for error checking purposes only.

User Action:

Use the error information in the message to find and correct the error.

N84207

error-location stmt STATEMENT INVALID IN ssssss SECTION.

Reason:

The AOM screening table compiler found a statement in a MESSAGE or COMMAND section that is not allowed there.

System Action:

The compile continues, for error checking purposes only.

User Action:

Use the error information in the message to find and correct the error.

N84208**error-location stmt STATEMENT UNREACHABLE, PREVIOUS
STATEMENT EXITS TABL****Reason:**

The AOM screening table compiler found a statement that cannot be reached at execution time, as all possible paths to this statement exit the screening table (for example, an ACCEPT statement in the COMMAND section).

System Action:

The compile continues, for error checking purposes only.

User Action:

Use the error information in the message to find and correct the error.

N84209**error-location stmt STATEMENT NOT SUPPORTED ON opsys.****Reason:**

The AOM screening table compiler found a statement that is not supported on this operating system. For example, a WTOR statement in AOM/VM.

System Action:

The compile continues, for error checking purposes only. file).

User Action:

Use the error information in the message to find and correct the error. A '+' continuation may be missing. This can lead to another error on the next source line.

N84210**error-location n MISSING DOENDS.****Reason:**

The AOM screening table compiler reached the end of the screening table source, but there were unpaired DO statements.

System Action:

The compile continues, for error checking purposes only.

User Action:

Use the error information in the message to find and correct the error.

N84211

error-location NO PROCESSING STATEMENTS IN TABLE.

Reason:

The AOM screening table compiler reached the end of the screening table source, but it found no processing statements, only comments and/or control statements.

System Action:

The compile continues, for error checking purposes only.

User Action:

Use the error information in the message to find and correct the error.

N84212

error-location OUT OF SEQUENCE stmt STATEMENT.

Reason:

The AOM screening table compiler detected an out of sequence statement. For example, a WTOR statement that was not after the GLOBAL statement.

System Action:

The compile continues, for error checking purposes only.

User Action:

Use the error information in the message to find and correct the error. Refer to the AOM screening table syntax descriptions in the AOM manuals.

N84213

error-location TWO ADJACENT MSGGROUPS, THIS STATEMENT UNREACHABLE.

Reason:

The AOM screening table compiler has found two logically adjacent MSGGROUP statements. The second cannot therefore be reached by any messages, and this is regarded as an error. This includes the condition where the only statements between two MSGGROUP statements do not reject any messages.

System Action:

The compile continues, for error checking purposes only.

User Action:

Use the error information in the message to find and correct the error.

N84214

error-location LAST MSGGROUP IS ALWAYS TRUE.

Reason:

The AOM screening table compiler found a MSGGROUP statement that was followed by end of file. This last MSGGROUP is therefore always true. This is a warning message only.

System Action:

The compile continues.

User Action:

Ensure that this is the correct action. This error can occur if an error is made in the match- criteria coded on the WTOR statement.

N84215

error-location STATEMENT LABEL ERROR: reason

Reason:

The AOM screening table compiler encountered a statement label error. The *reason* can be as follows:

- LABEL LONGER THAN 8 CHARACTERS: label
- END-STMT AFTER LABEL
- LABEL NOT ALLOWED ON A NESTED STATEMENT
- xxxxxxxx STATEMENT CANNOT HAVE A LABEL

System Action:

The compile continues, for error checking purposes only.

User Action:

Use the error information in the message to find and correct the error.

N84217

error-location UNRECOGNISED TOKEN `value' IN stmt STMT.

Reason:

The AOM screening table compiler encountered an unrecognized token in the nominated statement.

System Action:

The compile continues, for error checking purposes only.

User Action:

Use the error information in the message to find and correct the error.

N84218**error-location ITERATIVE DO SYNTAX ERROR: reason****Reason:**

The AOM screening table compiler encountered an iterative DO syntax error. The *reason* can be as follows:

- EXPECTED 'IX', FOUND xxxxxxxx
- EXPECTED '(', FOUND xxxxxxxx
- EXPECTED INDEX NUMBER, FOUND xxxxxxxx
- INDEX NUMBER nnnnnnnnn CURRENTLY ACTIVE
- EXPECTED ')', FOUND xxxxxxxx
- EXPECTED '=', FOUND xxxxxxxx
- 'FROM' NUMBER NOT 1:256
- EXPECTED 'TO', FOUND xxxxxxxx
- 'TO' NUMBER NOT 1:256
- 'TO' NUMBER LESS THAN 'FROM' NUMBER
- 'DOWNT0' NUMBER GREATER THAN 'FROM' NUMBER
- INVALID SYNTAX AFTER 'TO' VALUE: xxxxxxxx

System Action:

The compile continues, for error checking purposes only.

User Action:

Use the error information in the message to find and correct the error.

N84219**error-location stmt ERROR: reason****Reason:**

The AOM screening table compiler encountered a statement error. The *reason* can be as follows:

- INVALID LABEL: xxxxxxxx
- NOT END-STATEMENT AFTER LABEL
- NOT NESTED IN AN ITERATIVE 'DO'
- LABEL: xxxxxxxx NOT FOUND IN AN ENCLOSING 'DO'
- LABEL: xxxxxxxx IS NOT AN ITERATIVE 'DO' LABEL

System Action:

The compile continues, for error checking purposes only.

User Action:

Use the error information in the message to find and correct the error.

N84220

error-location PROCESS TYPE: type IS INVALID.

Reason:

The AOM screening table compiler found a PROCESS statement with an invalid type. The value was not MESSAGES or COMMANDS.

System Action:

The compile is terminated.

User Action:

Use the error information in the message to find and correct the error.

N84221

error-location PROCESS TYPE: type ALREADY HANDLED.

Reason:

The AOM screening table compiler found a PROCESS statement with a type that had been already encountered. This includes the case where a screening table started without a PROCESS statement, and thus a PROCESS MESSAGES statement was assumed.

System Action:

The compile is terminated.

User Action:

Use the error information in the message to find and correct the error. Refer to the AOM screening table reference documentation regarding the statement sequence required.

N84222

error-location PROCESS TYPE: type NOT SUPPORTED ON opsys.

Reason:

The AOM screening table compiler encountered a PROCESS STATEMENT with a valid type that is not supported in the current environment. For example, a PROCESS COMMANDS statement in VM.

System Action:

The compile is terminated.

User Action:

Use the error information in the message to find and correct the error.

N84223

error-location TOO MANY DEFCONDS (> 32).

Reason:

The AOM screening table compiler encountered more than 32 DEFCOND statements in the screening table.

System Action:

The compile continues, for error checking purposes only.

User Action:

Remove the excess number of DEFCOND statements.

N84224

error-location DEFCOND - `name' ALREADY DEFINED.

Reason:

The AOM screening table compiler encountered a duplicated DEFCOND name.

System Action:

The compile continues, for error checking purposes only.

User Action:

Remove or rename the duplicated DEFCOND statement.

N84225

error-location CONDITION NAME `value' NOT WORD OR TOO LONG.

Reason:

The AOM screening table compiler encountered an invalid DEFCOND condition name. This must be a 1 to 12 character word.

System Action:

The compile continues, for error checking purposes only.

User Action:

Use the error information in the message to find and correct the error. It is possible that an error in the match-criteria for this defcond generated this error message.

N84226

error-location TOO MANY CONDITIONS IN THIS SECTION (> 32).

Reason:

The AOM screening table compiler encountered more than 32 DEFCOND statements in the current section of the screening table.

System Action:

The compile continues, for error checking purposes only.

User Action:

Remove the excess DEFCOND statements.

N84227

error-location CONDITION NAME `name' ALREADY DEFINED.

Reason:

The AOM screening table compiler encountered a duplicated DEFCOND condition name in the current section.

System Action:

The compile continues, for error checking purposes only.

User Action:

Remove or rename the duplicated DEFCOND statement.

N84228

error-location EXPECTED `THEN', FOUND `token'.

Reason:

The AOM screening table compiler found unexpected data after processing the criteria on an IF statement, where a THEN keyword must be coded.

System Action:

The compile continues, for error checking purposes only.

User Action:

Use the error information in the message to find and correct the error.

N84229

error-location MISPLACED `ELSE' STATEMENT.

Reason:

The AOM screening table compiler found an ELSE statement where one is not valid. ELSE statements must follow an IF statement, or the DOEND that pairs with a DO statement that was on an IF statement.

System Action:

The compile continues, for error checking purposes only.

User Action:

Use the error information in the message to find and correct the error.

N84230

error-location MISPLACED DOEND STATEMENT, NO DO-GROUPS ACTIVE.

Reason:

The AOM screening table compiler encountered a DOEND statement, but there are no current DO groups (DO statements) active.

System Action:

The compile continues, for error checking purposes only.

User Action:

Remove or reposition the offending DOEND statement.

N84231

error-location EXPECTED END-STMT, FOUND `value'.

Reason:

The AOM screening table compiler encountered unexpected data at a point where a statement should have terminated.

System Action:

The compile continues, for error checking purposes only.

User Action:

Use the error information in the message to find and correct the error.

N84232

LAST MSGGROUP IS ALWAYS TRUE.

Reason:

The AOM screening table compiler encountered end-of-file after the last MSGGROUP statement in the input. Thus, all messages reaching this MSGGROUP statement will pass it.

System Action:

The compile continues. This is a warning message only.

User Action:

Check that this is the desired action.

N84233

error-location INVALID ISSUE TEXT: `text'. FOUND 'value'.

Reason:

The AOM screening table compiler expected a valid word or string to be used as text for an ISSUE statement. The data encountered was invalid.

System Action:

The compile continues, for error checking purposes only.

User Action:

Use the error information in the message to find and correct the error.

N84234

error-location WHEN STATEMENT HAD NO SET OR ISSUE CLAUSE.

Reason:

The AOM screening table compiler encountered a WHEN statement with no SET or ISSUE clause. One of these is required for each WHEN, or each ELSE part of a WHEN statement.

System Action:

The compile continues, for error checking purposes only.

User Action:

Use the error information in the message to find and correct the error.

N84235

error-location "TEXT=" INVALID WITH MSGTEXT/CMDTEXT=YES ON EVENT.

Reason:

The AOM screening table compiler found the TEXT='text' parameter as well as the MSGTEXT=YES or CMDTEXT=YES parameters on an EVENT statement. This combination is invalid.

System Action:

The compile continues, for error checking purposes only.

User Action:

Use the error information in the message to find and correct the error.

N84236

error-location `SET' FOUND MORE THAN ONCE IN THIS STATEMENT.

Reason:

The AOM screening table compiler encountered a SET clause a second time in a WHEN or WTOR statement (for WHEN, more than once within each ELSE).

System Action:

The compile continues, for error checking purposes only.

User Action:

Use the error information in the message to find and correct the error.

N84237

error-location `SET' CLAUSE INVALID UNLESS `CONTINUE' ALSO CODED ON WTOR STATEMENT.

Reason:

The AOM screening table compiler encountered a SET clause on a WTOR statement, but the keyword CONTINUE was not coded. This keyword is required to allow the SET processing to take effect.

System Action:

The compile continues, for error checking purposes only.

User Action:

Use the error information in the message to find and correct the error.

N84238

error-location `SET' CLAUSE INVALID IF `REJECT' ALSO CODED ON WHEN STATEMENT.

Reason:

The AOM screening table compiler encountered a SET clause on a WHEN statement that also had REJECT coded. This is not permitted, as the SET options will be ignored if the message is rejected.

System Action:

The compile continues, for error checking purposes only.

User Action:

Use the error information in the message to find and correct the error.

N84239

**error-location MPFATTR=YES MUT. EXCL. WITH
COLOUR=/HLITE=/INTENS=.**

Reason:

The AOM screening table compiler encountered a GLOBAL statement that had MPFATTR=YES coded, as well as the COLOUR, HLITE, or INTENS attributes specified. Since MPFATTR=YES causes these attributes to be automatically assigned, these operands may not be specified in this case.

System Action:

The compile continues, for error checking purposes only.

User Action:

Use the error information in the message to find and correct the error.

N84240

**error-location `keyword' IS NOT A VALID WTOR STATEMENT
KEYWORD.**

Reason:

The AOM screening table compiler encountered an invalid keyword on the WTOR statement.

System Action:

The compile continues, for error checking purposes only.

User Action:

Use the error information in the message to find and correct the error.

N84241

error-location `REPLY' CLAUSES DUPLICATED ON WTOR STATEMENT.

Reason:

The AOM screening table compiler found more than one REPLY clause on the indicated WTOR statement. SET clause. For example, ADDMVSRC AND NEWMVSRC are mutually exclusive.

System Action:

The compile continues, for error checking purposes only.

User Action:

Use the error information in the message to find and correct the error.

N84242

error-location INVALID OR MISSING REPLY LITERAL.

Reason:

The AOM screening table compiler did not find a valid literal after the REPLY keyword on a WTOR statement.

System Action:

The compile continues, for error checking purposes only.

User Action:

Use the error information in the message to find and correct the error.

N84243

error-location NO `REPLY' CLAUSE ON WTOR STATEMENT.

Reason:

The AOM screening table compiler did not find a REPLY clause on a WTOR statement.

System Action:

The compile continues, for error checking purposes only.

User Action:

Use the error information in the message to find and correct the error.

N84245**error-location REJECT STATEMENT WITH NO CRITERIA ONLY VALID INSIDE IF/EL****Reason:**

The AOM screening table compiler found a REJECT statement with no criteria (that is, an unconditional REJECT). This is only permitted if the REJECT statement is contained within the scope of an IF or ELSE statement, either on the IF or ELSE statement itself, or within a DO/DOEND group that is within an IF/ELSE.

System Action:

The compile continues, for error checking purposes only.

User Action:

Use the error information in the message to find and correct the error.

N84246**error-location UNKNOWN KEYWORD ON WHEN STATEMENT: `token'.****Reason:**

The AOM screening table compiler found an unrecognized keyword on a WHEN statement.

System Action:

The compile continues, for error checking purposes only.

User Action:

Use the error information in the message to find and correct the error. You should convert all WHEN statements to IF/ELSE/DO.

N84247

error-location EXPECTED ELSE/END-STMT, FOUND `value`.

Reason:

The AOM screening table compiler encountered a token other than the ELSE keyword, or end-of-statement, while processing a WHEN statement.

System Action:

The compile continues, for error checking purposes only.

User Action:

Use the error information in the message to find and correct the error. You should convert all WHEN statements to IF/ELSE/DO.

N84248

error-location NO ACTIONS SPECIFIED AFTER WHEN CRITERIA.

Reason:

The AOM screening table compiler did not find any actions for the current WHEN statement.

System Action:

The compile continues, for error checking purposes only.

User Action:

Use the error information in the message to find and correct the error. You should change all WHEN statements to IF/ELSE/DO.

N84249

error-location EXPECTED KEYWORD AFTER `ELSE`, FOUND: `value`.

Reason:

The AOM screening table compiler expected a valid WHEN statement keyword after the ELSE keyword, but did not find one. The value found is shown.

System Action:

The compile continues, for error checking purposes only.

User Action:

Use the error information in the message to find and correct the error.

N84250

error-location EXPECTED END-STMT, FOUND `value'.

Reason:

The AOM screening table compiler encountered unexpected data at a point where a statement should have terminated.

System Action:

The compile continues, for error checking purposes only.

User Action:

Use the error information in the message to find and correct the error.

N84255

error-location INVALID REISSUE TEXT: `text'.

Reason:

The AOM screening table compiler found invalid data where it expected text for the REISSUE statement.

System Action:

The compile continues, for error checking purposes only.

User Action:

Use the error information in the message to find and correct the error.

N84256

error-location INVALID MESSAGE TEXT: `text'.

Reason:

The AOM screening table compiler found invalid data where it expected text for the MESSAGE statement.

System Action:

The compile continues, for error checking purposes only.

User Action:

Use the error information in the message to find and correct the error.

N84257

error-location INVALID REPLACE TEXT: `text'.

Reason:

The AOM screening table compiler found invalid data where it expected text for the REPLACE statement.

System Action:

The compile continues, for error checking purposes only.

User Action:

Use the error information in the message to find and correct the error.

N84260

error-location NAME 'value' NOT A WORD OR TOO LONG.

Reason:

The AOM screening table compiler encountered an invalid subroutine definition name (DEFSUB). This must be a 1 to 12 character word.

System Action:

The compile continues, for error checking purposes only.

User Action:

Use the error information in the message to find and correct the error.

N84261

error-location TOO MANY DEFSUBS IN THIS SECTION (>127).

Reason:

The AOM screening table compiler encountered more than 127 subroutine definitions (DEFSUBs) in the current COMMAND or MESSAGE section.

System Action:

The compile continues, for error checking purposes only.

User Action:

Use the error information in the message to find and correct the error.

N84262

error-location SUBROUTINE NAME xxxxxxxx ALREADY DEFINED.

Reason:

The AOM screening table compiler encountered an existing subroutine definition, ie: DEFSUB xxxxxxxx is previously defined in the current COMMAND or MESSAGE section.

System Action:

The compile continues, for error checking purposes only.

User Action:

Use the error information in the message to find and correct the error.

N84263

error-location SUBROUTINE DEFINITION NOT OPEN.

Reason:

The AOM screening table compiler encountered an ENDSUB or RETSUB statement but a subroutine definition was not opened (DEFSUB xxxxxxxx) previously.

System Action:

The compile continues, for error checking purposes only.

User Action:

Use the error information in the message to find and correct the error.

N84264

error-location SUBROUTINE NAME xxxxxxxx NOT DEFINED.

Reason:

The AOM screening table compiler encountered an undefined subroutine name on the GOSUB xxxxxxxx statement. Subroutines must be defined before referencing them.

System Action:

The compile continues, for error checking purposes only.

User Action:

Use the error information in the message to find and correct the error.

N84265

error-location RECURSIVE CALLS OF SUBROUTINES NOT SUPPORTED.

Reason:

The AOM screening table compiler encountered a recursive subroutine call. Recursion is not supported by the screening table.

System Action:

The compile continues, for error checking purposes only.

User Action:

Use the error information in the message to find and correct the error.

N84266

error-location SUBROUTINES NESTING LIMIT REACHED (>32) OR CALL TABLE OVERFLOW.

Reason:

The AOM screening table compiler encountered more than 32 nested subroutine calls. The nesting of the subroutine calls is limited. It is also limited the size of the subroutine call table which contains the subroutines external subroutine references (GOSUB). The number of table entries is limited to 1500.

System Action:

The compile continues, for error checking purposes only.

User Action:

Use the error information in the message to find and correct the error.

N84267

error-location DEFSUB xxxxxxxx DEFINITION NOT CLOSED.

Reason:

The AOM screening table compiler encountered an unclosed subroutine definition at the end of the COMMAND or MESSAGE section. Subroutine definition (DEFSUB) must be closed by the ENDSUB statement.

System Action:

The compile continues, for error checking purposes only.

User Action:

Use the error information in the message to find and correct the error.

N84268

error-location ACTIVE INDEX USAGE OVERLAP IN TARGET SUBROUTINE

Reason:

The AOM screening table compiler encountered an overlapped iterative DO statement index usage in the target subroutine. The index variables are 'global' variables and overlapping these DO index variables during subroutine calls is not allowed.

System Action:

The compile continues, for error checking purposes only.

User Action:

Use the error information in the message to find and correct the error.

N84270**error-location NUMERIC KEYWORD/VALUE ERROR: reason****Reason:**

The AOM screening table compiler encountered a numeric keyword/value error on the iterative DO statement. The *reason* can be as follows:

- EXPECTED NUMBER OR KEYWORD, FOUND xxxxxxxx
- NO INDEXING ALLOWED FOR xxxxxxxx
- INDEXING REQUIRED FOR xxxxxxxx
- EXPECTED A NUMBER OR 'IX', FOUND xxxxxxxx
- INDEX NUMBER xxxxxxxx NOT IN VALID RANGE
- EXPECTED '(' AFTER 'IX'
- EXPECTED AN INDEX NUMBER, FOUND xxxxxxxx
- xxxxxxxx IS NOT A VALID IX(n) NUMBER
- EXPECTED ')' AFTER IX(n..., FOUND xxxxxxxx
- EXPECTED ')' AFTER INDEX, FOUND xxxxxxxx

System Action:

The compile continues, for error checking purposes only.

User Action:

Use the error information in the message to find and correct the error.

N84275**error-location VARIABLE NAME/VALUE ERROR: reason****Reason:**

The AOM screening table compiler encountered a variable name/value error. The *reason* can be as follows:

- NO INDEXING ALLOWED FOR xxxxxxxx
- INDEXING REQUIRED FOR xxxxxxxx
- EXPECTED A NUMBER OR 'IX', FOUND xxxxxxxx
- INDEX NUMBER xxxxxxxx NOT IN VALID RANGE
- EXPECTED '(' AFTER 'IX' - EXPECTED AN INDEX NUMBER, FOUND xxxxxxxx
- xxxxxxxx IS NOT A VALID IX(n) NUMBER
- EXPECTED ')' AFTER IX(n..., FOUND xxxxxxxx
- EXPECTED ')' AFTER INDEX, FOUND xxxxxxxx

System Action:

The compile continues, for error checking purposes only.

User Action:

Use the error information in the message to find and correct the error.

N84280

error-location EXPECTED VALID KEYWORD, FOUND: `value'.

Reason:

The AOM screening table compiler encountered an unrecognisable keyword for the current statement.

System Action:

The compile continues, for error checking purposes only.

User Action:

Use the error information in the message to find and correct the error.

N84281

error-location MISSING OR INVALID SUBSCRIPT AFTER: `token'.

Reason:

The AOM screening table compiler did not find a valid subscript when it expected one. Subscripts must be in the format (n) and n must be from 1 to the relevant maximum allowed.

System Action:

The compile continues, for error checking purposes only.

User Action:

Use the error information in the message to find and correct the error.

N84282

error-location DUPLICATE OR MUTUALLY EXCLUSIVE KEYWORD: keyword.

Reason:

The AOM screening table compiler found a keyword that duplicated an earlier keyword, or was mutually exclusive with an earlier keyword on this statement.

System Action:

The compile continues, for error checking purposes only.

User Action:

Use the error information in the message to find and correct the error.

N84283

error-location `value' INVALID VALUE FOR KEYWORD: keyword.

Reason:

The AOM screening table compiler encountered an invalid value for the indicated keyword.

System Action:

The compile continues, for error checking purposes only.

User Action:

Use the error information in the message to find and correct the error.

N84284

error-location `value' NOT WORD OR TOO LONG FOR: keyword.

Reason:

The AOM screening table compiler encountered an invalid value for the indicated keyword. The value must be a word, not exceeding the allowable length.

System Action:

The compile continues, for error checking purposes only.

User Action:

Use the error information in the message to find and correct the error.

N84285

error-location `value' NOT VALID HEX VALUE FOR: keyword.

Reason:

The AOM screening table compiler encountered an invalid value for the indicated keyword. The value must be an even number of hexadecimal digits.

System Action:

The compile continues, for error checking purposes only.

User Action:

Use the error information in the message to find and correct the error.

N84286

error-location INVALID TEXT VALUE FOR: keyword.

Reason:

The AOM screening table compiler did not find a valid text value for the indicated keyword. The value should be a string enclosed in quotes.

System Action:

The compile continues, for error checking purposes only.

User Action:

Use the error information in the message to find and correct the error.

N84287

error-location EXPECTED `)' AFTER PARAMETER FOR: keyword.

Reason:

The AOM screening table compiler did not find a required closing parenthesis.

System Action:

The compile continues, for error checking purposes only.

User Action:

Use the error information in the message to find and correct the error.

N84288

error-location EXPECTED VALID KEYWORD OR END-STMT, FOUND: `value'.

Reason:

The AOM screening table compiler expected a valid keyword for the current statement, or end of statement, but neither was found. The value found is shown.

System Action:

The compile continues, for error checking purposes only.

User Action:

Use the error information in the message to find and correct the error. A keyword is possibly misspelt.

N84289

error-location kwrđ KEYWORD NOT SUPPORTED ON opsys.

Reason:

The AOM screening table compiler encountered a keyword kwrđ that, while valid for the current statement, is not supported in this environment. For example, the DELETE option of the GLOBAL statement is not supported in AOM/VM.

System Action:

The compile continues, for error checking purposes only.

User Action:

Use the error information in the message to find and correct the error.

N84290

error-location kwrđ KEYWORD NOT SUPPORTED IN secname SECTION.

Reason:

The AOM screening table compiler encountered a kwrđ keyword that, while supported by the current statement, is not supported in the current screening table section. For example, MSGATTR on the EVENT statement is not supported in the COMMANDS section.

System Action:

The compile continues, for error checking purposes only.

User Action:

Use the error information in the message to find and correct the error.

N84291

***error-location* SEVERE STORAGE ERROR, UNABLE TO CONTINUE COMPILE.**

Reason:

The AOM screening table compiler was unable to obtain working storage while processing a statement. It is unable to continue processing.

System Action:

The compile terminates.

User Action:

Determine why the region is short on storage.

N84292

***error-location* VALUE FOR 'keyword' KEYWORD NOT SPECIFIED.**

Reason:

The AOM screening table compiler encountered an empty value specification for the 'keyword'. A correct value must be assigned to the keyword used on the current statement.

System Action:

The compile continues, for error checking purposes only.

User Action:

Use the error information in the message to find and correct the error.

N84293

***error-location* LITERAL AREA OVERFLOW. TOO MANY OR LONG LITERALS.**

Reason:

The AOM screening table compiler encountered an internal literal area length limitation. The total length of the literals used on the statement (eg.: EDSEVENT keyword=literal ...) exceeds this limitation.

System Action:

The compile continues, for error checking purposes only.

User Action:

Use the error information in the message to find and correct the error.

N84294

error-location SET INDEX, SUBSCRIPT <9 OR DYN.INDEX NOT SUPPORTED

Reason:

The AOM screening table compiler encountered an invalid index/subscript value specification or dynamic indexing not allowed for the keyword. Setting index variables is only permitted for IX(9) to IX(12). Index variables from 1 to 8 are reserved for iterative DO processing and cannot be set by another instruction.

System Action:

The compile continues, for error checking purposes only.

User Action:

Use the error information in the message to find and correct the error.

N84295

error-location EXPECTED '=', 'UP', 'DOWN', FOUND 'xxxxxxxx'

Reason:

The AOM screening table compiler encountered unexpected data at a point where a statement should have had '=', 'UP' or 'DOWN' specified.

System Action:

The compile continues, for error checking purposes only.

User Action:

Use the error information in the message to find and correct the error.

N84299

error-location UNLICENSED STATEMENT TYPE: 'xxxxxxx'

Reason:

The Screening Table compiler encountered an unlicensed statement type. The system must be licensed for AOM/Extension-2 to be able to use the requested function.

System Action:

The compilation continues, for error checking purposes only.

User Action:

Check with your product support representative.

N84301

error-location EXPECTED `)', FOUND `value'.

Reason:

The AOM screening table compiler encountered an unexpected token while processing a match-criteria, when a closing parenthesis was expected.

System Action:

The compile continues, for error checking purposes only.

User Action:

Use the error information in the message to find and correct the error.

N84302

error-location STACK OVERFLOW - TOO MANY LEVELS OF ().

Reason:

The AOM screening table compiler encountered too many nested parentheses. The criteria are too complex.

System Action:

The compile continues, for error checking purposes only.

User Action:

Use the error information in the message to find and correct the error. The maximum nesting of parentheses is 5. Use a DEFCOND statement to contain part of the criteria.

N84303

error-location UNEXPECTED END-STMT/END-FILE AFTER `OR`.

Reason:

The AOM screening table compiler encountered an unexpected end of statement or end of input file after an OR while processing criteria.

System Action:

The compile continues, for error checking purposes only.

User Action:

Use the error information in the message to find and correct the error.

N84304

error-location UNEXPECTED END-STMT/END-FILE AFTER `AND`.

Reason:

The AOM screening table compiler encountered an unexpected end of statement or end of input file after an AND while processing criteria.

System Action:

The compile continues, for error checking purposes only.

User Action:

Use the error information in the message to find and correct the error.

N84310

error-location UNABLE TO OBTAIN STACK STORAGE.

Reason:

The AOM screening table compiler was unable to obtain storage for a stack to process criteria.

System Action:

The compile is terminated.

User Action:

Determine why the region is short on storage.

N84401**OPTIMISER STATISTICS:****Reason:**

The AOM screening table compiler was asked to optimize the compiled table (this is the default). The optimizer will produce statistics on this. This heading indicates that the statistics follow.

System Action:

None.

User Action:

None.

N84402**nnnnnn description.****Reason:**

This message gives AOM screening table compiler optimizer statistics. `nnnnn' is the number, associated with `description'. Descriptions are:

PASSES - The number of passes the optimizer made over the code.

COND LINK L/ST REMOVED - The number of linkage instructions for CONDITION criteria that were removed.

BRANCHES NOP'D - The number of branch instructions that were removed, being redundant.

BRANCHES INVERTED - The number of branch instructions that had the condition inverted (usually in tandem with the previous optimization).

BRANCH CHAIN ADJUSTS MADE - The number of chained branches that were unchained.

(A)TEXT LEN BL UNCHAINS - the number of text length branch after test instructions that were unchained.

(A)TEXT LEN CLI/BL NOP'D - the number of redundant text length comparisons and branches that were removed.

ORIGINAL CODE SIZE - The size of the unoptimized code.

OPTIMISED CODE SIZE - The final optimized code size.

System Action:

None.

User Action:

None.

N84501

error-location FINAL CODE+LITERAL SIZE TOO LARGE.

Reason:

The AOM screening table that has been compiled has generated too much code and literal storage for the configuration. The table is too complex.

System Action:

The compile is terminated.

User Action:

Simplify the table. If this is not possible, contact your product support representative.

N84701

CODE HAS OVERFLOWED INTO LITERAL POOL.

Reason:

The AOM screening table compiler has had an overrun of the generated code into the generated literal pool. The table is too complex.

System Action:

The compile continues, for error checking purposes only.

User Action:

Simplify the table, if possible. If not, contact your product support representative.

N84702

LITERAL POOL HAS OVERFLOWED INTO CODE.

Reason:

The AOM screening table compiler has had an overrun of the generated literal pool into the generated code. The table is too complex.

System Action:

The compile continues, for error checking purposes only.

User Action:

Simplify the table, if possible. If not, contact your product support representative.

N84703**TOO MANY INTERNAL CODE LABELS.****Reason:**

The AOM screening table compiler has had an overflow of the internal code label table. The table is too complex.

System Action:

The compile continues, for error checking purposes only.

User Action:

Simplify the table, if possible. If not, contact your product support representative.

N84704**TOO MANY INTERNAL LITERAL LABELS.****Reason:**

The AOM screening table compiler has had an overflow of the internal literal label table. The table is too complex.

System Action:

The compile continues, for error checking purposes only.

User Action:

Simplify the table, if possible. If not, contact your product support representative.

N84705**EXTENDED LITERAL POOL OVERFLOW.****Reason:**

The AOM screening table compiler has had an overflow of the extended literal pool during compilation.

System Action:

The compile continues, for error checking purposes only.

User Action:

Increase the size of the extended literal pool, using the SYSPARMS AOMSTSIZ=(a,b) command. (b is the extended literal pool size).

N84801

error-location TOKEN TOO LONG, TRUNCATED.

Reason:

The AOM screening table compiler has encountered a token in the input source which is too long. The value is truncated so the compile may continue.

System Action:

The compile continues, for error checking purposes only.

User Action:

Use the error information in the message to find and correct the error.

N84802

error-location QUOTED STRING NOT TERMINATED BEFORE END STMT/END FILE.

Reason:

The AOM screening table compiler has encountered a quoted string that had no closing quote before the end of the statement or source file.

System Action:

The compile continues, for error checking purposes only.

User Action:

Use the error information in the message to find and correct the error. Possibly, a statement continuation is missing.

N84803

error-location EXPECTING STATEMENT CONTINUATION, FOUND END-OF-FILE.

Reason:

The AOM screening table compiler has encountered end of file when the last statement line had a continuation character (+) on it.

System Action:

The compile continues, for error checking purposes only.

User Action:

Use the error information in the message to find and correct the error.

N84804**nnnnn input-line****Reason:**

This is an echo of the input to the AOM screening compiler, if a listing is requested. The input line will have the statement number from columns 73-80 moved to the front, if it is nonblank.

System Action:

None.

User Action:

None.

N84805**READ ERROR ON PDS: ddname MEMBER: member.****Reason:**

The AOM screening table compiler has encountered an I/O error whilst reading the requested PDS member.

System Action:

The compile is aborted.

User Action:

Examine the activity log for further I/O error information.

N84806**PDS OPEN ERROR ON DDNAME: ddname.****Reason:**

The AOM screening table compiler has encountered an error when opening the library indicated.

System Action:

The compile is aborted.

User Action:

Check that the PDS is allocated, and not security protected.

N84807

PDS ON DDNAME: ddname IS NOT F(B)/80.

Reason:

The AOM screening table compiler found that the library nominated was not in the correct format. AOM screening table members must be fixed 80 byte records.

System Action:

The compile is aborted.

User Action:

Check that the correct library is specified.

N84808

PDS ON DDNAME: ddname DOES NOT CONTAIN MEMBER: member.

Reason:

The AOM screening table compiler found that the library nominated did not contain the requested member.

System Action:

The compile is aborted.

User Action:

Check that the correct library and member names are specified.

N84809

error-location INVALID VARIABLE FORMAT/UNKNOWN VARIABLE IN STRING.

Reason:

The AOM screening table compiler encountered an invalid or unknown variable when processing a REPLY or ISSUE string. Refer to the AOM manual for a list of the valid variable names.

System Action:

The compile continues, for error checking purposes only.

User Action:

Use the error location information in the message to find and correct the error.

N84815

READ ERROR ON FILE: filetype MEMBER: filename.

Reason:

The AOM screening table compiler has encountered an I/O error whilst reading the requested CMS file.

System Action:

The compile is aborted.

User Action:

Examine the activity log for further I/O error information.

N84816

CMS FILE OPEN ERROR FOR FILETYPE: *filetype*.

Reason:

The AOM screening table compiler has encountered an error when opening the CMS file indicated.

System Action:

The compile is aborted.

User Action:

Check that the CMS minidisks are allocated to the region.

N84818

SCREENING TABLE FILE: filename TYPE: filetype. NOT FOUND.

Reason:

The AOM screening table compiler could not find the CMS file indicated.

System Action:

The compile is aborted.

User Action:

Check that the correct filename, filetype, and filemode are specified.

N84860

% INCLUDE NCL VARIABLE: variable VALUE NOT NUMERIC, 0 to 9999.

Reason:

While attempting to initialize processing for an NCL virtual include file, the indicated global NCL variable was accessed. The value contained was not a number from 0 to 9999.

System Action:

The compile is aborted.

User Action:

Ensure that the correct NCL variable name was used on the % INCLUDE statement.

N84861

% INCLUDE NCL VARIABLE: variable VALUE LONGER THAN 72 CHARACTERS.

Reason:

While processing an NCL include file, the indicated variable contained a value longer than 72 characters.

System Action:

The compile is aborted.

User Action:

NCL include files must have individual lines no longer than 72 characters.

N84870

% LINE SYNTAX ERROR.

Reason:

The indicated % preprocessing line in the current screening table had a syntax error. The line could not be recognized as, for example, a % INCLUDE line.

System Action:

The compile is aborted.

User Action:

Correct the % line.

N84871**% INCLUDE HAS NO MEMBER/FILE NAME.****Reason:**

The indicated % INCLUDE line does not contain a member or file name.

System Action:

The compile is aborted.

User Action:

Correct the % INCLUDE line.

N84872**% INCLUDE UNRECOGNISED OPTION: option.****Reason:**

While processing a % INCLUDE line, an option surrounded by parentheses was found. The option is not recognized.

System Action:

The compile is aborted.

User Action:

Correct the % INCLUDE line.

N84873**% INCLUDE DUPLICATE/CONFLICTING OPTION: option.****Reason:**

An option specified on a % INCLUDE line conflicts with or duplicates an earlier option.

System Action:

The compile is aborted.

User Action:

Correct the % INCLUDE line.

N84874

% INCLUDE INVALID MEMBER/FILE/NCL NAME: name.

Reason:

The indicated name is not a valid PDS member name, or CMS file name, or NCL global variable prefix name.

System Action:

The compile is aborted.

User Action:

Correct the % INCLUDE line.

N84875

% INCLUDE INVALID PARAMETER: value.

Reason:

An invalid parameter was found on a % INCLUDE line.

System Action:

The compile is aborted.

User Action:

Correct the % INCLUDE line.

N84876

% INCLUDE NESTING DEPTH EXCEEDED.

Reason:

More than 5 nested % INCLUDE statements were found.

System Action:

The compile is aborted.

User Action:

Reorganize the % INCLUDE structure to have a maximum of 5 levels.

N84877**OPTIONAL % INCLUDE FILE: filename NOT FOUND.****Reason:**

The indicated % INCLUDE file was not found. The (OPTIONAL) parameter was specified, so the compile will continue as if the % INCLUDE line was not present. This is a warning message only.

System Action:

The compile continues.

User Action:

Check that this is the desired action.

N84878**% INCLUDE FILE: filename NOT FOUND.****Reason:**

The indicated % INCLUDE file was not found. Since the (OPTIONAL) parameter was not specified, this is treated as an error.

System Action:

The compile is aborted.

User Action:

Ensure that the correct include file name was specified on the % INCLUDE statement.

N84879**OPTIONAL % INCLUDE NCL GLOBAL VARIABLES: varname NOT FOUND.****Reason:**

The indicated % INCLUDE NCL global variables were not found. The (OPTIONAL) parameter was specified, so the compile will continue as if the % INCLUDE line was not present. This is a warning message only.

System Action:

The compile continues.

User Action:

Check that this is the desired action.

N84880

% INCLUDE NCL GLOBAL VARIABLES: varname NOT FOUND.

Reason:

The indicated % INCLUDE NCL global variables were not found. Since the (OPTIONAL) parameter was not specified, this is treated as an error.

System Action:

The compile is aborted.

User Action:

Ensure that the correct include variable prefix was specified on the % INCLUDE statement.

N84888

% INCLUDE ---> type NAME: name LEVEL: level - START.

Reason:

This message traces the start of an included file, to allow the file in which an error occurs during compilation to be detected.

System Action:

None.

User Action:

None.

N84889

% INCLUDE ---> type NAME: name LEVEL: level - END.

Reason:

This message traces the end of an include file, to allow the file in which an error occurs during compilation to be detected.

System Action:

None.

User Action:

None.

N84A01

error-location NUMBER OUT OF RANGE FOR keyword.

Reason:

A numeric operand for an AOM screening table keyword was out of the valid range for that keyword. error-location indicates the source line and column where the error was detected. keyword is the screening table keyword.

System Action:

The screening table compile will continue, to detect other errors. The table will not be loaded.

User Action:

Use the error information in the message to identify and correct the error.

N84A02

error-location EXPECTED VALID VALUE FOR keyword, FOUND value.

Reason:

value is not a valid value (keyword or number) for the AOM screening table keyword keyword.

System Action:

The screening table compile will continue, to detect other errors. The table will not be loaded.

User Action:

Use the error information in the message to identify and correct the error.

N84A03

error-location NUMBER RANGE INVALID FOR keyword.

Reason:

Numeric ranges are not permitted as operands of this AOM screening table keyword keyword.

System Action:

The screening table compile will continue, to detect other errors. The table will not be loaded.

User Action:

Use the error information in the message to identify and correct the error.

N84A04

error-location BOTH SIDES OF RANGE MUST BE NUMERIC.

Reason:

AOM screening table keywords that allow numeric ranges as operands (eg 5:10) require both sides of the range to be numeric. This message indicates a violation of that requirement.

System Action:

The screening table compile will continue, to detect other errors. The table will not be loaded.

User Action:

Use the error information in the message to identify and correct the error.

N84A05

error-location BOTH SIDES OF RANGE MUST BE A KEYWORD

Reason:

AOM screening table keywords that allow keyword ranges as operands (eg MON:FRI) require both sides of the range to be a keyword. This message indicates a violation of that requirement.

System Action:

The screening table compile will continue, to detect other errors. The table will not be loaded.

User Action:

Use the error information in the message to identify and correct the error.

N84A06

error-location THIS KEYWORD INVALID IN A RANGE FOR keyword.

Reason:

The keyword pointed to by error-location is not permitted as a side of a keyword range (eg MON:FRI) for keyword.

System Action:

The screening table compile will continue, to detect other errors. The table will not be loaded.

User Action:

Use the error information in the message to identify and correct the error.

N84A07

error-location CIRCULAR RANGE INVALID FOR keyword.

Reason:

The AOM screening keyword keyword does not allow circular (wrapped) numeric ranges eg 10:5.

System Action:

The screening table compile will continue, to detect other errors. The table will not be loaded.

User Action:

Use the error information in the message to identify and correct the error.

N84A08

error-location KEYWORD RANGE INVALID FOR keyword.

Reason:

The AOM screening keyword keyword does not allow keyword ranges eg MON:FRI.

System Action:

The screening table compile will continue, to detect other errors. The table will not be loaded.

User Action:

Use the error information in the message to identify and correct the error.

N84B01

error-location `value' IS NOT A WORD OR QUOTED STRING.

Reason:

The indicated token is not a word or quoted string. LOOKUP values must be one of these.

System Action:

The screening table compile will continue for syntax checking only. No table will be loaded.

User Action:

Correct the syntax and re-compile.

N84B02

error-location `value' CONTAINS WILDCARDS - NOT ALLOWED.

Reason:

The indicated token contains wildcard characters that are not escaped by a backslash. WILDCARDS are not permissible in the value lists for a LOOKUP criteria. Tokens containing an asterisk must be preceded by a backslash (\) to prevent its identification as a wildcard character.

System Action:

The screening table compile will continue for syntax checking only. No table will be loaded.

User Action:

Correct the syntax and re-compile.

N84B03**error-location VALUE TOO LONG FOR field.****Reason:**

The indicated LOOKUP value is too long for the field being searched. This is also possible with substrings of the search field.

System Action:

The screening table compile will continue for syntax checking only. No table will be loaded.

User Action:

Correct the syntax and re-compile.

N84B04**error-location TO VALUE LESS THAN FROM VALUE.****Reason:**

A range of values (A:B) for a LOOKUP criteria has a 'to' value less than the 'from' value.

System Action:

The screening table compile will continue for syntax checking only. No table will be loaded.

User Action:

Correct the syntax and re-compile.

N84B05**error-location OVERLAP OR DUPLICATES IN LIST.****Reason:**

The list of values for a LOOKUP criteria contains overlapping or duplicated values.

System Action:

The screening table compile will continue for syntax checking only. No table will be loaded.

User Action:

Correct the syntax and re-compile.

N84B06

***error-location* STORAGE SHORTAGE WHILE PROCESSING LIST.**

Reason:

While processing a LOOKUP criteria value list, the AOM compiler was unable to obtain working storage.

System Action:

The screening table compile continues for syntax checking only. No table will be loaded.

User Action:

Review the region size, and so on and then retry the compile.

N84B07

***error-location* LIST TOO LARGE FOR CURRENT IMPLEMENTATION.**

Reason:

The maximum amount of core or table space needed to compile the LOOKUP statement has been exceeded. The list contains too many values or is too long.

System Action:

The screening table compile will continue for syntax checking only. No table will be loaded.

User Action:

Attempt to simplify the size of the LOOKUP list. Consider using a mirrored VARTABLE instead.

N84B08

error-location keyword REQUIRED '(' or 'TABLE'.

Reason:

The LOOKUP keyword required either a list of value surrounded by parenthesis (), or the keyword TABLE, indicating a mirrored VARTABLE lookup. Neither was found.

System Action:

The screening table compile will continue for syntax checking only. No table will be loaded.

User Action:

Correct the syntax and re-compile.

N84B09

error-location EXPECTED A VALID LIST OPTION, FOUND: value.

Reason:

A LOOKUP list contained a parenthesized option at the start of the list. The option, however, was not a valid LOOKUP option.

System Action:

The screening table compile will continue for syntax checking only. No table will be loaded.

User Action:

Correct the syntax and re-compile.

N84B10

error-location LIST OPTION NOT FOLLOWED BY CLOSING PARENTHESIS `)'.

Reason:

A LOOKUP list option was not followed by a closing parenthesis. This is required.

System Action:

The screening table compile will continue for syntax checking only. No table will be loaded.

User Action:

Correct the syntax and re-compile.

N84B11

error-location `value' IS NOT A VALID TABLE NAME.

Reason:

A LOOKUP TABLE criteria did not have a valid table name specified.

System Action:

The screening table compile will continue for syntax checking only. No table will be loaded.

User Action:

Correct the syntax and re-compile.

N84B12

error-location EXPECTED WORD `EQUAL' OR `IGEN', FOUND: token.

Reason:

At this point, the LOOKUP criteria syntax requires the word EQUAL or IGEN to be specified.

System Action:

The screening table compile will continue for syntax checking only. No table will be loaded.

User Action:

Correct the syntax and re-compile.

N84B13**error-location EXPECTED `)', FOUND value****Reason:**

At this point in the LOOKUP criteria syntax, a closing parenthesis was expected. Instead, the indicated token was found.

System Action:

The screening table compile will continue for syntax checking only. No table will be loaded.

User Action:

Correct the syntax and re-compile.

N84B14**TOTAL LITERAL LENGTH EXCEEDS DESIGN LIMIT.****Reason:**

The total length of all literals in the indicated LOOKUP criterion has exceeded the current design limit of 8 Kbytes.

System Action:

The screening table compile will continue for syntax checking only. No table will be loaded.

User Action:

Break the LOOKUP criterion into 2 criterions, and OR them together.

N84B20**error-location SERIAL SEARCH MAY BE INEFFICIENT ON THIS LIST.****Reason:**

The automatic determination of lookup strategy was overridden by the user. The override specified SERIAL, but this search type is inefficient for lists with more than a very small number of entries. This warning message is produced as a reminder.

System Action:

The screening table compile continues. This is a warning message only.

User Action:

Ensure that the override is really required.

N84B21

error-location ORDERED SEARCH MAY BE INEFFICIENT ON THIS LIST.

Reason:

The automatic determination of lookup strategy was overridden by the user. The override specified ORDERED, but this search type is inefficient for lists with more than a small number of entries. This warning message is produced as a reminder.

System Action:

The screening table compile continues. This is a warning message only.

User Action:

Ensure that the override is really required.

N84B22

error-location INLINE BINARY SEARCH MAY BE INEFFICIENT ON THIS LIST.

Reason:

The automatic determination of lookup strategy was overridden by the user. The override specified INLINE, but this search type is space inefficient for lists with more than approximately 300 entries. This warning message is produced as a reminder.

System Action:

The screening table compile continues. This is a warning message only.

User Action:

Ensure that the override is really required.

N84B23

error-location SUBROUTINE SEARCH MAY BE INEFFICIENT ON THIS LIST.

Reason:

The automatic determination of lookup strategy was overridden by the user. The override specified SUBROUTINE, but this search type is inefficient for lists with less than approximately 20 entries. This warning message is produced as a reminder.

System Action:

The screening table compile continues. This is a warning message only.

User Action:

Ensure that the override is really required.

N84C01

error-location UNEXPECTED END-STMT/END-FILE.

Reason:

The AOM screening table compiler encountered an unexpected end-of-statement or end- of-file while processing a selection criteria.

System Action:

The compile continues, for error checking purposes only.

User Action:

Use the error information in the message to find and correct the error.

N84C02

error-location NULL SUBPARAMETER LIST IE ().

Reason:

The AOM screening table compiler encountered a null subparameter list after a match keyword, for example ROUTCDE(). This is not valid.

System Action:

The compile continues, for error checking purposes only.

User Action:

Use the error information in the message to find and correct the error.

N84C03

error-location EXPECTED MATCH CRITERIA KEYWORD, FOUND: token.

Reason:

The AOM screening table compiler encountered a keyword that was not a valid match criteria keyword, when one was expected.

System Action:

The compile continues, for error checking purposes only.

User Action:

Use the error information in the message to find and correct the error. You may have misspelled a keyword, for example TEXT instead of TEX.

N84C04

error-location STRING LENGTH + START POSITION OUTSIDE COMPARE FIELD.

Reason:

The AOM screening table compiler encountered a string match value that was too long or, when shifted by the specified starting position, extended past the possible field length.

System Action:

The compile continues, for error checking purposes only.

User Action:

Use the error information in the message to find and correct the error.

N84C05

error-location STRING LENGTH > START TO END RANGE.

Reason:

The AOM screening table compiler encountered a match string for a text comparison that also had a match range specified. The range was less than the length of the string, for example, TEXT(`ABCDEF',1:3). The end range must specify the position of the last character of the search string.

System Action:

The compile continues, for error checking purposes only.

User Action:

Use the error information in the message to find and correct the error.

N84C06

error-location EXPECTED STRING OR WORD, FOUND `value'.

Reason:

The AOM screening table compiler encountered the shown value when expecting either a word or quoted string.

System Action:

The compile continues, for error checking purposes only.

User Action:

Use the error information in the message to find and correct the error.

N84C07

error-location WILDCARD PROCESSING MADE STRING INVALID EG NULL.

Reason:

The AOM screening table compiler encountered a search string that, after processing any wildcard characters, became empty for example, TEXT(`*') is invalid, as it means `match any character'.

System Action:

The compile continues, for error checking purposes only.

User Action:

Use the error information in the message to find and correct the error.

N84C08

error-location STRING IS TOO LONG.

Reason:

The AOM screening table compiler encountered a match string that was too long for the specified keyword, eg: a 9-character JOBNAME match string.

System Action:

The compile continues, for error checking purposes only.

User Action:

Use the error information in the message to find and correct the error.

N84C09

error-location `value' NOT NUM, *, < 1, OR > MAX.

Reason:

The AOM screening table compiler encountered a number range value that was not valid. It was either not numeric, not an `*', not less than 1, or greater than the maximum value allowed for this keyword.

System Action:

The compile continues, for error checking purposes only.

User Action:

Use the error information in the message to find and correct the error.

N84C10

error-location `value' NOT NUM, *, < START, OR > MAX.

Reason:

The AOM screening table compiler encountered a number range end value that was not valid. It was either not numeric, not an `*', not less than the start position specified, or greater than the maximum value allowed for this keyword.

System Action:

The compile continues, for error checking purposes only.

User Action:

Use the error information in the message to find and correct the error.

N84C11

error-location EXPECTED NUMBER OR *, FOUND `value'.

Reason:

The AOM screening table compiler encountered a token that was neither a number, nor an asterisk. The syntax requires either a number or an asterisk at this point.

System Action:

The compile continues, for error checking purposes only.

User Action:

Use the error information in the message to find and correct the error.

N84C12

error-location EXPECTED VALID WORD FOR `keyword', FOUND `value'.

Reason:

The AOM screening table compiler encountered a token that was not a valid argument for the specified keyword, for example MPFSUPP(YES).

System Action:

The compile continues, for error checking purposes only.

User Action:

Use the error information in the message to find and correct the error.

N84C13

error-location EXPECTED VALID TIME HHMMSS, FOUND `value'.

Reason:

The AOM screening table compiler encountered a token that was not a valid time, either 2, 4, or 6 digits, in the range 000000 to 240000.

System Action:

The compile continues, for error checking purposes only.

User Action:

Use the error information in the message to find and correct the error.

N84C14

error-location EXPECTED VALID END TIME >= START, FOUND `value'.

Reason:

The AOM screening table compiler encountered a token that was not a valid end time in a time range. The value was not numeric, 2, 4, or 6 digits, range 000000:240000, or was less than the specified start time.

System Action:

The compile continues, for error checking purposes only.

User Action:

Use the error information in the message to find and correct the error.

N84C15

error-location EXPECTED END TIME, FOUND `value'.

Reason:

The AOM screening table compiler encountered a token that was not a valid end time.

System Action:

The compile continues, for error checking purposes only.

User Action:

Use the error information in the message to find and correct the error.

N84C16

error-location CONDITION - EXPECTED WORD LE 12 CHARS, FOUND `value'.

Reason:

The AOM screening table compiler encountered a token that was not a valid condition name, for example COND().

System Action:

The compile continues, for error checking purposes only.

User Action:

Use the error information in the message to find and correct the error.

N84C17

error-location CONDITION - `value' NOT FOUND.

Reason:

The AOM screening table compiler encountered a valid condition name, but this name has not been defined by a previous DEFCOND statement.

System Action:

The compile continues, for error checking purposes only.

User Action:

Use the error information in the message to find and correct the error.

N84C18

error-location STRING LENGTHS OR NUMBER OF LEAD/TRAIL *'S DIFFER.

Reason:

The AOM screening table compiler encountered two match strings of unequal length when processing a text range match. For example, TEXT(ABC:DEFG). Both match strings must have the same length for a text range match. This includes leading and/or trailing wildcard *'s.

System Action:

The compile continues, for error checking purposes only.

User Action:

Use the error information in the message to find and correct the error.

N84C19

error-location FIRST LITERAL IN RANGE HAS WILDCARDS - NOT ALLOWED.

Reason:

The AOM screening table compiler encountered a `from' match string with wildcard characters in it, when processing a text range match. Neither string may have wildcards in this case.

System Action:

The compile continues, for error checking purposes only.

User Action:

Use the error information in the message to find and correct the error.

N84C20

error-location SECOND LITERAL IN RANGE HAS WILDCARDS - NOT ALLOWED.

Reason:

The AOM screening table compiler encountered a `to' match string with wildcard characters in it, when processing a text range match. Neither string may have wildcards in this case.

System Action:

The compile continues, for error checking purposes only.

User Action:

Use the error information in the message to find and correct the error.

N84C21

error-location POSITION RANGE NOT ALLOWED WITH TEXT RANGE.

Reason:

The AOM screening table compiler encountered a match string range, that also had a position range, for example TEXT(ABC:DEF,1:10). This is not supported.

System Action:

The compile continues, for error checking purposes only.

User Action:

Use the error information in the message to find and correct the error.

N84C22

error-location STRING RANGE SECOND LITERAL NOT GT FIRST LITERAL.

Reason:

The AOM screening table compiler encountered a text string range, where the `to` string value was not greater than the `from` string value.

System Action:

The compile continues, for error checking purposes only.

User Action:

Use the error information in the message to find and correct the error.

N84C23

error-location (N) INDEX VALUE INVALID, MISSING, OR NOT IN RANGE.

Reason:

The AOM screening table compiler expected a valid subscript for a criteria, but no subscript was supplied, or had an invalid format.

System Action:

The compile continues, for error checking purposes only.

User Action:

Use the error information in the message to find and correct the error.

N84C24

error-location KEYWORD kwrd NOT VALID FOR criteria.

Reason:

The AOM screening table compiler encountered an unexpected keyword for a particular criteria. The value shown is not recognized.

System Action:

The compile continues, for error checking purposes only.

User Action:

Use the error information in the message to find and correct the error.

N84C25

error-location TOO MANY PARAMETERS FOR CRITERIA criteria.

Reason:

The supplied list of parameters has too many entries for the supplied criteria name.

System Action:

The compile continues, for error checking purposes only.

User Action:

Use the error information in the message to find and correct the error. Check the required syntax of the criteria.

N84C26

error-location EXPECTED `)', FOUND `token'.

Reason:

A right parenthesis was expected, but one was not encountered. The indicated token was found.

System Action:

The compile continues, for error checking purposes only.

User Action:

Use the error information in the message to find and correct the error.

N84C27

error-location INVALID SUBSTRING NOTATION.

Reason:

The AOM screening table compiler encountered an invalid substring notation for a field. The start or length parameters may be invalid, not numeric, or out of range. etc.

System Action:

The compile continues, for error checking purposes only.

User Action:

Use the error information in the message to find and correct the error.

N84C28

error-location FIELD: fieldname MAY NOT HAVE SUBSTRING NOTATION.

Reason:

The AOM screening table compiler encountered substring notation. The indicated field does not allow substring notation.

System Action:

The compile continues, for error checking purposes only.

User Action:

Use the error information in the message to find and correct the error.

N84C29

error-location fieldname DOES NOT SUPPORT EXACT EQ/NEQ.

Reason:

The AOM screening table compiler encountered the exact equal (==), or exact not equal operators. The specified criteria does not allow exact equal, etc.

System Action:

The compile continues, for error checking purposes only.

User Action:

Use the error information in the message to find and correct the error.

N84C30

error-location EXACT EQ/NEQ INVALID FOR WILDCARD, POS RANGE, OR BOTH.

Reason:

The AOM screening table compiler encountered the exact equal or not equal operators. These are permitted, but not if the match value(s) contain wildcards or position ranges. This is a warning only. The operator is treated as equal or not equal.

System Action:

The compile continues.

User Action:

Use the error information in the message to find and correct the error.

N84C50

error-location criteria NOT SUPPORTED UNDER opsys.

Reason:

The indicated criteria is not supported under the current operating environment.

System Action:

The compile continues, for error checking purposes only.

User Action:

Use the error information in the message to find and correct the error.

N84C51

error-location criteria NOT SUPPORTED IN section SECTION.

Reason:

The indicated criteria is not supported in the indicated screening table section. For example, MCSFLAG is not applicable to MVS commands.

System Action:

The compile continues, for error checking purposes only.

User Action:

Use the error information in the message to find and correct the error.

N84C52

error-location FUNCTION NOT LICENSED

Reason:

The Screening Table criteria statement contains an unlicensed criteria function call (COMPARE(...)) element. System must be licensed for AOM/Extension-2 to be allowed to use the COMPARE criteria function.

System Action:

The compilation continues, for error checking purposes only.

User Action:

Check with your product support representative.

N84D01

error-location INVALID VARIABLE FORMAT/UNKNOWN VARIABLE IN STRING.

Reason:

The indicated string contains an invalid AOM screening variable, or the variable is not correctly formatted, for example a bad substring specification.

System Action:

The compile continues, for error checking purposes only.

User Action:

Use the error information in the message to find and correct the error.

N84D02

error-location VARIABLE: variable ENCODING CAUSED STRING TO BECOME TOO L

Reason:

While processing a screening table variable, the encoding of it into internal form caused the string to exceed the limits imposed. These are 128 in MVS, and 240 in VM.

System Action:

The compile continues, for error checking purposes only.

User Action:

Use the error information in the message to find and simplify the string.

N84D50

error-location VARIABLE: variable NOT SUPPORTED UNDER opsys.

Reason:

The indicated variable is not supported in the current operating system environment. For example, JOBNAME is not valid in VM.

System Action:

The compile continues, for error checking purposes only.

User Action:

Use the error information in the message to find and correct the error.

N84D51

error-location VARIABLE: variable NOT SUPPORTED IN section SECTION.

Reason:

The indicated variable is not supported in the indicated screening table section. For example, JOBID is not applicable to MVS commands.

System Action:

The compile continues, for error checking purposes only.

User Action:

Use the error information in the message to find and correct the error.

N84D52

error-location VARIABLE: variable TYPE AND SUBSCRIPT PARAMETER(S) MUTUALLY EXCLUSIVE.

Reason:

The variable type of the indicated variable and one or more subscripting attributes are mutually exclusive. For example the following statement is invalid : SET LVAR(1) '&RETCODE(1,16,SLBLANK,UCASE)'

System Action:

The compile continues, for error checking purposes only.

User Action:

Use the error information in the message to find and correct the error.

N84E01

error-location name IS NOT A VALID LOOKUP SEARCH FIELD.

Reason:

The field name specified in the FIELD clause of the LOOKUP statement is not a valid field that may be used.

System Action:

The screening table compile will continue for syntax checking only. No table will be loaded.

User Action:

Use a valid field name.

N84E02

error-location DUPLICATED LOOKUP KEYWORD: keyword.

Reason:

The indicated LOOKUP statement keyword was found twice.

System Action:

The screening table compile will continue for syntax checking only. No table will be loaded.

User Action:

Remove the duplicate clause. Check that a comma separating 2 lookup requests was not accidentally omitted.

N84E03

error-location EXPECTED `)', FOUND value.

Reason:

The syntax of a LOOKUP clause expected a closing parenthesis. Instead, the indicated token was found.

System Action:

The screening table compile will continue for syntax checking only. No table will be loaded.

User Action:

Insert the missing parenthesis.

N84E04

error-location name IS NOT A VALID VARIABLE NAME.

Reason:

The table name specified in the LOOKUP statement TABLE clause did not meet the syntax rules of a VARTABLE name. It must be 1 to 12 characters with the first alpha or national, others alphanumeric or national.

System Action:

The screening table compile will continue for syntax checking only. No table will be loaded.

User Action:

Use a valid table name. The VARTABLE need not actually exist at compile time.

N84E05

error-location EXPECTED `EQUAL' OR `IGEN', found token

Reason:

The MATCH clause of the LOOKUP statement requires one of the keywords EQUAL or IGEN. Neither was found.

System Action:

The screening table compile will continue for syntax checking only. No table will be loaded.

User Action:

Correct the syntax to use EQUAL or IGEN.

N84E06

error-location EXPECTED NUMBER FROM 1 TO 8, FOUND: token

Reason:

The RESULT clause of the LOOKUP statement requires a number from 1 to 8.

System Action:

The screening table compile will continue for syntax checking only. No table will be loaded.

User Action:

Use a valid result number.

N84E07

error-location name IS NOT A VALID ADD DATA FIELD.

Reason:

The field name specified in the DATA clause of the LOOKUP statement is not a valid field that may be used.

System Action:

The screening table compile will continue for syntax checking only. No table will be loaded.

User Action:

Use a valid field name.

N84E08

error-location name IS NOT A VALID ASSIGN ATTRIBUTE FIELD.

Reason:

The indicated attribute name specified in the ASSIGN clause of the LOOKUP statement is not a valid attribute.

System Action:

The screening table compile will continue for syntax checking only. No table will be loaded.

User Action:

Use a valid attribute name.

N84E09

error-location DUPLICATE/MUTUALLY EXCLUSIVE ASSIGN KEYWORD: attribute.

Reason:

The indicated attribute name specified in the ASSIGN clause of the LOOKUP statement is duplicated or mutually exclusive with a previous attribute name.

System Action:

The screening table compile will continue for syntax checking only. No table will be loaded.

User Action:

Remove the attribute name that is in error.

N84E10

error-location INVALID UFLAG SUBSCRIPT SYNTAX/VALUE.

Reason:

The subscript for a UFLAG(n) assign attribute is invalid. It must be a number from 1 to 8, in parenthesis eg (5).

System Action:

The screening table compile will continue for syntax checking only. No table will be loaded.

User Action:

Correct the subscript.

N84E20

error-location NO FIELD OPERAND SPECIFIED IN THE LOOKUP CLAUSE.

Reason:

The FIELD clause is required for a LOOKUP statement. Check for a possible missing statement continuation.

System Action:

The screening table compile will continue for syntax checking only. No table will be loaded.

User Action:

Correct the syntax of the LOOKUP statement.

N84E21

error-location NO TABLE OPERAND SPECIFIED IN THE LOOKUP CLAUSE.

Reason:

The TABLE clause is required for a LOOKUP statement. Check for a possible missing statement continuation.

System Action:

The screening table compile will continue for syntax checking only. No table will be loaded.

User Action:

Use a valid field name.

N84E22

**error-location NO RESULT, COUNT, SAVE, ADD, ASSIGN, OR TOTAL
OPTIONS SPECIFIED IN THIS LOOKUP CLAUSE.**

Reason:

The LOOKUP statement had no action clauses. Thus, it would not do anything. Check that a statement continuation was not omitted.

System Action:

The screening table compile will continue for syntax checking only. No table will be loaded.

User Action:

Add the necessary action clauses to the LOOKUP statement.

N84E23

**error-location LOOKUP DATA OPERAND REQUIRES 'ADD' TO BE
SPECIFIED.**

Reason:

If the DATA clause of a LOOKUP statement is specified, the ADD clause is also required.

System Action:

The screening table compile will continue for syntax checking only. No table will be loaded.

User Action:

Add the ADD clause.

N84E24

error-location LOOKUP MATCH=IGEN AND ADD OPERANDS ARE MUTUALLY EXCLUSIVE

Reason:

The MATCH=IGEN and ADD operands of the LOOKUP statement may not both be specified.

System Action:

The screening table compile will continue for syntax checking only. No table will be loaded.

User Action:

Remove one of the mutually exclusive clauses. Entries may only be dynamically added with MATCH=EQUAL.

N84E30

error-location EXPECTED A VALID FIELD NAME, FOUND: name

Reason:

The FIELD or DATA clauses of the LOOKUP statement require a valid field name. The indicated value is not a valid field name.

System Action:

The screening table compile will continue for syntax checking only. No table will be loaded.

User Action:

Use a valid field name.

N84E31

error-location FIELD fieldname REQUIRES A SUBSCRIPT, EXPECTED `(', FOUND token.

Reason:

The field name specified in the FIELD clause of the LOOKUP statement is one that requires a subscript. No opening parenthesis for the subscript was found.

System Action:

The screening table compile will continue for syntax checking only. No table will be loaded.

User Action:

Add the required subscript to the field.

N84E32

error-location SUBSCRIPT value IS NOT NUMERIC OR NOT IN VALID RANGE FOR FIELD: field.

Reason:

The subscript value specified is not valid for the indicated field. It must be numeric, from 1 to the number allowed by the specified field.

System Action:

The screening table compile will continue for syntax checking only. No table will be loaded.

User Action:

Correct the subscript value.

N84E33

error-location EXPECTED CLOSING `)' FOR SUBSCRIPT.

Reason:

There was no closing parenthesis after the subscript value for a field.

System Action:

The screening table compile will continue for syntax checking only. No table will be loaded.

User Action:

Correct the subscript syntax.

N84E34

error-location INVALID OR OUT OF RANGE SUBSTRING START POSITION: value

Reason:

The substring start position for the field was beyond the field length.

System Action:

The screening table compile will continue for syntax checking only. No table will be loaded.

User Action:

Correct the substring syntax.

N84E35

error-location INVALID OR OUT OF RANGE SUBSTRING END POSITION: value

Reason:

The substring end position for this field is not valid.

System Action:

The screening table compile will continue for syntax checking only. No table will be loaded.

User Action:

Correct the substring syntax.

N84E36

error-location EXPECTED `)' FOR FIELD EXPRESSION.

Reason:

A field expression that started with an opening parenthesis did not have a closing parenthesis when expected.

System Action:

The screening table compile will continue for syntax checking only. No table will be loaded.

User Action:

Correct the syntax of the field expression.

N84E37

error-location SUBSTRINGING NOT PERMITTED FOR FIELD: fieldname.

Reason:

Substring notation is not permitted for the indicated field.

System Action:

The screening table compile will continue for syntax checking only. No table will be loaded.

User Action:

Remove the substring notation.

N84E40

error-location LOOKUP FIELD: field is invalid for opsys

Reason:

The field named is not supported in the indicated operating system environment.

System Action:

The screening table compile will continue for syntax checking only. No table will be loaded.

User Action:

Use a valid, supported field name.

N84E41

error-location DATA FIELD: field INVALID FOR opsys

Reason:

The data field named is not supported in the indicated operating environment.

System Action:

The screening table compile will continue for syntax checking only. No table will be loaded.

User Action:

Use a valid, supported data field name.

N84E42

error-location ASSIGN ATTRIBUTE: attr INVALID FOR opsys.

Reason:

The indicated ASSIGN attribute is invalid in this operating environment.

System Action:

The screening table compile will continue for syntax checking only. No table will be loaded.

User Action:

Use a valid supported attribute name.

N84E43

error-location LOOKUP KEYWORD: kwd IS INVALID FOR opsys.

Reason:

The LOOKUP statement keyword indicated is invalid in this operating environment.

System Action:

The screening table compile will continue for syntax checking only. No table will be loaded.

User Action:

Remove the offending clause.

N84E44

error-location LOOKUP FIELD: field IS INVALID FOR section.

Reason:

The field name specified in the FIELD clause of the LOOKUP statement is not a valid field for the current screening table section (MESSAGE or COMMAND).

System Action:

The screening table compile will continue for syntax checking only. No table will be loaded.

User Action:

Use a valid, supported field name.

N84E45**error-location DATA FIELD: field INVALID FOR section****Reason:**

The DATA field name specified is not supported in the current screening tables section (MESSAGES or COMMANDS).

System Action:

The screening table compile will continue for syntax checking only. No table will be loaded.

User Action:

Use a valid, supported DATA field name.

N84E46**error-location ASSIGN ATTRIBUTE: attr INVALID FOR section.****Reason:**

The attribute listed cannot be assigned in this screening table section.

System Action:

The screening table compile will continue for syntax checking only. No table will be loaded.

User Action:

Use a valid, supported attribute name only.

N84E47**error-location LOOKUP KEYWORD: kwd INVALID FOR section.****Reason:**

The indicated LOOKUP statement keyword cannot be used in the current screening table section.

System Action:

The screening table compile will continue for syntax checking only. No table will be loaded.

User Action:

Remove the clause in error.

N84F01

error-location UNEXPECTED END-STMT/END-FILE.

Reason:

The AOM screening table compiler encountered an unexpected end-of-statement or end- of-file while processing a selection criteria.

System Action:

The compile continues, for error checking purposes only.

User Action:

Use the error information in the message to find and correct the error.

N84F02

error-location EXPECTED '(', FOUND: 'token'.

Reason:

A left parenthesis was expected, but one was not encountered. The indicated token was found.

System Action:

The compile continues, for error checking purposes only.

User Action:

Use the error information in the message to find and correct the error.

N84F03

error-location EXPECTED A COMPARE OPERATOR, FOUND: 'token'.

Reason:

A valid COMPARE operator was expected, but was not encountered. The indicated token was found.

System Action:

The compile continues, for error checking purposes only.

User Action:

Use the error information in the message to find and correct the error.

N84F04**error-location INVALID OPERANDS SEPARATION.****Reason:**

The operands separation at the COMPARE criteria function call is incorrect. Valid separation character can be either blank or comma.

System Action:

The compile continues, for error checking purposes only.

User Action:

Use the error information in the message to find and correct the error.

N84F05**error-location EXPECTED ')', FOUND: 'token'.****Reason:**

A right parenthesis was expected, but one was not encountered. The indicated token was found.

System Action:

The compile continues, for error checking purposes only.

User Action:

Use the error information in the message to find and correct the error.

N84F06**error-location MUTUALLY EXCLUSIVE OPERAND TYPES.****Reason:**

Mutually Exclusive operand types were specified on the COMPARE criteria. Comparison is only allowed between same type of operands, eg.: numeric and string type comparison is invalid.

System Action:

The compile continues, for error checking purposes only.

User Action:

Use the error information in the message to find and correct the error.

N84F07

error-location 'value' IS NOT A KEYWORD OR STRING.

Reason:

The AOM screening table compiler expected a valid keyword or string specification but found *value* .

System Action:

The compile continues, for error checking purposes only.

User Action:

Use the error information in the message to find and correct the error.

N84F08

error-location kwrđ KEYWORD NOT SUPPORTED UNDER opsys.

Reason:

The AOM screening table compiler encountered a keyword *kwrđ* that, while valid for the current statement, is not supported in this environment.

System Action:

The compile continues, for error checking purposes only.

User Action:

Use the error information in the message to find and correct the error.

N84F09

error-location kwrđ KEYWORD NOT SUPPORTED IN secname SECTION.

Reason:

The AOM screening table compiler encountered a *kwrđ* keyword that, while supported by the current statement, is not supported in the *current* screening table section.

System Action:

The compile continues, for error checking purposes only.

User Action:

Use the error information in the message to find and correct the error.

N84F10

error-location INDEX VALUE INVALID, MISSING, OR NOT IN RANGE.

Reason:

The AOM screening table compiler expected a valid subscript in the COMPARE criteria function call, but no subscript was supplied, or had an invalid format.

System Action:

The compile continues, for error checking purposes only.

User Action:

Use the error information in the message to find and correct the error.

N84F11

error-location EXPECTED ',', FOUND: 'token'.

Reason:

A comma separation character was expected, but was not encountered. The indicated token was found.

System Action:

The compile continues, for error checking purposes only.

User Action:

Use the error information in the message to find and correct the error.

N84F12

error-location SUBSTR START/LENGTH PARAMETER IS INVALID OR MISSING.

Reason:

One of the SUBSTR parameters (start or length) used in the COMPARE criteria is either invalid or not specified.

System Action:

The compile continues, for error checking purposes only.

User Action:

Use the error information in the message to find and correct the error.

N84F13

error-location SUBSTR START POSITION + LENGTH IS OUTSIDE THE RANGE.

Reason:

The START or LENGTH value of the SUBSTR specification used in the COMPARE criteria function call statement is greater than the length of the SUBSTR keyword value. The start/length specification is limited to the maximum length of the SUBSTR keyword value.

System Action:

The compile continues, for error checking purposes only.

User Action:

Use the error information in the message to find and correct the error.

N84F14

error-location xxxxxxxx OPERAND CANNOT BE USED WITHIN SUBSTR.

Reason:

SUBSTR specification is not allowed for the xxxxxxxx parameter. For example if SUBSTR is requested for a single literal.

System Action:

The compile continues, for error checking purposes only.

User Action:

Use the error information in the message to find and correct the error.

N84F15

error-location STRING STARTING WITH xxxxxxxx IS INVALID.

Reason:

String starting with xxxxxxxx in the COMPARE criteria is invalid, ie.: not a valid keyword or literal specification.

System Action:

The compile continues, for error checking purposes only.

User Action:

Use the error information in the message to find and correct the error.

N84F16

error-location THE FIELD LENGTH OF OPERAND xxxxxxxx IS NULL.

Reason:

The value length of the operand xxxxxxxx in the COMPARE criteria function call statement is zero. For example null string *cannot* be used for comparison.

System Action:

The compile continues, for error checking purposes only.

User Action:

Use the error information in the message to find and correct the error.

N84F17

error-location EXPECTED A VALID WILDCARD DEFINITION, FOUND: 'token'.

Reason:

A valid wildcard definition was expected, but one was not encountered. The indicated token was found.

System Action:

The compile continues, for error checking purposes only.

User Action:

Use the error information in the message to find and correct the error.

N85001

BASE VERSION IS INCOMPATIBLE WITH THIS AOM VERSION - AOM NOT AVAILABLE.

Reason:

During initialization, the AOM initialization code determined that the base system is back-level; therefore, this version of AOM will not run.

System Action:

AOM is not available. System initialization continues.

User Action:

Check with Technical Support.

N85002

OPERATING SYSTEM INCOMPATIBLE WITH THIS AOM VERSION - AOM NOT AVAILABLE

Reason:

During initialization, the AOM initialization code determined that the operating system cannot support AOM; therefore, this version of AOM will not run.

System Action:

AOM is not available. System initialization continues.

User Action:

Check with Technical Support.

N85003

OPERATING SYSTEM SUPPORTS SUBSET AOM FACILITIES ONLY.

Reason:

During initialization, the AOM initialization code determined that the operating system only supports a subset of AOM facilities; therefore, only part of the AOM facility is available.

System Action:

Part of AOM is available. System initialization continues.

User Action:

Check that this is the expected result.

N85401

OPERAND keyword reason.

Reason:

An AOM SYSPARM command was entered but was not processed for the reason given.

System Action:

The command is not processed.

User Action:

Use the explanation to correct the SYSPARM operand in error.

N85402**AOMPROC CANNOT BE FLUSHED - NOT ACTIVE.****Reason:**

A SYSPARMS AOMPROC=FLUSH command was entered, but there was no current AOMPROC. The command is ignored.

System Action:

None. The command is ignored.

User Action:

None.

N85403**AOMPROC CANNOT BE STARTED, CURRENTLY ACTIVE.****Reason:**

A SYSPARMS AOMPROC=procname command was entered, but an AOMPROC was already executing. The command is ignored.

System Action:

None. The command is ignored.

User Action:

Use the SYSPARMS AOMPROC=FLUSH command to terminate the currently executing AOMPROC, if required.

N85404**AOMSSID CANNOT BE CHANGED, SSID ALREADY ACTIVATED.****Reason:**

The AOMSSID parameter cannot be altered, as it has already been activated. AOM stores MVS cross memory information in control blocks associated with the SSID, and thus the SSID must stay associated with the particular product region.

System Action:

None. The command is ignored.

User Action:

Do not attempt to alter AOMSSID until the product region is restarted.

N85410

NO CONSOLES ACQUIRED, CANNOT FREE.

Reason:

A SYSPARMS CONSOLES=FREE or CONSOLES=0 command was entered, but there were no consoles acquired.

System Action:

None. The command is ignored.

User Action:

None.

N85411

ERRORS RELEASING, NOT ALL CONSOLES RELEASED.

Reason:

A SYSPARMS CONSOLES=FREE command was entered, but errors occurred whilst freeing the consoles. Consult the log for more information about the error(s).

System Action:

The AOM console table is marked as unusable.

User Action:

Retry the command. If errors persist, contact your product support representative.

N85412

CANNOT FREE CONSOLES, AOM IS UP.

Reason:

A SYSPARMS CONSOLES=FREE command was entered, but AOM is started. Consoles cannot be freed whilst AOM is active.

System Action:

None. The command is ignored.

User Action:

Determine whether consoles are to be freed, and, if so, issue the AOM STOP command before re-entering this command.

N85413**COULD NOT ACQUIRE ALL, ONLY GOT nnnnn.****Reason:**

A SYSPARMS CONSOLES=n command was entered, but AOM was only able to acquire the shown number of JES consoles from MVS.

System Action:

None. The console table will only contain the shown number of consoles.

User Action:

Check to see if another SOLVE has acquired too many consoles. The MVS command, 'D C,L' may be of assistance.

N85414**COULD NOT ACQUIRE type ANY CONSOLES FROM opsys.****Reason:**

A SYSPARMS CONSOLES=n command was entered, but no consoles could be acquired. The type of consoles requested (as per the SYSPARMS AOMCTYPE setting) and operating system is displayed.

System Action:

AOM will not start until a SYSPARMS CONSOLES=FREE command is entered, or a successful SYSPARMS CONSOLES=n command is processed.

User Action:

Check whether there should be any free consoles of the type requested. If none are available, you may need to alter parameters in SYS1.PARMLIB to make more consoles available.

N85415

CONSOLES ALREADY ACQUIRED.

Reason:

A SYSPARMS CONSOLES=n command was entered, but consoles had already been acquired.

System Action:

None. The command is ignored.

User Action:

None.

N85416

REQUESTED NUMBER OF CONSOLES LT 1 OR GT MAX ALLOWED.

Reason:

A SYSPARMS CONSOLES=n command was entered, and n was less than 1 or greater than 99.

System Action:

None. The command is ignored.

User Action:

Correct and re-enter the command.

N85417

CANNOT ACQUIRE CONSOLES, SOLVE NOT AUTH OR SYSTEM DOES NOT HAVE SCS.

Reason:

A SYSPARMS CONSOLES=n command was entered. Either the SOLVE region is not APF authorized or the SCS module (IEAVG700) Is not available (MVS only).

System Action:

None. The command is ignored.

User Action:

Ensure that the SOLVE load library is APF authorized.
For MVS (XA, ESA), investigate whether module IEAVG700 is in the system libraries.

N85418**CANNOT ACQUIRE CONSOLES, AOM IS UP.****Reason:**

A SYSPARMS CONSOLES=n command was entered, but AOM is currently active. Consoles must be acquired when AOM is stopped.

System Action:

None. The command is ignored.

User Action:

Probably none. If consoles are needed, stop AOM, re-issue the command, and then restart AOM.

N85419**REQUESTED NUMBER OF CONSOLES ACQUIRED.****Reason:**

This message acknowledges the successful processing of a SYSPARMS CONSOLES=n command.

System Action:

None.

User Action:

None.

N85420**ALL ACQUIRED CONSOLES RELEASED.****Reason:**

This message acknowledges the successful processing of a SYSPARMS CONSOLES=FREE command.

System Action:

None.

User Action:

None.

N85422

CANNOT ACQUIRE CONSOLES, GETMAIN FAILURE.

Reason:

This message is produced if processing of a SYSPARMS CONSOLES command is terminated due to a storage shortage.

System Action:

SYSPARMS CONSOLES processing is terminated.

User Action:

Investigate the reason for the storage shortage and correct it.

N85423

UNABLE TO LOAD MODULE

Reason:

The SYSPARMS processor was unable to load a module.

System Action:

Processing of the SYSPARMS command is terminated.

User Action:

Dependent on the SYSPARMS command being issued.

N85426**COMMAND PREFIX *P1* *P2*****Reason:**

The CPF (command prefix facility) DEFINE request for prefix *P1* failed; the reason is *P2* and is one of the following errors:

ALREADY DEFINED

IS A SUBSET OF EXISTING PREFIX

IS A SUPERSET OF EXISTING PREFIX

COULD NOT BE DEFINED (RC=xx, REASON=xx)

The RC/REASON values are documented in the IBM manual, MVS Programming: Authorized Assembler Services Reference.

System Action:

Processing of the SYSPARMS command terminates. The parameter group \$RM OPSYSIDS action also terminates.

User Action:

Check the AOM SSI Command String Prefix specification. Issue an MVS D OPDATA command to display the command prefixes currently defined.

N85450**CONSOLE RELEASE REQUEST ACCEPTED, PROCESSING COMMENCED.****Reason:**

A SYSPARMS CONSOLES=FREE command was entered. Processing has commenced.

System Action:

Console release processing continues asynchronously.

User Action:

Wait for the processing to complete and check the results.

N85451

CONSOLE ACQUIRE REQUEST ACCEPTED, PROCESSING COMMENCED.

Reason:

A SYSPARMS CONSOLES=n command was entered. Processing has commenced.

System Action:

Console acquisition processing continues asynchronously.

User Action:

Wait for the processing to complete and then check the results.

N85501

OPERAND keyword description.

Reason:

A SHOW AOMxxx command was entered, but an error has occurred. The description describes the error.

System Action:

None. The command is ignored.

User Action:

Correct the error.

N85502

AOMSTAT=ALL ONLY VALID IF SYSPARM AOMALLST=YES.

Reason:

The SHOW AOMSTAT=ALL command is only accepted if the AOM SYSPARM AOMALLST, was set to YES before AOM was started. If it is not, AOM does not collect the statistics necessary for this display.

System Action:

None. The command is ignored.

User Action:

Use SH AOMSTAT, or stop AOM, alter AOMALLST to YES, and re-start AOM.

N85503**NO AOM ABENDS TO DISPLAY.****Reason:**

This message is displayed if a SHOW AOMABEND command is entered, but AOM has not ABENDED in the SSI or SRB code. Thus there is no ABEND information to display.

System Action:

None. The command is ignored.

User Action:

None.

N85510**n ENTRIES ON AOM DOM CORRELATION QUEUE.****Reason:**

This message is the first message displayed in response to a SHOW AOMDOMQ command. It shows the number of entries on the AOM DOM correlation queue.

System Action:

None.

User Action:

None.

N85511

DMN SYSDOMID ASID JSTCB SOLVE-DOMID FL TIME-ADD MSGID

Reason:

This message is a header message for the list of entries on the AOM DOM correlation queue. It gives the column headings for the N85513 messages that follow. The headings are:

DMN - The SOLVE domain that originated the message.

SYSDOMID - The system- assigned DOMID.

ASID - The MVS ASID that originated the message.

JSTCB - The MVS JSTCB that originated the message.

SOLVDOMID - The SOLVE assigned DOMID in this system.

TIME-ADD - The time the entry was added to the queue.

MSGID - The message id of the message.

System Action:

None.

User Action:

None.

N85512

X-REASON NCLID/LINK

Reason:

This message is a header message for the list of entries on the AOM DOM correlation queue. It gives the column headings for the N85514 messages that follow. The headings are:

X-REASON - extended reasons that this entry exists:

TO-LINK - msg is being tracked across an ISR link

NOTIFY - msg is being DOM-NOTIFY'd

SUB-AOMP - msg is being tracked for a secondary AOMPROC.

NCLID/LINK - The target NCLID or ISR link.

System Action:

None.

User Action:

None.

N85513**data****Reason:**

This message is a data line for the SHOW AOMDOMQ command. Refer to message N85511 for the meanings of the columns.

System Action:

None.

User Action:

None.

N85514**data****Reason:**

This message is an optional additional data message for the SHOW AOMDOMQ command. Refer to message N85512 for the column meanings.

System Action:

None.

User Action:

None.

N85602

AOM IS status.

Reason:

This message is displayed by the STATUS command to indicate the status of AOM. status can be:

ACTIVE (RUNNING) - AOM is active and running.

ACTIVE (PAUSED) - AOM is active, but in pause status.

INACTIVE - AOM has not been started.

If active or paused, the date and time that AOM was last started is also shown.

The message will say AOM HAS ABENDED if the AOM SSI code or SRB code has had an ABEND detected. The SHOW AOMABEND command will provide more information.

System Action:

None.

User Action:

None.

N85603

AOMPROC=name1 CMDPROC=name2 TABLE=name3(library)

Reason:

This message is displayed by the STATUS command to indicate the names of AOMPROC, CMDPROC, and the screening table. IN AOM/VM, no CMDPROC is present, and the TABLE is shown as: filename filetype filemode.

System Action:

None.

User Action:

None.

N85604**AOM GDB HAS 'nnnnnnnnnn' ENTRIES ' size'K 'typ' STORAGE****Reason:**

This message is displayed by the STATUS command. It gives information about the AOMGDB (AOM Global Data Base) usage:

nnnnnnnnnn The number of entries (records) in the AOM Global Data Base.

size The storage usage in Kbytes of the AOM Global Data Base.

typ The storage type allocated to PVT (private) or CSA area.

System Action:

None.

User Action:

None.

N85606**USERID NOT AUTHORISED FOR AOM MESSAGES.****Reason:**

This message is displayed by the PROFILE command if an attempt to alter AOM profile attributes is made, and the user is not authorized for AOM message receipt.

System Action:

None. The option is ignored.

User Action:

Contact your system administrator.

N85607

USERID NOT AUTHORISED FOR ALL REQUESTED ROUTING CODES.

Reason:

This message is displayed by the PROFILE command if an attempt to alter AOM message routing codes is made, and the supplied routing codes include ones that the user is not authorized for.

System Action:

None. The option is ignored.

User Action:

Contact your system administrator to check if you should have authority for the required routing codes.

N85608

USERID NOT AUTHORISED FOR ALL REQUESTED MESSAGE LEVELS.

Reason:

This message is displayed by the PROFILE command if an attempt to alter AOM message levels is made, and the supplied message levels include ones that the user is not authorized for.

System Action:

None. The option is ignored.

User Action:

Contact your system administrator to see if you should have authority for the required message levels.

N85609

AOM OPERATING AS SYSCMD-ONLY SYSTEM

Reason:

The AOM feature has been initialized to enable the use of the SYSCMD facility.

System Action:

None.

User Action:

None.

N85610**AOM opsys CONSOLE AUTH=auth.****Reason:**

This message is displayed by the PROFILE command as part of a user profile display, if the user has SYSCMD authority. The operating system and command authority levels are shown.

System Action:

None.

User Action:

None.

N85611**(AOMMSG=y/n..) AOM MESSAGES option.****Reason:**

This message is displayed by the PROFILE command as part of a user profile display. It indicates whether AOM messages may be delivered to this user. The current setting of PROFILE AOMMSG= is reflected.

System Action:

None.

User Action:

None.

N85612**(ROUTCDE=list) AOM MESSAGE ROUTING CODES.****Reason:**

This message is displayed by the PROFILE command as part of a user profile display. It indicates the current message routing codes that will be displayed. The current setting of PROFILE ROUTCDE= is reflected. Note that, if NONE is displayed, no AOM messages will be displayed.

System Action:

None.

User Action:

None.

N85613

(AOMMSGVL=list) AOM MESSAGE LEVEL CODES.

Reason:

This message is displayed by the PROFILE command as part of a user profile display. It indicates the current message level codes that will be displayed.

The current setting of PROFILE AOMMSGVL= is reflected. Values are:

ALL All the following message levels.

WTOR WTOR messages.

I Immediate action messages.

CE Critical eventual action messages.

E Eventual action messages.

IN Informational messages.

BC Broadcast messages.

NONE No messages. Note that if NONE is displayed, no AOM messages can be received.

System Action:

None.

User Action:

None.

N85614

(AOMPRFTM=y/n) AOM MESSAGES will/will not HAVE TIME PREFIX.

Reason:

This message is displayed by the PROFILE command as part of a user profile display. It indicates the current setting of the PROFILE AOMPRFTM= option, which governs the optional display of the message time for AOM messages.

System Action:

None.

User Action:

None.

N85615**(AOMPRFJN=y/n) OS-SOURCED AOM MESSAGES will/will not HAVE JOBNAME PREFIX****Reason:**

This message is displayed by the PROFILE command as part of a user profile display. It indicates the current setting of the PROFILE AOMPRFJN= option, which governs the optional display of the originating JOBNAME for AOM messages.

System Action:

None.

User Action:

None.

N85616**(AOMPRFJI=y/n) OS-SOURCED AOM MESSAGES will/will not HAVE JOBID PREFIX.****Reason:**

This message is displayed by the PROFILE command as part of a user profile display. It indicates the current setting of the PROFILE AOMPRFJI= option, which governs the optional display of the originating or relevant JES JOBID for AOM messages.

System Action:

None.

User Action:

None.

N85617

(AOMFMTRC=y/n) AOM ROUTING CODES will/will not BE DISPLAYED.

Reason:

This message is displayed by the PROFILE command as part of a user profile display. It indicates the current setting of the PROFILE AOMFMTRC= option, which governs the optional display of the message routing codes for AOM messages.

System Action:

None.

User Action:

None.

N85618

(AOMPRFUI=y/n) VM-SOURCED AOM MESSAGES will/will not HAVE USERID PREFIX.

Reason:

This message is displayed by the PROFILE command as part of a user profile display. It indicates the current setting of the PROFILE AOMPRFUI= option, which governs the optional display of the originating VM USERID for AOM messages.

System Action:

None.

User Action:

None.

N85619**(AOMPRFUN=y/n) VM-SOURCED AOM MESSAGES will/will not HAVE USER NODE PREF****Reason:**

This message is displayed by the PROFILE command as part of a user profile display. It indicates the current setting of the PROFILE AOMPRFUN= option, which governs the optional display of the originating or relevant VM node for AOM messages.

System Action:

None.

User Action:

None.

N85621**(AOMPRFMN=y/n) AOM MINOR LINE MESSAGES will/will not HAVE PREFIXES****Reason:**

This message is displayed by the PROFILE command as part of a user profile display. It indicates the current setting of the PROFILE AOMPRFMN= option, which governs the optional prefixing of multi-line WTO minor lines.

System Action:

None.

User Action:

None.

N85622

(AOMPRFSN=y/n) AOM messages will/will not have system name prefix

Reason:

This message is displayed by the PROFILE command as part of a user profile display. It indicates the current setting of the PROFILE AOMPRFSN= option, which governs the optional display of the sourcing system name for AOM messages.

System Action:

None

User Action:

None

N85701

AOM COMMAND REJECTED - AOM IS BUSY.

Reason:

This message indicates that the entered AOM command could not be processed, as a previous AOM command is still being processed. For example, entering a second AOM START when processing of another command is still in progress.

System Action:

None. The command is ignored.

User Action:

None.

N85702**AOM option COMMAND REJECTED - AOM MUST BE status.****Reason:**

This message indicates that the entered AOM command could not be processed, as AOM was not in the status indicated in the message. For example, AOM PAUSE requires AOM to be ACTIVE.

System Action:

None. The command is ignored.

User Action:

Verify AOM status and use other AOM commands if necessary.

N85703**AOM option COMMAND REJECTED - INSUFFICIENT AUTHORITY.****Reason:**

This message indicates that the entered AOM command could not be processed, as you do not have sufficient authority for the entered options.

System Action:

None. The command is ignored.

User Action:

Contact your system administrator.

N85704**AOM option COMMAND ACCEPTED.****Reason:**

This message indicates that the entered AOM command has been accepted, and processing has begun.

System Action:

The command is being processed.

User Action:

Await the outcome of command processing.

N85705

AOM *option* COMMAND REJECTED - SYSTEM SHUTTING DOWN.

Reason:

The entered AOM command has been rejected because the region is in final shutdown processing.

System Action:

The command is ignored.

User Action:

None.

N85722

AOM STARTED (PAUSED).

Reason:

This message indicates that AOM has successfully started, following entry of an AOM START command. If PAUSE was specified on the command, the literal (PAUSED) will indicate this.

System Action:

None.

User Action:

None.

N85723

AOM START FAILED, REASON, SUBREASON rrr-sss.

Reason:

This message indicates that AOM could not be started. The reason and subreason codes indicate the problem. Message N85724 will follow, providing an explanation of the reason. Refer to that message for the explanations.

System Action:

None. AOM has not started.

User Action:

Correct the error, after referring the message N85724.

N85724**DESC: reason-description optional-subreason-description.****Reason:**

This message follows message N85723, and provides an explanation of the reason and subreason why AOM cannot start.

The descriptions are as follows (note that some descriptions refer to a return code (RC); this return code is generally the subreason from the N85723 message):

001 REGION NOT RUNNING AUTHORIZED This region is not running from an authorized library, or is not link-edited as authorized.

003 SSI (SSAB) SETUP FAILED. RC: reason SSAB is the NetMaster SubSystem Anchor Block. There is one SSAB for each SSI acquired by NetMaster, pointed to by the operating system SSCT (SubSystem Communications vector Table) for the SSI. When AOM attempted to perform SSI setup, an error occurred. The following errors are possible:

NOT RUNNING AUTHORIZED. The product is not running authorized. (See reason 001 above).

ENQ ON AOMSSID FAILED. AOM is unable to use the SSID because an ENQ failed. It may be in use by another AOM.

NO SSCT FOUND (SSID BAD). The supplied AOMSSID cannot be found. Possibly, it is misspelt, or not in the subsystem definition member (for example, IEFSSNnn on MVS systems).

OTHER USER OF SSID. The SSID verification process determined that another user (not AOM) was using this SSID. Thus, it cannot be used.

SSAB LEVEL MISMATCH. An earlier level of AOM last used this SSID and it cannot be used.

SSVT EYECATCHER MISMATCH. Verification of the SSVT failed. There may be another user of the SSID.

SQA GETMAIN FAILURE. AOM is unable to obtain required SQA storage for control blocks.

CS OF SSAB PTR FAILED. AOM is unable to obtain use of a valid SSID. Another program obtained it in the meantime. (CS refers to the non-interruptible Compare and Swap instruction).

004 XMS REQUESTED BUT NO XMS SUPPORT. SYSPARMS AOMXMS=YES was specified, but AOM cannot use cross- memory services. Possibly, this operating system does not support

005 GETMAIN FOR AOM/VM CTL BLKS FAILED, RC: rc. A GETMAIN for AOM/VM control blocks failed with the indicated return code.

006 IUCVINI FOR PROP PATH FAILED, RC: rc. The IUCVINI macro instruction failed with the indicated return code.

*007 IUCVINI FOR *MSG PATH FAILED, RC: rc.* The IUCVINI macro instruction failed with the indicated return code.

010 CROSS-MEMORY SETUP FAILED: reason. SYSPARMS AOMXMS=YES was specified, but AOM was unable to establish the cross-memory environment. The following reasons are possible:

REGION RUNNING SWAPPABLE. SYSPARMS NONSWAP=NO was entered. Because MVS requires that cross-memory users are nonswappable, the XMS environment cannot be built.

NO XMS SUPPORT. This operating system does not support cross- memory services.

STORAGE SHORT (IHAETD). AOM cannot obtain storage to build control blocks.

XMS MODULE LOAD FAILED. AOM is unable to load cross-memory code.

SYSTEM LXRES FAILURE. AOM has a non-zero return code from an LXRES macro instruction. This includes the case where an 053- 111/112 abend occurs, which indicates that no system LXs are available.

SQA GETMAIN FAILED. AOM is unable to obtain storage for cross-memory control blocks.

011 GETMAIN FOR PVT Q FAILED, RC: rrr. AOM is unable to obtain storage for the private queue. The specified size (AOMPQSZ) may be too large or the region is too small.

012 GETMAIN FOR GLOB FIXED STG FAILED, RC: rrr. AOM is unable to obtain pagefixed storage in the CSA. This may be due to a small CSA allocation. An IPL may be required. In MVS/XA, this storage is below the line.

013 GETMAIN FOR GLOB PGBLE STG FAILED, RC: rrr. AOM is unable to obtain pageable CSA storage for the global be required. In MVS/XA, this storage is above the line.

014 GETMAIN FOR GLOB ST STG FAILED, RC: rrr. AOM is unable to obtain pageable CSA storage for the screening tables. This may be due to a small CSA allocation. An IPL may be required. In MVS/XA, this storage is above the line.

015 GETMAIN FOR GLOB WORK AREA FAILED, RC: rrr. AOM is unable to obtain pageable CSA storage for the subsystem code work areas. This may be due to a small CSA allocation. An IPL may be required. In MVS/XA, this

storage is below the line.

016 SWAP IN OF SSVT FAILED. When AOM attempted to activate the subsystem interface, the SSCVT had been changed. Another product is using this SSID.

017 FRONT-ENDING OF JES FAILED. When AOM attempted to alter the JES SSVT to allow front-ending of JES SSI code, SSI serialization failed. This should not occur on MVS/SP or MVS/XA.

018 NZ RC FROM IEAVG700 BROADCAST FUNC: rrr When AOM linked to IEAVG700 to enable WTO broadcast, a non-zero return code was set. Contact your product support representative.

019 SCREENING TABLE COMPILE FAILED. AOM was started with a screening table requested. The compilation failed. Other messages will describe the error. Correct the table and retry.

020 AOM SYSPARM IN ERROR: name. The previously entered value for the named AOM SYSPARM is invalid. The relevant SYSPARM must be reset to a valid value.

Note: A display of the SYSPARM value shows the last good value, not the in-error value. See the activity log for any error information.

021 UNABLE TO MIRROR SCOPE=AOM VARTABLES. AOM cannot successfully obtain storage to mirror all the active SCOPE=AOM VARTABLES.

030 CONS ALLOC FOR SCREENING TABLE FAILED. AOM cannot allocate a console to use for the screening table. Use the SHOW CONSOLES command to determine the current state of consoles allocated to AOM. There may be no consoles available.

031 IUCVINI FOR VMOPERATOR PATH FAILED, RC: rc The IUCVINI macro instruction that sets up the AOM/VM to VMOPERATOR VM system's GCS Macro Reference for a description of the return code.

032 IUCVINI FOR VMOPERATOR PATH FAILED, RC: rc The IUCVINI macro instruction that sets up the AOM/VM to VMOPERATOR communications to handle SYSCMD functions failed. See your VM system's GCS Macro Reference for a description of the return code.

033 IUCVINI FOR VMOPERATOR PATH FAILED, RC: rc The IUCVINI macro instruction that sets up the AOM/VM to VMOPERATOR communications to handle SECUSER functions failed. See your VM system's GCS Macro Reference for a description of the return code.

034 IUCVINI FOR VMOPERATOR PATH FAILED, RC: rc The IUCVINI macro instruction that sets up the AOM/VM to VMOPERATOR communications to handle SYSLOG functions failed. See your VM system's GCS Macro Reference

for a description of the return code.

035 IUCVINI FOR VMOPERATOR PATH FAILED, RC: rc The IUCVINI macro instruction that sets up the AOM/VM to VMOPERATOR communications to handle USERID functions failed. See your VM

N85746

AOM PAUSE - AOM IS ALREADY PAUSED.

Reason:

An AOM PAUSE command has been entered, but AOM was already in PAUSE status.

System Action:

None. The command is ignored.

User Action:

None.

N85747

AOM NOW PAUSED.

Reason:

An AOM PAUSE command was entered and processed successfully.

System Action:

None.

User Action:

None.

N85748**AOM GO - AOM IS ALREADY RUNNING.****Reason:**

An AOM GO command has been entered, but AOM was not PAUSED.

System Action:

None. The command is ignored.

User Action:

None.

N85749**AOM NOW RUNNING.****Reason:**

An AOM GO command was entered and processed successfully.

System Action:

None.

User Action:

None.

N85750**AOM COMMAND REJECTED - NOT SUPPORTED BY SUBSET AOM.****Reason:**

This message indicates that the AOM command was not accepted as subset AOM does not support it.

System Action:

The command is ignored.

User Action:

None.

N85801

WARNING - AOM SHUTDOWN ALREADY IN PROGRESS.

Reason:

The system was shutting down, and an AOM STOP command was already being processed. This is a warning message.

System Action:

None. The second shutdown will continue.

User Action:

None.

N85B01

FACILITY ONLY VALID FROM AOMPROC.

Reason:

This NCL procedure has attempted to use an AOM NCL verb, for example, *AOMREAD*. *These verbs are only valid in an AOMPROC.*

System Action:

The NCL procedure is terminated.

User Action:

Correct the procedure. For secondary AOMPROCs, ensure that they have issued an *AOMINIT* statement.

N85B02

USE OF &AOMDEL INVALID, NO CURRENT &AOMREAD.

Reason:

The NCL procedure has issued an &AOMDEL statement, when no message was currently active.

System Action:

The NCL procedure is terminated.

User Action:

Correct the procedure.

N85B03**USE OF &AOMCONT INVALID, NO CURRENT &AOMREAD.****Reason:**

The NCL procedure has issued an &AOMCONT statement, when no message was currently active.

System Action:

The NCL procedure is terminated.

User Action:

Correct the procedure.

N85B04**USE OF &AOMREPL INVALID, NO CURRENT &AOMREAD.****Reason:**

The NCL procedure has issued an &AOMREPL statement, when no message was currently active.

System Action:

The NCL procedure is terminated.

User Action:

Correct the procedure.

N85B05**USE OF &AOMREPL INVALID, CURRENT MSG IS A DOM.****Reason:**

The NCL procedure has issued an &AOMREPL statement, when the current message received by the last executed &AOMREAD was a DOM message. DOM messages cannot be replaced or deleted.

System Action:

The NCL procedure is terminated.

User Action:

Correct the procedure.

N85B06

ROUTCDE VALUE INVALID.

Reason:

The NCL procedure has issued an &AOMCONT or &AOMREPL statement, and the supplied value for the ROUTCDE= parameter is not a valid ROUTCDE list.

System Action:

The NCL procedure is terminated.

User Action:

Correct the procedure.

N85B07

USE OF &AOMINIT INVALID - PROC NOT IN AOMPROC ENVIRONMENT.

Reason:

The NCL procedure has issued an &AOMINIT verb. This is only valid if the NCL procedure is in the AOMP environment. It executes there if SUBMITTED to AOMP, or EXEC'd, STARTed, or &INTCMD STARTed by AOMPROC.

System Action:

The NCL procedure is terminated.

User Action:

Correct the procedure.

N85B08

&AOMCONT NCLID=/DOMAIN=/LINKNAME= INVALID FOR MINOR LINE.

Reason:

The NCL procedure has issued an &AOMCONT statement with the NCLID, LINKNAME, or DOMAIN parameters, when a minor line of a multi-line WTO was current. Only the major line (and thus the entire message) may be processed in this way.

System Action:

The NCL procedure is terminated.

User Action:

Correct the procedure.

N85B09**&AOMDEL DOMAIN=/LINKNAME= INVALID FOR MINOR LINE.****Reason:**

The NCL procedure has issued an &AOMDEL statement with the LINKNAME, or DOMAIN parameters, when a minor line of a multi-line WTO was current. Only the major line (and thus the entire message) may be processed in this way.

System Action:

The NCL procedure is terminated.

User Action:

Correct the procedure.

N85B10**RMTCLASS VALUE INVALID.****Reason:**

The NCL procedure has issued an &AOMCONT statement, and the supplied value for the RMTCLASS= parameter is not a valid RMTCLASS list.

System Action:

The NCL procedure is terminated.

User Action:

Correct the procedure.

N85B20**&AOMGFLAG VALUE NOT `ON' OR `OFF'.****Reason:**

The NCL procedure has issued an &AOMGFLAG statement to alter an AOM global flag. The value specified is not ON or OFF.

System Action:

The NCL procedure is terminated.

User Action:

Correct the procedure.

N85D01

NO NUMBER SUPPLIED.

Reason:

No number was supplied on an AOM builtin function that requires one. For example, &AOMGVAR or &AOMMINLN.

System Action:

The NCL procedure is terminated.

User Action:

Correct the procedure.

N85D02

NUMBER INVALID OR OUT OF RANGE.

Reason:

The NCL procedure has provided an invalid number to an AOM builtin function that requires one.

System Action:

The NCL procedure is terminated.

User Action:

Correct the procedure.

N85D03

UNEXPECTED DATA AFTER NUMBER

Reason:

The NCL procedure has provided invalid data after a number for an AOM builtin function. There should be no additional data after the number.

System Action:

The NCL procedure is terminated.

User Action:

Correct the procedure.

N85D05**COMMAND MISSING OR TOO LONG****Reason:**

The command being passed to the migration ID exit is either missing or too long.

System Action:

The NCL procedure is terminated.

User Action:

Correct the procedure.

N85D06**MIGID UNAVAILABLE SHUTDOWN in PROGRESS****Reason:**

Unable to supply a value for AOM built-in function &AOMMIGID because the system is being shutdown.

System Action:

The NCL procedure is terminated.

User Action:

None.

N85F01**AOM ISR CONTACT INITIATED WITH LINK linkname DOMAIN domain.****Reason:**

Following a LINK START, or ISR ENABLE, AOM has commenced establishment across the indicated ISR link.

System Action:

The ISR conversation attempts to enable.

User Action:

None.

N85F02

**AOM ISR CONTACT COMPLETED WITH LINK linkname DOMAIN
domainid VERSION versionid**

Reason:

AOM has completed the establishment of ISR contact across the indicated link. The remote system domain and AOM version are indicated.

System Action:

ISR message flow can commence.

User Action:

None.

N85F03

AOM ISR CONTACT LIST WITH LINK linkname DOMAIN domain.

Reason:

AOM has terminated the ISR conversation across the indicated link, possibly due to a LINK TSTOP, line error, or ISR DISABLE command.

System Action:

The ISR conversation is terminated.

User Action:

Determine whether the link needs to be restarted.

N85J01**type LA=la LRT=lrt RRT=rrt NMC=nmc****Reason:**

This message is issued when a SHOW ISR OPTIONS command is issued, and AOM is included in the classes to be displayed. The following parameters are displayed:

type The type of displayed information. This can be LOC - the local settings, RMT - the remote settings (if the link is active), or ACT - the actual settings (if the link is active).

la The setting of the LINKATTR AOM ISR option.

lrt The setting of the LCLROUTE AOM ISR option.

rrt The setting of the RMTRoute AOM ISR option.

nmc The setting of the NEWMSGCLASS AOM ISR option.

System Action:

None.

User Action:

None.

N85J02**type IMC=imc OMC=omc IML=iml OML=oml****Reason:**

This message is issued when a SHOW ISR OPTIONS command is issued, and AOM is included in the classes to be displayed. The following parameters are displayed:

type The type of displayed information. This can be LOC - the local settings, RMT - the remote settings (if the link is active), or ACT - the actual settings (if the link is active).

imc The setting of the INMSGCLASS AOM ISR option.

omc The setting of the OUTMSGCLASS AOM ISR option.

iml The setting of the INMSGLEVEL AOM ISR option.

omlc The setting of the OUTMSGLEVEL AOM ISR option.

System Action:

None.

User Action:

None.

N85J03

type IRC=irc

Reason:

This message is issued when a SHOW ISR OPTIONS command is issued, and AOM is included in the classes to be displayed. The following parameters are displayed:

type The type of displayed information. This can be LOC - the local settings, RMT - the remote settings (if the link is active), or ACT - the actual settings (if the link is active).

irc The setting of the INROUTCDE AOM ISR option. This parameter can be quite long, as there are 128 individual routing codes.

System Action:

None.

User Action:

None.

N85J04

type ORC=orc

Reason:

This message is issued when a SHOW ISR OPTIONS command is issued, and AOM is included in the classes to be displayed. The following parameters are displayed:

type The type of displayed information. This can be LOC - the local settings, RMT - the remote settings (if the link is active), or ACT - the actual settings (if the link is active).

orc The setting of the OUTROUTCDE AOM ISR option. This parameter can be quite long, as there are 128 individual routing codes.

System Action:

None.

User Action:

None.

N85J40**NEWMSGCLASS VALUE INVALID.****Reason:**

This message is issued when an ISR command is issued for AOM and the NEWMSGCLASS value supplied is invalid.

System Action:

The command is not processed.

User Action:

Correct the value and reissue the command.

N85J41**(IN/OUT) MSGCLASS VALUE INVALID.****Reason:**

This message is issued when an ISR command is issued for AOM and the MSGCLASS, or INMSGCLASS, or OUTMSGCLASS value supplied is invalid.

System Action:

The command is not processed.

User Action:

Correct the value and reissue the command.

N85J42**(IN/OUT) MSGLEVEL VALUE INVALID.****Reason:**

This message is issued when an ISR command is issued for AOM and the MSGLEVEL, or INMSGLEVEL, or OUTMSGLEVEL value supplied is invalid.

System Action:

The command is not processed.

User Action:

Correct the value and reissue the command.

N85J43

(IN/OUT) ROUTCDE VALUE INVALID.

Reason:

This message is issued when an ISR command is issued for AOM and the ROUTCDE, or INROUTCDE, or OUTROUTCDE value supplied is invalid.

System Action:

The command is not processed.

User Action:

Correct the value and reissue the command.

N85K33

INVALID TIME VALUE.

Reason:

This message is issued when an &AOMALERT verb has an invalid time value supplied. The time must be in the format hhmss.

System Action:

The NCL procedure is terminated.

User Action:

Correct the NCL procedure.

N85K34

INVALID ROUTCDE VALUE.

Reason:

This message is issued when an &AOMALERT verb has an invalid ROUTCDE value supplied.

System Action:

The NCL procedure is terminated.

User Action:

Correct the NCL procedure.

N85K35**INVALID DESC VALUE.****Reason:**

This message is issued when an &AOMALERT verb has an invalid DESC value supplied.

System Action:

The NCL procedure is terminated.

User Action:

Correct the NCL procedure.

N85K36**INVALID MSGLEVEL VALUE.****Reason:**

This message is issued when an &AOMALERT verb has an invalid MSGLEVEL value supplied.

System Action:

The NCL procedure is terminated.

User Action:

Correct the NCL procedure.

N85K37**INVALID RMTCLASS VALUE.****Reason:**

This message is issued when an &AOMALERT verb has an invalid RMTCLASS value supplied.

System Action:

The NCL procedure is terminated.

User Action:

Correct the NCL procedure.

N85K38

INVALID JOBID VALUE.

Reason:

This message is issued when an &AOMALERT verb has an invalid MVS JOBID value supplied.

System Action:

The NCL procedure is terminated.

User Action:

Correct the NCL procedure.

N85K39

PARAMETER IMPLIES OS TYPE OF opsys AND OS TYPE ALREADY SET TO opsys.

Reason:

This message is issued when an &AOMALERT verb has an invalid combination of operating system specific parameters. Two parameters conflict in their implied or forced operating system type.

System Action:

The NCL procedure is terminated.

User Action:

Correct the NCL procedure.

N85K40**ROUTE=TABLE NOT LICENSED.****Reason:**

The &AOMALERT NCL statement contains ROUTE=TABLE specification. This function is not licensed in the current system. ROUTE=TABLE allows NCL procedures to simulate single WTO messages on the AOM Screening Table without using system WTO (Write To Operator) services. The system must be licensed for AOM/Extension-2 to use this function.

System Action:

The NCL procedure is terminated.

User Action:

Check with your product support representative.

N85L01**CONSOLE POOL INITIALIZED****Reason:**

The pool used for console management has been initialized as part of processing a SYSPARMS CONSOLES=n command.

System Action:

None.

User Action:

None.

N85L02**CONSOLE POOL DELETED****Reason:**

The pool used for console management has been deleted as part of processing a SYSPARMS CONSOLES=0 or SYSPARMS CONSOLES=FREE command.

System Action:

None.

User Action:

None.

N85L10

CONSOLE POOL NOT BUILT. STORAGE SHORTAGE

Reason:

The pool used for console management could not be initialized as part of processing a SYSPARMS CONSOLES=n command due to a storage shortage.

System Action:

Processing of the SYSPARMS CONSOLES=n command is terminated.

User Action:

Check the storage size allocated to the SOLVE region.

N85L11

CONSOLE POOL NOT BUILT. SEE LOG

Reason:

The pool used for console management could not be initialized as part of processing a SYSPARMS CONSOLES=n command. The reason is given in an earlier message in the LOG.

System Action:

Processing of the SYSPARMS CONSOLES=n command is terminated.

User Action:

Check the SOLVE LOG for a message giving further details of the problem.

N85L20

CONSOLE POOL NOT DELETED. SEE LOG

Reason:

The pool used for console management could not be deleted as part of processing a SYSPARMS CONSOLES=0 or CONSOLES=FREE command. The reason is given in an earlier message in the LOG.

System Action:

Processing of the SYSPARMS CONSOLES=0 or CONSOLES=FREE command is terminated.

User Action:

Check the SOLVE LOG for a message giving further details of the problem.

N85M01**INVALID CORRELATOR VALUE IN FIELD: 'name'****Reason:**

The value belonging to the field 'name' (used for user correlator services in the &AOMGDB PUT/UPDATE stmt) is invalid. The value is either longer than 8 characters or is not an expanded hexadecimal string.

System Action:

The NCL procedure is terminated.

User Action:

Correct the NCL procedure.

N85M02**INVALID ADJUST/COUNTER VALUE IN FIELD: 'name'****Reason:**

The value belonging to the field 'name' definition (ADJUST or COUNTER on the &AOMGDB ... statement) is invalid. The value must be a non-zero number in the range - 2147483648 to 2147483647.

System Action:

The NCL procedure is terminated.

User Action:

Correct the NCL procedure.

N85M71**VAR= LIST HAS NULL ENTRIES****Reason:**

The VAR= list on an &AOMGDB statement has null entries eg: VAR=(A,,B). This is not permitted.

System Action:

The NCL procedure is terminated.

User Action:

Correct the NCL procedure.

N85M73

VAR= LIST HAS TOO MANY ENTRIES

Reason:

The VAR= list on an &AOMGDB statement has more entries than the system can handle.

System Action:

The NCL procedure is terminated.

User Action:

Correct the NCL procedure.

N85M74

VAR= LIST HAS INVALID SYNTAX

Reason:

The VAR= list on an &AOMGDB statement has invalid syntax.

System Action:

The NCL procedure is terminated.

User Action:

Correct the NCL procedure.

N85M75

VAR= LIST IS EMPTY

Reason:

The VAR= list on an &AOMGDB statement is empty.

System Action:

The NCL procedure is terminated.

User Action:

Correct the NCL procedure.

N85M76**VAR= LIST HAS AN INVALID VARIABLE NAME****Reason:**

The VAR list on an &AOMGDB statement contains an invalid variable name.

System Action:

The NCL procedure is terminated.

User Action:

Correct the NCL procedure.

N85M81**FIELDS= LIST HAS NULL ENTRIES****Reason:**

The FIELDS list on an &AOMGDB statement has null entries eg FIELDS=(A,,B). This is not permitted.

System Action:

The NCL procedure is terminated.

User Action:

Correct the NCL procedure.

N85M82**FIELDS= LIST HAS DUPLICATE ENTRIES****Reason:**

The FIELDS list on an &AOMGDB statement has a duplicated entry. This is not permitted.

System Action:

The NCL procedure is terminated.

User Action:

Correct the NCL procedure.

N85M83

FIELDS= LIST HAS TOO MANY ENTRIES

Reason:

The FIELDS list on an &AOMGDB statement has more entries than the system can handle.

System Action:

The NCL procedure is terminated.

User Action:

Correct the NCL procedure.

N85M84

FIELDS= LIST HAS INVALID SYNTAX

Reason:

The FIELDS list on an &AOMGDB statement has invalid syntax.

System Action:

The NCL procedure is terminated.

User Action:

Correct the NCL procedure.

N85M85

FIELDS= LIST IS EMPTY

Reason:

The FIELDS list on an &AOMGDB statement is empty.

System Action:

The NCL procedure is terminated.

User Action:

Correct the NCL procedure.

N85M86**FIELDS= LIST HAS AN INVALID OR UNRECOGNISED KEYWORD****Reason:**

The FIELDS list on an &AOMGDB statement contains invalid or unrecognizable keywords. Only the keywords listed for the current option of &AOMGDB can be used.

System Action:

The NCL procedure is terminated.

User Action:

Correct the NCL procedure.

N85M87**FIELDS= LIST HAS MUTUALLY EXCLUSIVE OPERANDS****Reason:**

The FIELDS list on an &AOMGDB statement contains mutually exclusive keywords. For example COUNTER and ADJUST specifications are mutually exclusive.

System Action:

The NCL procedure is terminated.

User Action:

Correct the NCL procedure.

N85M90**VAR= AND FIELDS= LISTS MUST BOTH BE SPECIFIED OR OMITTED****Reason:**

An &AOMGDB statement has a missing VAR= or FIELDS= list specification. Both specifications must be present or omitted.

System Action:

The NCL procedure terminates.

User Action:

Correct the NCL procedure.

N85M91

VAR= AND FIELDS= LISTS MUST HAVE THE SAME NUMBER OF ENTRIES

Reason:

An &AOMGDB statement was encountered where the number of elements in the fields list (FIELDS= keyword) was different to the number of elements in the variables list (VAR= keyword). There must be a 1-1 correspondence between the elements in the field list and the variables list.

System Action:

The NCL procedure terminates.

User Action:

Correct the NCL procedure.

N85M92

FUNCTION NOT LICENSED

Reason:

The &AOMGDB NCL verb is not licensed in the current system. The system must be licensed for AOM/Extension-2 to be able to use the AOM Global Data Base functions.

System Action:

The NCL procedure is terminated.

User Action:

Check with your product support representative.

N86101

SCS FUNCTION *ff* REQUESTED, RC WAS *rr*.

Reason:

The SCS module, IEAVG700, returned a non-zero return code. This message is only written to the Log.

System Action:

None. Other messages may be issued (eg: by AOM).

User Action:

None.

N86503**CONSOLE IS NOT IN VALID RANGE****Reason:**

A SYSCMD command was entered with CON=*value*, but the entered value was not numeric, or not a valid MVS console id for this environment.

System Action:

The command is ignored.

User Action:

Provide a valid CON= value.

N86504**SYSCMD COMMAND REJECTED, UNABLE TO ACQUIRE CONSOLE****Reason:**

A SYSCMD command was entered but no consoles were available to assign to this environment.

System Action:

The command is ignored.

User Action:

Use SHOW CONSOLES to check the status of the console table, and possibly acquire more if too few are provided.

N86508**SYSCMD OPT=REL PROCESSED****Reason:**

A SYSCMD OPT=REL command has been successfully processed.

System Action:

The console assigned to this environment has been released, if one was acquired.

User Action:

None.

N86509

SYSCMD OPT=LOCK PROCESSED

Reason:

A SYSCMD OPT=LOCK command has been successfully processed.

System Action:

A console has been assigned to this environment, and locked to it until either the environment terminates, or SYSCMD OPT=REL is entered.

User Action:

None.

N86510

COMMAND PASSED TO OPERATING SYSTEM

Reason:

A SYSCMD with command text has been processed, and the command passed to the operating system for processing.

System Action:

Depends on the command.

User Action:

Await the results of the command.

N86511

SYSCMD COMMAND REJECTED, UNABLE TO ACQUIRE CONSOLE

Reason:

A SYSCMD command was entered but no consoles were available to assign to this environment.

System Action:

The command is ignored.

User Action:

Use SHOW CONSOLES to check the status of the console table, and possibly acquire more if too few are provided.

N86512**SYSCMD COMMAND REJECTED, COMMAND TOO LONG****Reason:**

A SYSCMD command was entered with command text too long for the operating system or target environment. The limits are as follows:

- For z/OS, MSP, or VOS3, the limit is 126 characters.
- For VM DEST=GCS, the limit is 130 characters.
- For VM DEST=PROP or VMOP, the limit is 240 characters.

System Action:

The command is ignored.

User Action:

Correct the input command.

N86513**SYSCMD COMMAND REJECTED, BAD CONSOLE NUMBER****Reason:**

A SYSCMD CON=*nn* command was entered but the console number was less than 1, or greater than the maximum generated MVS console.

System Action:

The command is ignored.

User Action:

Correct the console number.

N86514

SYSCMD NOT ALLOWED FROM SYSOPER ON NM CONSOLE

Reason:

A SYSCMD command was entered from a SYSOPER environment that is assigned to an MVS console acquired by this SOLVE system. For example, the command `SYSCMD ?SYSCMD command' entered from OCS is not allowed (assuming `?' is the current AOMCMDCH for the system) as a processing loop can result.

System Action:

The command is ignored.

User Action:

None.

N86515

SYSCMD COMMAND REJECTED, AOM NOT STARTED OR IS PAUSED

Reason:

A SYSCMD command was entered but AOM is not started, or is started, but has been PAUSED.

System Action:

The command is ignored.

User Action:

Determine why AOM is not active.

N86516

SYSCMD COMMAND REJECTED, USER HAS NO CONSOLE AUTHORITY

Reason:

A SYSCMD command was entered but you have no console authority.

System Action:

The command is ignored.

User Action:

Check with your system administrator if you should have console authority.

N86517**SYSCMD COMMAND REJECTED, NOT AUTHORIZED FOR destination****Reason:**

You are not authorized for the target of this SYSCMD command.

In MVS, this could be CON=MASTER.

In VM, this could be DEST=GCS, DEST=PROP, or DEST=VMOP.

System Action:

The command is ignored.

User Action:

Contact your system administrator to check if you should have the appropriate console authority.

N86518**SYSCMD COMMAND REJECTED, MAST CONSOLE IN USE****Reason:**

A SYSCMD CON=MASTER command was entered but another user has recently issued SYSCMD CON=MASTER. The timeout (AOMCTO3) has not yet expired.

System Action:

The command is ignored.

User Action:

Wait, and try again.

N86519**SYSCMD COMMAND REJECTED, STORAGE SHORTAGE****Reason:**

A SYSCMD command was entered but SOLVE was unable to acquire storage to process the command.

System Action:

The command is ignored.

User Action:

Determine why SOLVE cannot obtain storage.

N86520

SYSCMD COMMAND REJECTED, AOM HAS ABENDED

Reason:

A SYSCMD command was entered but the AOM SSI Interface has ABENDED. No responses can be returned.

System Action:

The command is ignored.

User Action:

AOM should be restarted.

The following steps should be followed:

1. examine the SOLVE log for N83dxx messages that contain information about the AOM abend.
2. Issue an AOM STOP command to shut down the abended AOM SSI interface
3. When the AOM STOP has completed, issue an AOM START command to restart the interface.

When the AOM START has completed, the SYSCMD command can be reissued.

N86521

SYSCMD DEST=GCS NOT ALLOWED FROM SYSOPER

Reason:

A SYSCMD command was entered from the GCS console with DEST=GCS specified. As this can lead to a loop involving WTO, IUCV, and the GCS console, this is not permitted.

System Action:

The command is ignored.

User Action:

Do not issue this form of SYSCMD directly from the GCS console. Any commands that could be provided to GCS in this way can be entered directly to GCS.

N86522**SYSCMD CON=MASTER NOT ALLOWED FROM MASTER CONSOLE****Reason:**

A SYSCMD CON=MASTER command was entered from the MVS master console. Since this can lead to a message delivery loop, it is not allowed. Just issue the MVS command directly.

System Action:

The command is ignored.

User Action:

Do not issue this form of SYSCMD directly from the MVS master console. Any commands that could be provided to MVS in this way can be entered directly to MVS.

N86523**SYSCMD DEST=VMOP REJECTED, VMOPERATOR NOT CONNECTED****Reason:**

A SYSCMD DEST=VMOP command was entered, but VMOPERATOR is not active or has not connected to the region.

System Action:

The command is ignored.

User Action:

Wait, and try again.

N86524**SYSCMD CON=NN NOT ALLOWED WHEN USING type CONSOLES****Reason:**

The CON=*nn* operand of SYSCMD is not allowed when using the indicated console type (AOMCTYPE SYSPARM). This is typically EXTMCS, indicating Extended MCS consoles.

System Action:

The command is ignored.

User Action:

Remove the CON=*nn* operand from the command and retry the operation.

N86525

SYSCMD COMMAND REJECTED, PREVIOUS COMMAND STILL WAITING FOR CONSOLE

Reason:

A SYSCMD command has been entered and has been rejected by the system. A previous SYSCMD command with the WAIT= operand specified is still waiting for a console to become available. It is invalid to issue any further commands until the first command completes, with the exception of the SYSCMD OPT=REL command which may be used to cancel the first command before a console becomes available.

System Action:

The command is rejected.

User Action:

The SYSCMD command which is waiting for a console to become available may be cancelled using the SYSCMD OPT=REL command. No further commands are allowed until the first command acquires a console or is cancelled.

N86526

SYSCMD COMMAND REJECTED, MIGID REQUESTED. CURRENT CONSOLE ENVIRONMENT HAS NO MIGID

Reason:

The entered SYSCMD command requested a migration ID (using the MIGID operand). However, the environment currently has a console assigned, and that console has no migration ID.

This can occur if MIGID=YES, MIGID=DEFAULT (and SYSPARMS AOMCMIGI=YES), or MIGID=EXIT (and the command is analyzed as requiring a migration ID).

System Action:

The command is rejected.

User Action:

Issue a SYSCMD OPT=REL to release the current console (without a migration ID). Then reissue the command.

N86527**SYSCMD COMMAND REJECTED, MIGID=NO SPECIFIED. CURRENT
CONSOLE ENVIRONMENT HAS A MIGID****Reason:**

The entered SYSCMD command explicitly requested no migration ID (using the MIGID operand). However, the environment currently has a console assigned, and that console has a migration ID.

This can occur if MIGID=NO, MIGID=DEFAULT (and SYSPARMS AOMCMIGI=NO), or MIGID=EXIT (and the command is analyzed as not requiring a migration ID).

While this is not normally a problem, this situation probably indicates a programming logic error.

System Action:

The command is rejected.

User Action:

Issue a SYSCMD OPT=REL to release the current console (with a migration ID). Then reissue the command.

Alternatively, simply remove the MIGID operand from the command.

N86528**SYSCMD COMMAND REJECTED, CON=MASTER N/S BY THIS CONSOLE
TYPE OF *type*****Reason:**

The current console type (SYSPARMS AOMCTYPE) does not support the use of the SYSCMD CON=MASTER command.

System Action:

The command is ignored.

User Action:

Check the documentation for the correct approach to issuing master commands with this console type.

N86540

PARAMETER INVALID FOR THIS OPERATING SYSTEM

Reason:

A SYSCMD command was entered that contained parameters not supported by this operating system environment.

System Action:

The command is ignored.

User Action:

Correct the SYSCMD command and retry the operation.

N86550

SYSCMD COMMAND REJECTED, NOT SUPPORTED BY SUBSET AOM

Reason:

The SYSCMD command is not supported if SUBSET AOM is active.

System Action:

The command is ignored.

User Action:

Do not use SYSCMD unless full-function AOM is active.

N86701

STRUCTURED FIELD ffff IN ERROR.

Reason:

While processing an AOM structured field from an external security exit, an error was found in the nominated field.

System Action:

The default field value is taken.

User Action:

Correct the field value in the external security definition.

User Action:

None.

N86E21

**#-LOG-AQ #-PHY-AQ %-PL-A AV-TM-PA #-LOG-RL #-PHY-RL %-PL- R
AV-TM-PR**

Reason:

This message appears as a response to a SHOW CONSOLES command, it provides headings for the following N86E22 message. The headings name various statistics related to console pool management.

The column headings are:

#-LOG-AQ

The number of logical console acquire requests (for example, SYSCMD OPT=LOCK)

#-PHY-AQ

The number of physical console acquire requests (that is, the number of times a console was requested from the operating system)

%-PL-A

The percentage of physical to logical acquire requests. (A lower percentage indicates that more requests were satisfied from the console pool, without requiring a call to the operating system.)

AV-TM-PA

The average time (in seconds) that a physical acquire request took.

Note: This is the actual time taken for the operating system calls. It does not include any queueing time if the request(s) are single-threaded.

#-LOG-RL

The number of logical console release requests (for example, SYSCMD OPT=REL)

#-PHY-RL

The number of physical console release requests (that is, the number of times a console was released back to the operating system)

%-PL-R

The percentage of physical to logical release requests. (A lower percentage indicates that more requests were satisfied by simply returning the console to the pool, without requiring a call to the operating system.)

AV-TM-PR

The average time (in seconds) that a physical release request took Note: This is the actual time taken for the operating system calls. It does not include any queueing time if the request(s) are single-threaded.

System Action:

None.

User Action:

None.

N86E22

#-log-aq #-phy-aq %-pl-a av-tm-pa #-log-rl #-phy-rl %-pl-r av-tm-pr

Reason:

This message appears as a response to a SHOW CONSOLES command; it provides various statistics. Refer to message N86E21 for column headings and descriptions.

System Action:

N86E23

#-LA-MIG %-LA-M #-PA-MIG %-PA-M #-LA-FNC %-LA-F #-PA-FNC %-PA-F

Reason:

This message appears as a response to a SHOW CONSOLES command; it provides headings for the following N86E24 message. The headings name various statistics related to console pool management.

The column headings are:

#-LA-MIG

The number of logical console acquire requests that requested a migration id.

%-LA-M

The percentage of total logical console acquire requests that requested a migration id.

#-PA-MIG

The number of physical console acquire requests that requested a migration id.

%-PA-M

The percentage of total physical console acquire requests that requested a migration id.

#-LA-FNC

The number of logical console acquire requests that failed due to no consoles being available.

%-LA-F

The percentage of total logical console acquire requests that failed due to no consoles being available.

#-PA-FNC

The number of physical console acquire requests that failed to obtain a console from the operating system.

%-PA-F

The percentage of total physical console acquire requests that failed to obtain a console from the operating system.

System Action:

None.

User Action:

None.

N86E24

#-la-mig %-la-m #-pa-mig %-pa-m #-la-fnc %-la-f #-pa-fnc %-pa-f

Reason:

System Action:

None.

User Action:

None.

N86E30**C# ID NAME STATUS LOCK AUTH USERID ENV W T/O****Reason:**

This message appears as a response to a SHOW CONSOLES command; it provides headings for the following N86E31 message. The following N86E31 messages describe the currently allocated consoles.

The column headings are:

C#

The SOLVE console number (from 1 to 255)

ID

The MVS console (1-byte) id. If no id is assigned, for example when using Extended MCS consoles, this field has a dash (-).

NAME

The MVS console name. If no name is assigned, this field has a dash (-).

If the MASTER console is currently assigned to a user (SYSCMD CON=MASTER), the name shows *MASTER*, to indicate that this message displays the current owner of the master console.

STATUS

The status of this console:

IN-ALLOC - A console is being requested from the operating system.

IN-FREE - A console is being freed to the operating system.

IN-USE - This console is assigned to a user.

TIMEOUT - This console is in a timeout, after being released by a user.

POOL - This console is in the free-console pool, available for reassignment to another user.

LOCK

The LOCK status of this console:

- - Not locked

AOM - Locked by AOM (console 1)

SYSCMD - Locked by SYSCMD OPT=LOCK

WTOR - Locked because a WTOR was received as a command response

AUTH

The authority level of this console:

MASTER - The console has master authority.

PS-MAST - the console has pseudo-master authority.

INFO - The console has informational authority.

S,I,C - (Any combination) The console has SYS (S), I/O (I), and/or CONS (C) authorities.

USERID

The currently assigned user ID, if there is one; otherwise, a dash.

ENV

The currently assigned user environment, if there is one; otherwise, a dash. An OCS window is indicated as PRIM An NCL &INTCMD environment is indicated by the NCLID.

W

The window (1 or 2) for the currently assigned user (a dash if none).

T/O

If the console is not locked, or is in the timeout state, the number of seconds remaining before timeout completes.

System Action:

None.

User Action:

None.

N86E31

c# id name status lock auth userid env w t/o

Reason:

This message appears as a response to a SHOW CONSOLES command; it provides information on a console. Refer to message N86E30 for column headings and descriptions.

System Action:

None.

User Action:

None.

N86E80**CONSOLE POOL NOT INITIALIZED****Reason:**

This message appears as a response to a SHOW CONSOLES command, when no consoles have been acquired.

System Action:

None.

User Action:

Refer to the CONSOLES system parameter for information on acquiring consoles.

N86J01**COMMAND TEXT NULL OR TOO LONG****Reason:**

The command being passed to the migration ID exit is either null or too long.

System Action:

The OML procedure is terminated.

User Action:

Correct the procedure.

N86M01**MIGID EXIT TRACE. M= P1 F= P2 C=< P3>****Reason:**

A migration ID exit trace was requested. This message is produced after the migration exit has been called. *P1* is the result from the exit; *P2* and *P3* are the command byte and command passed to the exit.

System Action:

None.

User Action:

None.

N86M90

AOM MIGID EXIT (AOMCMIGX): *nnnnnnnn* ABEND: *ccc* - DISABLED (SEE LOG)

Reason:

The AOM migration ID exit specified in the AOMCMIGX setting ABENDED. *nnnnnnnn* is the migration exit name and *ccc* is the ABEND code.

System Action:

The exit is disabled.

User Action:

See the SOLVE log for further messages that may indicate the cause of the problem, particularly messages N86M91 and N86M92.

N86M91

PSW *pppppppp* - *pppppppp* ILC:*ll* INTCD: *cc* INST@: *iiiiiii*

Reason:

The AOM migration ID exit specified in the AOMCMIGX setting ABENDED.

pppppppp - *pppppppp* is the PSW

ll is the instruction length code extracted from the PSW

cc is the interrupt code extracted from the PSW

iiiiiii is the failing instruction address extracted from the PSW

System Action:

The exit is disabled.

User Action:

See the SOLVE log for further messages that may indicate the cause of the problem, particularly messages N86M90 and N86M92.

N86M92

Rww-Rzz: *xxxxxxxxxx xxxxxxxx yyyyyyyy zzzzzzzz*

Reason:

The AOM migration ID exit specified in the AOMCMIGX setting ABENDED. This message documents the register values of Rww-Rzz in the exit at the time of the ABEND.

System Action:

The exit is disabled.

User Action:

See the SOLVE log for further messages that may indicate the cause of the problem, particularly messages N86M90 and N86M91.

N86O01

JES CONSOLE POOL INITIALIZATION FAILURE: *rrrrrr*

Reason:

JES console pool initialization was requested as part of a SYSPARMS CONSOLES=*nn* command and failed. *rrrrrr* is one of the following reasons:

NO STORAGE FOR JES CONSOLE MANAGEMENT CONTROL BLOCKS

ATTACH OF: *nnnnnnnn* FAILED

nnnnnnnn

Is the name of the subtask being attached.

SUBTASK: *nnnnnnnn* FAILED

nnnnnnnn

Is the name of the subtask being attached.

System Action:

Processing of the SYSPARMS CONSOLES=*nn* command is terminated.

User Action:

Dependent on the reason given.

N86O80

JES SCS FUNC=ffffffff ERROR, RC: rr USERID: uuuuuuuu - AREAS FOLLOW

Reason:

An SCS function *ffffffff* was issued for user *uuuuuuuu* and failed with return code *rr*.

System Action:

The console request is terminated.

User Action:

See the dump of the SCS parameter list that follows to determine the cause of the problem.

N86O99

JES MANAGEMENT SUBTASK TERMINATED, ECB: eeeeeeee STQE: ssssssss

Reason:

The subtask that services JES console management requests has terminated. The ECB and STQE associated with the attach of the subtask are displayed.

ATTACH OF: nnnnnnnn FAILED

nnnnnnnn

Is the name of the subtask being attached.

SUBTASK: nnnnnnnn FAILED

nnnnnnnn

Is the name of the subtask being attached.

System Action:

SOLVE ABENDS with an ABEND code 99.

User Action:

See the system log for other messages relating to the problem.

N86Q01**EXTMCS CONSOLE POOL INITIALIZATION FAILURE: *rrrrrr*****Reason:**

EXTMCS console pool initialization was requested as part of a SYSPARMS CONSOLES=*nn* command and failed. *rrrrrr* is one of the following reasons:

NO STORAGE FOR EXTMCS CONSOLE MANAGEMENT CONTROL BLOCKS

ATTACH OF: *nnnnnnnn* FAILED

nnnnnnnn

Is the name of the subtask being attached.

SUBTASK: *nnnnnnnn* FAILED

nnnnnnnn

Is the name of the subtask being attached.

System Action:

Processing of the SYSPARMS CONSOLES=*nn* command is terminated.

User Action:

Dependent on the reason given.

N86Q80**EXTMCS MCSOPER FUNC=*fffffff* ERROR, RC: *rr* RSN: *ss* NAME: *nnnnnnnn* - AREAS FOLLOW****Reason:**

An EXTMCS function *fffffff* issued for console name *nnnnnnnn* failed with return code *rr* and reason code *ss*.

Note: if the return code is 4 and the reason is 00000000, this is a soft error, which is ignored (the console is already in use possibly by another region that is sharing the same prefix). Other console names (using different suffix values) are tried.

System Action:

The console request is terminated. (Except in the case of return code 4 and reason code 00000000, where other console names are tried).

User Action:

See the dump of the MCSOPER parameter list and associated areas that follow to determine the cause of the problem.

N86Q99

EXTMCS MANAGEMENT SUBTASK TERMINATED, ECB: eeeeeeee STQE: ssssssss

Reason:

The subtask that services EXTMCS console management requests has terminated. The ECB and STQE associated with the attach of the subtask are displayed.

ATTACH OF: nnnnnnnn FAILED

nnnnnnnn

Is the name of the subtask being attached.

SUBTASK: nnnnnnnn FAILED

nnnnnnnn

Is the name of the subtask being attached.

System Action:

SOLVE ABENDS with an ABEND code 99.

User Action:

See the system log for other messages relating to the problem.

N87011

UNLOCK OF NDB FILE dbname SUCCESSFUL.

Reason:

An NDB START UNLOCK command has been successfully processed. The database has been unlocked.

System Action:

The indicated database is restarted.

User Action:

None.

N87012**UNLOCK OF NDB FILE *dbname* FAILED, *reason*.****Reason:**

An NDB START UNLOCK command was not successfully processed. Possible reasons are: REQUESTS PENDING - there are still requests queued to the locked database.

System Action:

The database remains locked.

User Action:

Re-enter the command when all queued requests have been processed. The SHOW *NDB=dbname* command will indicate how many requests are still pending.

N87101**NDB *dbname* START - *reason*.****Reason:**

An NDB START command for the indicated database has been received, and reason indicates the result:

OK

The database has been successfully started.

DB ALREADY STARTED

The database was already started.

PENDING STOP RESET

The database was stopping, but there were still active users. The pending stop has been reset. The database is now regarded as started.

FLAGGED, DB ALREADY RUNNING

The database was already active, due to an &NDBOPEN. It is now flagged as started, so that it will stay active when there are no signed on users.

System Action:

As indicated by the message.

User Action:

None.

N87102

NDB *dbname* option STATUS SET TO *value*.

Reason:

An NDB START command was entered for the indicated database. The status of ~option~ has been altered as indicated.

System Action:

The relevant status has been altered.

User Action:

Ensure that the option has been set as requested.

N87103

NDB *dbname* - PENDING STOP SET.

Reason:

An NDB STOP command was entered for the indicated database.

System Action:

The database will stop when there are no users.

User Action:

If this is not what is wanted, issue an NDB START command for the database.

N87104

NDB *dbname* IMMEDIATE STOP IN PROGRESS.

Reason:

An NDB STOP IMM command was entered for the indicated database. All active users are immediately disconnected and the database will stop.

System Action:

As described.

User Action:

None.

N87105**NDB *dbname* WILL BE LOCKED WHEN STOPPED.****Reason:**

An NDB STOP LOCK command was entered for the indicated database. When the database stops, it will be locked to prevent further access until an NDB START UNLOCK command is entered, or SOLVE is restarted.

System Action:

As described.

User Action:

None.

N87106**NDB *dbname* RESET - DATA ALL DELETED.****Reason:**

An NDB RESET command was entered for the indicated database and successfully processed. All data has been deleted from the database, but field definitions are left intact.

System Action:

As described. The database will stop after this command.

User Action:

None.

N87107**NDB *dbname* SIGNON REJECTED - DB IS STOPPING.****Reason:**

An &NDBOPEN statement was rejected by the indicated database as it is stopping.

System Action:

The NCL procedure is given a response code.

User Action:

Determine why the database is stopping, and rerun the NCL procedure.

N87108

NDB *dbname* DEFER OPTION IGNORED, UDB NOT LSR AND DEFER.

Reason:

To start an NDB in DEFER status requires that the database dataset be opened by the UDBCTL command with the options LSR and DEFER. If this was not done, DEFER status cannot be set.

System Action:

The database runs in NODEFER status.

User Action:

If DEFER status is necessary, STOP the database, UDBCTL CLOSE it, UDBCTL OPEN it, with LSR and DEFER, and NDB START DEFER it.

N87109

NDB *dbname* SIGNON REJECTED - DB IS OPEN EXCLUSIVE.

Reason:

An &NDBOPEN statement was processed for the indicated database, but another user issued an &NDBOPEN EXCLUSIVE statement. Only the exclusive user can access the database.

System Action:

The NCL procedure is given a non-zero response code.

User Action:

Wait for the exclusive user to sign off.

N87110

NDB *dbname* SIGNON EXCLUSIVE REJECTED - OTHER USERS.

Reason:

An &NDBOPEN EXCLUSIVE statement was processed by the indicated database, but there are currently other users. Thus, the EXCLUSIVE request cannot be honoured.

System Action:

The NCL procedure is given a non-zero response code.

User Action:

Wait for the other users to sign off.

N87111***WARNING* NDB *ndbname* IS IN LOAD MODE.****Reason:**

The indicated NDB has started, and is (now) in LOAD MODE. This message is a warning message to inform all MONITOR users of this.

System Action:

The NDB does not process keys.

User Action:

Check that LOAD MODE is wanted.

N87112**NDB *ndbname* IS ALREADY IN LOAD MODE.****Reason:**

The indicated NDB was started with a LOAD MODE request. It was already in LOAD MODE.

System Action:

The NDB does not process keys.

User Action:

Be aware that LOAD MODE is in effect. It can only be reset by using NDB ALTER OPT=BLDX

N87113**NDB *ndbname* OPEN IN INPUT MODE.****Reason:**

The indicated NDB was started with an INPUT mode request. Only non-update operations are allowed.

System Action:

No update operations are allowed.

User Action:

NO updating can be done.

N87114

NDB *ndbname* ALREADY OPEN UPDATE, `INPUT' OPTION IGNORED.

Reason:

The indicated NDB was started with an INPUT mode request. It was already active in update mode. The input request is ignored.

System Action:

The NDB remains open in update mode.

User Action:

If input mode is wanted, stop and restart the NDB.

N87115

NDB *ndbname* OPEN FOR INPUT, LOADMODE CANNOT BE SET.

Reason:

The indicated NDB was active, in INPUT mode. The NDB START LOADMODE request cannot be honoured, as it requires the NDB be open for update.

System Action:

The NDB remains open in input mode.

User Action:

If LOADMODE is wanted, stop and restart the NDB.

N87116

KEYSTATS=START REQUEST FOR NDB: *ndbname* FAILED, *reason*.

Reason:

AN NDB START *ndbname* KEYSTATS=START command was processed. KEYSTATS were unable to start for the displayed reason.

The reason can be:

'ALREADY ACTIVE' - KEYSTATS are already active for this NDB.

System Action:

The request is ignored.

User Action:

Correct the command and re-issue it if required.

N87117

KEYSTATS=STOP REQUEST FOR NDB: *ndbname* FAILED, *reason*.

Reason:

An NDB START *ndbname* KEYSTATS=STOP command was processed. KEYSTATS could not be stopped for one of the following reasons:

'NOT ACTIVE' - KEYSTATS are not active for this NDB.

System Action:

The KEYSTATS=STOP request is ignored.

User Action:

Correct the command and-re-enter it if required.

N87120

NDB *ndbname* RID REUSE STATUS CANNOT BE ALTERED: *reason*

Reason:

The indicated NDB was started with a RIDREUSE option. However, RID reuse status for this NDB cannot be altered. Possible reasons are as follows:

RID REUSE NOT POSSIBLE

This NDB cannot have RID reuse enabled because the VSAM record length is too short. Control records cannot be upgraded to support RID Reuse. (You must unload the NDB and load it to a new data set with a longer record length.)

RID REUSE ALREADY ENABLED

RID reuse is already enabled for this NDB.

RID REUSE ALREADY DISABLED

RID reuse is already disabled for this NDB.

System Action:

RID Reuse status for this NDB is not altered.

User Action:

If required, perform the corrective action as described in the message reason descriptions.

N87121

NDB *ndbname* RID REUSE STATUS IS NOW: *status*

Reason:

The indicated NDB was started with a RIDREUSE option. RID reuse status for this NDB was altered to the indicated status (ENABLED or DISABLED).

System Action:

RID Reuse status for this NDB was altered as requested.

User Action:

None.

N87148

NDB *ndbname* - UNABLE TO LOAD MODULE: *name* - ERROR: *error-info*.

Reason:

An NDB request failed as a required load module could not be loaded. The message gives the error reason.

System Action:

The request is not processed.

User Action:

Contact your systems administrator.

N87149

NDB *dbname* SUBTHREADS ALL FAILED, TERMINATING.

Reason:

When attempting to queue a request to a subthread for the indicated database, the Database Manager found that all the subthreads had terminated unexpectedly.

System Action:

The database terminates (stops).

User Action:

Examine the log for messages indicating the reasons the subthreads terminated. Correct the problems and restart the database.

N87150**NDB *dbname* HAS STOPPED.****Reason:**

The indicated database has stopped, either in response to an NDB STOP command, or because the number of users dropped to 0 and the database was not started.

System Action:

As indicated.

User Action:

None.

N87201**CREATE OF NDB FILE: *dbname* SUCCESSFUL. LOG HAS *n* RECORDS. TIMESTAMP: *timestamp*. (LOAD MODE SET)****Reason:**

An NDB CREATE command for the indicated database has been successful. The number of records formatted for the NDB journal is indicated. The VSAM timestamp value is displayed. If LOAD MODE was requested, this is indicated.

System Action:

The database is now ready to be used.

User Action:

Start the database and insert field definitions. Data may then be added.

N87210**CREATE OF NDB FILE: *dbname* FAILED, STORAGE UNAVAILABLE.****Reason:**

An NDB CREATE command for the indicated database failed as the Database Manager was unable to obtain necessary storage.

System Action:

The database is not created.

User Action:

Determine the reason for the storage shortage. Then retry the create.

N87211

CREATE OF NDB FILE: *dbname* FAILED, VSAM OPEN FAILED.

Reason:

An NDB CREATE for the indicated database failed because the Database Manager was unable to open the VSAM dataset.

System Action:

The database is not created.

User Action:

Determine why the open failed. Possibly, a UDBCTL OPEN has not been issued.

N87212

CREATE OF NDB FILE: *dbname* FAILED, FILE IS NOT A VSAM KSDS.

Reason:

An NDB CREATE for the indicated database failed because the dataset is not a VSAM KSDS.

System Action:

The database is not created.

User Action:

Check that the correct database name was used on the command.

N87213

CREATE OF NDB FILE: *dbname* FAILED, RKP IS NOT 0.

Reason:

An NDB CREATE command for the indicated database failed, as the VSAM relative key position was not 0.

System Action:

The database is not created.

User Action:

Check that the correct database name was used, and, if so, check the VSAM define for the dataset.

N87214**CREATE OF NDB FILE: *dbname* FAILED, KEYLEN TOO SHORT.****Reason:**

An NDB CREATE command for the indicated database failed, as the VSAM keylength was less than 16.

System Action:

The database is not created.

User Action:

Correct the VSAM definition for the database.

N87215**CREATE OF NDB FILE: *dbname* FAILED, RECORD SIZE TOO SHORT.****Reason:**

An NDB CREATE command for the indicated database failed, as the VSAM maximum record size was less than $338 + 2 * \text{keylength}$.

System Action:

The database is not created.

User Action:

Check the VSAM definition for the database.

N87216**CREATE OF NDB FILE: *dbname* FAILED, FILE NOT EMPTY.****Reason:**

An NDB CREATE command for the indicated database failed, the dataset had data in it.

System Action:

The database is not created. Existing data is not removed.

User Action:

Check that you are not trying to create an already created database. If you really want to clear out existing data, consider the NDB RESET command as an alternative. Otherwise, either delete and redefine the dataset, or UDBCTL OPEN it with the RESET option. The RESET option may be used only for a dataset which has been defined with the REUSE option.

N87217

CREATE OF NDB FILE: *dbname* FAILED, BAD VSAM FDBK: *ff*.

Reason:

An NDB CREATE command for the indicated database failed, as a VSAM error occurred. *ff* is the VSAM feedback code, in hex.

System Action:

The database is not created.

User Action:

Refer to the VSAM feedback code to determine the cause of the error.

N87218

CREATE OF NDB FILE: *dbname* FAILED, I/O ERROR.

Reason:

An NDB CREATE command for the indicated database failed due to an I/O error during processing.

System Action:

The database is not created. Some data may have been inserted.

User Action:

Determine the cause of the I/O error. The dataset may need to be redefined.

N87219

CREATE OF NDB FILE: *dbname* FAILED, FILE FILLED UP.

Reason:

An NDB CREATE command for the indicated database failed, as a 'file full' condition was encountered during insertion of control information.

System Action:

The database is not created. Some data has been inserted but the database is unusable.

User Action:

Re-allocate the database with more space.

N87301**FIELD: *fieldname* ALREADY EXISTS IN FILE DEFINITION.****Reason:**

While processing an &NDBDEF ADD, the indicated field name was found to be already defined in the database.

System Action:

The entire &NDBDEF statement is not processed.

User Action:

Correct the definition statement.

N87302**ERROR BUILDING FIELD INDEXES.****Reason:**

While building internal indexes for the fields defined in a database, an error occurred. The database cannot start.

System Action:

The database fails to start.

User Action:

Contact your product support representative.

N87303**FIELD: *fieldname* NOT FOUND IN FILE DEFINITION.****Reason:**

While processing an &NDBDEF DELETE, the indicated field name was not found to be defined in the database.

System Action:

The entire &NDBDEF statement is not processed.

User Action:

Correct the definition statement.

N87304

FIELD: *fieldname* IS SEQUENCE KEY, CANNOT DELETE.

Reason:

While processing an &NDBDEF DELETE, the name of the sequence key field was found. The sequence key field cannot be deleted.

System Action:

The entire &NDBDEF statement is not processed.

User Action:

Remove the sequence key field name from the delete list.

N87305

FIELD: *fieldname* KEY=SEQ, MUST BE FIRST FIELD DEFINED, AND ONLY ONE SEQUENCE KEY ALLOWED.

Reason:

While processing an &NDBDEF ADD, a field other than the first defined for the database was found with a description of KEY=SEQ. Only the first field ever defined to the database is accepted to be the key field for the database.

System Action:

The entire &NDBDEF statement is not processed.

User Action:

Correct the definition statement.

N87306

FIELD: *fieldname* HAS CAUSED INTERNAL FIELD ID OVERFLOW.

Reason:

An &NDBDEF statement was executed, attempting to add field names to the NDB. However, there were too many fields already in the NDB. The limit is 32,767.

System Action:

The request is cancelled.

User Action:

Split the database into more than one NDB.

N87320**NULL FIELD LIST PASSED.****Reason:**

An &NDBDEF statement contained no fields to add or delete.

System Action:

The statement is not processed.

User Action:

Correct the statement.

N87321**EXPECTED VALID FIELD-NAME, FOUND: *token*.****Reason:**

While processing an &NDBDEF statement, a field name was expected, but not found.

System Action:

The statement is not processed.

User Action:

Correct the &NDBDEF statement.

N87322**INVALID KEYWORD OR MISSING `)', FOUND: *token*.****Reason:**

While processing an &NDBDEF statement, an invalid keyword was found. This could be due to a missing closing parenthesis.

System Action:

The statement is not processed.

User Action:

Correct the &NDBDEF statement.

N87323

KEYWORD: *keyword* **INVALID FOR FIELD action.**

Reason:

While processing an &NDBDEF statement, an invalid keyword was found. This keyword is not valid for the requested action.

System Action:

The statement is not processed.

User Action:

Correct the &NDBDEF statement.

N87326

INVALID FIELD NAME: *token* - **NOT VALID NCL-FORMAT NAME.**

Reason:

While processing an &NDBDEF statement, an invalid field name was found. A field name must follow the rules for NCL variable names (less the ampersand).

System Action:

The &NDBDEF statement is not processed.

User Action:

Correct the &NDBDEF statement.

N87328

INVALID FIELD NAME: *fieldname* - **SPECIFIED MORE THAN ONCE IN INPUT.**

Reason:

While processing an NDBDEF statement, the indicated field name was duplicated in the field list.

System Action:

The statement is not processed.

User Action:

Correct the &NDBDEF statement.

N87330

KEYWORD: *token* - EXPECTED VALID VALUE, **FOUND:** *token*.

Reason:

While processing an &NDBDEF statement, an invalid value was found for the indicated keyword, for example, CAPS=X.

System Action:

The statement is not processed.

User Action:

Correct the &NDBDEF statement.

N87332

KEYWORD: *keyword* - SPECIFIED TWICE.

Reason:

While processing an &NDBDEF statement, a keyword was duplicated in a field definition.

System Action:

The statement is not processed.

User Action:

Correct the &NDBDEF statement.

N87333

EXPECTED VALID TEXT FOR *keyword*, **FOUND:** *value*.

Reason:

While processing an &NDBDEF statement, a keyword requiring text was found, but the value after the '=' was not either a word or a quoted string.

System Action:

The statement is not processed.

User Action:

Correct the &NDBDEF statement.

N87334

TEXT TOO LONG FOR *keyword*.

Reason:

While processing an &NDBDEF statement, the text found for a keyword, eg: USER1, was longer than permissible.

System Action:

The statement is not processed.

User Action:

Correct the &NDBDEF statement.

N87335

INVALID FIELD NAME: *value*.

Reason:

While processing an &NDBDEF statement, an invalid field name was found.

System Action:

The statement is not processed.

User Action:

Correct the &NDBDEF statement.

N87341

FIELD: *fieldname* IS KEY=SEQ, AND NULLFIELD=YES IS INVALID FOR KEY=SEQ.

Reason:

While processing an &NDBDEF statement, a sequence key field definition was found that contained NULLFIELD=YES. Since a sequence key field must be present in all records, this is invalid.

System Action:

The statement is not processed.

User Action:

Correct the &NDBDEF statement.

N87343

FIELD: *fieldname* HAS KEY=SEQ, AND UPD=YES IS INVALID FOR KEY=SEQ.

Reason:

While processing an &NDBDEF statement, a sequence key field definition was found that contained UPDATE=YES. Since a sequence key field cannot change in value, this is invalid.

System Action:

The statement is not processed.

User Action:

Correct the &NDBDEF statement.

N87344

FIELD: *fieldname* HAS FMT ^= CHAR, AND CAPS ^= Y IS INVALID.

Reason:

While processing an &NDBDEF statement, a field definition was found that was not FORMAT=CHAR. The definition also had CAPS=NO. This is invalid. Only character format fields can have CAPS=NO.

System Action:

The statement is not processed.

User Action:

Correct the &NDBDEF statement.

N87350

NEW FIELDNAME: *name* ALREADY EXISTS IN FILE.

Reason:

While processing an &NDBDEF statement, a field update request had a new name for the field that matches the name of a field in the NDB.

System Action:

The statement is not processed.

User Action:

Correct the &NDBDEF statement.

N87351

NEW FIELDNAME: *name* MATCHES I/P FIELDNAME.

Reason:

While processing an &NDBDEF statement, a field update request had a new name for the field that matches the name of another field in the statement.

System Action:

The statement is not processed.

User Action:

Correct the &NDBDEF statement.

N87352

NEW FIELDNAME: *name* MATCHES OTHER I/P NEW FIELDNAME.

Reason:

While processing an &NDBDEF statement, a field update request had a new name for the field that matches the new name of another field in the statement.

System Action:

The statement is not processed.

User Action:

Correct the &NDBDEF statement.

N87353

FIELD: *name* FORMAT CANNOT BE ALTERED, FILE NOT EMPTY.

Reason:

While processing an &NDBDEF statement, a field update request had a changed field format. The NDB is not empty, and field format changes are only allowed if the NDB is completely empty.

System Action:

The statement is not processed.

User Action:

Correct the &NDBDEF statement.

N87354**FIELD: *name* CANNOT BE ALTERED TO/FROM KEY=SEQ****Reason:**

While processing an &NDBDEF statement, a field update request had a KEY alteration to or from KEY=SEQ. This is not permitted.

System Action:

The statement is not processed.

User Action:

Correct the &NDBDEF statement.

N87355**KEY OPTION ALTERATION FOR FIELD: *name* NOT ALLOWED. REQUIRES EMPTY FILE OR LOADMODE.****Reason:**

While processing an &NDBDEF statement or an NDB FIELD command, a field update request had a KEY alteration that is not permitted unless the NDB is empty, or is in LOAD MODE. Only the following key alterations are permitted at any time:

- key=Y to key=N;
- key=U to key=Y or N.

System Action:

The statement or command is not processed.

User Action:

Correct the statement/command.

N87356

FIELD: *name* IS KEY=SEQ. NULLFIELD=YES NOT ALLOWED.

Reason:

While processing an &NDBDEF statement, a field update request had a NULLFIELD=YES specification for a field with KEY=SEQ. This is not permitted.

System Action:

The statement is not processed.

User Action:

Correct the &NDBDEF statement.

N87357

FIELD: *name* IS KEY=SEQ. UPDATE=YES NOT ALLOWED.

Reason:

While processing an &NDBDEF statement, a field update request had a UPDATE=YES specification for a field with KEY=SEQ. This is not permitted.

System Action:

The statement is not processed.

User Action:

Correct the &NDBDEF statement.

N87358

FIELD: *name* NOT FMT=CHAR. NEW CAPS= VALUE INVALID

Reason:

While processing an &NDBDEF statement, a field update request had a CAPS= value other than YES, for a field format other than CHAR. This is not permitted.

System Action:

The statement is not processed.

User Action:

Correct the &NDBDEF statement.

N87359

NEW CAPS= VALUE FOR FIELD: *name* NOT ALLOWED. CHECK FILE/FIELD STATUS.

Reason:

While processing an &NDBDEF statement, a field update request had a CAPS= value specified that requires an empty NDB or possibly LOADMODE.

System Action:

The statement is not processed.

User Action:

Correct the &NDBDEF statement.

N87360

UPDATE OF FIELD: *name* FAILED, UNABLE TO READ OLD DEFINITION.

Reason:

While processing an &NDBDEF statement, a field update request could not be honoured, as the old field definition on the NDB could not be read.

System Action:

The statement is not processed. The NDB will stop.

User Action:

Investigate the integrity of the NDB.

N87390

NUMERIC FIELD NAMES FOUND IN NDB: AAAAAAAA

Reason:

A numeric fieldnames found in the Database while a numeric fields is not allowed.

System Action:

The NDB start fails.

User Action:

Correct the error fields in the given Database and try again.

N87401

REQUIRED FIELD `*fieldname*' NOT PROVIDED, HAS NULLFIELD=NO.

Reason:

While processing an &NDBADD or &NDBUPD statement, the nominated field was either not provided (&NDBADD), or the null indicator passed (&NDBUPD), or the field definition has been added since the record was added or last updated (&NDBUPD). The field must be present in the record.

System Action:

The record is not added or updated.

User Action:

Correct the add/update *field=value* list.

N87402

SEQUENCE FIELD `*fieldname*' VALUE ALREADY IN FILE.

Reason:

While processing an &NDBADD statement, the value provided for the sequence key field already exists. Duplicate values are not permitted for sequence keys.

System Action:

The record is not added.

User Action:

Correct and retry.

N87403

RECORD NOT FOUND FOR DELETE.

Reason:

While processing an &NDBDEL or &NDBUPD statement, no record with the supplied RID was found.

System Action:

The record is not deleted.

User Action:

Provide the correct RID.

N87404

FIELD `fieldname' ALTERED BY UPDATE REQUEST, HAS UPDATE=NO.

Reason:

While processing an &NDBUPD statement, the new value for the indicated field was different to the existing value, and the field is defined as UPDATE=NO.

System Action:

The record is not updated.

User Action:

Correct the update field=value list to either remove the nominated field, or to provide the current value.

N87405

FORMAT `fmtname' NOT DEFINED. CANNOT USE FOR ADD/UPDATE.

Reason:

An &NDBADD or &NDBUPD NCL statement with the FORMAT=*fmtname* operand was executed, but the format name is not presently defined.

System Action:

An NDB error condition is raised.

User Action:

Correct the NDB NCL statement.

N87406

FORMAT `fmtname' IS NOT AN OUTPUT FORMAT.

Reason:

An &NDBADD or &NDBUPD NCL statement with the FORMAT=*name* operand was executed, but the named format is not an output format. Only output formats may be used on &NDBADD and &NDBUPD NCL statements.

System Action:

An NDB error condition is raised.

User Action:

Correct the NDB NCL statement.

N87501

FORMAT ID `*formatid*' INVALID FOR ADD.

Reason:

While processing an &NDBFMT statement, the supplied format name was invalid.

System Action:

The statement is not executed.

User Action:

Correct the format name.

N87502

FORMAT ID `*formatid*' ALREADY EXISTS, CANNOT ADD.

Reason:

The format id supplied on an &NDBFMT statement already exists. It cannot be added.

System Action:

The statement is not processed.

User Action:

Provide a unique format name.

N87601

FORMAT ID `*formatid*' NOT DEFINED.

Reason:

The format id supplied on an &NDBGET statement is not currently defined for this user within the scope specified (defaulted).

System Action:

The statement is not processed.

User Action:

Provide a valid, defined format id. Ensure that the same scope is specified on &NDBFMT and &NDBGET statements.

N87602

FIELD `fieldname' NOT ON DATABASE, CANNOT RETRIEVE.

Reason:

The field name supplied on an &NDBGET for get by key field is not defined on the database.

System Action:

The statement is not processed.

User Action:

Provide the name of a defined, key field on the database.

N87603

FIELD `fieldname' IS NOT A KEY FIELD.

Reason:

The field name supplied on an &NDBGET for get by key field is not defined as a key field in the database.

System Action:

The statement is not processed.

User Action:

Provide the name of a defined, key field on the database.

N87604

SEQUENCE `seqid' IS NOT DEFINED.

Reason:

The sequence id supplied on an &NDBGET statement is not defined for this user.

System Action:

The statement is not processed.

User Action:

Provide a defined sequence id. If the sequence was not defined originally with KEEP=YES, and an EOF was returned for it in a previous &NDBGET, the sequence will have been automatically deleted.

N87605

SEQUENCE `*seqname*' KEY FIELD HAS BEEN DELETED.

Reason:

The key field that the indicated sequence was defined on has been deleted by an &NDBDEF DELETE statement. Thus, no further retrieval by that sequence is possible.

System Action:

The statement is not processed.

User Action:

Determine why the field was deleted.

N87606

SEQUENCE `*seqname*' SKIP=0 AND NO CURRENT POSITION.

Reason:

An &NDBGET statement requested get by the indicated sequence, and also specified SKIP=0 (re-read current record). The sequence is currently not positioned on a record.

System Action:

The statement is not processed.

User Action:

Establish position before requesting a re-read.

N87607

SEQUENCE `*seqname*' SKIP=0 INVALID AT EOF.

Reason:

An &NDBGET statement for the indicated sequence specified SKIP=0, but the sequence is currently at either front or back EOF.

System Action:

The statement is not processed.

User Action:

Re-establish position before requesting re-read of a record.

N87608**GET GENERIC INVALID FOR FORMAT OF FIELD *fieldname*.****Reason:**

An &NDBGET statement requested a generic retrieval. The indicated field's format does not support generic retrieval.

System Action:

The statement is not processed.

User Action:

Provide a valid field for generic retrieval.

N87609**GET HISTOGRAM NOT VALID FOR SEQUENCE KEY FIELD *fieldname*.****Reason:**

An &NDBGET statement requested a histogram retrieval. The indicated field is an NDB sequence key. Histogram is not supported for a sequence key.

System Action:

The statement is not processed.

User Action:

Provide a valid field for histogram processing.

N87610**FORMAT '*fmtname*' IS NOT AN INPUT FORMAT.****Reason:**

A format that is defined, but is not an input format, was requested for use on an &NDBGET NCL statement.

System Action:

An error condition is raised.

User Action:

Correct the format name.

N87701

TOKEN TOO LONG, TRUNCATED.

Reason:

While parsing free-form text for an &NDBxxx statement, a token value longer than 256 characters was detected.

System Action:

The statement is not processed.

User Action:

Correct the free-form text. A quote may be misplaced or missing.

N87702

QUOTED STRING NOT TERMINATED BEFORE END STMT/END FILE.

Reason:

While processing free-form text for an &NDBxxx statement, a quoted string had no closing quote.

System Action:

The statement is not processed.

User Action:

Correct the free-form text.

N87703

DATA VALUE TOO LONG, TRUNCATED.

Reason:

A data item passed in free-format text to the NDB processor on an &NDBxxx NCL statement was too long and was truncated.

System Action:

An error condition is raised.

User Action:

Correct the free-format text.

N87710

TOKEN: token.

Reason:

The NCL process has set &NDBCTL TRACE=YES. This message dumps the first 20 characters of each token encountered during parsing of free-form text.

System Action:

None.

User Action:

The messages may be used to detect the point of an error in free-form text.

N87901**ERROR code OPENING NDB *dbname* - *description*.****Reason:**

An error occurred when attempting to open the indicated database. The error codes and meanings are:

CODE DESCRIPTION**51 VFS OPEN FAILED**

The Database manager was unable to open the database. Possibly, no UDBCTL *OPEN=dbname* has been issued for this dataset.

52 NOT A VSAM KSDS

The indicated database dataset is not a VSAM KSDS. Check that the correct *dbname* was specified.

53 VSAM KEY OFFSET NOT 0.

The indicated database dataset VSAM RKP was not 0. This cannot be a valid NDB database.

54 VSAM KEYLEN TOO SMALL

The indicated database dataset VSAM keylength was less than 16. This cannot be a valid NDB database.

55 VSAM DATALEN TOO SMALL

The indicated database dataset VSAM maximum data length is less than $274 + 2 * \text{keylength}$. This cannot be a valid NDB database.

56 READ OF NDB CTL REC FAILED

The database manager was unable to read the NDB control record. This cannot be a valid, formatted NDB database. The dataset is empty, including the case when the RESET operand was specified on UDBCTL OPEN.

57 INVALID NDB CTL RECORD

The database manager did not find a valid NDB control record. This cannot be a valid, formatted NDB database. This error can occur if an NDB CREATE failed to complete.

58 UNABLE TO GET CTL REC STG

The database manager was unable to obtain required storage for holding the NDB control record.

59 READ OF TXN CTL REC FAILED

The database manager was unable to read the NDB transaction control record. This could indicate a corruption of the NDB.

60 INVALID NDB TXN CTL RECORD

The database manager did not find a valid NDB transaction control record. This could indicate a corruption of the NDB.

61 UNABLE TO GET TXN CTL STG

The database manager was unable to obtain required storage for holding the NDB transaction control record.

62 UNABLE TO GET TXN DATA STG

The database manager was unable to obtain required storage for holding the NDB transaction data record.

64 RE-APPLY LAST TXN FAILED

The database manager detected a previous transaction had not been applied, and had an error when attempting to re-apply it. The database may be full, and need to be copied to a larger dataset.

65 DEFER FLAG SET - CORRUPT

The defer status flag in the NDB control record was set. This indicates that the database was running in DEFER status when a system or SOLVE failure occurred. As there can be no way of determining the validity or otherwise of the database, it cannot be used.

66 UDB HAS OTHER USERS

The UDB is currently open to other users (eg: NCL &FILE ID). An NDB cannot be open as a UDB as well as an NDB.

67 UDB OPEN 'INPUT'

The UDB was opened with the 'INPUT' option but the NDB START did not have 'INPUT' specified. The NDB cannot be opened in update mode.

68 DOMAIN ID MISMATCH: *xxxx*

The SOLVE domain ID *xxxx* stored in the NDB control record was different to the domain ID of this SOLVE system.

This means that either (1) the NDB is currently open on another SOLVE system, or, (2) that it was last used with another SOLVE system that did not terminate normally.

This return code warns you that you may be trying to open the NDB for update simultaneously under 2 SOLVE systems. You can override this error if required by using the 'FORCE' and the 'UNLOCK' operands of the NDB START command. However, the 'FORCE' operand should be used only after ensuring that the return code was given because of reason (2) above.

69 BAD NDB VERSION: *nnnn*.

The NDB you are STARTing was created under a version *nnnn* of SOLVE that is unsupported by this version.

70 FILE OPEN UND ID: *xxxxxxxx*.

This NDB appears to be already allocated to this SOLVE system (under fileid xxxxxxxx). You are attempting to open it twice. (This is detected by the VSAM timestamps being the same).

System Action:

The database does not start.

User Action:

Use the error information to find and correct the problem.

N87902

VSAM ERROR ON NDB FILE: *dbname* VFS REQUEST CODE: *rr* R15: *cc* FDBK: *ff*.

Reason:

An error occurred while performing I/O on an NDB.

VFS REQUEST CODE describes the failing action:

4 = GET

8 = PUT

16 = REPL

36 = RESET

R15 is the return code from the action:

8 = Error, see FDBK code for details

12 = I/O Error

16 = Dataset is full

FDBK is the Error Reason Code from the Feedback Area in the VSAM RPL.

System Action:

The database is stopped and LOCKED.

User Action:

If necessary, see the IBM manual DFSMS Macro Instructions for Datasets to determine the meaning of the feedback and the appropriate course of corrective action.

N87903

JOURNAL ERROR FOR NDB: *aaaaaaaa*, R15: *bb* FDBK: *cc*.

Reason:

An error occurred while writing to the Management Services JOURNAL dataset. R15 and FDBK are the VSAM error codes from the JOURNAL write operation.

System Action:

NDB *aaaaaaaa* is stopped and journaling is discontinued.

User Action:

Correct the problem with the journal dataset. If it is not possible to recover the journal dataset, all NDBs which rely on journaling should be stopped and backed up before proceeding.

N87904

NDB FILE: *dbname* ACCESSING SOLVE DOMAIN ID RESET FROM *domain*.

Reason:

When opening an NDB, the internal saved SOLVE domain ID was not blank, and not the same as the current domain ID. The NDB START command had FORCE specified, and the domain ID has been reset.

System Action:

The database starts.

User Action:

Check that the NDB is not simultaneously open on another SOLVE system.

N87905

NDB FILE: *dbname* INTERNAL FILE ID RESET FROM *id*.

Reason:

When opening an NDB, the internal saved UDB FILEID was not the same as the NDB name. It has been reset.

System Action:

The database starts.

User Action:

This is a warning message. The different file id could be because a copy of a production database is being opened under another name.

N87A01

`*fieldname*` IS NOT A VALID FIELD NAME.

Reason:

The indicated token in the free-form text is not a valid field name.

System Action:

The requested NDB operation is cancelled.

User Action:

Correct the free-format text field name.

N87A02

FIELD `*fieldname*` IS NOT A FIELD ON THE FILE.

Reason:

The indicated field name is a valid field name, but is not defined on the NDB.

System Action:

The requested NDB operation is cancelled.

User Action:

Provide the correct, defined field name.

N87A03

FIELD `fieldname' DUPLICATED IN VALUES LIST, WITH DIFFERENT VALUES.

Reason:

The indicated field was specified more than once in a *fieldname = fieldvalue* list for an &NDBADD or &NDBUPD statement, but the values were different.

System Action:

The requested NDB operation is cancelled.

User Action:

Correct the duplicated entry, by either removing it, or by ensuring the values are identical.

N87A04

EXPECTED `=', FOUND `value'.

Reason:

While processing a *fieldname = fieldvalue* list for an &NDBADD or &NDBUPD statement, something other than `=' or `EQ' was found following a field name.

System Action:

The requested NDB operation is cancelled.

User Action:

Correct the syntax of the list.

N87A05

EXPECTED VALID VALUE FOR FIELD `fieldname', FOUND `value'.

Reason:

The value found for the indicated fieldname was not in the correct format, or was unrecognisable.

System Action:

The requested NDB operation is cancelled.

User Action:

Correct the value for the indicated field.

N87A06

VALUE FOR FIELD `fieldname' IS TOO LONG.

Reason:

The supplied value for the indicated field was too long. For example, a character-format field that is keyed had a value longer than the VSAM keylength - 8.

System Action:

The requested NDB operation is cancelled.

User Action:

Correct the value for the indicated field.

N87A07

VALUE FOR FIELD `fieldname' IS NOT NUMERIC OR IS TOO BIG FOR FULLWORD.

Reason:

The supplied value for a numeric field had non-numeric characters, or the numeric value was greater than the valid range that will fit in a fullword (-2,147,483,648 to +2,147,483,647).

System Action:

The requested NDB operation is cancelled.

User Action:

Correct the value for the indicated field.

N87A08

VALUE FOR FIELD `fieldname' IS NOT VALID HEX.

Reason:

The supplied value for a hex-format field contained characters other than 0-9, A-Z, a-z, or had an odd number of characters.

System Action:

The requested NDB operation is cancelled.

User Action:

Correct the value for the indicated field.

N87A09

**VALUE FOR FIELD ` *fieldname* ' IS NULL, AND FIELD IS
NULLVALUE=NO.**

Reason:

The supplied value for the indicated field is the null value (blank for character, 0 for numeric, blank for hex, 000000 for date), and the field has been defined with NULLVALUE = NO. Thus, the null value is not permitted.

System Action:

The requested NDB operation is cancelled.

User Action:

Correct the value for the indicated field.

N87A10**VALUE FOR FIELD `fieldname' IS NOT A VALID DATE.****Reason:**

The supplied value for the indicated field is not a valid DATE or CDATE. The expected format depends on the &NDBCTL DATEFMT setting. These formats are:

NO

For the field format of DATE means that the date will only be accepted in the YYMMDD (DATE7) format. For the field format of CDATE means that a 6-digit number is processed as YYMMDD (DATE7) and an 8-digit number is processed as YYYYMMDD (DATE8).

*

The date data will be accepted in the format that the current user is profiled with, either UK or US format.

1 or DATE1

YY.DDD

2 or DATE2

DAY DD-MON-YEAR

3 or DATE3

DD-MON-YEAR

4 or DATE4 or UK

DD/MM/YY

5 or DATE5 or US

MM/DD/YY

6 or DATE6

YY/MM/DD

7 or DATE7

YYMMDD

8 or DATE8

YYYYMMDD

9 or DATE9

n (the number of days from 1 January 0001)

10 or DATE10

YYYYMMDDHHMMSSxHHMM

Note that a 0 value is always valid and indicates a null date. See the NCL Reference (&DATE*n* system variables) for more explanation about the date formats.

System Action:

The requested NDB operation is cancelled.

User Action:

Correct the value for the indicated field.

N87A11**VALUE FOR FIELD `fieldname' IS NOT VALID FLOATING POINT.****Reason:**

The supplied value for the indicated field is not a valid floating point number.

System Action:

The requested NDB operation is cancelled.

User Action:

Correct the value for the indicated field.

N87A12**VALUE FOR FIELD `fieldname' MUST BE QUOTED.****Reason:**

&NDBCTL QUOTE=YES is in effect, and thus the value supplied for the named field must be in quotes.

System Action:

The value is rejected. Further action depends on the specific &NDBxxx NCL statement being processed.

User Action:

Correct the supplied value.

N87A13

VALUE FOR FIELD `fieldname' IS NOT A VALID HEXADECIMAL NUMBER.

Reason:

The supplied value for the named field must be a valid hexadecimal number, from 1 to 8 hex digits.

System Action:

The value is rejected. Further processing depends on the specific &NDBxxx NCL statement being processed.

User Action:

Correct the value.

N87A14

VALUE FOR FIELD `fieldname' IS NOT A VALID TIME.

Reason:

The supplied value for the indicated field name is not a valid time, in the format 'HHMMSS.ttttt'.

System Action:

The value is rejected. Further processing depends on the specific &NDBxxx NCL statement being processed.

User Action:

Correct the supplied value.

N87A15

VALUE FOR FIELD `fieldname' IS NOT A VALID TIMESTAMP.

Reason:

The supplied value for the named field is not a valid timestamp, in the format 'YYYYMMDDHHMMSS.ttttt'.

System Action:

The value is rejected. Further processing depends on the specific &NDBxxx NCL statement being processed.

User Action:

Correct the value.

N87A21

EXPECTED VALID DATA VALUE, FOUND: *value*.

Reason:

The supplied value was not a either a number, word, or quoted string.

System Action:

The requested NDB operation is cancelled.

User Action:

Correct the value.

N87A22

EXPECTED END OF DATA, FOUND: *value*.

Reason:

While processing a value entry for a field, invalid data was found following it.

System Action:

The requested NDB operation is cancelled.

User Action:

Correct the value. Quoting may be required.

N87A23

DATA TOO LONG IN VARIABLE: *varname*

Reason:

While processing an output format, the value retrieved from a variable was too long for the target NDB field.

System Action:

The requested NDB operation is cancelled.

User Action:

Correct the value.

N87B01

**READ OF CONTINUATION DATA RECORD FAILED, NDB=*filename*
RID=*rid*.**

Reason:

While attempting to read an NDB data record with the indicated RID, an error occurred.

System Action:

The requested NDB operation is cancelled.

User Action:

Report the problem to your systems administrator.

N87C10

UNIQUE KEY FIELD '*fieldname*' VALUE ALREADY IN FILE.

Reason:

While processing an &NDBADD or &NDBUPD statement, the supplied value for the indicated field already exists in the NDB, and the field is defined as uniquely keyed (or a sequence key).

System Action:

The requested NDB operation is cancelled.

User Action:

Correct the value for the indicated field.

N87C11

KEY FIELD '*fieldname*' ERROR READING KGE FOR DBKR.

Reason:

While processing key records for the indicated field, an error occurred when issuing an internal GET KGE for the key value.

System Action:

The requested NDB operation is cancelled.

User Action:

Report the problem to your systems administrator.

N87C20**KEY FIELD `fieldname' ERROR READING HEXFF DBKR.****Reason:**

While processing key records for the indicated field, an error occurred when issuing an internal GET for the high-value key record.

System Action:

The requested NDB operation is cancelled.

User Action:

Report the problem to your systems administrator.

N87C21**KEY FIELD `fieldname' ERROR READING KGE FOR DBKR.****Reason:**

While processing key records for the indicated field, an error occurred when issuing an internal GET KGE for the key value.

System Action:

The requested NDB operation is cancelled.

User Action:

Report the problem to your systems administrator.

N87D01**EXPECTED FORMAT TYPE, FOUND: value.****Reason:**

While processing a format list on &NDBFMT or &NDBGGET, the first word was not a valid format type: NO-FIELDS, KEY-FIELDS, ALL-FIELDS, FIELDS for INPUT formats or ALL- FIELDS, FIELDS for OUTPUT formats

System Action:

The requested NDB operation is cancelled.

User Action:

Correct the format definition.

N87D02

INVALID FORMAT LIST SYNTAX AT: *format-text*.

Reason:

While processing a format list on an &NDBFMT or an &NDBGET, an invalid, or an out of place keyword/variable name was encountered.

System Action:

The requested NDB operation is cancelled.

User Action:

Correct the format definition.

N87D03

EXPECTED END OF FORMAT LIST/FIELD NAME/[, FOUND: *value*.

Reason:

While processing a format list on &NDBFMT or &NDBGET, invalid data was found when either the end of the list, a field name, or an opening parenthesis was expected.

System Action:

The requested NDB operation is cancelled.

User Action:

Correct the format definition.

N87D04

EXPECTED VALID *aaaaaaaa* NAME, FOUND: *value*.

Reason:

While processing a format list on &NDBFMT or &NDBGET, an invalid database field name (for an INPUT format) or NCL variable name (for an OUTPUT format) was found. The.RID keyword may be specified on the right hand side of a field entry for an INPUT format only.

System Action:

The requested NDB operation is cancelled.

User Action:

Correct the format definition.

N87D05

EXPECTED `)', FOUND: *value*.

Reason:

While processing a format list on &NDBFMT or &NDBGET, unrecognized data was encountered when a closing parenthesis was expected.

System Action:

The requested NDB operation is cancelled.

User Action:

Correct the format definition.

N87D06

EXPECTED GENERIC DATABASE FIELD NAME, FOUND: *data*.

Reason:

While processing a format list on an &NDBFMT or an &NDBGET, a field assignment statement was found where the target variable name was generic but the source database field name was not. Either both or neither of these values may be generic.

System Action:

The requested NDB operation is cancelled.

User Action:

Correct the format definition.

N87D07

GENERIC RENAME OF FIELD: *field* USING *variable* = *dbfield* EXCEEDED 12 CHAR

Reason:

While processing a format list on an &NDBFMT or an &NDBGET, a generic assignment was encountered where the target variable name prefix was longer than the source *dbfield* name prefix, however, a field field was encountered, which although not 12 characters long, would have generated an NCL variable name longer than 12 characters when the *dbfield* prefix was replaced with the field prefix.

System Action:

The requested NDB operation is cancelled.

User Action:

Correct the format definition.

N87D08

OPEN PAREN NOT FOLLOWED BY (GENERIC) FIELD NAME: *data*.

Reason:

While processing a format list on an &NDBFMT or an &NDBGET, an opening parenthesis was encountered, however *data* was not a valid field/variable name or a generic name.

System Action:

The requested NDB operation is cancelled.

User Action:

Correct the format definition.

N87D09**GENERIC RENAME NUMERIC PREFIX ERROR: *variableprefix*
dbnameprefix.****Reason:**

While processing a format list on an &NDBFMT or an &NDBGET, a generic assignment statement was encountered which contained a numeric prefix for *variableprefix* but a non-numeric prefix for *dbnameprefix*. This would cause variable names to be generated which were non-numeric but which began with a numeric character, which is not allowed in NCL statements.

System Action:

The requested NDB operation is cancelled.

User Action:

Correct the format definition.

N87D11**FIELD NAME: *fieldname* IS NOT A FIELD ON THE DATABASE.****Reason:**

While processing a format list on &NDBFMT or &NDBGET, a field name that is not a defined field on the database was encountered.

System Action:

The requested NDB operation is cancelled.

User Action:

Correct the format definition.

N87D12

FIELD NAME: *keyword* INVALID AS RETURN FIELD, NCL KEYWORD.

Reason:

While processing an input format list on an &NDBFMT or an &NDBGET, an assignment of a database field to an NCL variable name was encountered, however, the variable name was a special NCL reserved keyword, for example, IF. NCL keywords may not be used as targets for assignment of database fields.

System Action:

The requested NDB operation is cancelled.

User Action:

Correct the format definition.

N87D13

FIELD NAME: *fieldname* INVALID AS SOURCE FIELD, NCL VERB/BIF.

Reason:

The nominated source field name is an NCL verb or builtin function name, for example, IF. Only NCL system variables are valid as output format source field names.

System Action:

The output format is not built.

User Action:

Correct the output format.

N87D20

EXPECTED ')' OR VALID FORMAT OPTION, FOUND: *data*.

Reason:

While processing a format list on an &NDBFMT or an &NDBGGET, a format field entry in parentheses was encountered, and either an unrecognized or misspelt keyword was encountered, or more than one field entry was entered. Each field entry must be in its own set of parenthesis.

System Action:

The requested NDB operation is cancelled.

User Action:

Correct the format definition.

N87D14

NDB FIELD: *fieldname* REFERRED TO TWICE IN OUTPUT FORMAT.

Reason:

An output format has named the same NDB field twice.

System Action:

The output format is not built.

User Action:

Correct the format definition.

N87D21

EXPECTED '=' AFTER *formatoption*, FOUND *data*.

Reason:

While processing a format list on an &NDBFMT or an &NDBGGET, a formatting option which required an argument preceded by an equals sign (for example, PAD = character) was found, however, there was no equals sign encountered.

System Action:

The requested NDB operation is cancelled.

User Action:

Correct the format definition.

N87D22

***data* IS AN INVALID VALUE FOR FORMAT OPTION: *bbbbbb*.**

Reason:

While processing a format list on an &NDBFMT or an &NDBGET, formatting option *bbbbbb* was encountered, however the argument *data* specified for it was not valid.

System Action:

The requested NDB operation is cancelled.

User Action:

Correct the format definition.

N87D23

***length* IS NOT A VALID LENGTH, 0 TO 255.**

Reason:

While processing a format list on an &NDBFMT or an &NDBGET, the LENGTH option was encountered but the operand, *length*, was not in the range 0- 255.

System Action:

The requested NDB operation is cancelled.

User Action:

Correct the format definition.

N87D24

***character* IS NOT A VALID PAD CHARACTER.**

Reason:

While processing a format list on an &NDBFMT or an &NDBGET, the PAD option was encountered but the operand, *character*, was more than one character long or was not properly enclosed in quotes..

System Action:

The requested NDB operation is cancelled.

User Action:

Correct the format definition.

N87D30**MORE THAN n .LINK REQUESTS IN FORMAT.****Reason:**

While processing a format list on an &NDBFMT or an &NDBGGET, the facility to link multiple records was used, but an attempt was made to link more than the maximum allowed. The maximum number allowed was n .

System Action:

The requested NDB operation is cancelled.

User Action:

Correct the format definition. To link more records, use separate NDB statements.

N87D31**.LINK NOT FOLLOWED BY '('.****Reason:**

While processing a format list on an &NDBFMT or an &NDBGGET, the LINK option was encountered but was not followed by an opening parenthesis. The operands for the .LINK are required to be in parentheses.

System Action:

The requested NDB operation is cancelled.

User Action:

Correct the format definition.

N87D32

EXPECTED ')' OR VALID .LINK KEYWORD, FOUND: *data*.

Reason:

While processing a format list on an &NDBFMT or an &NDBGET, either an unknown or misspelt .LINK keyword was encountered, or there was no closing parenthesis after the .LINK keywords. The field lists following the link keywords and any subsequent .LINK keywords must not come before the closing parenthesis.

System Action:

The requested NDB operation is cancelled.

User Action:

Correct the format definition.

N87D33

EXPECTED '=', FOUND: *data*.

Reason:

While processing the .LINK options within a format list on an &NDBFMT or an &NDBGET, an option was encountered which needed an operand preceded by an equals sign, for example, the FROM= operand, however no equals sign was encountered.

System Action:

The requested NDB operation is cancelled.

User Action:

Correct the format definition.

N87D34***kwrd* KEYWORD DUPLICATED IN .LINK PARAMETERS.****Reason:**

While processing a format list on an &NDBFMT or an &NDBGET, keyword *kwrd* was encountered twice. Each keyword should only be present once.

System Action:

The requested NDB operation is cancelled.

User Action:

Correct the format definition.

N87D35**FROM= VALUE INVALID FIELD NAME OR NOT DEFINED: *name*.****Reason:**

While processing a format list on an &NDBFMT or an &NDBGET, the fieldname *name* specified as the field from which to extract the search key value for a .LINK was not a valid field name or does not exist on the NDB.

System Action:

The requested NDB operation is cancelled.

User Action:

Correct the format definition.

N87D36**TO= VALUE INVALID FIELD NAME, NOT DEFINED, OR NOT KEYED:
name.****Reason:**

While processing a format list on an &NDBFMT or an &NDBGET, the fieldname *name* specified as the field to search on to perform the .LINK either was not a valid field name, did not exist on the NDB, or was not keyed. The field must be keyed to perform the search.

System Action:

The requested NDB operation is cancelled.

User Action:

Correct the format definition.

N87D37

ID= VALUE INVALID VALUE OR DUPLICATED: *linkid*.

Reason:

While processing a format list on an &NDBFMT or an &NDBGET, the ID *linkid* specified as the reference for this .LINK operation was either invalid (contained invalid characters) or was used in a previous link operation on the same statement.

System Action:

The requested NDB operation is cancelled.

User Action:

Correct the format definition.

N87D38

FROMID= VALUE INVALID VALUE OR NOT DEFINED: *linkid*.

Reason:

While processing a format list on an &NDBFMT or an &NDBGET, the *linkid* representing the ID of the previous link operation from which to link in this operation was either invalid (that is contained invalid characters) or did not exist on a previous link operation on the same statement.

System Action:

The requested NDB operation is cancelled.

User Action:

Correct the format definition.

N87D39

NOFIND= VALUE INVALID: *data*.

Reason:

While processing a format list on an &NDBFMT or an &NDBGET, the value of the nofind operand was invalid.

System Action:

The requested NDB operation is cancelled.

User Action:

Correct the format definition.

N87D40**.LINK FROM= AND/OR TO= NOT PROVIDED.****Reason:**

While processing a format list on an &NDBFMT or an &NDBGET, a .LINK operation was attempted, however one or both of the FROM= and TO= operands was missing. Both of these operands are mandatory.

System Action:

The requested NDB operation is cancelled.

User Action:

Correct the format definition.

N87D41**.LINK FROM= AND TO= FIELD FORMATS DIFFERENT.****Reason:**

While processing a format list on an &NDBFMT or an &NDBGET, a .LINK operation was attempted, however the fields specified on the FROM= and the TO= operands were a different format. They must be the same format, that is, both character, or both numeric etc.

System Action:

The requested NDB operation is cancelled.

User Action:

Correct the format definition.

N87E01**SEQUENCE ID '*seqname*' INVALID FOR ADD.****Reason:**

The sequence name *seqname* is not a valid sequence name.

System Action:

The sequence is not defined.

User Action:

Provide a valid sequence name.

N87E02

SEQUENCE ID '*seqname*' ALREADY EXISTS, CANNOT ADD.

Reason:

The sequence name supplied on an &NDBSEQ already exists for this process, and thus cannot be added.

System Action:

The sequence is not redefined.

User Action:

Provide a unique sequence name.

N87E03

FROM RECORD ID IS NOT VALID.

Reason:

When defining a sequence by RID, the supplied 'from' RID value was not valid.

System Action:

The sequence is not defined.

User Action:

Correct the from RID value.

N87E04

TO RECORD ID IS NOT VALID.

Reason:

When defining a sequence by RID, the supplied 'to' RID value was not valid.

System Action:

The sequence is not defined.

User Action:

Correct the to RID value.

N87E05**FROM RECORD ID IS GREATER THAN TO RECORD ID.****Reason:**

When defining a sequence by RID, the supplied `from` RID value was greater than the supplied `to` RID value.

System Action:

The sequence is not defined.

User Action:

Correct the RID values.

N87E06**FIELD `*fieldname*' IS NOT A NAME ON THE FILE.****Reason:**

When defining a sequence by a key field, the named field was not defined on the database.

System Action:

The sequence is not defined.

User Action:

Provide a valid key field name.

N87E07**FIELD `*fieldname*' IS NOT A KEY FIELD.****Reason:**

When defining a sequence by a key field, the named field was not defined as keyed.

System Action:

The sequence is not defined.

User Action:

Provide a valid, keyed field name.

N87E08

FROM VALUE IS NULL.

Reason:

When defining a sequence by a key field, the provided FROM value was null.

System Action:

The sequence is not defined.

User Action:

Provide a non-null from value, or omit it altogether.

N87E09

TO VALUE IS NULL.

Reason:

When defining a sequence by a key field, the provided TO value was null.

System Action:

The sequence is not defined.

User Action:

Provide a non-null to value, or omit it altogether.

N87E10

FROM VALUE GREATER THAN TO VALUE.

Reason:

When defining a sequence by a key field, the provided FROM value was greater than the provided TO value.

System Action:

The sequence is not defined.

User Action:

Ensure that the supplied FROM and TO values are correctly specified.

N87E11**VALUE IS NULL.****Reason:**

When defining a sequence by a key field, the provided VALUE= value was null.

System Action:

The sequence is not defined.

User Action:

Provide a non-null VALUE value.

N87E12**GENERIC SEQUENCE NOT ALLOWED ON FORMAT OF FIELD *fieldname*.****Reason:**

When defining a sequence by a key field, the GENERIC= option was used, but this field format does not support generic operations.

System Action:

The sequence is not defined.

User Action:

Use the FROM/TO or VALUE options instead.

N87E13**GENERIC VALUE IS NULL.****Reason:**

When defining a sequence by a key field, the provided GENERIC= value was null.

System Action:

The sequence is not defined.

User Action:

Provide a non-null GENERIC= value.

N87E14

SEQUENCE ID '*seqname*' DEFINED FOR ACTIVE SCAN, CANNOT ADD.

Reason:

The indicated sequence name is currently defined by an in-progress NDBSCAN operation.

System Action:

The sequence is not defined.

User Action:

Provide a unique sequence name.

N87E15

FIELD '*fieldname*' IS A SEQUENCE KEY, HISTOGRAM NOT ALLOWED.

Reason:

The indicated field name is a sequence key for the NDB. A Histogram sequence is not permitted on the sequence key.

System Action:

The sequence is not defined.

User Action:

use a non-sequence-key field.

N87E16

SEQUENCE ON FIELD '*fieldname*' NOT ALLOWED, NDB IN LOAD MODE.

Reason:

The NDB is in LOAD MODE. Thus no keys are maintained. This prevents a sequence from being defined on a keyed field.

System Action:

The sequence is not defined.

User Action:

Use the NDB ALTER command to build the indices.

N87E30

SEQUENCE ID '*seqname*' NOT DEFINED, CANNOT RESET.

Reason:

The indicated sequence name is not known, so it cannot be reset.

System Action:

None.

User Action:

Provide the name of a defined sequence. Check that the desired sequence was defined with KEEP=YES, if you wish to reset it after an EOF has occurred.

N87E41

FROM RID VALUE '*value*' NOT NUMERIC.

Reason:

The supplied FROM RID value for a sequence definition was not numeric.

System Action:

The sequence is not defined.

User Action:

Correct the RID value.

N87E42

EXPECTED END-DATA AFTER FROM RID VALUE, FOUND: *value*.

Reason:

After processing the FROM RID value on an &NDBSEQ statement, unrecognized data was found following it.

System Action:

The sequence is not defined.

User Action:

Correct the &NDBSEQ statement.

N87E43

TO RID VALUE `value' NOT NUMERIC.

Reason:

The supplied TO RID value for a sequence definition was not numeric.

System Action:

The sequence is not defined.

User Action:

Correct the RID value.

N87E44

EXPECTED END-DATA AFTER TO RID VALUE, FOUND: value.

Reason:

After processing the TO RID value on an &NDBSEQ statement, unrecognized data was found following it.

System Action:

The sequence is not defined.

User Action:

Correct the &NDBSEQ statement.

N87E45

REPOS RID VALUE INVALID OR OUT OF RANGE: value.

Reason:

The supplied REPOS= RID value was not numeric, or was less than the defined FROM RID, or greater than the defined TO RID.

System Action:

The sequence is reset, but not repositioned.

User Action:

Correct the reposition RID value.

N87E46**NULL FIELD INVALID FOR REPOS.****Reason:**

The supplied REPOS= field value was null.

System Action:

The sequence is reset, but not repositioned.

User Action:

Correct the reposition value.

N87E47**SCAN LIST *seqname* WAS NOT SORTED, CANNOT REPOSITION.****Reason:**

An &NDBSEQ RESET REPOS= statement was attempted on a sequence built by &NDBSCAN. The scan did not specify a sort field. Only sorted scan sequences can be repositioned.

System Action:

The sequence is reset, but not repositioned.

User Action:

If repositioning is required for the list, specify a SORT field on the &NDBSCAN.

N87E48**SEQUENCE *seqname* NOT BUILT BY SCAN, CANNOT RID REPOSITION.****Reason:**

A reposition by RID was attempted on a sequence not built by &NDBSCAN.

System Action:

The sequence is reset, but not repositioned.

User Action:

Only sequences built by &NDBSCAN can be repositioned to a specific RID. If you require this, build the sequence using &NDBSCAN.

N87E49

SEQUENCE *seqname* NOT BUILT BY SCAN, CANNOT RELPOS REPOSITION.

Reason:

An &NDBSEQ RESET NCL statement attempted to use the RELPOS=*n* operand to reposition the nominated sequence. The sequence was not built by &NDBSCAN, thus the RELPOS reposition is not supported.

System Action:

An NDB error is returned.

User Action:

Correct the &NDBSEQ NCL statement.

N87E50

SCAN LIST *seqname* SORT OPTIONS DO NOT ALLOW REPOSITION.

Reason:

An &NDBSEQ RESET REPOS=*value* NCL statement has attempted to reposition a sequence that, whilst sorted, is not suitable for reposition. This is because the primary sort field was substringed.

System Action:

An NDB error is returned.

User Action:

Correct the &NDBSEQ NCL statement.

N87G01

PASSED RELATIVE FIELD NUMBER LT 1 OR GT NUM FLDS.

Reason:

The relative field number provided on an &NDBINFO NUMBER=*n* was less than 1, or greater than the number of fields currently defined in the database.

System Action:

No information is returned.

User Action:

Correct the relative field number.

N87H01**SEQUENCE ID `seqname' CURRENTLY IN USE BY A SEQUENCE.****Reason:**

The supplied sequence name on an &NDBSCAN is currently defined as a sequence (not necessarily a SCAN sequence).

System Action:

The scan is not processed.

User Action:

Provide a unique sequence name.

N87H02**SEQUENCE ID `seqname' CURRENTLY IN USE BY A SCAN.****Reason:**

The supplied sequence name on an &NDBSCAN is currently being processed as another &NDBSCAN.

System Action:

The scan is not processed.

User Action:

Provide a unique sequence name.

N87H03**SORT EXPRESSION ERROR - *information*****Reason:**

An error was found in the &NDBSCAN sort expression. The message text describes the error and location.

System Action:

The scan is not processed.

User Action:

Correct the sort expression.

N87I40

EXPECTED)/AND/OR, FOUND: *token*.

Reason:

An unexpected token was found in the scan expression. An 'AND', 'OR', or a right parenthesis was expected.

System Action:

The scan is not processed.

User Action:

Correct the scan expression.

N87I50

IGNORE MUST BE FOLLOWED BY TRUE/FALSE, FOUND: *token*

Reason:

The optional IGNORE clause is followed by '*token*', the value allowed is TRUE or FALSE.

System Action:

The scan is not processed.

User Action:

Correct the scan expression.

N87I51

INVALID FIELD/GENERIC FIELD NAME

Reason:

An invalid field name found in the scan expression.

System Action:

The scan is not processed.

User Action:

Correct the scan expression.

N87I52

FIELD NAME: *field-name* NOT DEFINED ON DATABASE.

Reason:

The field-name found in the scan expression is not defined on database.

System Action:

The scan is not processed.

User Action:

Correct the scan expression.

N87I53

FIELD RANGE, TO INVALID FIELD NAME: *fieldname*

Reason:

The fieldname on the left of the RANGE expression is invalid.

System Action:

The scan is not processed.

User Action:

Correct the scan expression.

N87I54

FIELD RANGE, TO NAME < FROM NAME: *aaa*

Reason:

The fieldname on the right of the RANGE expression is less than the fieldname on the the left of the RANGE expression.

System Action:

The scan is not processed.

User Action:

Correct the scan expression.

N87I55

NO FIELDS MATCH RANGE OR GENERIC: *value*

Reason:

A range or generic field name specification was provided but no fields on the NDB match the name specification.

System Action:

The scan is not processed.

User Action:

Correct the scan expression.

N87I56

EXPECTED VALID RELATIONAL OPERATOR, FOUND: *aaaaaa*

Reason:

The operator *aaaaaa* found in the scan expression is invalid.

System Action:

The scan is not processed.

User Action:

Correct the scan expression.

N87I57

EXPECTED 'NULL' FOUND: *aaaaaa*

Reason:

The operator *aa* found in the scan expression is invalid. It must be NULL.

System Action:

The scan is not processed.

User Action:

Correct the scan expression.

N87I58**EXPECTED OPERATOR AFTER 'NOT' FOUND: *aaaaaa*****Reason:**

The operator found after NOT is not a valid operator.

System Action:

The scan is not processed.

User Action:

Correct the scan expression.

N87I59**ANY/ALL INVALID ON LHS OF OPERATOR: *aaaaaa*****Reason:**

ANY or ALL is invalid on the left hand side of the operator *aaaaaa*

System Action:

The scan is not processed.

User Action:

Correct the scan expression.

N87I60**FIELD LISTS INVALID ON LHS OF OPERATOR: *aaaaaa*****Reason:**

The field lists on the left hand side of the given operator is invalid.

System Action:

The scan is not processed.

User Action:

Correct the scan expression.

N87I61

MIXED FIELD FORMATS INVALID FOR THIS OPERATOR: *aaaaaa*

Reason:

A mixed field formats is invalid when using the operator *aaaaaa*.

System Action:

The scan is not processed.

User Action:

Correct the scan expression.

N87I62

CONTAINS/LIKE OPERATOR INVALID FOR THIS FIELD FORMAT.

Reason:

CONTAINS or LIKE operator is invalid while using the given field format.

System Action:

The scan is not processed.

User Action:

Correct the scan expression.

N87I63

OPERATOR *aaaaaa* DOES NOT SUPPORT LEFT HAND SIDE.

Reason:

The given operator *aaaaaa* does not support fields on the left hand side.

System Action:

The scan is not processed.

User Action:

Correct the scan expression.

N87I64**EXPECTED '(' FOUND: token****Reason:**

Syntax error found in the scan expression. A '(' was expected, but the displayed token was found.

System Action:

The scan is not processed.

User Action:

Correct the scan expression.

N87I65**INVALID SEQUENCE NAME: aaaaaa****Reason:**

The sequence name *aaaaaa* found in the scan expression is invalid.

System Action:

The scan is not processed.

User Action:

Correct the scan expression.

N87I66**SEQUENCE NAME: aaaaaa NOT FOUND.****Reason:**

The sequence name *aaaaaa* found in the scan expression was not found in the current list of sequences owned by the requesting user ID.

System Action:

The scan is not processed.

User Action:

Correct the scan expression.

N87I67

SEQUENCE: *name* NOT BUILT BY SCAN.

Reason:

The sequence name in the scan expression names a sequence not built by an &NDBSCAN.

System Action:

The scan is not processed.

User Action:

Use &NDBSCAN SEQUENCE=*name* to specify the sequence name used in the scan expression.

N87I68

EXPECTED 'AND' FOUND: *token*

Reason:

Syntax error found in the scan expression. The word 'AND' was expected but the displayed token was found.

System Action:

The scan is not processed.

User Action:

Correct the scan expression.

N87I69

RANGE OF VALUES, SECOND LOWER THAN FIRST: *value*

Reason:

The value of the second operand is lower than the first operand in the scan expression.

System Action:

The scan is not processed.

User Action:

Correct the scan expression.

N87I70

EXPECTED , OR) FOUND: *token*.

Reason:

Syntax error found in the scan expression. Either ',' or ')', was expected but the displayed token was found.

System Action:

The scan is not processed.

User Action:

Correct the scan expression.

N87I71

FIELD FORMAT INCOMPATIBLE WITH OTHER FIELD(S) IN THIS RELATION: *fldname*

Reason:

At least one of the fields provided to a scan operator is of a different type to the other fields.

System Action:

The scan is not processed.

User Action:

Correct the scan expression.

N87I72

PLUS/MINUS N INVALID FOR FIELD FORMAT.

Reason:

For the given field format in the scan expression PLUS or MINUS N is invalid.

System Action:

The scan is not processed.

User Action:

Use &NDBSCAN SEQUENCE=*name* to specify the sequence name used in the scan expression.

N87I73

INVALID ADJUST AMOUNT, OR TOO LARGE/SMALL: *amount*.

Reason:

The adjust amount given in the the scan expression is invalid.

System Action:

The scan is not processed.

User Action:

Correct the scan syntax.

N87I74

GENERIC OR RANGE VALUE(s) INVALID ON RHS OF RELATIONAL OPERATOR *opername*

Reason:

The generic or range value on the right hand side of the operator given is invalid.

System Action:

The scan is not processed.

User Action:

Correct the scan expression.

N87I75

INVALID CORRELATION ID: *name*

Reason:

The indicated scan subselect correlation id is not valid. It must be a 1 to 8 character name with the first character alpha or national, and the remaining characters alphanumeric or national, or a single asterisk (*).

System Action:

The scan is not processed.

User Action:

Correct the scan expression.

N87I76**CORRELATION ID: xxxxxx IS NOT ANY PARENT ID.****Reason:**

The correlation id xxxxxx found in the scan expression is not a parent id.

System Action:

The scan is not processed.

User Action:

Correct the scan expression.

N87I77**EXPECTED ')' AFTER CORRELATION ID, FOUND: *token*****Reason:**

Syntax error found in the scan expression expected ')' after correlation id but found '*token*'.

System Action:

The scan is not processed.

User Action:

Correct the scan expression.

N87I78**PLUS/MINUS NOT ALLOWED WITH CORRELATED REFERENCE.****Reason:**

A correlated scan test was found with the PLUS or MINUS clause. PLUS/MINUS is not permitted when performing a correlated test.

System Action:

The scan is not processed.

User Action:

Correct the scan expression.

N87179

FIELD FORMAT DOES NOT SUPPORT 'GENERIC' COMPARISONS: *data data*.

Reason:

A generic comparison has been requested for a field with a format that does not support it, for example a numeric field.

System Action:

The scan is not processed.

User Action:

Correct the scan expression.

N87185

FIELD *fieldname* HAS WRONG FORMAT FOR THIS SUBSELECT.

Reason:

The format of the fieldname is invalid when using this subselect.

System Action:

The scan is not processed.

User Action:

Correct the scan expression.

N87186

EXPECTED 'WHERE' FOUND: *xxxxx*

Reason:

Syntax error found in the scan expression. Expected 'WHERE' but found xxxx.

System Action:

The scan is not processed.

User Action:

Correct the scan expression.

N87I87**EXPECTED ',' OR 'FROM' FOUND: xxxxx****Reason:**

Syntax error found in the scan expression. Either ',' or 'FROM' was expected but found xxxxx.

System Action:

The scan is not processed.

User Action:

Correct the scan expression.

N87I88**EXPECTED CURRENT NDB NAME FOUND: xxxxx****Reason:**

Syntax error found in the scan expression. An NDB name was expected but xxxxx was found.

System Action:

The scan is not processed.

User Action:

Correct the scan expression.

N87I89**INVALID CORRELATION ID: xxxxxx****Reason:**

The correlation id xxxxxx found in the scan expression is invalid.

System Action:

The scan is not processed.

User Action:

Correct the scan expression.

N87I91

UNEXPECTED END-OF-DATA AFTER: *aaaaaa*.

Reason:

The scan expression is incomplete, missing information after *aaaaaa*.

System Action:

The scan is not processed.

User Action:

Correct the scan expression.

N87I92

'SELECT' KEYWORD EXPECTED, FOUND: *keyword*

Reason:

The scan expression is invalid, the keyword expected is 'SELECT'.

System Action:

The scan is not processed.

User Action:

Correct the scan expression.

N87I93

NULL FIELD INVALID FOR COMPARISON.

Reason:

Both of the fields used in comparison must be non NULL.

System Action:

The scan is not processed.

User Action:

Correct the scan expression.

N87I94**INITIAL 'SELECT/FROM/WHERE' CLAUSE INVALID.****Reason:**

In the scan expression SELECT or FROM or WHERE clause is invalid.

System Action:

The scan is not processed.

User Action:

Correct the scan expression.

N87I99**INVALID OR UNRECOGNISABLE SYNTAX: *aaaaaa*.****Reason:**

The syntax *aaaaaa* in the scan expression is invalid.

System Action:

The scan is not processed.

User Action:

Correct the scan expression.

N87K01**DEBUG DUMP OF type SCAN REQUEST FOR NDB: *ndb* IID: *id*****Reason:**

This message indicates that a dump of a successfully parsed (analysed but not yet processed) scan request follows. This will occur if &NDBCTL SCANDEBUG=YES is in effect. If optimisation is in effect for this request, the 'type' field will show 'OPTIMISED', otherwise it will show 'PARSED'. The NDB name and internal scan id are shown. These will match up the processed trace messages, starting with N87K31.

System Action:

None. The debug information follows.

User Action:

None.

N87K02**SEQUENCE ID SRT KEP EXE RTD RTP OPTM IOLIM TIMELIM STGLIM RECLIM****Reason:**

This is the first line of scan debug output. It provides headings for message N87K03. The headings are:

SEQUENCE ID

The sequence name assigned to this scan, or '-' if none.

SRT

The SORT option, YES or NO.

KEP

The KEEP option, YES or NO.

EXE

The EXECUTE option, YES or NO.

RTD

The RETDEL option, YES OR NO.

RTP

The RETPOS option, YES or NO.

OPTM

The OPTIMISE option, YES or NO.

IOLIM

The value used as the I/O limit for this scan.

TIMELIM

The value used as the TIME limit for this scan.

STGLIM

The value used as the STORAGE limit for this scan.

RECLIM

The value used as the RECORD limit for this scan.

System Action:

None.

User Action:

None.

N87K03

data data data ...

Reason:

This line of the scan debug output displays various parameters in effect for the scan. The column headings and descriptions are in message N87K02. Refer to that message for details.

System Action:

None.

User Action:

None.

N87K04

TEXT: *scan-expression*

Reason:

This line of the scan debug output shows up to the first 50 characters of the scan expression.

System Action:

None.

User Action:

None.

N87K05

(CONT): *scan-expression*

Reason:

This line of the scan debug output contains addition scan expression text, as required.

System Action:

None.

User Action:

None.

N87K06

SORT: *nnnn fieldname (s,e,d)*

Reason:

This scan debug message describes the sort options in effect for this scan. Each line displays the field name, and the optional start and end substring, and sort direction.

System Action:

None.

User Action:

None.

N87K10**IID CORR-ID PRNT TYPE LINE COR PRTY****Reason:**

This line of scan debug output is a header line for the following list of individual scan tables and sub-scan table (subselects). The headings are:

IID

The internally assigned scan table id.

CORR-ID

An optional correlation id.

PRNT

The parent scan table.

TYPE

The scan table result type:

PRIMARY - The primary scan table - result is the list of records.

UNIQUE - Keep unique field values for outer scan

LARGEST - Keep largest unique value for outer scan

SMALLEST - Keep smallest unique value for outer scan

EXISTS - Keep existence of at least one matching record.

LINE

The index of the first line in the action table dump.

COR

Whether or not the scan is correlated. There are 3 possibilities:

NO - The scan is not correlated.

YES - The scan is correlated.

DEP - The scan is not correlated, but depends on a correlated sub-select.

PRTY

The optimizer-assigned priority.

System Action:

None.

User Action:

None.

N87K11

data data data ...

Reason:

This line contains the information about each scan table. Refer to message N87K10 for an explanation of each field.

System Action:

None.

User Action:

None.

N87K12**LINE NEXT TYP PRTY S/IG RELATION INFORMATION****Reason:**

This is a heading line of the scan debug table. It provides column headings for the following dump of the parsed scan action table. The column headings are:

LINE - The table line number. Referred to in other columns, and indexed by the N87K11 individual table description lines.

NEXT - The next table line to execute after this one, including under a parent (for example AND) line.

TYP - The type of table line. The values can be:

AND - 'AND' operation.

OR - 'OR' operation.

NOT - 'NOT' operation.

REL - 'relation' test operation.

PRTY - The optimizer-assigned priority.

S/IG - Either a sub-line index or the IGNORE option.

RELATION INFORMATION - individual relation information.

System Action:

None.

User Action:

None.

N87K13***iid line*****Reason:**

This scan debug message precedes the action table for each individual scan expression or sub-select expression. The internal id and first line number of the following expression are displayed. These line up under the LINE and NEXT heading columns of the N87K12 message.

System Action:

None.

User Action:

None.

N87K14***line next typ prty s/ig specific-information*****Reason:**

This scan debug message describes a single scan action table entry. The columns are:

line - the assigned line number of this line.

next - the next-to-execute line number under the line's parent.

type - the type of line, AND, OR, NOT, or REL.

prty - the optimizer-assigned priority.

s/ig - The first sub-line (AND/OR/NOT), or IGNORE option (REL).

specific-information - depends on the type of line:

- For AND, OR, and NOT, is blank.
- For REL, depends on the relation:
 - For a standard operator (eg =), shows the field name, operator, ANY/ALL option, and compare type (field or value).
 - For an EXISTS or SEQUENCE operator, shows the operator, and the sequence name.

System Action:

None.

User Action:

None.

N87K15

specific-information

Reason:

This scan debug line provides additional information about a specific scan test as described in the preceding N87K14 message. The specific information contains:

- For field to value comparisons, the values and generic/range flags.
- For field to field comparisons, the field names and adjust amount. If correlated, the correlation id is also included.
- For a subselect, the subselect name.

System Action:

None.

User Action:

None.

N87K16

specific-information

Reason:

This scan debug message follows message N87K15 and provides additional information for sub-select tests.

The list of fields that values will be extracted from is contained in this message, which will repeat if required.

System Action:

None.

User Action:

None.

N87K31

DEBUG DUMP OF PROCESSED SCAN REQUEST FOR NDB: *ndbname* IID: *iid*.

Reason:

This scan debug message is the first message produced following the execution of an &NDBSCAN with the debug facility requested. The NDB name and internal id (*iid*) can be used to match the execution dump with the parsed dump (headed by message N87K01).

System Action:

None.

User Action:

None.

N87K32

RSP RECORDS I/O TIME MAXSTG

Reason:

This scan debug message provides headings for the following N87K33 message, which provides result information about the scan. The headings are:

RSP - The NDB response code.

RECORDS - The number of records that passed the scan.

I/O - The total number of logical I/Os issued.

TIME - The elapsed time in seconds.

MAXSTG - The peak amount of storage used while processing the scan.

System Action:

None.

User Action:

None.

N87K33

rsp records i/o time maxstg

Reason:

This scan debug message provides information about the results of the scan. Refer to message N87K32 for column headings and meanings.

System Action:

None.

User Action:

None.

N87K34**IID K-EXE I/O-K TIME-K R-EXE I/O-R TIME-R RSTG RECORDS
UNQVALS****Reason:**

This scan debug message provides column headings for the following N87K35 messages, one per scan or sub-select. A correlated scan or subselect will produce 2 N87K35 lines, the second of which will contain grand totals (the first contains last-exec totals only).

The headings are:

IID - The internal id assigned to this scan or sub-select. When displaying grand totals for a correlated scan, the iid will be '-CT' meaning this is the totals for the scan identified on the previous line.

'PRI' identifies the primary (outer) scan.

'SRT' identifies the final sort (if performed)

K-EXE - The number of times key-level processing was performed for this scan (0 or 1, unless correlated, where many executions are possible).

I/O-K - The number of key-level I/Os performed.

TIME-K - The time taken for key-level processing.

R-EXE - The number of time record-level processing was performed for this scan (0 or 1, unless correlated, where many executions are possible).

I/O-R - The number of record-level I/Os performed.

TIME-R - The time taken for record-level processing.

RSTG - The amount of storage used for the result list from this scan or sub-select.

UNQVALS - For a sub-select, the number of unique values that were found and stored in the result list.

System Action:

None.

User Action:

None.

N87K35

iid k-exe i/o-k time-k r-exe i/o-r time-r rstg records unqvals

Reason:

This scan debug message provides scan or sub-select level totals. Refer to message N87K34 for column headings and details.

System Action:

None.

User Action:

None.

N87K36

LINE |----- KEY PROCESS -----| |----- REC SCAN PROCESS -----|

Reason:

This scan debug message provides column headings for the following N87K40 Messages. It shows which columns are relevant to the key level processing, and which are relevant to the record level processing.

System Action:

None.

User Action:

None.

N87K37**RESULT SCAN COUNT IN PASS FAIL NULL-FLD****Reason:**

This scan debug message provides column headings for the following N87K40 messages.

For key-level processing, the headings are:

RESULT - The result of the key level processing of this line. Possible values are:

SKIPPED - This line was not executed due to run-time decisions or optimisation.

ABANDONED - This line was abandoned due to excessive I/O counts.

NO-FILE - No records passed this line.

ALL-FILE - All records passed this line.

PART_FILE - Some records passed this line.

NOT-PART - all but some records passed this line.

SCAN - Whether or not the result list of records requires re-evaluation by scanning.

COUNT - The number of records passing (for PART-FILE) or not passing (for NOT-PART).

For record-level processing, the headings are:

IN - The number of records passed into this line for evaluation

PASS - The number of passed in records that passed the test.

FAIL - The number of passed in records that failed the test.

NULL-FLD - The number of passed in records that had a null-field failure on this test.

System Action:

None.

User Action:

None.

N87K38

TIME I/O BMENT BMSTG

Reason:

This scan debug message provides column headings for the following N87K41 messages, that contain statistical information about key-level processing. The headings are:

TIME - The time taken to process this line.

I/O - The number of logical I/Os expended processing this line, excluding I/O expended in evaluating any required sub-selects.

BMENT - The number of spare bitmap blocks required to store the result list.

BMSTG - The amount of bitmap storage required to store the result list.

System Action:

None.

User Action:

None.

N87K39

id warning

Reason:

This scan debug message heads up the action table dump for each scan expression or subselect. The internal id of the scan or subselect is shown. Also, if this subselect is correlated, a warning re the following statistics only representing the last execution is shown.

System Action:

None.

User Action:

None.

N87K40

data data data ...

Reason:

This scan debug message shows execution information about a single scan action table line. Refer to message N87K37 for column meanings.

System Action:

None.

User Action:

None.

N87K41

data data data data

Reason:

This scan debug message provides additional key-level processing statistics for each line of a scan action table. Refer to message N87K38 for column headings.

N87K49

****END****

Reason:

This line of the scan debug messages indicates the end of the scan debug output.

System Action:

None.

User Action:

None.

N87U01

UNLOAD OF NDB: *dbname* COMMENCED *time*.

Reason:

This message is issued when an NDB UNLOAD is requested.

System Action:

The unload commences processing.

User Action:

None.

N87U02

UNLOAD OF NDB: *dbname* - *n* FIELD DEFINITIONS UNLOADED.

Reason:

This message is issued during an NDB UNLOAD request after the field definitions have been successfully unloaded. The message indicates that *n* field definitions were unloaded.

System Action:

The unload continues.

User Action:

None.

N87U03

UNLOAD OF NDB: *dbname* - STARTING DATA UNLOAD *time*.

Reason:

This message is issued during an NDB UNLOAD request at the commencement of the unload of the data portion of the database.

System Action:

The unload continues.

User Action:

None.

N87U04

UNLOAD OF NDB: *dbname* - *time* RECS UNLOADED *m* RECS/MIN.

Reason:

This message is issued at the completion of an NDB UNLOAD request. It indicates that *n* records were unloaded from the NDB, the unload finished at *time*, and *m* records per minute were unloaded.

System Action:

None.

User Action:

None.

N87U08

UNLOAD OF NDB: *dbname* HAD *n* RECS IN ERROR, OF WHICH *m* WERE UNLOADED.

Reason:

This message is issued at the completion of an NDB UNLOAD request. It indicates that *n* records were in error during the unload, however, out of those *n* records, *m* records were still unloaded.

System Action:

None.

User Action:

None.

N87U09

UNLOAD OF NDB: *dbname* COMPLETE, *n* RECS UNLOADED *time*. AVG *m* RECS/MIN. O/P HAS *q* RECS.

Reason:

This message is issued at the completion of an NDB UNLOAD request. It indicates that *n* records were unloaded from the NDB, the unload finished at *time*, the average rate of unloading the database was *m* records per minute and there were a total of *q* records written to the output UDB.

System Action:

None.

User Action:

None.

N87U20

UNLOAD OF NDB: *dbname* FAILED, FIELD *name* NOT DEFINED.

Reason:

An NDB UNLOAD was requested, however the fieldname *name* specified in the SEQUENCE option does not exist on the NDB *dbname*. The fieldname must exist on the NDB and it must be a keyed field.

System Action:

The unload request is not performed.

User Action:

Correct and retry.

N87U21**UNLOAD OF NDB: *dbname* FAILED, FIELD *name* NOT KEYED.****Reason:**

An NDB UNLOAD was requested, however the fieldname *name* specified in the SEQUENCE option specifies a field which is not keyed. The fieldname must exist on the NDB and it must be a keyed field.

System Action:

The unload request is not performed.

User Action:

Correct and retry.

N87U30**UNLOAD OF NDB: *dbname* FAILED, UNSUPPORTED OPTION REQUESTED.****Reason:**

An NDB UNLOAD was requested, however an option was specified on the unload request which is not recognized. See the Command Reference for a description of the correct NDB UNLOAD command syntax.

System Action:

The unload request is not performed.

User Action:

Correct and retry.

N87U31

UNLOAD OF NDB: *dbname* FAILED, VFS OPEN FAILED FOR OUTPUT FILE: *ddname*

Reason:

An NDB UNLOAD was requested for file *dbname* specifying the file *ddname* as the output UDB. However, when the UNLOAD command attempted to open the file, it received an open error. The file *ddname* must be an existing ESDS, and must be ALLOCATED and opened via UDBCTL.

System Action:

The unload request is not performed.

User Action:

Correct and retry.

N87U32

UNLOAD OF NDB: *dbname* FAILED, OUTPUT FILE: *ddname* IS NOT AN ESDS.

Reason:

An NDB UNLOAD was requested, however the output fileid *ddname* was not a VSAM ESDS.

System Action:

The unload request is not performed.

User Action:

Correct and retry.

N87U33

UNLOAD OF NDB: *dbname* FAILED, VSAM RECORD LENGTH OF OUTPUT FILE: *aaaaaaaa* IS LESS THAN 300.

Reason:

An NDB UNLOAD was requested, however the output file specified by *ddname aaaaaaaaa* had a record size of less than 300 bytes. The output file must have a record size of at least 300 bytes for the unload.

System Action:

The unload request is not performed.

User Action:

Correct and retry.

N87U34

UNLOAD OF NDB: *ddname* FAILED, OUTPUT FILE: *ddname* HAS OTHER USERS.

Reason:

An NDB UNLOAD was requested, however the output file *ddname* was in use by another user. The output file for an unload must not be in use for the unload to perform.

System Action:

The unload request is not performed.

User Action:

Correct and retry.

N87U40

UNLOAD OF NDB: *dbname* FAILED, ERROR READING FIELD DEFINITION FOR: *name*.

Reason:

An NDB UNLOAD was requested. An error occurred while attempting to read the field definition record for the indicated field. Refer the problem to the system administrator.

System Action:

The unload request is not performed.

User Action:

Report the problem to your systems administrator.

N87U80

UNLOAD OF NDB: *dbname* - RECORD WITH RID: *rid* ERROR: *reason*.

Reason:

During an NDB UNLOAD, the record with id *rid* had invalid internal pointers stored in the NDB. This indicates that the NDB *dbname* may be corrupted.

System Action:

The record is unloaded and the unload continues, provided the option to stop in error is not specified.

User Action:

None.

N87U90

UNLOAD OF NDB: *dbname* - ERROR RECORD WITH RID: *mmmmmm* WILL BE UNLOADED. O/P REC# = *number* (RSP *nn*).

Reason:

During an NDB UNLOAD, a response code of *nn* was encountered reading the record with the rid of *mmmmmm*.

System Action:

The record is unloaded and the unload continues, provided the option to stop in error is not specified.

User Action:

number is the record number of the output UDB of the record in question. Examine this record to check what actually got unloaded.

N87U91

UNLOAD OF NDB: *dbname* - ERROR RECORD WITH RID: *mmmmmm* NOT UNLOADED, NO FIELDS ACCESSIBLE (RSP *nn*).

Reason:

During an NDB UNLOAD, a response code of *nn* was encountered reading the record with the rid of *mmmmmm*.

System Action:

The record is not unloaded but the unload continues, provided the option to stop in error is not specified.

User Action:

None.

N87U92

UNLOAD OF NDB: *dbname* - FAILED, STORAGE SHORTAGE.

Reason:

During an NDB UNLOAD request, SOLVE ran short of storage.

System Action:

The unload request terminates.

User Action:

Consider increasing the SOLVE region/virtual storage/partition size.

N87U96

UNLOAD OF NDB: *dbname* TO OUTPUT FILE: *ddname* FAILED, VSAM ERROR ON OUTPUT ESDS. R15=*code* FDBK=*feedback*.

Reason:

While performing an NDB UNLOAD request, a VSAM I/O error was encountered writing to the output ESDS *ddname*.

System Action:

The unload request terminates.

User Action:

Refer to the VSAM messages and codes manual for a description of code and feedback.

N87U97

UNLOAD OF NDB: *dbname* FAILED, NDB VSAM READ ERROR. R15=*code* FDBK=*feedback*

Reason:

While performing an NDB UNLOAD request, a VSAM I/O error was encountered reading the NDB *dbname*.

System Action:

The unload request terminates.

User Action:

Refer to the VSAM messages and codes manual for a description of code and feedback.

N87U98**UNLOAD OF NDB: *dbname* TO OUTPUT FILE: file ABORTED BY USER REQUEST.****Reason:**

While performing an NDB UNLOAD request, an NDB STOP IMMEDIATE command for *dbname* was entered on this SOLVE system.

System Action:

The unload request terminates.

User Action:

None.

N87U99**UNLOAD OF NDB: *dbname* TO OUTPUT FILE: file ABORTED BY PREVIOUS ERROR.****Reason:**

An error occurred during an NDB UNLOAD request as described by a previous message, and the unload is terminating because the option to terminate the unload if an error occurs was in effect.

System Action:

The unload terminates.

User Action:

None.

N87V01**NDB: *ndbname* KEYSTATS RUN STARTING (restart).****Reason:**

This message is produced whenever an NDB KEYSTATS run is commenced or restarted.

System Action:

NDB key statistics collection commences.

User Action:

None.

N87V02

NDB: *ndbname* KEYSTATS RUN ENDED. RECS READ: *nnn* YIELDS: *nnn*.

Reason:

This message is produced when an NDB key statistics collection run ends normally. The number of VSAM records read during collection, and the number of yields (times when statistics collection paused while other NDB activity occurred) is displayed.

System Action:

None.

User Action:

None.

N87V10

ndbname fldname fldid a b c d e f g h i j k l m n o p q r s

Reason:

This message is produced during an NDB KEYSTATS run, at the end of statistics collection for each field. Various statistics are displayed. These statistics fields are:

ndbname

The name of the NDB.

fldname

The name of the field.

fldid

The internal field identification (in hex).

a

The number of unique values of the key field.

b

The number of VSAM records containing key information.

c

The number of NDB records that contain the field.

d

The minimum count of any unique value.

e

The maximum count of any unique value.

f

The average count of any unique value.

g

The modal occurrence of any unique value.

h

The count of modal occurrence.

i

The minimum count of unique value key records.

j

The maximum count of unique value key records.

k

The average count of unique value key records.

l

The modal occurrence of any unique value key records.

m

The count of modal occurrence of key records.

n

The minimum key length.

o

The maximum key length.

p

The average key length.

q

The modal key length.

r

The count of modal occurrence of key length.

s

The maximum all-equal key length.

System Action:

None.

User Action:

None.

N87V60

NDB: *ndbname* RID REUSE SCAN STARTING...

Reason:

This message is produced during a KEYSTATS run when the RID Reuse scan phase is starting.

System Action:

NDB RID reuse scan processing commences.

Message N87V70 will be logged, with additional information.

User Action:

None.

N87V61

NDB: *ndbname* RID REUSE SCAN ENDED. *aaa* RIDS SCAVENGED. *bbb* TOTAL REUSEABLE RIDS

Reason:

This message is produced during a KEYSTATS run when the RID Reuse scan phase has ended.

The number of RIDs recovered and the total number of available reuseable RIDs is displayed.

System Action:

NDB RID reuse scan processing terminates.

Message N87V71 will be logged, with additional information.

User Action:

None.

N87V70

NDB: *ndbname* RID REUSE SCAN STARTING... RANGE(S): *a-b, c-d*

Reason:

This message is logged during a KEYSTATS run when the RID Reuse scan phase is starting.

It shows the RID range(s) that will be scanned looking for deleted, and therefore reuseable RIDs.

System Action:

NDB RID reuse scan processing commences.

User Action:

None.

N87V71

NDB: *ndbname* RID REUSE SCAN ENDED. SCAV-RID: *a* SCAV-RNG: *b* N/S-RID: *c* N/S-RNG: *d* TOT-RRID: *e* RU-RECS: *f* PREV-REU: *g* PREV-NEW: *h* READS: *i* YIELDS: *j*

Reason:

This message is logged during a KEYSTATS run when the RID Reuse scan phase has ended.

Various statistics are shown:

a - The total number of RIDs that were scavenged for reuse by this scan.

b - The number of consecutive RID ranges that were scavenged for reuse by this scan.

c - The total number of free RIDs that were found during this scan that were in consecutive ranges less than the reuse threshold (as set by the NDBRUMIN Sysparm).

d - The number of consecutive RID ranges that were found during this scan that were smaller than the reuse threshold range (as set by the NDBRUMIN Sysparm).

e - The total number of reuseable RIDs following completion of this run. This total includes previous reuseable RID ranges that were outside the range scanned by this run, as well as the 'current' reuse range.

f - The number of VSAM records written to hold the reuse lists.

g - The number of RIDs actually reused since the last completed KEYSTATS (and reuse scan) run.

h - The number of new RIDs allocated since the last completed KEYSTATS (and reuse scan) run.

i - The number of VSAM reads issued during this reuse scan.

j - The number of yields issued due to work arriving for this NDB during the reuse scan.

System Action:

NDB RID reuse scan processing terminates.

User Action:

None.

N87V90

NDB: *ndbname* KEYSTATS NOT STARTED, REASON: *reason*.

Reason:

This message explains why a KEYSTATS=START request has failed. The descriptive reason will be:

NDB IS IN LOAD MODE.

NDB IS OPEN FOR INPUT.

System Action:

The KEYSTATS run is not started.

User Action:

Correct the problem, if required and restart the NDB.

N87V91

NDB: *ndbname* KEYSTATS/RIDSCAN STOPPED AT NDB SHUTDOWN *restart-option*.

Reason:

This message is produced if an NDB STOP command is entered for an NDB whilst a KEYSTATS collection run is in progress.

The statistics collection is terminated. Unless overridden, the keystats will be restarted on the next NDB START.

System Action:

Key statistics collection is terminated.

User Action:

None.

N87V92

NDB: *ndbname* KEYSTATS/RIDSCAN STOPPED BY KEYSTATS=STOP REQUEST.

Reason:

An NDB START *ndbname* KEYSTATS=STOP command has caused an in-progress key statistics collection run to be terminated.

System Action:

Key statistics collection is terminated.

User Action:

None.

N87V93

NDB: *ndbname* KEYSTATS/RIDSCAN RESTART CANCELLED BY KEYSTATS=STOP REQUEST .

Reason:

This message is produced at NDB start-up when an NDB START *ndbname* KEYSTATS=STOP command causes the pending keystats restart to be cancelled.

System Action:

The pending keystats restart is cancelled.

User Action:

None.

N87V94

NDB: *ndbname* KEYSTATS READ ERROR. R15=*rr* FDBK=*ff*.

Reason:

A VSAM I/O error occurred during KEYSTATS processing. The R15 value and VSAM feedback codes are displayed.

System Action:

The keystats run is terminated.

User Action:

Report the error information to your product support representative.

N87W01

***function ndb* ALL INDEXES TO BE BUILT/CHECKED.**

Reason:

This message indicates the actions that will be performed by the entered NDB ALTER command.

System Action:

None.

User Action:

None.

N87W02

***function ndb* FIELD *fieldname* TO BE INDEXED. (UNIQUE).**

Reason:

This message indicates that the indicated field will be indexed by the entered NDB ALTER command. If it is to be marked as unique, the word (UNIQUE) will appear.

System Action:

None.

User Action:

None.

N87W03

***function ndb* WORK FILE *fileid* OPENED.**

Reason:

This message indicates that the indicated work file for NDB ALTER command processing has opened successfully.

System Action:

None.

User Action:

None.

N87W04

function ndb SORT SPACE nnnK.

Reason:

This message indicates the amount of sort work space that the NDB ALTER command will use.

System Action:

None.

User Action:

None.

N87W05

function ndb n FIELDS, OF WHICH n ARE KEYED (EXCL SEQ KEY).

Reason:

This message indicates the number of fields on the NDB that the NDB ALTER command is processing, and the number which are keyed in some way.

System Action:

None.

User Action:

None.

N87W10

function ndb time READING DATA.

Reason:

This message indicates that NDB ALTER processing has commenced, and the NDB data is being read.

System Action:

None.

User Action:

None.

N87W11

function ndb time number RECORDS READ, CONTAINING number KEYS.

Reason:

This message indicates that NDB ALTER processing has read some records, and the number of keys extracted is noted. This is a checkpoint message, to inform of progress through the ALTER processing.

System Action:

None.

User Action:

None.

N87W12

function ndb time STRING n BEING WRITTEN TO WORK.

Reason:

This message indicates that a the NDB ALTER sort work area filled up, and the sorted string is being written to the work file.

System Action:

Processing continues.

User Action:

If excessive strings are written, consider increasing the SORT= size on the NDB ALTER command.

N87W13

function ndb time STRING n WRITTEN. nkeys KEYS. nblocks BLOCKS.

Reason:

This message indicates that a the NDB ALTER sort string has been written to the work file.

System Action:

Processing continues.

User Action:

If excessive strings are written, consider increasing the SORT= size on the NDB ALTER command. Also consider using a large CI and record size for the work file to speed up writing.

N87W14

function ndb time n KEYS. n STRINGS. n KEYS WRITTEN TO WORK FILE.

Reason:

This message indicates shows the totals for the sorted keys and strings for NDB ALTER processing.

System Action:

Processing continues.

User Action:

None.

N87W15

function ndb time number RECORDS READ, CONTAINING number KEYS. (EOF).

Reason:

This message indicates that NDB ALTER processing has read all records, and the number of keys extracted is noted.

System Action:

Processing continues.

User Action:

None.

N87W16

***function ndb time* LOAD MODE SET.**

Reason:

This message indicates that NDB ALTER processing has updated the NDB to set LOAD MODE.

System Action:

Processing continues. If the ALTER is aborted, the NDB remains in LOAD MODE.

User Action:

None.

N87W17

***function ndb time* COMMENCING DELETE OF EXISTING KEY RECORDS.**

Reason:

This message indicates that NDB ALTER processing is now deleting any old key records on the NDB.

System Action:

Processing continues. If the ALTER is aborted, the NDB remains in LOAD MODE.

User Action:

None.

N87W18

***function ndb time n* KEY RECORDS DELETED.**

Reason:

This message indicates that NDB ALTER processing has deleted the old key records. The number of records deleted is indicated.

System Action:

Processing continues. If the ALTER is aborted, the NDB remains in LOAD MODE.

User Action:

None.

N87W19

function ndb time STARTING KEY LOAD.

Reason:

This message indicates that NDB ALTER processing is now reloading the key records from the sorted keys. This is a checkpoint message.

System Action:

Processing continues. If the ALTER is aborted, the NDB remains in LOAD MODE.

User Action:

None.

N87W20

function ndb time FIELD: *fieldname* - START.

Reason:

This message indicates that NDB ALTER processing is now reloading the key records for the indicated field. This is a checkpoint message.

System Action:

Processing continues.

User Action:

None.

N87W21

***function ndb UNIQUE KEY ERROR. FIELD: fieldname COUNT: number
VALUE: val***

Reason:

This message indicates that a unique key violation for the indicated field/value has occurred during NDB ALTER processing. The indicated field had more than one record with the indicated value.

System Action:

Processing continues. The field is loaded as if not unique. This allows easy correction using NCL procedures. The field is still defined as unique, and no additional records may be added with that value.

User Action:

When the alter completes, use the messages to provide the fields in error. Access and correct the records as appropriate with NCL procedures. Alternatively, update the field definition from KEY=UNIQUE to KEY=YES.

N87W22

***function ndb time FIELD: fieldname - LOADED. KEYS: nkeys VALUES:
nvals VSAM RECS: nrecs***

Reason:

This message indicates that NDB ALTER processing has completed loading the key records for the indicated field. This is a checkpoint message. Statistics on the number of unique values, keys, and VSAM records are provided.

System Action:

Processing continues.

User Action:

None.

N87W23

function ndb time KEY LOAD COMPLETE. nnn KEYS. nnn VSAM RECORDS. nnn UNIQUE KEY VIOLATIONS.

Reason:

This message indicates that NDB ALTER processing has completed loading all key records. The number of keys and VSAM records loaded is indicated. If any unique key violations have occurred, this is noted. (see message N87W21).

System Action:

Processing continues.

User Action:

None.

N87W24

function ndb LOAD MODE RESET.

Reason:

This message indicates that NDB ALTER processing has updated the NDB to reset LOAD MODE.

System Action:

Processing continues. The keys have been rebuilt. LOADMODE is no longer required.

User Action:

None.

N87W25

function ndb FIELD LENGTH ERROR. FIELD: fieldname RID: rid.

Reason:

This message indicates that NDB ALTER processing has encountered a field value that is too long to be keyed. The name of the field and the RID of the containing record are displayed.

System Action:

Processing continues until all data has been read. The NDB will not have the keys rebuilt. Only the first 10 violations for each field name are reported.

User Action:

When the ALTER stops (after reading all data), examine the records in error and correct the field values if required. Alternatively, increase the VSAM keylength of the NDB.

N87W26

function ndb KEY ATTRIBUTE ALTERED FOR FIELD: fieldname.

Reason:

This message indicates that NDB ALTER processing has updated the key option of the field from NO to YES or UNIQUE.

System Action:

Processing continues.

User Action:

None.

N87W30

function ndb time STARTING STRING MERGES. n STRINGS TO MERGE.

Reason:

This message indicates that NDB ALTER processing is merging the sorted key strings. This is a checkpoint message.

System Action:

Processing continues.

User Action:

None.

N87W31

function ndb time STARTING MERGE PASS n . n STRINGS. 1ST VSAM BLOCK IS n .

Reason:

This message indicates that NDB ALTER processing is performing a string merge. This is a checkpoint message.

System Action:

Processing continues.

User Action:

None.

N87W32

function ndb time STARTING MERGE.

Reason:

This message indicates that NDB ALTER processing is performing an individual string merge. This is a checkpoint message.

System Action:

Processing continues.

User Action:

None.

N87W33

function ndb time ENDED MERGE. IN: $n1$, $n2$. OUT: $n3$ BLKS: $n4$.

Reason:

This message indicates that NDB ALTER processing has completed an individual string merge. The statistics show the number of keys in from each string, and out. The number of VSAM blocks is also displayed. This is a checkpoint message.

System Action:

Processing continues.

User Action:

None.

N87W34

function ndb time ENDED MERGE PASS.

Reason:

This message indicates that NDB ALTER processing has completed a merge pass (which halves the number of strings). This is a checkpoint message.

System Action:

Processing continues.

User Action:

None.

N87W35

function ndb time ENDED STRING MERGES.

Reason:

This message indicates that NDB ALTER processing has completed all string merge processing, resulting in a single complete sorted list of all keys.

System Action:

Processing continues.

User Action:

None.

N87W70

function ndb ERROR n FIELD: fldname (ID xxxx) RID drid (xrid).

Reason:

This message is an error message resulting from an NDB ALTER OPT=CHKX command. The details are:

error number (n)

- 1 - value for field in indicated record is not in the key lists.
- 2 - value in key list is not in the associated record (field itself is not in record)
- 3 - value in key list is not in the associated record (field has a different value in record, this will pair with a type 1 error).
- 4 - data record not found.
- other - 1000 + NDBRC rsp from internal record read

fldname

The field in error.

xxxx

The internal field id in hex.

drid

The RID of the data record.

xrid

The RID in hex.

This message will be followed by N87W71 and N87W72 messages containing further information.

System Action:

Processing continues.

User Action:

When the NDB ALTER completes, the errors should be investigated.

N87W71***function ndb VALUE (X): keyval*****Reason:**

This message is an error message resulting from an NDB ALTER OPT=CHKX command. It follows an N87W70 message and shows the key value *keyval* in hex.

System Action:

Processing continues.

User Action:

When the NDB ALTER completes, the errors should be investigated.

N87W72***function ndb DATA (X): value*****Reason:**

This message is an error message resulting from an NDB ALTER OPT=CHKX command. It follows an N87W70 message and shows the data value in hex.

System Action:

Processing continues.

User Action:

When the NDB ALTER completes, the errors should be investigated.

N87W79***function ndb number ERRORS. DATABASE LOCKED.*****Reason:**

This message is the final message resulting from an NDB ALTER OPT=CHKX command. It shows the number of errors found. If any were found, the NDB is locked.

System Action:

NDB ALTER processing terminates.

User Action:

Check the results of the ALTER.

N87W80

function ndb FAILED, WORK FILE ERROR: error.

Reason:

This message is produced from an NDB ALTER command if the work file nominated cannot be used. The error message explains the problem. NDB is locked.

System Action:

NDB ALTER processing terminates.

User Action:

Correct the problem with the work file.

N87W81

function ndb FAILED, UNABLE TO OBTAIN SORT STORAGE.

Reason:

This message is produced from an NDB ALTER command if the amount of sort storage requested could not be obtained.

System Action:

NDB ALTER processing terminates.

User Action:

Specify a lesser amount of sort work storage, or increase the region size for SOLVE.

N87W82

function ndb FAILED, FIELD: fldname NOT DEFINED.

Reason:

This message is produced from an NDB ALTER command if the specific field nominated is not defined on the NDB.

System Action:

NDB ALTER processing terminates.

User Action:

Correct the field name.

N87W83

function ndb FAILED, FIELD: fldname ALREADY KEYED.

Reason:

This message is produced from an NDB ALTER command if the specific field nominated for indexing is already keyed.

System Action:

NDB ALTER processing terminates.

User Action:

Correct the field name. Use the NDB FIELD command to alter the key attributes if required.

N87W84

function dbname FAILED, NDB IS IN LOAD MODE.

Reason:

This message is produced from an NDB ALTER command if keying of a single field is requested, and the NDB is in load mode. It is also produced if OPT=CHKX is entered, and the NDB is in load mode.

System Action:

NDB ALTER processing terminates.

User Action:

The entire NDB must be indexed. Use the DB option on the NDB ALTER OPT=BLDX command.

N87W85

function ndb FAILED, FIELD: fieldname NOT KEYED OR IS SEQUENCE KEY.

Reason:

This message is produced from an NDB ALTER command if checking of the indexes for a keyed field is requested, but it is not keyed or is a sequence key.

System Action:

NDB ALTER processing terminates.

User Action:

Correct the NDB ALTER command. It makes no sense to check keys for a non-keyed field.

N87W90

function ndb VFS FILE ERROR DD=ddname VFSREQ=req VFSR15=r14 VSAMRC=rc VSAMFDBK=fdbk.

Reason:

This message is produced from an NDB ALTER command if an error occurs when writing to the work file or the NDB. The VSAM error codes may be checked against the relevant IBM manual. (FDBK=1C means out of space).

System Action:

NDB ALTER processing terminates.

User Action:

Determine the cause of the problem and re-enter the NDB ALTER command.

N87W95

function ndb FAILED, UNABLE TO OBTAIN REQUIRED STORAGE.

Reason:

This message is produced from an NDB ALTER command if an error occurs when setting up internal control blocks. No storage is available.

System Action:

NDB ALTER processing terminates.

User Action:

Correct the cause of the storage shortage and reissue the NDB ALTER command.

N87W96

function dbname FAILED, NDB RECORD READ FAILURE.

Reason:

This message is produced from an NDB ALTER command if an error occurs when reading NDB records. There will be a message on the SOLVE log preceding this message informing of the failure reason.

System Action:

NDB ALTER processing terminates.

User Action:

Correct the cause of the read failure and reissue the NDB ALTER command.

N87W97

function dbname FAILED, num FIELD LENGTH VIOLATIONS (SOME LISTED ABOVE).

Reason:

This message is produced from an NDB ALTER command if field length errors occur (see message N87W25). It indicates that the processing has been aborted because of the errors.

System Action:

NDB ALTER processing terminates.

User Action:

Use an NCL procedure to read the records in error and correct the field values.

N87W98

function dbname FAILED, NDB INTERNAL I/O ERROR.

Reason:

This message is produced from an NDB ALTER command if an internal NDB I/O error occurs. There should be a message on the activity log describing the error.

System Action:

NDB ALTER processing terminates.

User Action:

Determine the cause of the I/O error.

N87W99

function dbname TERMINATED BY NDB STOP IMM COMMAND.

Reason:

This message is produced from an NDB ALTER command if it is terminated by the entering of and NDB STOP *dbname* IMM command.

System Action:

NDB ALTER processing terminates.

User Action:

Confirm that the ALTER was to be stopped. If not, reissue the NDB ALTER command.

N87X90

NDB: ndbname INTERNAL ABEND mod-rc - SEE LOG.

Reason:

AN NDB module has detected an internal ABEND condition related to NDB corruption. Diagnostic information follows.

The NDB name, and an abend code are displayed.

System Action:

The NDB may stop.

User Action:

Report the ABEND condition to you product support representative.

N87X91

NDB: *ndbname* **REASON:** *reason*.

Reason:

This message follows message N87X90 and provides a descriptive reason for the NDB ABEND.

System Action:

Refer to message N87X90.

N87Y01

***dbname req-code response recordid seconds reccount dbuid nclid
procname***

Reason:

This message is produced by an NDB request on *dbname* when the TRACE option is in effect in the NDB START command. The column meanings are:

dbname

The NDB the request is for.

req-code

The NDB request code.

response

The response code from the request (0=success).

recordid

The recordid this request was for.

seconds

The time taken to process this request in seconds.

reccount

The number of records accessed in processing this request.

dbuid

The internal Database ID.

nclid

The nclid of the NCL procedure making the request.

procname

The procedure name of the NCL procedure making the request.

statement

The statement number within the procedure of the request.

System Action:

None.

User Action:

None.

N87Z01**NDB FILE: *dbname* SUBTHREAD STARTING.****Reason:**

This message is issued when a database starts a subthread to handle asynchronous database commands, for example, &NDBSCAN.

System Action:

The subthread commences processing.

User Action:

None.

N87Z02**NDB FILE: *dbname* SUBTHREAD TERMINATING.****Reason:**

This message is issued when a database subthread finds no more pending work, and the number of started subthreads for this database is above the NDBSUBMN value. The thread terminates.

System Action:

The subthread terminates.

User Action:

None.

N88801**ERROR DETECTED IN IMAGE BUFFER FOR LU AAAAAAAAA CODE=B

TSILJR**

Reason:

This message is in response to the SHOW NDB=<ALL | *dbname*> command and labels the columns displayed for each database. The column headings are:

NAME

The name of the database.

STATUS

The status of the database:

STARTING

The database is initializing.

ACTIVE

The database is currently active.

STOPPING

The database is stopping.

PENDSTOP

The database is active, but an NDB STOP command has set a pending stop. It will stop when all users sign off it.

LOCKED

An NDB command with the LOCK option was entered. The database is locked from all access.

BAD-LOCKED

An error occurred on the database (eg: I/O error), and the database manager has stopped and locked it.

QCMD

The number of pending DB commands and requests.

USERS

The following values may be displayed in this field:

n

The number of signed-on users.

EXCL-1

A single user is signed-on with the EXCLUSIVE option.

UNLOAD

The database is currently being unloaded by an NDB UNLOAD command.

ALTER

The database index is currently being (re)building or validating by an NDB ALTER command.

CMDS-DONE

The number of database commands processed since starting.

SUBT

The current number of subthreads active.

QSUB

The number of requests queued to subthreads.

DFR

Whether the database was started in DEFER status (highlighted YES) or not (NO).

LSIZ

The number of blocks in the transaction journal.

LHWM

The highest used block number in the transaction journal.

TSILJR

The status of TRACE (T), SCANDEBUG (S), INPUT (I), LOADMODE (L), JOURNAL (J), and RIDREUSE (R).

The value of each is either N (No) or Y (Yes), with the exception of RIDREUSE (R), which has the following statuses:

N

RID reuse is not possible on the NDB (reclen too short).

P

RID reuse is possible but not enabled.

A

RID reuse is enabled and active.

C

RID reuse is enabled and active, and the collection of reuseable RIDs is in progress.

System Action:

None.

User Action:

None.

N89504

name status qcmd users cmds-done subt qsub dfr lsiz lhwmm tsiljr

Reason:

This message follows the N89503 message for each database. Refer to N89503 for the column descriptions.

System Action:

None.

User Action:

None.

N89505

END

Reason:

This message terminates a multi-line display of NDB databases or VARTABLES.

System Action:

None.

User Action:

None.

N89506

No NDBS match search criteria.

Reason:

This message indicates that the database on a `SHOW NDB=dbname` command was not found in the list of currently active, starting, stopping, or locked databases.

System Action:

None.

User Action:

Check that the database name was correctly spelled. If so, the database could be stopped (but not locked). Stopped databases do not display.

N89507

DB-NAME USERID LUNAME NCL-PROC NCL-ID

Reason:

This message is a header message for the following list of messages, the response to a `SHOW NDBUSER` command. The columns are:

DB-NAME

The name of the database.

USERID

The user id of a signed on database user.

LUNAME

The LU (terminal) the user is logged on from.

NCL-PROC

The highest-level NCL procedure in the NCL process using the database.

NCL-ID

The NCLID of the NCL process.

System Action:

None. The user list follows.

User Action:

None.

N89508

db-name userid luname ncl-proc ncl-id (EXCLUSIVE)

Reason:

This message is produced for each signed on user to each database, in response to the SHOW NDBUSER command. The columns are described in the N89507 description. If the user has opened as an EXCLUSIVE user, that is indicated by the text (EXCLUSIVE).

System Action:

None.

User Action:

None.

N89701

NDB COMMAND REJECTED - STORAGE SHORTAGE.

Reason:

Insufficient working storage was available to process the NDB command.

System Action:

The command is not processed.

User Action:

Determine the reason for the storage shortage.

N89702

NDB *option* COMMAND ACCEPTED.

Reason:

This message indicates that the entered NDB command had no syntax errors, and processing has commenced.

System Action:

The command is being processed.

User Action:

Wait for the N89703 message to indicate the results of the command.

N89703

NDB *option* OF DATABASE *dbname* PROCESSED, RC WAS *rrr*.

Reason:

This message indicates the completion of processing for the entered NDB command. The response code (RC) is displayed.

System Action:

The command is complete.

User Action:

Your action depends on the displayed response code. For more information about NDB response codes, enter **/NDBERR**.

N89704

LANGUAGE CODE NOT SUPPORTED

Reason:

The LANG operand of an NDB CREATE command has specified a language code that is unrecognized.

System Action:

The NDB CREATE is rejected.

User Action:

Correct the value specified on the LANG operand to supply a valid two character language code.

N89B01

NDBxxx - NDB *dbname* NOT OPEN.

Reason:

An &NDBxxx statement refers to an NDB that has not been successfully opened.

System Action:

The NCL procedure is terminated.

User Action:

Correct the NCL procedure.

N89B02**NDBxxx - NDB *dbname* ALREADY OPEN.****Reason:**

An &NDBOPEN statement refers to an NDB that has already been successfully opened.

System Action:

The NCL procedure is terminated.

User Action:

Correct the NCL procedure.

N89B03**NDBxxx - NDB *dbname* `END' INVALID - NOT STARTED.****Reason:**

An &NDBxxx END statement refers to an NDB for which no START/DATA/END set is currently in progress.

System Action:

The NCL procedure is terminated.

User Action:

Correct the NCL procedure.

N89B04**NDBxxx - NDB *dbname* `START' INVALID - ALREADY STARTED.****Reason:**

An &NDBxxx START statement refers to an NDB for which a START/DATA/END set is already in progress.

System Action:

The NCL procedure is terminated.

User Action:

Correct the NCL procedure.

N89B05

NDBxxx - NDB *dbname* - KEYWORD INVALID WITHIN START..END.

Reason:

An &NDBxxx DATA or END statement contains a keyword which is only valid on an NDBxxx START, or single-line DATA statement.

System Action:

The NCL procedure is terminated.

User Action:

Correct the NCL procedure.

N89B06

INVALID TIMEZONE VALUE

Reason:

An &NDBCTL command has an invalid time zone value specified.

System Action:

The NCL procedure is terminated.

User Action:

Correct the NCL procedure.

N89B11

&NDBxxx *dbname* - ERROR RC *rrr*.

Reason:

An &NDBxxx statement has received an error response from the database manager.

System Action:

The NCL procedure is terminated.

User Action:

If you wish to retain control after an error, use &NDBCTL ERROR=CONTINUE.

N89B13

NDBxxx END - NO DATA PROVIDED FOR NDB: *dbname*.

Reason:

An &NDBxxx START/DATA/END set had no data statements.

System Action:

The NCL procedure is terminated.

User Action:

Correct the NCL procedure.

N89B14

&NDBGET MDO OPERAND INVALID.

Reason:

An MDS error occurred for the MDO specified on an &NDBGET NCL statement.

System Action:

MDS retcode and fdbk are set and the &NDBGET fails.

User Action:

Ensure the MDO specified can be correctly mapped.

N89B20

NDBOPEN *dbname* - ALREADY OPEN.

Reason:

An &NDBOPEN statement was executed for an NDB that was already open.

System Action:

The NCL procedure is terminated.

User Action:

Correct the NCL procedure, or, if you wish to retain control after this error, use &NDBCTL ERROR=CONTINUE.

N89B21

NDBCLOSE *dbname* - NOT OPEN.

Reason:

An &NDBCLOSE statement was executed for an NDB that is not open.

System Action:

The NCL procedure is terminated.

User Action:

Correct the NCL procedure, or, if you wish to retain control after this error, use &NDBCTL ERROR=CONTINUE.

N89D01

MORE THAN ONE PARM PROVIDED TO NDBQUOTE.

Reason:

An assignment statement using the &NDBQUOTE builtin function had more than one parameter specified.

System Action:

The NCL procedure is terminated.

User Action:

Correct the NCL procedure. &NDBQUOTE may only have one parameter.

N89D02

DATA FOR NDBQUOTE GREATER THAN 256 CHARACTERS.

Reason:

The data supplied to the &NDBQUOTE builtin function was longer than 256 characters.

System Action:

The NCL procedure is terminated.

User Action:

Correct the NCL procedure.

N89D03**DATA FOR &NDBQUOTE TOO LONG TO QUOTE.****Reason:**

The data supplied to the &NDBQUOTE builtin function was longer than 254 characters, or an excessive number of embedded quotes would have made the resulting quoted data longer than 256 characters. Since only 256 characters can be stored in a variable, the addition of a leading and trailing quote and/or doubling up embedded quotes would have made it too long.

System Action:

The NCL procedure is terminated.

User Action:

Correct the NCL procedure.

N89D10**NO CONVERSION TYPE SPECIFIED FOR &NDBPHON.****Reason:**

The &NDBPHON NCL builtin function requires the conversion type to be specified. It must be either SOUNDEX or USER.

System Action:

The NCL procedure is terminated.

User Action:

Correct the NCL procedure.

N89D11**&NDBPHON USER REQUIRES ACTIVE NDBPHONX.****Reason:**

The &NDBPHON NCL builtin function can only perform USER phonetic processing if a phonetic exit has been activated.

System Action:

The NCL procedure is terminated.

User Action:

Use the SYSPARMS NDBPHONX command to load the user phonetic exit.

N89D12

INVALID CONVERSION TYPE SPECIFIED FOR &NDBPHON.

Reason:

The &NDBPHON NCL builtin function requires the conversion type to be specified. It must be either SOUNDEX or USER.

System Action:

The NCL procedure is terminated.

User Action:

Correct the NCL procedure.

N89D13

&NDBPHON EXIT RC NOT 0 (VALUE WAS *nn*).

Reason:

The &NDBPHON NCL builtin function exit returned a non-zero return code in register 15. The value is displayed.

System Action:

The NCL procedure is terminated.

User Action:

Determine the reason for the non-zero return code.

N89F11

NDB VERB ERROR, RC *rrrr* ID *iiiiiii*

Reason:

This message indicates that an OML NDB_ERROR has been raised.

System Action:

An OML NDB_ERROR condition is raised.

User Action:

Examine the NDB error code and correct the procedure if required.

N89F20**NDB OPEN *iiii* - ALREADY OPEN****Reason:**

An NDB OPEN verb was requested for an NDB that this process has already opened.

System Action:

An error may be raised.

User Action:

Examine the NDB error code and correct the procedure if required.

N89F21**NDB CLOSE *iiii* - NOT OPEN****Reason:**

An NDB CLOSE verb was requested for an NDB that this process has not yet opened.

System Action:

An error may be raised.

User Action:

Examine the NDB error code and correct the procedure if required.

N89F90**NDB *oooo* ERROR - END WHEN NOT STARTED****Reason:**

An NDB verb that uses START/DATA/END had an END option when no START was issued.

System Action:

An error may be raised.

User Action:

Examine the procedure source for a logic error.

N89F91

NDB 00000 ERROR - END - NO DATA PROVIDED

Reason:

An NDB verb that uses START/DATA/END had an END option but no data had been provided by DATA options.

System Action:

An error may be raised.

User Action:

Examine the procedure source for a logic error.

N89F92

NDB 00000 ERROR - START WHEN ALREADY STARTED

Reason:

An NDB verb that uses START/DATA/END had a START option when it was already STARTed.

System Action:

An error may be raised.

User Action:

Examine the procedure source for a logic error.

N89F93

NDB 00000 ERROR - OPTIONS SPECIFIED INSIDE START..END

Reason:

An NDB verb that uses START/DATA/END had other options specified with a DATA or END option when a previous START was issued.

System Action:

An error may be raised.

User Action:

Examine the procedure source for a logic error.

N89F94**NDB 00000 ERROR - NO DATA PROVIDED****Reason:**

An NDB verb that requires data to be provided (using the DATA operand) had no data specified.

System Action:

An error may be raised.

User Action:

Examine the procedure source for a logic error.

N89F95**NDB 00000 ERROR - FORMAT INVALID INSIDE START..END****Reason:**

An NDB ADD or UPDATE verb had a FORMAT operand specified inside a START..END sequence.

System Action:

An error may be raised.

User Action:

Examine the procedure source for a logic error.

N89F96**NDB 00000 ERROR - REQUIRED OPERANDS OMITTED****Reason:**

An NDB verb had required operands omitted. For NDB UPDATE, no RID was provided. For NDB FORMAT, either the OPT or FORMAT operands were omitted.

System Action:

An error may be raised.

User Action:

Examine the procedure source for a logic error.

N89F97

NDB GET ERROR - MDO OPERATION FAILED.

Reason:

An MDS error occurred while processing the MDO operand of an NDB GET statement.

System Action:

NDB GET statement processing is terminated.

User Action:

Ensure the MDO operand specifies an MDO which can be correctly mapped.

N89J01

NO NDB PHONETIC EXIT - 'SER' OPTION INVALID

Reason:

No NDB phonetic exit has been set.

The NDBPHON function 'USER' option

System Action:

An error is raised.

User Action:

Use the NDBPHONX SYSPARM to set the exit name.

N89J02

PHONETIC EXIT RETURNED NON-ZERO RETURN CODE

Reason:

An NDB phonetic exit returned a non-zero return code in R15.

System Action:

An error is raised.

User Action:

Examine the exit to determine the reason for the return code.

N89L01**JOURNAL DATASET aaaaaaaa bbbbbbbbbbbbbbbbbbbbbbbbbbbbbbbbbb****Reason:**

An error occurred while trying to initialize the journal dataset. aaaaaaaa is the DD name of the dataset. The reason is shown in the message.

System Action:

NDB Journaling is terminated.

User Action:

Check the system journal dataset definitions. The NDB which caused journaling to start or swap will need to be unlocked.

N89L02**JOURNAL SWAP REJECTED - JOURNAL NOT ACTIVE.****Reason:**

A JOURNAL SWAP command was issued, but no NDBs which require journaling have been started.

System Action:

The SWAP command is not processed.

User Action:

None.

N89L03**JOURNAL PROC NOT STARTED - INSUFFICIENT STORAGE.****Reason:**

A JOURNAL SWAP operation occurred and the system attempted to start the journal procedure, however the procedure failed due to insufficient storage.

System Action:

none.

User Action:

Attempt to start the JOURNAL procedure manually to ensure that journal processing occurs.

N89Z01

JOURNAL SWAP COMMAND ACCEPTED.

Reason:

This message is issued in response to a JOURNAL SWAP command to verify that the command has been accepted.

System Action:

N/A

User Action:

N/A

N89Z02

JOURNAL SWAP COMPLETED SUCCESSFULLY.

Reason:

This message is issued when a JOURNAL SWAP command has been successfully completed.

System Action:

N/A

User Action:

N/A

N89Z03

JOURNAL SWAP FAILED.

Reason:

This message indicates that a JOURNAL SWAP command was unsuccessful.

System Action:

NDB journaling is unavailable.

User Action:

The reason will be displayed in message N89L01. Determine the reason for failure and correct the problem. The system will attempt to open the journal dataset again next time a journaled NDB is started.

N8A001**BASE VERSION IS INCOMPATIBLE WITH THIS EDBS VERSION - EDBS NOT AVAILABLE****Reason:**

During EDBS initialization, it was determined that the EDBS load module was incompatible with the product version.

System Action:

EDBS feature is not available.

User Action:

Determine the cause for the incompatibility. This release of EDBS requires version 2.2 or higher of the SOLVE foundation. This message indicates that either the SOLVE foundation or the EDBS feature is not properly installed.

N8A502**EXTERNAL DATABASES: *i* EXTERNAL DATABASES DEFINED, *j* STOPPED****Reason:**

This message is displayed in response to SH EDB command; *i* is the number of external databases defined for SOLVE and *j* is the number of external databases currently stopped.

System Action:

None.

User Action:

None.

N8A503

NAME TYPE ID STATUS MAXT MINT FSQL ASQL

Reason:

The heading displayed in response to SH EDB={ALL|*dbname*} command. This information is used to determine how the database was defined and the current status of the database connection.

System Action:

None.

User Action:

None.

N8A504

name type id status maxt mint fsql asql

Reason:

A detail line displayed in response to the SHOW EDB={ALL|*dbname*} command. The fields are as follows:

name

The external ID of the database.

type

The type of external database.

id

The internal ID of the database. Used in NCL procedures to reference the database.

status

The current status of the connection to the external database. The following values are possible:

ABEND - The external database connection is inactive. The CAF manager has abended.

ACTIVE - The external database connection is active. NCL procedures can communicate with the external database.

ATTACH - The external database connection is inactive. The CAF manager did not attach.

DOWN - The external database connection has been started but the database is unavailable. When the database becomes available, the connection will be activated automatically.

ERROR - The external database connection is inactive. An error condition was detected by the database.

FORCED - The external database connection is inactive. The system operator issued an EDB STOP command with FORCE operand.

NOLOAD - The external database connection is inactive. The interface load modules failed to load.

NOSTART - The external database connection is inactive. The NOSTART operand was specified on the EDB DEFINE command or some other DB2 system is currently ACTIVE

NOTDEF - The external database connection is inactive. It is not known to the operating system.

STOPPED - The external database connection is inactive. The system operator issued an EDB STOP command.

maxt

The maximum number of subtasks that can be attached by the CAF manager. That is, the maximum number of NCL procedures that can simultaneously communicate with the database.

mint

The number of subtasks in a pool of tasks, waiting for an NCL procedure to request a database connection. These tasks will be allocated to NCL procedures as required.

fsql

The number of free subtasks in the pool.

asql

The number of active subtasks.

System Action:

None.

User Action:

The appropriate action can be taken, depending on the status of the external database connections.

N8A505

DATABASE *dbname* NOT DEFINED.

Reason:

This message is displayed in response to a SHOW EDB= *dbname* command if the database *dbname* is not defined to SOLVE.

System Action:

None.

User Action:

Define the database or re-enter the SHOW EDB= *dbname* command with the correct *dbname*.

N8A506**DB-NAME DB-TYPE DB-ID USERID LUNAME NCL-PROC NCLID****Reason:**

The heading displayed in response to SHOW EDBUSER command.

System Action:

None.

User Action:

None.

N8A507

db-name db-type db-id userid luname ncl-proc nclid

Reason:

A detail line displayed in response to the SHOW EDBUSER command. This message displays user information for each open external database connection from NCL. The fields are as follows:

db-name

The external ID of the database.

db-type

The type of the database.

db-id

The id by which NCL procedures know the external database i.e. the internal ID.

userid

The ID of the user that started the NCL procedure that is communicating with the external database.

luname

The user's LU name (logical unit name).

ncl-proc

The name of the NCL procedure that is communicating with the external database.

nclid

The ID of NCL procedure that is communicating with the external database.

System Action:

None.

User Action:

None.

N8A508**DB-NAME DB-TYPE DB-ID RQ-CNT DB-TIM DB-AVG RQ-TIM RQ- AVG****Reason:**

The heading displayed in response to SHOW EDBSTAT command.

System Action:

None.

User Action:

None.

N8A509

db-name db-type db-id rq-cnt db-tim db-avg rq-tim rq-avg

Reason:

A detail line displayed in response to the SHOW EDBSTATS command. This message displays statistical information for each external database connection. The fields are as follows:

db-name

The external ID of the database.

db-type

The type of the database.

db-id

The id by which NCL procedures knows the database i.e. the internal ID.

rq-cnt

The number of &SQL and/or &EDB requests processed that resulted in communications with the external database.

db-tim

The total elapsed time consumed by the external database.

db-avg

The average response time of the database.

rq-tim

The total elapsed time taken to execute all requests (SOLVE's time plus database time).

rq-avg

The average response time to the user.

All time values are displayed in seconds.

System Action:

None.

User Action:

None.

N8A510**DB-ID USERID NCLID TOT-RQ DB-RQ DB-TIM DB-AVG RQ-TIM RQ- AVG****Reason:**

The heading displayed in response to SHOW EDBUSTAT command.

System Action:

None.

User Action:

None.

N8A511

db-id userid nclid tot-rq db-rq db-tim db-avg rq-tim rq-avg

Reason:

A detail line displayed in response to the SHOW EDBUSTAT command. This message displays statistical information for each user attached to an open external database connection. Statistics are collected only if the external database was started with the STATS operand. The fields are as follows:

db-id

The ID by which NCL procedures know the database.

userid

The ID of the executing the NCL procedure that is communicating with the external database.

nclid

The ID of the NCL procedure that is communicating with the external database.

tot-rq

The number of &SQL and &EDB requests executed.

db-rq

The number of &SQL and &EDB requests executed that required communications with the external database.

db-tim

The total elapsed time consumed by the external database to execute &SQL and &EDB requests.

db-avg

The average response time of the database.

rq-tim

The total elapsed time taken to execute all requests (SOLVE's time plus database time).

rq-avg

The average response time to the user.

All time values are displayed in seconds.

System Action:

None.

User Action:

None.

N8A701

DATABASE *cmdname* COMMAND ACCEPTED.

Reason:

EDB *cmdname* command request has been accepted.

System Action:

Processing of the command commences.

User Action:

None.

N8A702

EDB DEFINE COMMAND FAILED, DATABASE *dbname* ALREADY DEFINED.

Reason:

An attempt was made to redefine database *dbname*.

System Action:

Request is not performed.

User Action:

Delete database definition before issuing EDB DEFINE again.

N8A703

EDB DEFINE COMMAND FAILED, DATABASE *dbname* MATCHES OTHER DATABASE.

Reason:

An attempt was made to define database *dbname* with either a database ID matching the external ID of an already defined database or the database ID is matching the internal ID of already defined database.

System Action:

Request is not performed.

User Action:

Change the name or the ID of the database.

N8A704

EDB *command* FAILED, DATABASE *dbname* NOT DEFINED.

Reason:

An attempt was made to issue an EDB *command* request but no definition for database *dbname* exists.

System Action:

Request is not performed.

User Action:

If the *dbname* was incorrectly specified, re-issue the command with the correct *dbname*. Alternately define the database *dbname*.

N8A705

EDB DEFINE COMMAND FAILED, MAXTASKS IS LESS THAN MINTASKS.

Reason:

An attempt was made to define a database, but the MAXTASK and/or MINTASK specified on the EDB DEFINE command are incorrect.

System Action:

Request is not performed.

User Action:

Re-issue the command with the correct MAXTASK and/or MINTASK.

N8A706

EDB DEFINE COMMAND FAILED, DATABASE TYPE *dbtype* NOT SUPPORTED.

Reason:

An attempt was made to define a database but TYPE operand specified a database type that is not supported by this release of EDBS.

System Action:

Request is not performed.

User Action:

Re-issue the command with the correct type.

N8A707**DATABASE *dbname* HAS BEEN DEFINED.****Reason:**

Inform the user that *dbname* database was successfully defined for SOLVE.

System Action:

None.

User Action:

None.

N8A708**DATABASE CANCEL COMMAND REJECTED - NCLID IS NOT CONNECTED.****Reason:**

An attempt was made to cancel the connection between an NCL procedure and the database, but the NCL procedure was not communicating with the database.

System Action:

Request is not performed.

User Action:

Re-issue the command with correct NCLID.

N8A709**DATABASE *dbname* STARTED, DELETE NOT ALLOWED.****Reason:**

An attempt was made to delete an external database connection that has not been stopped.

System Action:

Request is not performed.

User Action:

Stop the database connection, then re-issue the EDB DELETE command.

N8A710

STORAGE SHORTAGE - REQUEST REJECTED.

Reason:

The EDB command failed due to system storage shortage.

System Action:

Request is not performed.

User Action:

Investigate SOLVE's use of storage.

N8A711

DATABASE *dbname* TASK IS NOT ATTACHED.

Reason:

An attempt was made to issue EDB CANCEL command with FORCE option and a subtask associated with specified NCLID could not be found.

System Action:

Request is not performed.

User Action:

Check if connection between the NCL procedure and the database is still active.

N8A801

DATABASE *dbtype* MODULES DSNALI, DSNHLI2, DSNTIAR LOADED.

Reason:

Informs the user that DB2's modules DSNALI, DSNHLI2 and DSNTIAR were successfully loaded.

System Action:

None.

User Action:

None.

N8A802**DATABASE *dbtype* MODULE *modname* FAILED TO LOAD.****Reason:**

Informs the user that the module *modname* failed to load.

System Action:

The database connection is not started.

User Action:

Investigate the reasons for load failure.

N8A803**DATABASE *dbname* STARTED.****Reason:**

Informs the user that the connection to the external database *dbname* is ACTIVE.

System Action:

None.

User Action:

None.

N8A804**DATABASE *dbname* SUBTASK ATTACH FAILED, REFER TO LOG.****Reason:**

Informs the user that the EDBS has failed to attach the CAF management subtask for external database *dbname*.

System Action:

Database connection is not started.

User Action:

Refer to the SOLVE's job log for attach failure reasons.

N8A805

DATABASE *dbname* CONNECTION FAILED: ABEND *type-code*

Reason:

Informs the user that the SOLVE connection to the external database *dbname* failed. The *type* and *code* are the abend type and abend code returned by the system.

System Action:

The database connection is not active.

User Action:

Refer to the relevant system manual for an explanation of abend codes.

N8A806

DATABASE *dbname* STOPPED.

Reason:

Informs the user that the SOLVE connection to the external database *dbname* was stopped.

System Action:

None.

User Action:

None.

N8A807

DATABASE *dbname* DEFINITION DELETED.

Reason:

Informs the user that the definition for the external database *dbname* was deleted.

System Action:

None.

User Action:

None.

N8A808**DATABASE *dbname* IS DOWN.****Reason:**

Informs the user that the SOLVE connection to the external database *dbname* is down.

System Action:

When the database becomes available, the connection is activated automatically.

User Action:

Investigate the reasons for the external database being inactive.

N8A809**DATABASE *dbname* IS NOW ACTIVE.****Reason:**

Informs the user that the connection to the external database *dbname* is ACTIVE.

System Action:

Connection between SOLVE and the external database is established.

User Action:

None.

N8A810**DATABASE *dbname* ALREADY STARTED.****Reason:**

An attempt was made to start an external database connection that was already started.

System Action:

None.

User Action:

If the *dbname* was incorrectly specified, re-issue the command with the correct *dbname*.

N8A811

DATABASE *dbname* CANNOT BE STOPPED - NOT STARTED.

Reason:

An attempt was made to stop an external database connection that was already inactive.

System Action:

None.

User Action:

If the *dbname* was incorrectly specified, re-issue the command with the correct *dbname*.

N8A812

DATABASE *dbname* STARTED, DELETE NOT ALLOWED.

Reason:

An attempt was made to delete an external database connection that is ACTIVE.

System Action:

None.

User Action:

Stop the database connection, then re-issue the command.

N8A813

DATABASE *dbname* MANAGEMENT TASK ABENDED *type-code*

Reason:

Informs the user that the EDBS CAF manager for the external database *dbname* has abended. The *type* and *code* are the abend type and abend code returned by the system.

System Action:

Database connection is terminated.

User Action:

Refer to the relevant system manual for an explanation of abend codes.

N8A814**DATABASE *dbname* FORCED.****Reason:**

Informs the user that the connection to the external database *dbname* was stopped. The system operator issued an EDB STOP request with the FORCE operand. This means that all open NCL connections are force-detached; all transactions in progress will be backed out by the database.

System Action:

Database connection is terminated.

User Action:

None.

N8A815**DATABASE *dbname* CONNECTION IS IN SHUTDOWN.****Reason:**

Informs the user that the connection to the external database *dbname* is in a shutdown state. The system operator issued an EDB STOP request with QUIESCE operand. This means that the connection is stopped after all NCL processes finish database access.

System Action:

Stops the connection to the external database after all NCL procedures close their connections. New connections by NCL procedures are not allowed.

User Action:

None.

N8A816

DATABASE *dbname* CONNECTION FAILED - RC=*rc* REASON=*reason*.

Reason:

Informs the user that the connection to the external database *dbname* has failed. The *rc* and *reason* are return and reason codes from the database.

System Action:

Database connection is not activated.

User Action:

Refer to the relevant database manual for an explanation of return and reason codes.

N8A817

DATABASE *dbname* START FAILED - ONLY ONE DB2 CONNECTION CAN BE STARTED.

Reason:

An attempt was made to connect SOLVE to multiple DB2 databases. This is not allowed due to IBM restriction of an address space being able to connect only to one DB2 database via CAF at any one time.

System Action:

Request is not performed.

User Action:

Terminate other DB2 connection and re-issue the command.

N8AF01

INVALID REQUEST.

Reason:

Informs the user that the request specified on &EDB or &SQL verb was invalid.

System Action:

The NCL procedure terminates.

User Action:

Correct the NCL procedure.

N8AF02**INVALID DATABASE ID.****Reason:**

Inform the user that the database ID specified on an &EDB or &SQL verb was invalid.

System Action:

NCL procedure terminates.

User Action:

Correct the NCL procedure.

N8AF04**RETURN CODE GREATER THAN 99.****Reason:**

Inform the user that return code from an &EDB or &SQL verb was greater than 99.

System Action:

NCL procedure terminates.

User Action:

Report the problem to your product support representative.

N8AF07**INVALID SYNTAX.****Reason:**

Inform the user that the syntax of an &EDB or &SQL verb was incorrect.

System Action:

NCL procedure terminates.

User Action:

Correct the NCL procedure.

N8AF09

CALL TO DATABASE *dbname* FAILED. REASON=*reason*.

Reason:

Informs the user that communication between NCL procedure and the external database failed.

System Action:

NCL procedure terminates.

User Action:

Report the problem to your product support representative.

N8AF14

STORAGE SHORTAGE.

Reason:

Informs the user that an &EDB or &SQL request failed due to system storage shortage.

System Action:

NCL procedure terminates.

User Action:

Investigate storage usage by SOLVE.

N8AI01

explanation of SQL error code.

Reason:

This message is returned in the &ZSQLERRM0 variable after the execution of &EDB INFO request. The message contains an explanation of the error code available in &ZSQLCODE.

System Action:

None.

User Action:

See &ZSQLCODE in the chapter titled System Variable Descriptions.

N8AI02***modname* SQL PROCEDURE DETECTING ERROR.****Reason:**

This message is returned in the &ZSQLERRM1 variable after the execution of an &EDB INFO request. The message contains the name of the module that detected the SQL error available in &ZSQLCODE variable.

System Action:

None.

User Action:

None.

N8AL01**NAME PARAMETER MISSING OR INVALID.****Reason:**

The NAME parameter on the &SQLFMT verb is missing or invalid.

System Action:

NCL procedure terminates.

User Action:

Correct the NCL procedure.

N8AL02**INVALID SYNTAX.****Reason:**

The syntax of the &SQLFMT verb is invalid.

System Action:

NCL procedure terminates.

User Action:

Correct the NCL procedure.

N8AL03

FORMAT HAS BEEN ALREADY DEFINED.

Reason:

The NCL procedure tried to define a format, using the &SQLFMT verb, and the format already exists.

System Action:

NCL procedure terminates.

User Action:

Correct the NCL procedure.

N8AL04

FORMAT NOT DEFINED.

Reason:

The NCL procedure tried to use a format, using the &SQLFMT verb, and the format has not been defined.

System Action:

NCL procedure terminates.

User Action:

Correct the NCL procedure. Use the &SQLFMT verb to define the format.

N8AL05

STORAGE SHORTAGE.

Reason:

The execution of the &SQLFMT verb failed due to system storage shortage.

System Action:

NCL procedure terminates.

User Action:

Investigate the reason for system storage shortage.

N9x to NSx Messages

N90101

INSUFFICIENT STORAGE - PROCESSING TERMINATED

Reason:

A process has been unable to obtain storage.

System Action:

The process is terminated.

User Action:

Retry the request. If the problem persists notify your installations help desk facility.

N92001

UNABLE TO LOAD MODULE xxxxxxxxxx REASON CODE=cccc. FORMAT FUNCTION BYPASSED.

Reason:

During formatted dump processing, an attempt was made to load the module identified in the message failed. The reason code refers to the BLDL and/or LOAD macro. This is normally due to insufficient storage.

System Action:

Formatted dump processing continues with the next report.

User Action:

Refer to the descriptions and return codes associated with the LOAD and BLDL macros in publications for the relevant operating system.

N92002

***** END OF FORMATTED DUMP *****

Reason:

Identifies the last line of a formatted dump.

System Action:

None, for information only.

User Action:

None, for information only.

N92003

**PROGRAM CHECK IN LOAD MODULE xxxxxxxxxxxx INTERRUPTION
CODE=cccc. FORMAT FUNCTION BYPASSED**

Reason:

An abend occurred during formatted dump processing, the module and abend code are identified in the message. The particular formatted dump report is incomplete.

System Action:

Formatted dump processing continues with the next report.

User Action:

Ascertain the cause of the (original) formatted dump which may be related. Contact your product support representative.

N92049**SOLVE INTERNAL ABEND MODULE NM000xxx REASON yy.****Reason:**

An internal error has occurred in the module identified in the message. The reason code further clarifies the type of abend. A full list of internal abend codes may be obtained using the CAS : Message Definition menu. All internal abend codes are prefixed by \$ABEND ie. \$ABENDxxx-yy.

System Action:

A formatted dump and a system dump are normally produced.

User Action:

Use the internal abend code to obtain the cause and description of the internal abend. If the problem cannot be easily diagnosed, refer the problem to your product support representative.

N93801**VSMLIST RETURNED BAD RC *nn*****Reason:**

The VSMLIST macro returned retcode *nn*. This return code was deemed to represent an error condition.

System Action:

Processing terminates.

User Action:

Refer to the discussion of VSMLIST in the SPL: System macros and Facilities Volume 2 manual for a description of the return code.

N93802

WORKAREA NOT AVAILABLE

Reason:

The workarea for VSMLIST to place data into was not available.

System Action:

Processing terminates.

User Action:

The workarea address is found at symbol XCUSHONA within the GVT. If the word at this address is zero then this error condition is encountered.

N93803

NO SUBPOOL INFORMATION WAS RETURNED

Reason:

The VSMLIST macro did not return any subpool information to process.

System Action:

Processing terminates.

User Action:

None.

N93804

Reason:

This message is an underline for messages N93806 and N93809

System Action:

None.

User Action:

None.

N93805

Reason:

This message is an underline for messages N93807 and N93810

System Action:

None.

User Action:

None.

N93806**SP# KEY TYPE TCB-ADDR BLK-ADDR BLK-SIZE FREE-ADDR FREE-SIZE****Reason:**

This is the title line for a SH SUBPOOL detailed request where :

SP# : Subpool number

KEY : Storage key within subpool

TYPE : Storage type (CSA/SQA/LSQA/PVT)

TCB- ADDR : The TCB address of the owner (when TYPE=PVT)

BLK-ADDR : The starting address of the storage block

BLK-SIZE : The size of the block

FREE-ADDR : The starting address of free space within a block

FREE-SIZE : The size of the free space

System Action:

None.

User Action:

None.

N93807

SP# KEY TYPE TCB-ADDR TOTAL FREE % FREE

Reason:

This is the title line for a SH SUBPOOL detailed request where :

SP# : Subpool number

KEY : Storage key within subpool

TYPE : Storage type (CSA/SQA/LSQA/PVT)

TCB- ADDR : The TCB address of the owner (when TYPE=PVT)

TOTAL : The total storage for key 'key' in subpool 'sp#'

FREE : The total free storage for key 'key' in subpool 'sp#'

% FREE : The percentage of free storage

System Action:

None.

User Action:

None.

N93809

aaa b cccc ddddddK eeeeeK

Reason:

This is a total line for a detailed list where :

aaa : The subpool number the total is for

b : The storage key the total is for

cccc : The storage type (CSA/SQA/LSQA/PVT)

dddddK : The total allocated storage

eeeeK : The total free storage

System Action:

None.

User Action:

None.

N93810

TOTAL *aaaa bbbbbbK ccccccK nn%*

Reason:

This is a total line for a summary list where :

aaaa : The storage type (CSA/SQA/LSQA/PVT)

bbbbbbK : The total storage

cccccK : The total free

nn% : The percentage of free storage within total

System Action:

None.

User Action:

None.

N93811

aaa b cccc dddddddd eeeeeeee fffffff ggggggg hhhhhhh

Reason:

This is the data line from a SH SUBPOOL=*nnn* request where :

aaa : Subpool number

b : Storage key within subpool

cccc : Storage type (CSA/SQA/LSQA/PVT)

ddddddd : The TCB address of the owner (when *cccc*=PVT)

eeeeeee : The starting address of the storage block

ffffff : The size of the block

ggggggg : The starting address of free space within a block

hhhhhhh : The size of the free space

System Action:

None.

User Action:

None.

N95001

EASINET OPTION SPECIFIED, MENU OPTION IGNORED.

Reason:

Both the EASINET and Menu options were specified on the LOGON command. The Menu option has been ignored.

System Action:

Invokes EASINET processing.

User Action:

Varies depending on EASINET action for your installation.

N95002

VTAM ACB OPEN FAILED - ACBERFLG = X'*nn*'.

Reason:

To connect to a product region the TSO interface module must open one of the NMTSO*nnn* ACBs. This open failed. The ACBERFLG value X'*nn*' is the VTAM error code associated with this failure.

System Action:

The request is ignored.

User Action:

Correct and retry.

N95003

NO AVAILABLE SESSIONS (NO VTAM ACB'S) - RETRY LATER.

Reason:

All of the TSO interface ACB's are in use.

System Action:

The request is ignored.

User Action:

A maximum of 999 ACB's (VTAM APPLS) of the form NMTSO*nnn* can be defined. If more concurrent TSO interface sessions are to be supported then extra VTAM APPL statements should be defined.

N95004**REQUESTED LU IS NOT AVAILABLE - RETRY LATER.****Reason:**

The LU requested on the NMLOGON command is unknown or in use.

System Action:

The request is rejected.

User Action:

Retry specifying another LU.

N95007**VTAM SETLOGON FAILED.****Reason:**

The VTAM SETLOGON macro failed.

System Action:

This message will be followed by message N95099 giving specific return codes.

User Action:

Interpret the return codes and correct the error.

N95008**VTAM REQSESS FAILED.****Reason:**

The VTAM REQSESS macro failed.

System Action:

This message will be followed by message N95099 giving specific return codes.

User Action:

Interpret the return codes and correct the error.

N95009

VTAM OPNSEC FAILED.

Reason:

The VTAM OPNSEC macro failed.

System Action:

This message will be followed by message N95099 giving specific return codes.

User Action:

Interpret the return codes and correct the error.

N95017

TSO INTERFACE ONLY SUPPORTED FROM A DISPLAY TERMINAL

Reason:

The user has attempted to invoke the TSO interface from a terminal other than a display terminal.

System Action:

The request is rejected.

User Action:

Use a 3270 type display terminal.

N95020

SESSION ESTABLISHMENT FAILED (NSEXIT DRIVEN).

Reason:

The VTAM NSEXIT was driven during establishment of the session with SOLVE.

System Action:

Processing of the TSO interface is terminated.

User Action:

This condition may indicate that the product has not been correctly installed. A VTAM buffer trace may aid in problem determination.

N95023**REQUESTED SOLVE APPL IS UNKNOWN TO VTAM - APPL: *applname*****Reason:**

The requested SOLVE VTAM APPL (application) is not defined to VTAM.

System Action:

The request is rejected.

User Action:

Validate that the APPL you requested has been varied active to VTAM. The APPL name *applname* may be the default APPL name of NM or it may be one you have specified incorrectly in the APPL parameter of the NMLOGON command.

N95024**REQUESTED SOLVE SYSTEM IS NOT ACTIVE - APPL: *applname*****Reason:**

The requested SOLVE system is not executing.

System Action:

The request is rejected.

User Action:

Validate that the APPL you requested is correct. If the APPL parameter was not specified in the TSO interface request the default VTAM APPL name of NM will be used.

N95025**VTAM GENCB FAILED - R15=X'*nn*'. R0=X'*mm*'.****Reason:**

The VTAM GENCB macro failed.

System Action:

The TSO interface request has failed.

User Action:

See the VTAM Programming Manual for a description of these register return codes.

N95026

TSO PARSE FAILED - R15=X'*nn*'.

Reason:

A call to IKJPARS has returned a non zero return code *nn* in register 15.

System Action:

The TSO interface request has failed.

User Action:

This may indicate an incompatibility with your system. Refer this to your systems administrator.

N95027

UNAUTHORISED USE OF TSO INTERFACE.

Reason:

The TSO interface will only function with an SOLVE that is licensed for the External Interface Package (EIP) feature. This message will also appear if the user tries to logon to an application other than SOLVE.

System Action:

The request fails.

User Action:

If the logon attempt was to SOLVE, then your system is not licensed for this facility. Contact your product support representative.

N95028

SESSION WITH SOLVE SYSTEM FAILED.

Reason:

The session with SOLVE has failed.

System Action:

Processing of the TSO interface is terminated.

User Action:

Refer to preceding messages for determination of the problem.

N95029**REQUESTED SOLVE SYSTEM IS UNAVAILABLE - APPL: *applname*****Reason:**

The requested SOLVE system is inactive or not accepting logons.

System Action:

The request is rejected.

User Action:

Determine the status of the required SOLVE system and retry when it available.

N95099

FDBK/SENSE = X'nnnnnnnnnnnn'. R15 = X'xx'. R0 = X'yy'.

Reason:

This message is preceded by a message giving broad details of the error. This message supplies specific information to use in problem determination.

System Action:

The associated request has failed.

User Action:

Using the error codes above refer to the VTAM Programming Manual for the reasons for the failure. Correct the error and retry.

N95104**VTAM SEND FAILED.****Reason:**

The VTAM SEND macro failed.

System Action:

This message will be followed by message N95199 giving specific return codes.

User Action:

Interpret the return codes and correct the error.

N95105

VTAM RECEIVE FAILED.

Reason:

The VTAM RECEIVE macro failed.

System Action:

This message will be followed by message N95199 giving specific return codes.

User Action:

Interpret the return codes and correct the error.

N95114

SCREEN INPUT ERROR. CODE = X'nn'.

Reason:

An error occurred on a TGET macro. The code shown is that returned in register 15.

System Action:

Processing of the TSO interface is terminated.

User Action:

Interpret the return code and correct the error.

N95115

SCREEN OUTPUT ERROR. CODE = X'nn'.

Reason:

An error occurred on a TPUT macro. The code shown is that returned in register 15.

System Action:

Processing of the TSO interface is terminated.

User Action:

Interpret the return code and correct the error.

N95118**LENGTH OF SCREEN INPUT EXCEEDS INTERNAL BUFFER SIZE.****Reason:**

The amount of data presented to the TSO interface from the TSO screen exceeded the internal buffer size.

System Action:

The request is rejected.

User Action:

Report this error to your product support representative.

N95121**INTERNAL ERROR - UNSUPPORTED CHAINED MESSAGE RECEIVED FROM SOLVE.****Reason:**

A chained message should not be received from SOLVE.

System Action:

Processing of the TSO interface is terminated.

User Action:

This is an internal error. Report it to your product support representative.

N95122**INTERNAL ERROR - SOLVE MESSAGE EXCEEDS INTERNAL BUFFER SIZE.****Reason:**

The amount of data received by the TSO interface from SOLVE exceeds the internal buffer size.

System Action:

Processing of the TSO interface is terminated.

User Action:

This is an internal error. Report it to your product support representative.

N95125

VTAM MODCB FAILED.

Reason:

The VTAM MODCB macro has failed.

System Action:

This message will be followed by message N95199 giving specific return codes.

User Action:

Interpret the return codes and correct the error.

N95126

SCREEN OUTPUT ERROR. CODE=X'xx'.

Reason:

An error occurred on a TPUT macro. The code shown is that returned in register 15.

System Action:

Processing of the TSO interface is terminated.

User Action:

Interpret the return code and correct the error.

N95199

FDBK/SENSE = X'ffffssssuuuu'. R15 = X'xx'. R0 = X'yy'.

Reason:

This message is preceded by a message giving broad details of the error. This message supplies specific information to use in problem determination.

System Action:

The associated request has failed.

User Action:

Using the error codes above refer to the VTAM Programming Manual for the reasons for the failure. Correct the error and retry.

N95401**GETMAIN/FREEMAIN FAILURE - R15=X'xx'.****Reason:**

A storage request failed with the specified value in Register 15.

System Action:

Processing of the TSO interface is terminated.

User Action:

Determine the cause of the error.

N95402**TSO PARSE IN ERROR - R15=X'xx'.****Reason:**

A call to IKJPARS has returned a non zero return code nn in register 15.

System Action:

The TSO interface request has failed.

User Action:

This may indicate an incompatibility with your system. Refer this to your systems administrator.

N95403**TSO SCAN IN ERROR - R15=X'xx'.****Reason:**

A call to IKJSCAN has returned a non zero return code xx in register 15.

System Action:

The TSO interface request has failed.

User Action:

This may indicate an incompatibility with your system. Refer this to your systems administrator.

N95404

TSO PUTGET IN ERROR - R15=X'xx'.

Reason:

A PUTGET macro has returned a return code greater than 4 in register 15.

System Action:

Processing of the TSO interface is terminated.

User Action:

Refer to the TSO Guide to Writing a TMP or CP for explanation of the contents of R15.

N95405

INVALID COMMAND - IGNORED

Reason:

The command entered was not a valid command name.

System Action:

The command is rejected.

User Action:

Check that the command name was not longer than 8 characters, and did not contain invalid characters. Correct and retry.

N95407

LOST SYNCHRONISATION - POSSIBLY DUE TO A LOOPING OR FLUSHED PROCEDURE

Reason:

The procedure being processed via the NMCMD interface is in all probability looping, or has been flushed.

System Action:

Processing of the TSO interface is terminated.

User Action:

Determine the cause of the error and retry. The activity log may contain a reason for the failure.

N95408**SPECIFY A VALID SUBCOMMAND OR 'END' TO RETURN TO TSO****Reason:**

This is a help message issued to assist the user.

System Action:

None.

User Action:

Enter a valid NMCMD subcommand.

N95410**SESSION ERROR - RETURN CODE R15=x'xx', FUNCTION CODE=*fc*
*descript*****Reason:**

An error has occurred whilst performing processing associated with the function code as described.

System Action:

Processing of the TSO interface is terminated.

User Action:

An associated message is issued to provide more precise details of the reason for failure.

N95411**LOGON FAILED - REASON UNKNOWN****Reason:**

An attempted logon to SOLVE using NMCMD failed.

System Action:

Processing is terminated.

User Action:

Refer to the SOLVE log for details regarding this error.

N95412

UNKNOWN PANEL FORMAT RECEIVED - REQUEST CANCELLED.

Reason:

The panel that was received was not in the expected format.

System Action:

NMCMD processing terminates.

User Action:

Verify that the procedures and panels required for NMCMD processing have been installed correctly.

1. If using NMCMD without the USER operand check that the TSO userid is defined in UAMS with TSO Autologon=Y.
2. Check that the TSO userid or userid specified on the USER operand is defined to have access to a User Services Member (Normally \$USERSER.)
3. Ensure that \$USERSER (if modified) or installation User Services procedure supports NMCMD/BCI.
4. Check that the correct version of NMCMD is available to TSO - (usually via LINKLST).

Refer to the activity log for further details of the error associated with this request.

N95413

INSUFFICIENT INPUT FIELDS ON PANEL - REQUEST FAILED.

Reason:

An internal error has occurred in the 3270 virtual interface.

System Action:

The command is rejected.

User Action:

Verify that the procedures and panels required for NMCMD processing have been installed correctly. Ensure sufficient input fields are available on the panel for the specified request. Refer to the SOLVE log for further details of the error associated with this requested. If the problem persists report it to your product support representative.

N95414**INVALID VALUE SPECIFIED - MAXRC NOT SET****Reason:**

The MAXRC command did not specify an operand that was in the range 0-99.

System Action:

The command is rejected, and MAXRC is reset to the default value of 8.

User Action:

Re-enter the command specifying a number in the range 0-99. NMCMD processing will be terminated if a SOLVE procedure invoked by an NMCMD subcommand sets a return code greater than or equal to the last value set by the MAXRC command.

N95415**SUB-CMD RETURN CODE *rc* - NMCMD PROCESSING TERMINATED****Reason:**

The SOLVE procedure invoked by an NMCMD subcommand has set a return code greater than or equal to the value specified by the MAXRC command.

System Action:

Processing of the TSO interface is terminated.

User Action:

None.

N95416**TSO STACK MACRO ERROR RC=*rc* - NMCMD PROCESSING TERMINATED****Reason:**

An error was encountered when executing the TSO STACK macro. The return code *rc* was returned in R15. Refer to the TSO Guide to Writing a TMP or CP for details on the meaning of the return code.

System Action:

Processing of the TSO interface is terminated.

User Action:

Refer the problem to your systems administrator.

N95417

FILE COULD NOT BE OPENED.

Reason:

During processing of the READ sub-command of NMCMD an attempt was made to open the input file (specified by the INDD parameter when NMCMD is invoked). The open failed.

System Action:

Processing of the TSO interface is terminated.

User Action:

Check whether the file is available or refer the problem to your systems administrator.

N95420

TSO GETLINE MACRO ERROR RC=*rc* - NMCMD PROCESSING TERMINATED

Reason:

An error occurred on execution of the TSO GETLINE macro. The return code was returned in R15. Refer to the TSO Guide to Writing a TMP or CP for details of the return code meaning.

System Action:

Processing of the TSO interface is terminated.

User Action:

Refer the problem to your systems administrator.

N95501

UNKNOWN FTS SUBCOMMAND - IGNORED

Reason:

Commands prefixed by FTS are passed to an FTS sub-command processor. The command entered is unknown to this processor.

System Action:

The command is rejected.

User Action:

Determine the correct FTS sub-command and retry.

N95502**TSO PARSE FAILURE - R15=X'xx'.****Reason:**

A call to IKJPARS has returned a non zero return code *nn* in register 15.

System Action:

NMCMD processing terminates.

User Action:

This may indicate an incompatibility with your system. Refer this to your systems administrator.

N95503**SPECIFYING OPERANDS AS (*) VALID FOR COPY ONLY****Reason:**

A value of '*' was specified for an FTS sub-command keyword indicating that the data for this operand should be extracted from the stored FTS definition, but the copy keyword was not entered.

System Action:

The Command is rejected.

User Action:

Supply full details or specify the COPY keyword.

N95504**INVALID OPERANDS. NEITHER OR BOTH OF FRVOL AND FRUNT (FROM VOL/UNIT) REQUIRED.****Reason:**

If either FRVOL or FRUNT is specified then the other must also be specified. Neither should be specified if FRDSN refers to a cataloged dataset.

System Action:

The request is rejected.

User Action:

Determine the requirements of the request and retry.

N95505

INVALID OPERANDS. FOR TODSN=SYSOUT INVALID TO SPECIFY TOVOL, TOUNT, TODSP, TOSPC, TOLRL TORFM OR IMAGECOPY.

Reason:

SYSOUT has been requested as the TODSN for an FTS transmission, it is invalid to specify other operands as explained in this message.

System Action:

The request is rejected.

User Action:

Determine the requirements of the request and retry.

N95506

INVALID OPERANDS. TOVOL, TOUNT OR TOSPC INVALID UNLESS TODSP IS NEW OR REP.

Reason:

The operands TOVOL, TOUNT and TOSPC are invalid for a request that does not specify TODSP (NEW or REP).

System Action:

The request is ignored.

User Action:

Correct and retry.

N95507

INVALID OPERANDS. TOLRL, TORFM OR TOBLK INVALID WHEN IMAGECOPY REQUESTED

Reason:

Specifying TIMCO(Y) requests an FTS imagecopy which dictates that the dataset attributes of the TODSN dataset will be copied from the FRDSN dataset and so dataset attributes must not be supplied.

System Action:

The request is rejected.

User Action:

Determine the requirements of the request and retry.

N95508

INVALID OPERANDS. SPECIFY ALL OR NONE OF TOLRL, TORFM OR TOBLK ONLY.

Reason:

If dataset attributes are to be specified, then specify all of them.

System Action:

The request is rejected.

User Action:

Determine the requirement of the request and retry.

N95509

SPECIFY DATASET.NAME(MEMBER) OR DATASET.NAME AND MEMBER LIST.

Reason:

When a member name is specified in either the FRDSN or TODSN operand, the specification of a member list through the MEMBER operand is invalid.

System Action:

The request is rejected.

User Action:

Correct and retry.

N95510

**SESSION ERROR - RETURN CODE R15=X'xx', FUNCTION CODE=*fc*
*descript***

Reason:

An error has occurred in the virtual 3270 interface whilst performing processing with the function code as described.

System Action:

NMCMD processing terminates.

User Action:

Determine the cause of the error and retry.

N95511

UNKNOWN DATASTREAM RECEIVED - REQUESTED CANCELLED.

Reason:

An invalid datastream was received.

System Action:

NMCMD processing is terminated.

User Action:

Determine the cause of the error. Verify that all procedures and panels were installed correctly. The activity log may contain further details regarding this error.

N95512

INSUFFICIENT INPUT FIELDS ON PANEL - REQUEST FAILED.

Reason:

An internal error has occurred in the 3270 virtual interface.

System Action:

The request is rejected, and processing is terminated.

User Action:

Determine the cause of the error. Verify that all procedures and panels were installed correctly. The SOLVE log may contain further details regarding this error.

N95513

NO SPACE PARAMETERS SUPPLIED FOR DATASET WITH TODSP OF NEW OR REP.

Reason:

If TODSP is NEW or REP then the amount of space required for the dataset must be specified with the TOSPC operand.

System Action:

The request is rejected.

User Action:

Determine the amount of space required for the TODSN and retry.

N95514**MISSING OPERAND. TOVOL OR TOUNT REQUIRED WHEN TODSP IS NEW OR REP.****Reason:**

If TODSP is NEW or REP then either TOVOL or TOUNT, or both, must be supplied to provide the unit/volume information for the dataset.

System Action:

The request is rejected.

User Action:

Provide the unit/volume information and retry the request.

N95515**SPECIFY BOTH OR NEITHER DIRECTORY BLOCKS AND TODSN MEMBER NAME.****Reason:**

For a new dataset, the space allocation may specify directory blocks only if a PDS is indicated by inclusion of a member name in the dataset name, or the presence of a list of members in the MEMBERS operand. Otherwise directory block information cannot be specified.

System Action:

The request is rejected.

User Action:

Correct and retry the request.

N95601**INVALID FUNCTION CODE****Reason:**

The virtual 3270 interface has been invoked with an invalid function code.

System Action:

The request is rejected.

User Action:

Determine the cause of the error and retry.

N95602

SEND REQUEST ERROR - NO SESSION EXISTS

Reason:

Either a successful start session request has not been processed by the virtual 3270 interface, or the current session has failed. A send request is not permitted unless a session exists.

System Action:

The request is rejected.

User Action:

The session start call must be used to start or restart the session with SOLVE.

N95603

RECEIVE REQUEST ERROR - NO SESSION EXISTS

Reason:

Either a successful start session request has not been processed by the virtual 3270 interface, or the current session has failed. A receive request is not permitted unless a session exists.

System Action:

The request is rejected.

User Action:

The session start call must be used to start or restart the session with SOLVE.

N95604

VTAM SEND FAILED

Reason:

The VTAM SEND macro failed.

System Action:

This message will be followed by a message giving specific return codes.

User Action:

Interpret the return codes and correct the error.

N95605**VTAM RECEIVE FAILED****Reason:**

The VTAM RECEIVE macro failed.

System Action:

This message will be followed by a message giving specific return codes.

User Action:

Interpret the return codes and correct the error.

N95621**INTERNAL ERROR - UNSUPPORTED CHAINED MESSAGE RECEIVED FROM SOLVE****Reason:**

A chained message should not be received from SOLVE.

System Action:

Processing of the virtual 3270 interface is terminated.

User Action:

This is an internal error. This error should be reported to your product support representative.

N95622**INTERNAL ERROR - SOLVE MESSAGE EXCEEDS INTERNAL BUFFER SIZE****Reason:**

The amount of data received by the Virtual Terminal Interface from SOLVE exceeds the internal buffer size.

System Action:

Processing of the interface is terminated.

User Action:

This is an internal error and should be reported to your Product Support Representative.

N95623

SOLVE LOGON PANEL EXPECTED BUT NOT RECEIVED

Reason:

The virtual 3270 interface was requested to start a session with SOLVE using a supplied user ID and password. The first panel received from SOLVE was not the logon panel so further processing was not possible.

System Action:

Processing terminates.

User Action:

Refer to the SOLVE log for details.

N95699

FDBK/SENSE = X'*fdbk fdbk2*' R15=X'*xx*'. R0=X'*xx*'.

Reason:

This message is preceded by a message giving broad details of the error. This message supplies specific information to use in problem determination.

System Action:

The associated request has failed.

User Action:

Using the error codes above refer to the VTAM Programming Manual for the reasons for the failure. Correct the error and retry.

N95701

SOLVE USERID/PASSWORD REQUIRED BUT NOT SUPPLIED

Reason:

A SOLVE user ID and password are required for batch processing, but have not been supplied.

System Action:

The request is rejected.

User Action:

Correct the problem and retry the operation.

N95702**VTAM ACB OPEN FAILED - ACBERFLG = X'xx'****Reason:**

The virtual 3270 interface was unable to open an ACB.

System Action:

Processing of the interface is terminated.

User Action:

Refer to the VTAM Programming Guide for explanation of the ACBERFLG.

N95703**NO AVAILABLE SESSIONS (NO VTAM ACBS) - RETRY LATER****Reason:**

No VTAM ACBs were available for use by the virtual 3270 interface.

System Action:

Processing of the interface is terminated.

User Action:

Retry later. If the problem persists refer to your systems administrator.

N95704**REQUESTED ACB IN USE - RETRY LATER****Reason:**

The ACB requested in the LUNAME operand of the NMCMD command is currently in use.

System Action:

The request is rejected.

User Action:

Select a different luname for the requested, or retry when this ACB is no longer in use.

N95705

xxxxxxx FAILED, R15=X`nn'.

Reason:

A system macro - xxxxxxxx is GETVIS or FREEVIS - failed with a return code of *nn*.

System Action:

The program cancels.

User Action:

Refer to the IBM VSE Application Programming: Macro Reference manual using the macro name and the return code. A GETVIS error will probably mean running in a larger partition/region. A snap dump may also be produced which may be required by your product support representative if an immediate diagnosis cannot be ascertained.

N95706

UNAUTHORISED USE OF EXTERNAL INTERFACE FEATURE

Reason:

The virtual 3270 interface will only function with a SOLVE system that is licensed for the external interface feature. This message will also appear if a user of the TSO interface tries to logon to an application other than SOLVE.

System Action:

The request fails.

User Action:

If the logon attempt was to SOLVE, then your system is not licensed for this facility. Contact your product support representative.

N95707**VTAM SETLOGON FAILED****Reason:**

The VTAM SETLOGON macro failed.

System Action:

This message will be followed by message N95799 giving specific return codes.

User Action:

Interpret the return codes and correct the error.

N95708**VTAM REQSESS FAILED****Reason:**

The VTAM REQSESS macro failed.

System Action:

This message will be followed by message N95799 giving specific return codes.

User Action:

Interpret the return codes and correct the error.

N95709**VTAM OPNSEC FAILED****Reason:**

The VTAM OPNSEC macro failed.

System Action:

This message will be followed by message N95799 giving specific return codes.

User Action:

Interpret the return codes and correct the error.

N95720

SESSION ESTABLISHMENT FAILED (NSEXIT DRIVEN)

Reason:

The VTAM NSEXIT was driven during establishment of the session with SOLVE.

System Action:

Processing of the virtual 3270 interface is terminated.

User Action:

This condition may indicate that the product has not been correctly installed.

N95723

REQUESTED SOLVE APPL IS UNKNOWN TO VTAM - APPL: *applname*

Reason:

The requested SOLVE VTAM APPL (application) is not defined to VTAM.

System Action:

The request is rejected.

User Action:

Validate that the APPL major node you requested has been varied active to VTAM. If it has not been, you can vary it active with the ACT command from an OCS screen. The APPL name '*applname*' may be the default APPL name of NM or it may be one you have specified incorrectly in the APPL parameter of the NMCMD command.

N95724

REQUESTED SOLVE IS NOT ACTIVE - APPL: *applname*

Reason:

The requested SOLVE *applname* is not executing.

System Action:

The request is rejected.

User Action:

Validate that the APPL you requested is correct.

N95725**VTAM GENCB FAILED - R15=X'xx'. R0=X'xx'.****Reason:**

The VTAM GENCB macro failed.

System Action:

The TSO interface request has failed.

User Action:

See the VTAM Programming Manual for a description of these register return codes.

N95728**SESSION WITH SOLVE FAILED****Reason:**

The session with SOLVE has failed.

System Action:

Processing of the virtual 3270 interface is terminated.

User Action:

Refer to preceding messages for determination of the problem.

N95729**REQUESTED SOLVE SYSTEM IS UNAVAILABLE - APPL: *applname*****Reason:**

The SOLVE application requested is inactive, or not accepting logons.

System Action:

The request is rejected.

User Action:

Determine the status of the required SOLVE system and retry the operation when the application is available.

N95799

FDBK/SENSE = X'ffffssssuuuu'. R15=X'xx'. R0=X'xx'.

Reason:

This message is preceded by a message giving broad details of the error. This message supplies specific information to use in problem determination.

System Action:

The associated request has failed.

User Action:

Using the error codes above refer to the VTAM Programming Manual for the reasons for the failure. Correct the error and retry.

N95801

INVALID 3270 COMMAND CODE RECEIVED

Reason:

An invalid 3270 command code was received in a datastream sent from SOLVE.

System Action:

Processing of the virtual 3270 interface is terminated.

User Action:

This should not occur. Report the occurrence to your product support representative.

N95802

INVALID 3270 BUFFER ORDER ENCOUNTERED

Reason:

An invalid buffer order was detected in a datastream received from SOLVE.

System Action:

Processing of the virtual 3270 interface is terminated.

User Action:

This should not occur. Report the occurrence to your product support representative.

N95803**INSUFFICIENT FIELD STORAGE GENERATED****Reason:**

A user-defined User Services screen has more than 86 fields. Each field is equivalent to an attribute byte, unprotected (i.e. input field) or protected (output). In the case of protected fields this extends to text literals etc., everywhere where a #FLD character is present.

Note: This message can be generated because the wrong panel is being presented as a result of incorrect logic in the User Services procedure. For example, if the MENU option of an NMLOGON or BCILOGON command is incorrect, an unexpected User Services panel may be presented if you the User Services procedure has been tailored.

System Action:

The program cancels.

User Action:

Check that the User Services panel does not have more than 86 fields defined. If so, correct and retry.

If the field count is correct ensure that the correct User Services panel is being presented as a result of the NMLOGON or BCILOGON MENU operand, or subsequent command(s). To check which panel is being presented, simulate the NMCMD or BCI data by using a real 3270 and entering the commands.

N96001**COMMAND IGNORED - NO SOLVE SESSION****Reason:**

The command just read from the system input device has been bypassed because there is no SOLVE session successfully established. This is possibly due to the failure of an earlier BCILOGON command.

System Action:

The command is ignored.

User Action:

Determine why there is no SOLVE session active. If a BCILOGON failed, correct it and re- run. If there was no BCILOGON command, rerun with the BCILOGON command added.

N96002

BCILOGON REJECTED - SOLVE SESSION ALREADY ACTIVE

Reason:

A BCILOGON command has been read while a session (i.e. previous BCILOGON command) is still active. This may be due to the failure of an earlier BCIDISC command.

System Action:

The command is ignored.

User Action:

Determine why there is a SOLVE session active and correct the input accordingly.

N96003

VIRTUAL 3270 INTERFACE NOT FOUND

Reason:

In executing a BCILOGON command, the Virtual 3270 Interface (NMV3270I), has to be loaded from the load/core-image library but it could not be found.

System Action:

The program cancels.

User Action:

Ensure that the library containing the member is in the search chain.

N96004

xxxxxxx ERROR, R15=X'nn'.

Reason:

The macro or load-member xxxxxxxx, which may be GETVIS, FREEVIS, CDLOAD or NMV3270I, has failed with a return code nn.

System Action:

The program cancels.

User Action:

If the message indicates NMV3270I, there may be an earlier message providing additional explanatory details. In the case of a macro, the appropriate IBM manual should be referenced using the return code given. GETVIS/CDLOAD errors will probably mean running in a larger partition/region. A snap dump is also produced which may be required by your product support representative if an immediate diagnosis cannot be ascertained.

N96005**BCIDISC FORCED****Reason:**

A session has to be implicitly disconnected for one of the following reasons:

- after message N96009 indicating a return code error
- at end of system input when a session is still active

System Action:

A BCIDISC command is assumed and actioned.

User Action:

If message N96009 was issued, the cause of that problem should be ascertained. If this message is issued for the latter reason, a BCIDISC command should be added to the input, unless a previous BCIDISC failed.

N96006

SESSION ESTABLISHED - APPL-ID=*applid*

Reason:

A BCILOGON command has been successfully processed. The BCI *applid* is shown on the system output file.

System Action:

None.

User Action:

None.

N96007

INCOMPLETE BCILOGON COMMAND

Reason:

A BCILOGON command is incomplete for one of the following reasons:

- there are no parameters specified
- the user-id is missing
- the password is missing

System Action:

The command is ignored.

User Action:

Determine the actual cause of the error and correct the command.

N96008**UNRECOGNISABLE DATA AT 'xxx.....xxx'****Reason:**

A BCILOGON command, shown in the message, cannot be actioned because the parameters and keywords cannot be recognized. Possible causes are:

- SOLVE applid (first parameter) missing
- a mandatory keyword/parameter missing, or not paired
- a keyword/parameter pair duplicated

System Action:

The command is ignored.

User Action:

Determine the cause of the error and correct the command.

N96009**USER SERVICES RETURN CODE *nn*****Reason:**

The User Services procedure has returned (in the third control field of the panel) a non- zero code (ie. &RETCODE = *nn*).

System Action:

BCI sends a F12 function (to clear any internal command replies), forces a disconnect (issuing N96005), and the job is cancelled setting the JCL return code to 1000 plus the &RETCODE value, for example, if &RETCODE was set to 30, the JCL return code is 1030.

User Action:

Use the return code to establish the reason for the error and correct either the command or the procedure.

N96010

SESSION DISCONNECTED - APPL-ID=*applid*

Reason:

A BCIDISC has been successfully executed terminating the session with the *applid* shown in the message.

System Action:

None.

User Action:

None.

N96011

LOGON FAILED FOR USER=*userid*

Reason:

The *userid* and/or password are not known to the SOLVE system identified by the *applid* in the BCILogon command. Possible explanations are:

- incorrect (or expired password)
- incorrect *userid*, or not added to SOLVE
- wrong *applid*/*userid* combination

This message is also produced after N96016.

System Action:

The BCILogon is rejected.

User Action:

Determine the cause of the error and correct the command.

N96012**USER EXIT NOT ACTIVE - IGNORED****Reason:**

A BCIEEXITC command with no operand was found, but there is no command user-exit currently active. This may be due to the failure of a previous BCIEEXITC command.

System Action:

The command is ignored.

User Action:

Determine why there is no command user-exit active and correct the input accordingly.

N96013**USER EXIT *exitname* NOT FOUND****Reason:**

This can occur for VSE/SP only. The program name specified cannot be located in the core-image library. If this condition should occur in an OS environment an S806 abend or equivalent will occur.

System Action:

The job cancels.

User Action:

Ensure that the *exitname* is specified correctly and that the library containing the member is in the search chain.

N96014

USER EXIT *exitname* CURRENTLY ACTIVE

Reason:

A BCIEXITC command specifying an *exitname* has been found while an exit is still active.

System Action:

The job cancels.

User Action:

De-activate the current exit by including a BCIEXITC command with no operands before the BCIEXITC command in error.

N96015

USER EXIT ERROR. RETURN CODE *nn*

Reason:

For *nn*=4, the user-exit name specified on the BCIEXITC command is invalid. Possible reasons are:- - name longer than 8 characters - name is NMBCI or NMV3270I Other return codes are returned by the user coded exit.

System Action:

The job cancels.

User Action:

If the return code is 4, correct the user-exit name in the input data stream. If the code is not 4, refer to the command user exit in question.

N96016

PASSWORD HAS EXPIRED AND MUST BE CHANGED

Reason:

The password for this user has expired. This is due to either the password expiry period has elapsed, or this is the first logon after the setting of an initial or forced password.

System Action:

The user is logged off and message N96011 issued.

User Action:

Access SOLVE from a 3270 terminal to set a new password for this user.

N96017**RECONNECT ENVIRONMENTS CANCELLED****Reason:**

A BCILOGON request has established that reconnect environments existed, possibly due to previous BCI jobs that have failed. BCI does not support reconnection of these environments.

System Action:

The reconnect environments are cancelled and the BCILOGON continues.

User Action:

None.

N96101**OPEN FOR DD= P1 FAILED. CHECK RUN JCL.****Reason:**

The Batch Command Interface (BCI) has tried to open the file whose DD name is *P1* but the open failed due to a JCL error. The nature of the error is indicated by an operating system message, for example: IEC130I *P1* DD STATEMENT MISSING.

System Action:

The message is written to the JES log as a Write-To-Operator (WTO) message. BCI terminates with return code 12.

User Action:

Check the job output for additional operating system messages. Correct the JCL and rerun.

N98101

SSI CONNECTION ESTABLISHED TO SSID=xxxx JOBNAME=yyyyyyyyyy

Reason:

The SSI interface has connected to a SOLVE SSI for the indicated SSID and JOBNAME.

System Action:

SSI facilities are now available.

User Action:

None.

N98102

SSI CONNECTION STOPPED TO SSID=xxxx REASON: explanation.

Reason:

The SSI interface has lost connection with the indicated SSI for the indicated reason.

System Action:

SSI facilities are unavailable.

User Action:

Check that the connection failure is expected. If not, investigate and restart the SSI.

N98110

SSI ENVIRONMENT CONNECTION TERMINATED.

Reason:

The SSI interface has lost connection with the indicated SSI and cleaned up the SSI command environment for this SOLVE system.

System Action:

SSI commands cannot be issued.

User Action:

None.

N98190**SSI CONNECTION TO SSID=xxxx FAILED, RC=nn R0=nn reason1
reason2****Reason:**

The SSI interface could not connect with the indicated SSID.

The return code values and reasons (reason1) are:

- 12 - SSI Shut down
- 28 - Connection refused
- 32 - Abend occurred
- 36 - SSI communications error

The R0 value and reasons (reason2) are:

- 1 - (connection key expired) (timeout)
- 2 - (duplicate jobname)
- 3 - (duplicate domain id)
- 4 - (duplicate nmid)
- 5 - (duplicate acbname)
- 6 - (duplicate ascb)
- 7 - (no connection slots left)
- 8 - (jobname not in restriction list)
- 9 - (no connection tokens left)
- 10 - (no endpoint ids left)
- 11 - (unable to obtain \$etm)

System Action:

The SSI interface remains inactive.

User Action:

Investigate the failure reason and correct it.

N98191

RETRYING SSI CONNECTION TO *ssid* IN *n* SECONDS.

Reason:

The SSI interface could not connect with the indicated SSID. It will retry in the indicated interval.

System Action:

The SSI interface remains inactive.

User Action:

If the retry is not wanted, use the SYSPARMS SSID=NO command to stop retries.

N98192

UNABLE TO CONNECT TO SSID=*xxxx* - NOT FOUND OR NOT SUITABLE.

Reason:

The SSI interface could not connect with the indicated SSID. Either the SSID is not in the system SSI names list, or it is not a recognisable SOLVE subsystem.

System Action:

The SSI interface remains inactive.

User Action:

Check that the correct SSID was specified.

N98250

SSI INTERFACE SEND ERROR, RC=*rr*

Reason:

The SSI interface encountered an error when sending data buffers to the connected NMSSI.

System Action:

Depending on the reason for the error, either the NMSSI connection will be stopped or a retry will occur.

User Action:

Check that the SSI job is still processing.

N98290**SSI INTERFACE SEND BUFFER SHORTAGE, SSID=ssss****Reason:**

The SSI interface could not obtain the communications buffers used to send commands and messages to the SSI. This could indicate that the SSI job is hung or looping.

System Action:

The message will be reissued every 5 seconds until the SSI interface is stopped or buffers become available.

User Action:

Check that the SSI job is still processing.

N98350**SSI INTERFACE RECV ERROR, RC=rr****Reason:**

The SSI interface encountered an error when receiving data buffers from the connected NMSSI.

System Action:

Depending on the reason for the error, either the NMSSI connection will be stopped or a retry will occur.

User Action:

Check that the SSI job is still processing.

N98401**SSI ENVIRONMENT SIGNED OFF FOR USER *userid*.****Reason:**

The SSI command interface environment has been signed off for this user. This is as a result of the SSI SIGNOFF command.

System Action:

The environment is terminated in the SSI job.

User Action:

None.

N98490

***opt* IS NOT A VALID OPTION FOR THE *cmd* COMMAND.**

Reason:

An invalid option *opt* for the SSI command *cmd* has been entered.

System Action:

The command is not processed.

User Action:

Correct the command.

N98491

USERID *uuuuuuuu* IS NOT AUTHORISED FOR THE *aaaaaa* OPTION OF THE *cmdname* COMMAND.

Reason:

You are not authorized for this option of the indicated command.

System Action:

The command is not processed.

User Action:

Correct the command.

N98492

***cmdname* COMMAND NOT PROCESSED, SSI NOT CONNECTED.**

Reason:

The indicated command could not be processed, as there is no active connection to the SOLVE SSI.

System Action:

The command is not processed.

User Action:

Investigate why the SSI is not active.

N98495***cmdname* COMMAND NOT PROCESSED, STORAGE SHORTAGE.****Reason:**

The indicated command could not be processed, as a storage shortage prevented obtaining required buffers.

System Action:

The command is not processed.

User Action:

Retry after determining the cause of the storage shortage.

N98501**SSID CANNOT BE CHANGED AT THIS TIME****Reason:**

The SYSPARMS SSID command cannot be entered while the SSI interface is attempting a connection.

System Action:

The command is not processed.

User Action:

Retry after the SSI interface has finished the attempt at connection.

N98502**NEW SSID NAME NOT ALLOWED. REQUIRED SSID: *subsysid*****Reason:**

The SYSPARMS SSID command was used to set a new SSID. The new SSID is not allowed, as a previous connection to the indicated SSID *subsysid* has occurred. This is the only acceptable SSID until SOLVE is stopped.

System Action:

The command is not processed.

User Action:

Correct the SSID.

N98601

SUBSYSTEM INTERFACE STATUS IS valstat SSID=subsysid.

Reason:

This message is a response message to the STATUS command; it provides the status of the SSI interface. Values for the status are:

- INACTIVE
- ACTIVE
- STARTING
- RETRY-WAIT
- STOPPING
- UNKNOWN

System Action:

None.

User Action:

None.

N98F02

STORAGE SHORTAGE DURING PROCESSING FOR aaaaaaaa

Reason:

Input has been received from terminal *aaaaaaa* but the input could not be processed due to a SOLVE temporary storage shortage.

System Action:

The connection with the terminal is closed.

User Action:

Investigate the cause of the SOLVE storage shortage.

N98G01**CONNECT OF *aaaaaaaa* FAILED - STORAGE SHORTAGE****Reason:**

Terminal *aaaaaaaa* has attempted to logon to SOLVE but the logon has been unsuccessful due to a SOLVE temporary storage shortage.

System Action:

The logon attempt fails. The terminal will return to SSI control.

User Action:

Investigate the reason for the SOLVE temporary storage shortage.

N98K01**EPS REGISTER FOR NVTAM FAILED, RC=*rrr*****Reason:**

During initialization, the communication path between the product and NMSSI is initialized to allow communication for use of non-SNA terminals from NMSSI. This communication path initialization failed. EPS (EndPoint Services) returned a non-zero return code on registration.

System Action:

Support for Non-SNA terminals from NMSSI is disabled.

User Action:

Contact your product support office.

N98N01**STORAGE SHORTAGE DURING SEND PROCESSING FOR *aaaaaaaa*****Reason:**

A storage shortage has occurred during an attempt to send some data to terminal *aaaaaaaa*.

System Action:

The send to the terminal fails. The connection with the terminal will be closed.

User Action:

Investigate the reason for the SOLVE storage shortage.

N98X01

LXRES FAILURE, RC=xxxxxxx ABCC=xxxxxxx GR15=xxxxxxx.

Reason:

The SOLVE SSI was unable to obtain a system linkage index. The return code, abend code, and r15 value are shown.

System Action:

Cross-memory services are not set up.

User Action:

Contact your product support representative.

SVC-ID NAME...

Reason:

This message is a response to the SHOW EPS command and provides column headings for following N99755 messages.

The columns are:

SVC-ID

The internal ID assigned to this service name.

NAME

The service name

System Action:

None.

User Action:

None.

N99751**OWNER-EP TYPE SCOPE DESCRIPTION...****Reason:**

This message is a response to the SHOW EPS command and provides column headings for following N99756 messages.

The columns are:

OWNER-EP

The EndPoint ID of the owner of this service.

TYPE

The service 'type'

SCOPE

The service scope, GLOBAL or LOCAL

DESCRIPTION...

A textual description of the service, if available.

System Action:

None.

User Action:

None.

N99755***svc-id name...*****Reason:**

This message is a response to the SHOW EPS command and provides service information. Refer to message N99750 for headings.

System Action:

None.

User Action:

None.

N99756

owner-ep type scope description...

Reason:

This message is a response to the SHOW EPS command and provides service information. Refer to message N99751 for headings.

System Action:

None.

User Action:

None.

N99760**CID TYPE FL EPID RMT-CID CL SVID DESCRIPTION...****Reason:**

This message is a response to the SHOW EPS command and provides column headings for following N99765 messages.

The columns are:

CID

The internal identifier assigned to this conversation

TYPE

The conversation type (PRI or SEC)

FL

A flag representing internal conversation state.

EPID

The Endpoint Identifier of the other end of the conversation

RMT-CID

The CID for this conversation at the other end.

CL

The EPS internal class of this conversation.

SVID

If this conversation is with a service, the service id.

DESCRIPTION...

If a description was provided on the connect request, the value provided.

System Action:

None.

User Action:

None.

N99761

MSG-SENT BYT-SENT MSG-RCVD BYT-RCVD

Reason:

This message is a response to the SHOW EPS command and provides column headings for following N99766 messages.

The columns are:

MSG-SENT

The number of messages sent on this conversation

BYT-SENT

The number of message bytes sent on this conversation

MSG-RCVD

The number of messages received on this conversation

BYT-RCVD

The number of message bytes received on this conversation

System Action:

None.

User Action:

None.

Reason:

This message is a response to the SHOW EPS command and provides service information. Refer to message N99761 for headings.

System Action:

None.

User Action:

None.

N99A01

EPS ACCESS METHOD \$NMEPS REGISTER FAILED, RC=xxxxxxxx

Reason:

This message is issued during initialization if an error occurs during EPS access method initialization.

System Action:

The EPS access method is not initialized.

User Action:

Contact your support office.

N99C01

PROCESSING OF INPUT FOR *nnnnnnnn* FAILED DUE TO STORAGE SHORTAGE

Reason:

This message indicates that the EPS access method was unable to process input from the indicated EPS source node due to a storage shortage.

System Action:

The session is closed.

User Action:

ensure that the SOLVE region has sufficient storage available.

N99D01

CONNECT OF *nnnnnnnn* FAILED, STORAGE SHORTAGE

Reason:

An attempt to establish a session using EPS failed due to a lack of storage.

System Action:

The session establishment fails.

User Action:

Ensure that the SOLVE region has sufficient storage.

N99D02

CONNECT-*ffffff* PROCESSING FOR *nnnnnnnn* FAILED, *reason*

Reason:

EPS session connection failed for the indicated target system name. The specific type of processing is indicated (the *ffffff* operand), and a reason is displayed.

For each processing type, the possible reasons are:

ACCEPT

- INTERNAL ERROR - UNKNOWN EPS CID
- STORAGE SHORTAGE
- INTERNAL ERROR - INVALID USERDATA LENGTH
- EPS FACILITY NOT AVAILABLE

REJECT

- INTERNAL ERROR - UNKNOWN EPS CID
- STORAGE SHORTAGE
- INTERNAL ERROR - INVALID USERDATA LENGTH
- EPS FACILITY NOT AVAILABLE

System Action:

The session establishment fails.

User Action:

Examine the reason and if possible, correct the problem.

N99E01**CONNECT OF *nnnnnnnn* FAILED, STORAGE SHORTAGE****Reason:**

An attempt to establish a session using EPS failed due to a lack of storage.

System Action:

The session establishment fails.

User Action:

Ensure that the SOLVE region has sufficient storage.

N99H01**SEND OF DATA FOR *nnnnnnnn* FAILED, STORAGE SHORTAGE****Reason:**

An attempt to send data across an EPS session failed due to a lack of storage.

System Action:

The send fails.

User Action:

Ensure that the SOLVE region has sufficient storage.

N99H02

EPS SEND PROCESSING FOR *nnnnnnnn* FAILED, *reason*

Reason:

An attempt to send data across an EPS session failed. The target SOLVE system name is shown. The reasons are:

INTERNAL ERROR - INVALID CID
STORAGE SHORTAGE
INTERNAL ERROR - INVALID USERDATA LENGTH
EPS FACILITY NOT AVAILABLE
REQUEST GAVE RC *nnnnnnnn*

System Action:

The send fails.

User Action:

Correct the problem if possible. It is possible that the target SOLVE system has terminated or EPS contact was lost. If the problem persists, contact your SOLVE product support office.

N99T01

CONNECT OF *nnnnnnnn* FAILED, STORAGE SHORTAGE

Reason:

An attempt to establish a session using EPS failed due to a lack of storage.

System Action:

The session establishment fails.

User Action:

Ensure that the SOLVE region has sufficient storage.

N99T02**CONNECTION TO *nnnnnnnn* EPS LINK LOST****Reason:**

A EPS connection to the named SOLVE system has been lost

System Action:

Any active EPS sessions are terminated.

User Action:

Determine why the EPS connection was lost and reestablish it if possible.

N99T04**PROCESSING OF INPUT FOR *nnnnnnnn* FAILED DUE TO STORAGE SHORTAGE****Reason:**

This message indicates that the EPS access method was unable to process input from the indicated EPS source node due to a storage shortage.

System Action:

The session is closed.

User Action:

ensure that the SOLVE region has sufficient storage available.

NA4001

NM/PASS FEATURE INITIALIZATION ERROR: LOAD FOR MODULE aaaaaaaa FAILED, R15=xxxx R1=yyyy

Reason:

The NM/PASS feature could not be initialized because a required load module *aaaaaaaa* could not be loaded. The R15 and R1 values relate to the operating system LOAD macro and represent a return code and reason code respectively.

System Action:

NM/PASS will be disabled until the problem is corrected and SOLVE is restarted.

User Action:

Refer this problem to your systems administrator.
For OS systems the reason code (R1) equates to a system abend code. The most common reason code is *0806* which means that the load module does not exist in any library in the STEPLIB concatenation.

NA4101

INPUT VARIABLE aaaaaaaaa DOES NOT EXIST

Reason:

NCL variable *aaaaaaaa* coded as an operand value on a &PASSCHK verb does not exist.

System Action:

The NCL procedure terminates.

User Action:

Correct and retry.

NA4102**PROCESSING ERROR (RC=8) RETURNED FROM PASS MODULE****Reason:**

During execution of a &PASSCHK verb, the internal algorithm used to check or verify a session pin failed.

System Action:

The NCL procedure terminates.

User Action:

Check the content of the variables coded on the &PASSCHK verb. This failure is generally due to invalid data being applied to the algorithm.

NA4103**INPUT VARIABLE aaaaaaaaa NON-NUMERIC OR TOO LONG****Reason:**

NCL variable aaaaaaaaa coded as an operand value on a &PASSCHK verb contains invalid data.

System Action:

The NCL procedure terminates.

User Action:

Correct and retry.

NA4104**PK INPUT PARAMETER WAS INVALID****Reason:**

The NCL variable coded on the PK operand of a &PASSCHK verb did not contain a valid NM/PASS passkey.

System Action:

The NCL procedure terminates.

User Action:

Correct and retry. The passkey required is a 44-character, expanded hexadecimal number, maintained for synchronisation purposes for a NM/PASS userid.

NA4105

PASSCHK *aaaaaa* VERB INVOKED. NCLPROC *bbbbbbb* RC=*cc*

Reason:

This message is written to the activity log on every use of the &PASSCHK verb. It shows the name of the invoking NCL procedure, and the return code from the verb.

System Action:

None.

User Action:

This message provides the basis for an audit trail for NM/PASS usage.

NB0101

PROC ASMOS COPYRIGHT (C) 2006 CA.

Reason:

This message is logged when the SAS Object Services Procedure is initialised.

System Action:

None.

User Action:

None.

NB0102

PROC ASMOS COMPLETED, OBSERVATIONS=~P1 RC=~P2

Reason:

This message is logged when the SAS Object Services Procedure completes processing. P1 indicates the number of observations written to the output dataset and P2 indicates the completion code of proc ASMOS.

System Action:

The procedure terminates.

User Action:

If the completion code is not 0 then review the SAS message log for other NBxxxx warning or error messages.

NB0201**ATTR STATEMENT ERROR: ~P1****Reason:**

The SAS Object Services Procedure has detected a syntax error in one of the supplied ATTR statements. This message is preceded by message NB0202 which displays the statement in error. P1 describes the type of syntax error which was detected.

System Action:

The SAS procedure terminates.

User Action:

Correct the source statement and retry the operation.

NB0202**ATTR ~P1****Reason:**

This message displays the SAS Object Services Procedure source ATTR statement which contains a syntax error. This message is followed by message NB0201 which describes the type of syntax error detected.

System Action:

The SAS procedure terminates.

User Action:

Correct the source statement and retry the operation.

NB0301

~P1 OBJECT INSTANCES SELECTED FROM CLASS ~P2.

Reason:

The SAS Object Services Procedure has received a response from Object Services to the object selection criteria specified in the source statements. P1 indicates the number of objects which will be extracted from the class nominated by P2.

System Action:

If P1 is greater than 0 processing continues otherwise the SAS Object Services Procedure terminates.

User Action:

None.

NB0302

SOLVE INTERFACE MODULE (NMOSAPI) NOT FOUND.

Reason:

The SAS Object Services Procedure was unable to locate the load module required to access Object Services.

System Action:

The SAS Object Services Procedure terminates.

User Action:

Ensure that the nominated load module is available either in the LPA or in the load search path for the SAS environment.

NB0303**NO ATTR STATEMENTS PROCESSED.****Reason:**

The SAS Object Services Procedure was executed without any source ATTR statements being supplied.

System Action:

The SAS Object Services Procedure terminates without performing any data extraction.

User Action:

If object data extraction is desired then code at least one ATTR statement, otherwise no action is required.

NB0401**GETMAIN FAILURE DETECTED. INCREASE REGION SIZE AND RETRY.****Reason:**

The SAS Object Services Procedure was unable to obtain sufficient storage for normal operation.

System Action:

The SAS Object Services Procedure terminates.

User Action:

Increase the region size available to the SAS environment and retry the operation.

NB0501

MAXIMUM ~P1 STATEMENTS EXCEEDED, STATEMENT DISCARDED.

Reason:

The SAS Object Services Procedure has been supplied more than the maximum allowed number of the nominated type of source statements. P1 indicates the type of source statement.

System Action:

The SAS Object Services Procedure continues processing. The source statement is ignored.

User Action:

Reduce the number of the nominated type of source statements supplied to the SAS Object Services Procedure.

NB0601

DATA RECEIVED FROM SOLVE HAS BEEN TRUNCATED.

Reason:

Object Services returned a greater number of attributes than the SAS Object Services Procedure was able to receive.

System Action:

Some attribute data will be discarded.

User Action:

Contact your product support representative.

NB0602**ERROR INDICATION: FUNCTION= P1 SERVICE= P2 ERRORID= P3****Reason:**

The SAS Object Services procedure received an error indication.

P1 indicates the communications function being performed. If an Object Services method was being accessed this is described by *P2* while the error category is indicated by *P3*. This message is generally immediately followed by another message describing the error.

System Action:

The SAS Object Services Procedure terminates.

User Action:

Determine the cause of the error by reviewing associated NBxxxx and other messages in the SAS log. The SOLVE system activity log may also contain related information.

NB0603**COMMUNICATION FAILURE WITH SOLVE, ASMID= P1 RC= P2****Reason:**

The SAS Object Services Procedure was either unable to establish contact with the SOLVE system or else an existing communication path was unexpectedly terminated. *P1* is the PPI address of the OS PPI Server NCL procedure. *P2* is the return code associated with the Object Services Applications Programming Interface.

System Action:

The SAS Object Services Procedure terminates.

User Action:

Refer to the Object Services Applications Programming Interface documentation to determine the meaning of the return code.

NB1001

CONVERSION OF ATTR ~P1 TO SAS FORMAT FAILED AT OCCURRENCE ~P2.

Reason:

The SAS Object Services Procedure was unable to convert the value of attribute *P1* according to the FORMAT and INFORMAT specifications of the source ATTR statement for that attribute. *P2* indicates the nth processed object from which the attribute value was retrieved.

System Action:

The SAS Object Services Procedure continues.

User Action:

Refer to SAS FORMAT and INFORMAT specifications to determine the cause of the error.

NB1002

ATTRIBUTE P1 RECEIVED BUT NOT DEFINED IN AN ATTR STATEMENT.

Reason:

The SAS Object Services Procedure received an attribute which was not described by a source ATTR statement.

System Action:

The SAS Object Services Procedure discards the attribute data and continues processing.

User Action:

Contact your product support representative.

NB4001**SOLVE INTERFACE MODULE (NMOSAPI) NOT FOUND****Reason:**

The interface module for reporting problems to SOLVE:Problem from NetView was unable to load the Object Services Application Programming Interface (OS API) module.

System Action:

The request to create a SOLVE:Problem Problem object is terminated.

User Action:

Ensure the OS API load module is accessible from NetView.

NB4002**SOLVE OBJECT SERVICES ERROR, RC=*nnnn*, ERRORID=*aaaaa*****Reason:**

The interface module for reporting problems to SOLVE:Problem from NetView received an error response from the Object Services Application Programming Interface (OS API). The return code returned by the OS API was *nnnn*. If the return code is 8, then *aaaaa* will be the Object Services ErrorID (if applicable). If the Object Services error message is available, it will be returned with message NB4003.

System Action:

The request to create a SOLVE:Problem Problem object is terminated.

User Action:

If message NB4003 was also issued then refer to this message for further information.

NB4003

aaaaa

Reason:

The interface module for reporting problems to SOLVE:Problem from NetView received an error response from the Object Services Application Programming Interface (OS API). The return code and ErrorID for the error was returned in message NB4002 and *aaaaa* contains the accompanying error message returned by Object Services.

System Action:

The request to create a SOLVE:Problem Problem object is terminated.

User Action:

Refer to the explanation of message *aaaaa*.

NB4004

NAMING ATTRIBUTE ZPRPROBID NOT RETURNED FROM OBJECT SERVICES CREATE

Reason:

The interface module for reporting problems to SOLVE:Problem from NetView issued a create service request to the Object Services Application Programming Interface (OS API). The create was successful however the naming attribute for the created object was not returned to the interface. The expected attribute ID was ZPRPROBID.

System Action:

The request to create a SOLVE:Problem Problem object was successful however the Problem ID will not be returned to NetView since it was not available.

User Action:

None.

NB4005**INTERNAL KEY ATTRIBUTE ZOSINTKEY NOT RETURNED FROM OBJECT SERVICES CREATE, CANNOT ADD REFERENCE TEXT****Reason:**

The interface module for reporting problems to SOLVE:Problem from NetView issued a create service request to the Object Services Application Programming Interface (OS API). The create was successful however the internal key attribute for the created object was not returned to the interface. The expected attribute ID was ZOSINTKEY.

The internal key was not available because the interface could not issue the create request for the related Reference Text object.

System Action:

The request to create a SOLVE:Problem Problem object was successful however the related Reference Text was not added.

User Action:

None.

NB4101**INVALID \$PECBDS POINTER PASSED****Reason:**

Endevor passed a pointer to the \$PECBDS DSECT on the call to the package exit. This pointer was examined and found to be zero which is invalid.

System Action:

The package exit terminates.

User Action:

Contact the person responsible for Endevor at your installation.

NB4102

INVALID VALUE IN PECBID FIELD

Reason:

Endevor passes a pointer to the \$PECBDS DSECT on a package exit call. The exit reads the PECBID field in this DSECT. This field is supposed always to be "PECB". However, another value was found in this field.

System Action:

The package exit terminates.

User Action:

Contact the person responsible for Endevor at your installation.

NB4103

INVALID VALUE IN PHDRID FIELD

Reason:

Endevor passes a pointer to the \$PHDRDS DSECT on a package exit call. The exit reads the PHDRID field in this DSECT. This field is supposed always to be "PHDR". However, another value was found in this field.

System Action:

The package exit terminates.

User Action:

Contact the person responsible for Endevor at your installation.

NB4104

INVALID VALUE IN PACTID FIELD

Reason:

Endevor passes a pointer to the \$PACTREQ DSECT on a package exit call. The exit reads the PACTID field in this DSECT. This field is supposed always to be "PACT". However, another value was found in this field.

System Action:

The package exit terminates.

User Action:

Contact the person responsible for Endevor at your installation.

NB4105**WORKAREA DSECT ADDRESSABILITY LOST****Reason:**

The package exit GETMAINS a storage area and stores the pointer to this area in the field PECBUEXT in the \$PECBDS control block. Register 12 is used to access this storage area. The exit periodically checks that the value in register 12 is still the same as that in PECBUEXT. A check showed that these values were different.

System Action:

The package exit terminates.

User Action:

Contact the person responsible for Endeavor at your installation.

NB4106**UNABLE TO LOAD MODULE NMOSAPI****Reason:**

The Endeavor package exit was unable to load the SOLVE Object Services Application Programming Interface (OS API) module.

System Action:

The package exit terminates.

User Action:

Contact the person responsible for Endeavor at your installation.

NB4107**GETMAIN REQUEST FAILED****Reason:**

A request by the Endeavor package to obtain working storage failed. The request for storage was made via the assembler macro GETMAIN.

System Action:

The Endeavor package exit terminates.

User Action:

Contact the person responsible for Endeavor at your installation.

NB4108

INVALID POINTER TO GETMAIN AREA

Reason:

The Endeavor package obtains the working storage which it needs via a call to the GETMAIN macro. The pointer returned via the GETMAIN call is invalid.

System Action:

The Endeavor package exit terminates.

User Action:

Contact the person responsible for Endeavor at your installation.

NB4109

INVALID VALUE IN PREQID FIELD

Reason:

Endeavor passes a pointer to the \$PREQPDS DSECT on a package exit call. The exit reads the PREQID field in this DSECT. This field is supposed always to be "PREQ". However, another value was found in this field.

System Action:

The package exit terminates.

User Action:

Contact the person responsible for Endeavor at your installation.

NB4110

CHANGE NOT UPDATED, CCID P1 DOES NOT CONTAIN A CHANGE NUMBER

Reason:

The package exit did not invoke the ZCGENDLOG action to update text because no change number could be determined from the action CCID. *P1* is the CCID.

System Action:

None.

User Action:

None.

NB4111**INVALID CCID P1 - PACKAGE REJECTED****Reason:**

The Endeavor exit attempted to extract a change number from the action CCID. The exit failed to extract a change number. *P1* is the CCID.

System Action:

The Endeavor exit rejects the package function.

User Action:

Correct the CCID.

NB4112**NMOSAPI RC P1 P2****Reason:**

The Endeavor exit called the Object Services Application Programming Interface (OS API). The Object Services API returned an error code. *P1* is the error code. *P2* contains an associated message if available.

System Action:

The package function is rejected if this is a before or mid exit call or the change is not updated if this is an after exit call.

User Action:

Review the explanation of associated messages.

NB4113**PPI ERROR - RC P1****Reason:**

The Endeavor exit called the Object Services Application Programming Interface (OS API). The Object Services API returned an error indicating a PPI error. *P1* is the returned error code.

System Action:

The package function is rejected if this is a before or mid exit call or the change is not updated if this an after exit call.

User Action:

None.

NB5001

INVALID PARAMETER LIST USED

Reason:

The Memo API Interface module was called with an invalid parameter list format.

System Action:

The Memo API Interface ignores the call.

User Action:

Contact the system administrator.

NB5002

NON-SUBSYS CALL MADE TO NMMEMO

Reason:

The Memo API Interface module NMMEMO was invoked in other than a defined SUBSYS environment.

System Action:

The Memo API Interface terminates.

User Action:

Contact the system administrator.

NB5003

UNAUTHORISED PROGRAM CALLING NMMEMO

Reason:

The Memo API Interface module NMMEMO was invoked by a procedure other than that which initially invoked it.

System Action:

The Memo API Interface ignores the call.

User Action:

Contact the system administrator.

NB5004**MEMO INTERFACE NOT YET INITIALIZED****Reason:**

The Memo API Interface module NMMEMO was called to send data to the Memo email system but a valid initialization call has not yet been executed.

System Action:

The Memo API Interface ignores the call.

User Action:

Contact the system administrator.

NB5101**NO CONTROL PARAMETERS PASSED TO NMMEMO****Reason:**

The Memo API Interface module NMMEMO was called without any parameters passed in the first NCL variable.

System Action:

The Memo API Interface ignores the call.

User Action:

Contact the system administrator.

NB5102**INVALID KEYWORD PARAMETER, KEYWORD= P1 VALUE= P2****Reason:**

The Memo API Interface module NMMEMO was called with an invalid keyword parameter or parameter value. *P1* is the keyword and *P2* is the keyword value.

System Action:

The Memo API Interface ignores the call.

User Action:

Contact the system administrator.

NB5103

REQUIRED KEYWORD PARAMETER FOR OPT= P1 NOT SUPPLIED, KEYWORD= P2

Reason:

The Memo API Interface module NMMEMO was called without a mandatory keyword for the requested function. *P1* is the function requested. *P2* is the keyword which was not supplied.

System Action:

The Memo API Interface ignores the call.

User Action:

Contact the system administrator.

NB5201

MEMO API ERROR, REQ= P1 RC= P2 FDBK= P3

Reason:

The Memo API has returned an error indication to the Memo API Interface module NMMEMO. The Memo API function requested was *P1*. *P2* is the API return code and *P3* is the API feedback code.

System Action:

The request fails.

User Action:

Refer to the Memo/API User Reference Manual (supplied with the Memo email system) to determine the exact nature of the error.

NB5301

MEMO INTERFACE SUCCESSFULLY INITIALIZED

Reason:

The Memo API Interface has successfully connected to the Memo email system.

System Action:

None.

User Action:

None.

NB5302**MEMO INTERFACE ALREADY INITIALIZED****Reason:**

The Memo API Interface was called to connect to the Memo email system but was already connected.

System Action:

None.

User Action:

Contact the system administrator.

NB5401**MSG DELIVERED TO P1 P2****Reason:**

The Memo API Interface has successfully delivered a mail item to the Memo email system known as *P1*. *P2* is only present if one or more of the message receivers were not valid Memo users. *P2* indicates a warning condition rather than an error.

System Action:

None.

User Action:

If *P2* indicates an invalid receiver review the destination specification or the Memo distribution list for invalid Memo ID's.

NB5501**MEMO INTERFACE SUCCESSFULLY TERMINATED****Reason:**

The Memo API Interface has successfully disconnected from the Memo email system.

System Action:

The Memo API Interface terminates.

User Action:

None.

NC6401

UNABLE TO CHANGE UCE NAME - UCE ALREADY CATALOGED.

Reason:

An attempt to change the name of SOLVE's UCE using SYSPARMS XNFUCENM has failed. The current UCE name is already cataloged, and cannot be changed.

System Action:

The SYSPARMS command is rejected.

User Action:

To change a cataloged UCE name, you must first release the UCE connection by using XNF STOP, then retry the command.

NC6402

SPECIFIED SCREEN SIZE IS NOT SUPPORTED.

Reason:

The screen size specified on SYSPARMS XNFSCRSZ= is not supported. Enter the screen size in the format (*mmm,nnn*) where *mmm* (rows) is between 12 and 255 and *nnn* (columns) is between 40 and 255.

System Action:

The SYSPARMS command is rejected.

User Action:

Correct and re-enter the command.

NC6601

NO NODE NAME SPECIFIED.

Reason:

A CONNECT command has been entered to connect a network node to SOLVE, but the node name has been omitted.

System Action:

The command is rejected.

User Action:

Specify a node name on the command.

NC6602**INVALID NODE NAME.****Reason:**

A CONNECT command has been entered with a node name which is not a valid network node name.

System Action:

The command is rejected.

User Action:

Correct the node name and retry. The name must be 8 characters or less.

NC6603**INVALID SYNTAX.****Reason:**

A CONNECT command has been entered but contains an operand which is not recognised or has been entered in an invalid format.

System Action:

The command is rejected.

User Action:

Correct the format of the command and retry.

NC6604**SPECIFIED SCREEN SIZE IS NOT SUPPORTED.****Reason:**

A CONNECT command has been entered which specifies the SIZE=(*rrr,ccc*) operand but the screen size supplied is not valid. The row value *rrr* must be from 12 to 255, and the column value *ccc* must be from 40 to 255.

System Action:

The command is rejected.

User Action:

Correct the screen size and retry.

NC6701

XNFTRACE FOR *aaaaaaaa* ALREADY ENABLED, START COMMAND IGNORED.

Reason:

Command XNFTRACE START=*aaaaaaaa* has been entered, but node *aaaaaaaa* is already being traced.

System Action:

The command is rejected.

User Action:

None. The SHOW XNFTRACE command can be used to list active XNF traces.

NC6702

XNFTRACE FOR *aaaaaaaa* NOT ENABLED, STOP COMMAND IGNORED.

Reason:

Command XNFTRACE STOP=*aaaaaaaa* has been entered, but node *aaaaaaaa* is not being traced.

System Action:

The command is rejected

User Action:

Correct the node name and retry. The SHOW XNFTRACE command can be used to list active XNF traces.

NC6703

XNFTRACE REQUEST ACCEPTED FOR *aaaaaaaa*

Reason:

Command XNFTRACE START=*aaaaaaaa* has been accepted.

System Action:

Since node *aaaaaaaa* is not currently connected, the trace request is put in PENDING state. Tracing will go ACTIVE as soon as the node is connected.

User Action:

None. The SHOW XNFTRACE command can be used to list active XNF traces.

NC6704**XNFTRACE NOW ACTIVE FOR *aaaaaaaa*****Reason:**

Command XNFTRACE START=*aaaaaaaa* has been accepted.

System Action:

Tracing of node *aaaaaaaa* will start immediately. Trace messages will be written to the activity log.

User Action:

None. The SHOW XNFTRACE command can be used to list active XNF traces.

NC6705**XNFTRACE REQUEST FOR *aaaaaaaa* CANCELLED.****Reason:**

Command XNFTRACE STOP=*aaaaaaaa* has been accepted.

System Action:

The PENDING request for trace of *aaaaaaaa* is cancelled.

User Action:

None.

NC6706**XNFTRACE OF *aaaaaaaa* STOPPED.****Reason:**

Command XNFTRACE STOP=*aaaaaaaa* has been accepted.

System Action:

The active trace of *aaaaaaaa* is stopped immediately.

User Action:

None.

NC6707

NO XNFTRACE ACTIVE.

Reason:

Command XNFTRACE STOP=ALL has been entered, but no XNFTRACE is active or pending in the system.

System Action:

None.

User Action:

None.

NC6708

XNF STOP COMMAND ACCEPTED.

Reason:

Command XNF STOP has been accepted

System Action:

All connections between SOLVE and other nodes in the XNF network will be dropped. This includes connections to terminals, other SOLVE systems and NETM. When the disconnections are complete, SOLVE's UCE will be released. When all communication with XNF has ceased, a WTOR message will be written to the system console.

User Action:

To reestablish communication between SOLVE and XNF, reply to the outstanding WTOR.

NC6709

XNF OPERAND INVALID OR MISSING.

Reason:

The XNF command was entered with an invalid operand. The only valid operand is 'STOP'.

System Action:

The command is rejected.

User Action:

Correct and retry.

NC6710**XNF CONNECTION NOT ACTIVE.****Reason:**

An XNF STOP command has been entered, but no connection exists between SOLVE and XNF.

System Action:

The command is rejected.

User Action:

Check the system console for messages relating to the state of the SOLVE system's connection to XNF.

NC6801**ULENAME REQ-UID REQ-DATE REQ-TIME STATUS****Reason:**

This is the heading line displayed in response to a SHOW XNFTRACE command.

ULENAME - The name of the ULE node being traced

REQ-UID - The userid who requested the trace

REQ-DATE - The date the trace was requested

REQ-TIME - The time the trace was requested

STATUS - The current status of the trace, 'ACTIVE' or 'PENDING'.

System Action:

None

User Action:

None.

NC6802

aaaaaaaa bbbbbbbb cccccccccc dddddddd eeeeeeee

Reason:

This is a detail line of a SHOW XNFTRACE display. Refer to message NC6801 for a description of each field.

System Action:

None

User Action:

None

NC6803

NO XNFTRACE ACTIVE

Reason:

A SHOW XNFTRACE command has been entered, but no traces are active or pending.

System Action:

None

User Action:

None

NC6A01

NO NETM CONNECTION PATHS DEFINED.

Reason:

A NETM command was entered, but no connection paths to NETM/OP have been defined.

System Action:

The command is rejected.

User Action:

To pass commands to NETM/OP, one or more connection paths must be defined. Use the NETMCNTL ADD= command to define the required paths.

NC6B01**COMMAND FAILED. NETM COMMUNICATION ERROR. REFER TO LOG FOR DETAILS.****Reason:**

A NETM command was entered, but the system could not pass it to NETM for processing. A subsequent message has been written to the log explaining the specific error condition.

System Action:

The command is rejected.

User Action:

Refer to the log. Immediately following this message will be a message indicating failure codes. Refer to the explanation of that message for further information.

NC6B02**ERROR CODE xxxxx RETURNED FROM yyyy CALL TO NETM API****Reason:**

Follows a NC6B01 or NC6G01 message, indicating an error has occurred in communications with NETM. xxxxx indicates the return code from the call to the NETM Application Programming Interface. yyyy indicates the type of call to the API that caused the error.

System Action:

For command processing, the command is rejected. For UNSOL processing, unsolicited message receipt is stopped.

User Action:

The error code (xxxxx) and call type (yyyy) are described in the NETM manual 'Operation Management UAP Interface Function Instruction Manual'. Refer to this manual for an explanation of the codes, or contact your product support representative. Common error code values (xxxxx) are:

79101 : Specified UAP name not defined to XNF/AM

79300 : Specified UAP name already in use

79021 : UAP name not alphanumeric

79023 : UAP name not defined to NETM/OP

NC6B03

INSUFFICIENT STORAGE FOR NETM COMMUNICATION TASK

Reason:

A storage shortage caused a failure in either NETM command handling or unsolicited message receipt.

System Action:

For command processing, the command is rejected. For UNSOL processing, unsolicited message receipt is stopped.

User Action:

Refer to your installation support representative to establish why there is insufficient storage.

NC6B04

NETM API SUBTASK ABEND. CODE Sxxx

Reason:

A subtask abend has occurred during communication with NETM. The abend code is indicated by xxx.

System Action:

For command processing, the command is rejected. For UNSOL processing, unsolicited message receipt is stopped.

User Action:

Refer to your support representative.

NC6E01

CONNECTION PATH xxxx ALREADY DEFINED

Reason:

A NETMCNTL ADD=xxxx command was entered, specifying a connection path name xxxx that is already defined.

System Action:

The command is rejected.

User Action:

Correct the name and re-enter.

NC6E02**CONNECTION PATH xxxx ADDED****Reason:**

Confirms successful completion of a NETMCNTL ADD=xxxx command

System Action:

None

User Action:

None

NC6E03**CONNECTION PATH xxxx DOES NOT EXIST****Reason:**

A NETMCNTL DEL=xxxx command was entered, specifying a connection path name that has not been defined.

System Action:

The command is rejected

User Action:

Correct the name and re-enter

NC6E04

CONNECTION PATH xxxx SCHEDULED FOR DELETION.

Reason:

Confirms successful execution of a NETMCNTL DEL=xxxx command. Depending on the connection path's status at the time of the command, the path may not be deleted immediately, but will be deleted within two or three minutes at the maximum. Use the SHOW NETMCNTL command to display the status of the connection path if confirmation of actual deletion is required.

Note that the same name may not be re-defined using a NETMCNTL ADD command until the original definition has been successfully deleted.

System Action:

None.

User Action:

None.

NC6E05

NETM COMMAND TEXT REQUIRED

Reason:

A NETM command was entered with no command text supplied. This is required, so that the command text can be sent to NETM.

System Action:

The command is rejected.

User Action:

Correct the command and re-enter.

NC6E06**COMMAND QUEUED FOR PROCESSING****Reason:**

A NETM command was accepted, but no NETM communication paths (defined by the NETMCNTL ADD=*name* command) are immediately available to process the command. It has been queued for processing.

System Action:

The command will be processed by the first available NETM communication path.

User Action:

This is a symptom of too many commands being issued simultaneously for the current number of defined NETM communication paths. If necessary, use the NETMCNTL ADD= command to define more NETM communication paths to allow more concurrent commands to be processed.

NC6E07**CONNECTION PATH xxxx IN USE FOR UNSOLICITED MESSAGES.****Reason:**

A NETMCNTL DEL=xxxx command was entered specifying the name of a NETM communication path that is currently active for the receipt of unsolicited messages from NETM. This entry was defined using the NETMCNTL ADD=xxxx TYPE=UNSOL command, and activated by an earlier NETMCNTL START=UNSOL command.

System Action:

The command is rejected because the entry cannot be deleted until it is no longer active.

User Action:

If the entry is to be deleted, issue NETMCNTL STOP=UNSOL command, then re-issue the NETMCNTL DEL=xxxx command.

NC6E08

TYPE=UNSOL CONNECTION PATH ALREADY DEFINED

Reason:

A NETMCNTL ADD=xxxx TYPE=UNSOL command was entered, to define a connection path for receiving unsolicited messages from NETM/OP, but a TYPE=UNSOL definition already exists. You cannot define multiple TYPE=UNSOL paths.

System Action:

The command is rejected.

User Action:

None.

NC6E09

NETM UNSOLICITED MESSAGE FLOW IS xxxx STARTED

Reason:

xxxx may have the value of 'ALREADY' or 'NOT'. If its value is 'ALREADY', a NETMCNTL START=UNSOL command has been issued, but unsolicited message flow has been activated by an earlier NETMCNTL START= command. If xxxx has a value of 'NOT', a NETMCNTL STOP=UNSOL command was issued, but unsolicited message flow has not previously been activated by a NETMCNTL START=UNSOL command.

System Action:

The command is rejected.

User Action:

None.

NC6E10**NO UNSOLICITED CONNECTION PATH EXISTS. START REJECTED****Reason:**

A NETMCNTL START=UNSOL command was entered, but there is no available TYPE=UNSOL connection path.

System Action:

The command is rejected.

User Action:

Use NETMCNTL ADD=xxxx TYPE=UNSOL to define a NETM communication path to receive unsolicited messages, then re-issue the NETMCNTL START=UNSOL command.

NC6E11**NETM COMMANDS NOT ENABLED****Reason:**

A NETM command was entered, but NETM commands have been disabled by NETMCNTL STOP=CMD. No NETM commands will be accepted.

System Action:

The command is rejected.

User Action:

NETM commands can be enabled by a NETMCNTL START=CMD command. When NETM commands have been enabled, reenter your command.

NC6E12**NETM COMMANDS ENABLED|DISABLED****Reason:**

Confirms successful completion of a NETMCNTL START=CMD or STOP=CMD

System Action:

If NETMCNTL START=CMD has been issued, NETM commands will now be accepted. If NETMCNTL STOP=CMD has been issued, NETM commands will be disallowed

User Action:

None.

NC6E13

NETM UNSOLICITED MESSAGE RECEIPT: *aaaaa* REQUESTED

Reason:

This message acknowledges a NETMCNTL START=UNSOL or STOP=UNSOL command (*aaaaa* is START or STOP).

System Action:

The request to START or STOP the unsolicited message flow will be notified to NETM. Confirmation of successful start or stop will be subsequently logged to all MONITOR users and to the activity log.

User Action:

None.

NC6F01

TYPE NAME CATEGORY STATUS

Reason:

This is the heading line of a SHOW NETMCNTL command, which lists defined NETM connection paths.

System Action:

None

User Action:

None

NC6F02

www xxxx yyyy zzzz qqqq

Reason:

The text line of a SHOW NETMCNTL command. For each defined entry, (created by an earlier NETMCNTL ADD= command) one of these messages will be displayed.

www is the type of the connection path (COMMAND or UNSOL)

xxxx is the name of the connection path

yyyy is the NETM category used by the connection path.

zzzz is the status of the path, and will have one of the following values:

STOPPED

The path type has been stopped by a NETMCNTL STOP=CMD|UNSOL command, or has not yet had a NETMCNTL START= command issued.

ACTIVE

Currently in use.

AVAILABLE

Not currently in use (TYPE=COMMAND only)

CONNECTED

Active but awaiting work (TYPE=COMMAND only)

The tag *qqqq* will have the value -DEL- if the path has been scheduled for deletion. It will be deleted once it ceases its 'ACTIVE' status.

System Action:

None.

User Action:

None.

NC6G01

NETM UNSOLICITED MESSAGE SUPPORT FAILED. REFER TO LOG FOR DETAILS.

Reason:

A NETMCNTL START=UNSOL command has failed. A subsequent message has been written to the log explaining the specific error condition.

System Action:

Unsolicited message receipt is stopped.

User Action:

Refer to the log. Immediately following this message will be a message indicating failure codes. Refer to the explanation of that message for further information.

NC6G05

NETM UNSOLICITED MESSAGE RECEIPT STARTED|STOPPED

Reason:

A NETMCNTL START=UNSOL or STOP=UNSOL command has been entered. This message confirms successful completion of the command.

System Action:

None.

User Action:

None.

NC7001

STORAGE SHORTAGE DURING SEND PROCESSING FOR *aaaaaaaa*

Reason:

During an attempt to send data to node *aaaaaaaa*, a temporary SOLVE storage shortage has occurred. The send of data could not be completed.

System Action:

The connection to *aaaaaaaa* will be terminated.

User Action:

Investigate the reason for the SOLVE storage shortage.

NC7002**XNF SEND PROCESSING FOR *aaaaaaaa* FAILED, DETAIL CODE *bbbb*****Reason:**

An attempt to send data on a connection to node *aaaaaaaa* has failed. The detail code shows the return code from the XNF PUT service.

System Action:

The connection to node *aaaaaaaa* is terminated.

User Action:

Investigate the reason for the send failure using the detail code in this message.

NC7201**INVALID VAPDU RECEIVED FROM *aaaaaaaa* - CONNECTION ABORTED****Reason:**

An invalid DT VAPDU has been received by SOLVE.

System Action:

The connection to node *aaaaaaaa* will be aborted. A dump of the invalid APDU will appear on the activity log following this message.

User Action:

Investigate the invalid APDU.

NC7202

+000 xxxxxxxx xxxxxxxx xxxxxxxx xxxxxxxx cccccccccccccccc

Reason:

This message contains a hexadecimal (xxxxxxx) and character (ccccccc) format dump of an invalid APDU which has been received by SOLVE. This message is preceded by message NC7201 which shows which node sent the invalid APDU.

System Action:

None.

User Action:

None.

NC7203

STORAGE SHORTAGE DURING PROCESSING FOR *aaaaaaaa* - CONNECTION ABORTED

Reason:

A temporary SOLVE storage shortage has prevented processing of some input received from node *aaaaaaaa*.

System Action:

The connection to node *aaaaaaaa* will be terminated.

User Action:

Investigate the reason for the SOLVE storage shortage.

NC7204

ABORT RECEIVED FROM *aaaaaaaa* - *bbbbbbbbbbbbbbbbbbbbbbbbbbbbbbbbbbbb*

Reason:

An ABORT APDU (UAB or PAB) has been received from node *aaaaaaaa*. An abort indicates that node *aaaaaaaa* has detected an error. *bbbbbbbbbbbbbb* gives further information about the reason of the abort.

System Action:

The connection to node *aaaaaaaa* is terminated.

User Action:

Investigate the reason for the abort.

NC7501**INVALID VAPDU RECEIVED FROM *aaaaaaaa* - ERROR AT OFFSET *X'bbbb'*****Reason:**

A connection request has been received from node *aaaaaaaa*, but the request is not a valid format. *'bbbb'* shows the offset of the field in the APDU which failed validation.

System Action:

The connection is force disconnected. The invalid APDU is dumped to the activity log following this message.

User Action:

Investigate the invalid APDU.

NC7502

+ooo xxxxxxxx xxxxxxxx xxxxxxxx xxxxxxxx cccccccccccccccc

Reason:

This message contains a hexadecimal (*xxxxxxx*) and character (*ccccccc*) format dump of an invalid APDU which has been received by SOLVE. This messages is preceded by message NC7501 which shows which node sent the invalid APDU and the offset of the field which failed validation.

System Action:

None.

User Action:

None.

NC7503

CONNECT OF *aaaaaaaa* FAILED - STORAGE SHORTAGE

Reason:

A connection request has been received from node *aaaaaaaa*, but could not be processed due to a temporary SOLVE storage shortage.

System Action:

The connection will be refused.

User Action:

Investigate the reason for the SOLVE storage shortage.

NC7801

UNEXPECTED|INVALID INPUT RECEIVED FROM *aaaaaaaa*

Reason:

A connection has been successfully completed with node *aaaaaaaa*, and Start Data Traffic (SDT) processing has begun. During processing, SOLVE received invalid input, or input which was unexpected (ie. not SDT related).

System Action:

The connection will be terminated. The invalid/unexpected APDU will be dumped to the activity log following this message.

User Action:

Investigate the received APDU and determine the cause of the error.

NC7802

+000 xxxxxxxx xxxxxxxx xxxxxxxx xxxxxxxx cccccccccccccccc

Reason:

This message contains a hexadecimal (*xxxxxxx*) and character (*ccccccc*) format dump of an invalid APDU which has been received by SOLVE. This message is preceded by message NC7801 which shows which node sent the invalid APDU.

System Action:

None.

User Action:

None.

NC7A01**LOCK|UNLOCK PROCESSING FOR *aaaaaaaa* FAILED.****Reason:**

An attempt has been made to LOCK or UNLOCK input on an XNF connection, and the request has failed.

System Action:

The connection is terminated.

User Action:

Investigate the reason for the failure.

NC7B01**CONNECT OF *aaaaaaaa* FAILED - STORAGE SHORTAGE****Reason:**

A connection request for node *aaaaaaaa* has failed due to a temporary SOLVE storage shortage.

System Action:

The connection attempt fails.

User Action:

Investigate the reason for the SOLVE storage shortage.

NC7C01**CONNECT OF *aaaaaaaa* FAILED - STORAGE SHORTAGE****Reason:**

A connection request was received from another application but could not be successfully processed due to a temporary SOLVE storage shortage.

System Action:

The connection will be rejected.

User Action:

Investigate the reason for the SOLVE storage shortage.

NC7C02

CONNECT-ACCEPT PROCESSING FOR *bbbbbbbb* FAILED, DETAIL CODE=0000

Reason:

A connect request has been received from another application but the attempt to accept the connection has failed.

System Action:

The connection request is rejected.

User Action:

Investigate the reason for the connection failure using the detail code supplied in this message.

NC7D01

INVALID INPUT RECEIVED FROM *aaaaaaaa* - ERROR AT OFFSET *X'bbbb*

Reason:

An invalid DT-APDU has been received from *aaaaaaaa*.

System Action:

The invalid APDU is dumped to the activity log and the connection on which it was received is terminated.

User Action:

Investigate the APDU format error. '*bbbb*' indicates the offset in the APDU of the field which failed validation.

NC7D02

+000 xxxxxxxx xxxxxxxx xxxxxxxx xxxxxxxx cccccccccccccccc

Reason:

This message contains a hexadecimal (xxxxxxx) and character (ccccccc) format dump of an invalid APDU which has been received by SOLVE. This message is preceded by message NC7D01 which shows which node sent the invalid APDU and the offset of the field which failed validation.

System Action:

None.

User Action:

None.

NC7E01**CONNECT-REFUSE PROCESSING FOR aaaaaaa FAILED - STORAGE SHORTAGE****Reason:**

An incoming connection request from node aaaaaaa could not be refused normally due to a temporary SOLVE storage shortage.

System Action:

The connection will be force-disconnected.

User Action:

Investigate the reason for the SOLVE storage shortage.

NC7F01

INVALID INPUT RECEIVED FROM *aaaaaaaa* - ERROR AT OFFSET *X'bbbb'*

Reason:

An invalid EST or ASR APDU has been received from node *aaaaaaaa*.

System Action:

The connection with node *aaaaaaaa* will be terminated. The invalid APDU will be dumped to the activity log.

User Action:

Investigate the APDU to see why it is invalid. '*bbbb*' indicates the offset in the APDU of the field which failed validation.

NC7F02

+000 xxxxxxxx xxxxxxxx xxxxxxxx xxxxxxxx cccccccccccccccc

Reason:

This message contains a hexadecimal (*xxxxxxx*) and character (*ccccccc*) format dump of an invalid or unexpected APDU which has been received by SOLVE. This message is preceded by message NC7F01 or NC7F03 which shows the name of the node which sent the APDU.

System Action:

None.

User Action:

None.

NC7F03**UNEXPECTED INPUT RECEIVED FROM aaaaaaaa****Reason:**

An ASR APDU or EST APDU was expected during connection establishment but a different APDU has been received.

System Action:

This is a protocol violation, so the connection will be terminated. The received APDU will appear on the activity log following this message.

User Action:

Investigate the dump of the received APDU to see what was received.

NC8001**XNF ENTRY FAILED FOR UCE aaaa : CODE=XX, DETAIL=XXXX. REPLY RETRY OR END****Reason:**

The XNF 'ENTRY' service, used to catalog SOLVE's UCE to XNF, has failed. No connection to SOLVE is possible until the ENTRY succeeds. The message contains the reason code and detail code returned by ENTRY.

System Action:

This message is sent to the system console as a WTOR. SOLVE waits for a reply of 'RETRY' or 'END'.

User Action:

Reply as required. Refer to the VOS3 XNF Messages manual (Appendix B) for the meaning of the error codes.

NC8002

XNF ENTRY FAILED FOR UCE *aaaa* : CODE=XX, DETAIL=XXXX. AUTO RETRY IN 30 SECONDS

Reason:

The XNF 'ENTRY' service, used to catalog SOLVE's UCE to XNF, has failed. No connection to SOLVE is possible until ENTRY succeeds. The message contains the reason code and detail code returned by ENTRY.

System Action:

Because SYSPARMS XNFRETRY is set to YES, SOLVE will automatically retry the ENTRY process every 30 seconds.

User Action:

Refer to the VOS3 XNF Messages manual (appendix B) for the meaning of the error codes.

NC8003

XNF ENTRY COMPLETED SUCCESSFULLY, UCE=*aaaaaaaa*

Reason:

The ENTRY service to catalog SOLVE's UCE to XNF has completed successfully.

System Action:

SOLVE will now accept logon requests and other requests for connection.

User Action:

None

NC8004

XNF RELEASE FAILED, CODE=XX, DETAIL=XXXX

Reason:

An attempt to RELEASE SOLVE's UCE from XNF has failed. The message shows the error codes from the RELEASE service.

System Action:

None

User Action:

Refer to the VOS3 XNF Messages manual (Appendix B) for an explanation of the error codes.

NC8005**XNF RELEASE COMPLETED SUCCESSFULLY, UCE=aaaaaaa****Reason:**

SOLVE's UCE *aaaaaaa* has been released from XNF.

System Action:

None.

User Action:

None

NC8101**CONNECTION TO XNF RELEASED. REPLY RESTART OR END.****Reason:**

SOLVE's connection to XNF has been released, either due to an 'XNF STOP' command or because of a forced release from XNF. All XNF connections have been terminated.

System Action:

This message is sent to the system console as a WTOR message. SOLVE waits for a reply of 'RESTART' or 'END'.

User Action:

Reply as required.

NC8102**CONNECTION TO XNF RELEASED. AUTO-RECONNECT IN 30 SECONDS.****Reason:**

SOLVE's connection to XNF has been forcibly released by XNF.

System Action:

Because SYSPARMS XNFRETRY=YES, SOLVE will automatically attempt to reestablish the connection to XNF in 30 seconds.

User Action:

None.

NC8103

***** CONNECTION TERMINATED BY XNF STOP COMMAND *****

Reason:

This message is logged to all terminals connected to SOLVE prior to their being disconnected due to a 'XNF STOP' command.

System Action:

This message is followed by disconnection of the terminal.

User Action:

Wait for XNF services to be reestablished, then reconnect to SOLVE.

NC8201

ERROR ON XNF GET: CODE=XX, DETAIL=XXXX

Reason:

An XNF GET service has failed. The message shows the error codes returned from the GET service.

System Action:

Processing continues. The error is ignored.

User Action:

If the cause of this message cannot be determined, contact your product support representative.

NC8202

CONNECTION TO *aaaaaaaa* FORCIBLY RELEASED BY XNF

Reason:

SOLVE's connection to network node *aaaaaaaa* has been unexpectedly released by XNF.

System Action:

SOLVE completes the disconnection from XNF.

User Action:

Investigate the cause of the connection failure.

NC8203**CONNECTION TO *aaaaaaaa* ABORTED BY REMOTE END****Reason:**

An ABORT SPDU has been received on the connection to node *aaaaaaaa*.

System Action:

The AB-SPDU is traced to the activity log and the connection to *aaaaaaaa* is terminated.

User Action:

Investigate the reason for the abort.

NC8204**INVALID INPUT RECEIVED FROM *aaaaaaaa*****Reason:**

An invalid DT-SPDU has been received from node *aaaaaaaa*.

System Action:

The invalid message is traced to the activity log and the connection to *aaaaaaaa* is aborted.

User Action:

Investigate the reason for the invalid message. If the problem persists, contact your product support representative.

NC8205**TRACE OF INCOMING MESSAGE FROM *aaaaaaaa*:****Reason:**

This is a header message preceding the trace of an incoming SPDU. The connection to *aaaaaaaa* is being traced because of an XNFTRACE command.

System Action:

A trace of the SPDU is written to the activity log.

User Action:

None

NC8301

CONNECTION TO *aaaaaaaa* RELEASED DUE TO STORAGE SHORTAGE

Reason:

The connection to *aaaaaaaa* has been released because SOLVE could not obtain sufficient storage to process the connection.

System Action:

aaaaaaaa is disconnected.

User Action:

Investigate why SOLVE is short of storage.

NC8302

CONNECTION TO *aaaaaaaa* FORCIBLY RELEASED BY XNF

Reason:

The connection from SOLVE to node *aaaaaaaa* has been released by XNF.

System Action:

aaaaaaaa is disconnected

User Action:

Investigate the cause of the failure.

NC8303

CONNECTION TO *aaaaaaaa* ABORTED BY REMOTE END

Reason:

The connection from SOLVE to node *aaaaaaaa* has been aborted by node *aaaaaaaa*.

System Action:

aaaaaaaa is disconnected.

User Action:

Investigate the reason for the abort.

NC8304**INVALID INPUT RECEIVED FROM *aaaaaaaa*****Reason:**

An invalid or unexpected SPDU has been received on a GET-BY-KEY service

System Action:

The invalid SPDU is traced to the activity log, and *aaaaaaaa* is disconnected.

User Action:

Investigate the cause of the invalid SPDU. If the error persists, contact your product support representative.

NC8305**TRACE OF OUTGOING MESSAGE TO *aaaaaaaa*:****Reason:**

This is the header message preceding the trace of an outgoing SPDU. The connection to *aaaaaaaa* is being traced because of an XNFTRACE command.

System Action:

A trace of the SPDU is written to the activity log.

User Action:

None

NC8306**TRACE OF INCOMING MESSAGE FROM *aaaaaaaa*:****Reason:**

This is the header message preceding the trace of an incoming SPDU. The connection to *aaaaaaaa* is being traced because of an XNFTRACE command.

System Action:

A trace of the SPDU is written to the activity log.

User Action:

None

NC8601

XNF SDISCONNECT FAILED: CODE=XX, DETAIL=XXXX

Reason:

An XNF SDISCONNECT service, issued in response to an error, has failed. The error codes from the SDISCONNECT are displayed in the message. This message will normally follow another message describing the original error.

System Action:

None

User Action:

Refer to the VOS3 XNF Messages manual (Appendix B) for an explanation of the error codes.

NC8701

SPL:

Reason:

This message is part of a formatted trace of an incoming or outgoing SPDU. This message is the header preceding the trace of the XNF SPL used to send or receive the SPDU.

System Action:

None

User Action:

None

NC8702

+000 xxxxxxxx xxxxxxxx xxxxxxxx xxxxxxxx cccccccccccccccc

Reason:

This message is a hexadecimal (xxxxxxx) and character (ccccccc) display of a trace of an SPL or SPDU used in XNF communications. This display follows another message which explains what the display is.

System Action:

None.

User Action:

None.

NC8703**CEPID=aaaaaaaaaaaaaaaa****Reason:**

This message is part of a formatted trace of an SPDU, logged because of an XNFTRACE command. This message displays the CEPID of the connection being traced.

System Action:

None

User Action:

None

NC8704**??-SPDU. TOTAL LENGTH=nnnnn****Reason:**

This message is part of a formatted trace being logged because of an XNFTRACE command. This message identifies the type of SPDU being traced, and its total length.

System Action:

None

User Action:

None

NC9201**TERMINAL DEFINITION aaaaaaa ADDED****Reason:**

Confirms successful completion of a DEFTERM command. DEFTERM is valid on VOS3 systems only.

System Action:

None

User Action:

None

NC9202

TERMINAL DEFINITION *aaaaaaaa* ALREADY EXISTS

Reason:

A DEFTERM command was entered, specifying a terminal name *aaaaaaaa* that is already defined.

System Action:

The command is rejected.

User Action:

Correct the name and re-enter.

NC9203

TERMINAL DEFINITION *aaaaaaaa* DELETED

Reason:

Confirms successful completion of a DELTERM command. DELTERM is valid on VOS3 systems only.

System Action:

None

User Action:

None

NC9204

TERMINAL DEFINITION *aaaaaaaa* DOES NOT EXIST

Reason:

A DELTERM command was entered, specifying a terminal name *aaaaaaaa* that has not been defined by a previous DEFTERM command.

System Action:

The command is rejected

User Action:

Correct the name and re-enter

NC9301**NAME TYPE DBCS COLOUR HLIGHT****Reason:**

This is the heading line of a SHOW DEFTERM display, which lists terminal definitions created by the DEFTERM command. DEFTERM is available on VOS3 systems only.

System Action:

None

User Action:

None

NC9302***aaaa bbbb ccc ddd eee*****Reason:**

The text line of a SHOW DEFTERM command. For each terminal definition (created by an earlier DEFTERM command) one of these messages will be displayed.

aaaa is the terminal name. This may be a name-mask, with asterisks as wildcards.

bbbb is the terminal type (3270 or 560/20)

ccc shows whether or not (Y or N) the terminal supports DBCS (Kanji)

ddd shows whether or not (Y or N) the terminal supports 7-color display.

eee shows whether or not (Y or N) the terminal supports extended highlighting (blink, reverse video and outlining).

System Action:

None.

User Action:

None.

NCD101

CDI EPS REGISTERED, NAME=*P1*

Reason:

This message is issued during initialization of the SOLVE SSI region and as part of the SSI STATUS display. It provides information about the Configuration Data Interface (CDI) feature. It indicates that the feature is active and operational in the SOLVE SSI region.

P1 is the name of the SSI end point used for the CDI feature.

System Action:

None.

User Action:

None.

NCD102

CDI EPS REGISTRATION FAILED, RC=*P1*, NAME=*P2*

Reason:

An attempt to register an SSI end point to provide an interface to the Configuration Data Interface (CDI) feature failed.

P1 is the SSI EndPoint Services (EPS) return code.

P2 is the SSI end point name.

System Action:

The CDI feature is unavailable.

User Action:

This is an internal error. Contact Technical Support.

NCD103**P1 ACTIVE CDI REQUEST(S)****Reason:**

This message is part of the SSI STATUS display and provides information about the Configuration Data Interface (CDI) feature. It shows the total number (*P1*) of active Endpoint Services (EPS) requests from all regions.

System Action:

None.

User Action:

None.

NCD281**EPSRQST: CID=*P1* NMID=*P2* FUNC=*P3* UCORR=*P4*****Reason:**

This message precedes a dump of a Configuration Data Interface (CDI) Endpoint Services (EPS) request buffer when tracing of CDI EPS requests and responses is enabled.

P1 identifies the EPS connection.

P2 identifies the NetMaster region.

P3 identifies the EPS function.

P4 identifies the EPS connection correlator.

System Action:

None.

User Action:

None.

NCD282

EPSRESP: CID=*P1* NMID=*P2* FUNC=*P3*

Reason:

This message precedes a dump of a Configuration Data Interface (CDI) Endpoint Services (EPS) response buffer when tracing of CDI EPS requests and responses is enabled.

P1 identifies the EPS connection.

P2 identifies the NetMaster region.

P3 identifies the EPS function.

System Action:

None.

User Action:

None.

NCD283

+000 xxxxxxxx xxxxxxxx xxxxxxxx xxxxxxxx cccc cccc cccc cccc

Reason:

This message contains a hexadecimal and character dump of a Configuration Data Interface (CDI) Endpoint Services (EPS) request or response buffer. The message is written when tracing of CDI EPS requests and responses is enabled.

System Action:

None.

User Action:

User Action:

None.

NCD374

**USSRESP: CID=*P1* FUNCTION=*P2* RETVAL=*P3* RETCODE=*P4*
RSNCODE=*P5***

Reason:

This message shows UNIX System Services (USS) function results for a Configuration Data Interface (CDI) request. It is written when tracing of CDI requests and responses is enabled.

P1 identifies the EPS connection.

P2 identifies the USS function.

P3 is the USS return value.

P4 is the USS return code.

P5 is the USS reason code.

System Action:

None.

User Action:

None.

NCD390**P1 APPARENT STALLED CDI REQUESTS****Reason:**

Requests queued to the SOLVE SSI Configuration Data Interface (CDI) subtask are not being serviced in a timely manner. The subtask may have stalled.

P1 is the number of stalled requests.

System Action:

The SOLVE SSI region continues to monitor the CDI subtask.

This message is written approximately every 60 seconds until stalled requests are not detected.

User Action:

Ensure that the dispatching priority of the SOLVE SSI region enables subtasks in the region to be dispatched when ready.

If the problem persists, contact Technical Support.

NCD580**CDI SUBTASK ATTACH FAILED (REFER TO LOG)****Reason:**

The Configuration Data Interface (CDI) feature is active in the SOLVE SSI region. The region attempted to attach a subtask under which CDI requests could be executed. The operation failed.

System Action:

The operation is retried every 60 seconds.

User Action:

See the SSI log for other messages that describe the cause of the error when attaching the subtask.

NCD581

CDI SUBTASK INIT FAILED, RC: *P1* CODE: *P2* SUBCODE: *P3*

Reason:

The Configuration Data Interface (CDI) feature is active in the SOLVE SSI region. The region attached a subtask under which CDI requests could be executed. The subtask initialization failed.

P1 is the subtask return code.

P2 is the subtask error code:

00 indicates an expected termination (for example, the SOLVE SSI region is stopping) or the subtask abended.

04 indicates that the subtask engine cannot be initialized.

08 indicates that the SOLVE SSI region has insufficient virtual storage.

P3 is the subtask error subcode.

System Action:

The operation is retried every 60 seconds.

User Action:

See the SSI log for other messages that describe the cause of the subtask initialization error.

NCD582**CDI SUBTASK TERMINATED, RC: P1 CODE: P2 SUBCODE: P3****Reason:**

The Configuration Data Interface (CDI) feature is active in the SOLVE SSI region. The region attached a subtask under which CDI requests could be executed. The subtask terminated.

P1 is the subtask return code.

P2 is the subtask error code:

00 indicates an expected termination (for example, the SOLVE SSI region is stopping) or the subtask abended.

04 indicates that the subtask engine cannot be initialized.

08 indicates that the SOLVE SSI region has insufficient virtual storage.

P3 is the subtask error subcode.

System Action:

If it is an expected termination, no action is taken; otherwise, the SOLVE SSI region waits 60 seconds and then reattaches the subtask.

User Action:

See the SSI log for other messages that describe the cause of an unexpected subtask termination.

NCH710**CACHE HT% ACC ACT INA NLD LFT SIZE LIM-CT/SZ Load Drop
Flsh****Reason:**

This is the title line of the SHOW CACHE CACHE=* display.

System Action:

None.

User Action:

None.

NCH711

cache ht% acc act ina nld lft size lim-ct/lim-sz load drop flsh

Reason:

This message forms part of the SHOW CACHE CACHE= display. The list of caches can be filtered by specifying a specific or generic cache name (using * and ?). A message is issued for each matching cache defined to the region.

cache is the cache name.

hit% is the hit ratio. This is number of element references where the element is found in the cache divided by the total number of cache references. The high this figure, the better the cache is operating.

acc is the total number of open/query references to the cache.

act is the number of elements on the active queue.

ina is the number of elements on the inactive queue.

nld is the number of elements on the not loaded queue.

lft is the number of elements on the lifetime expiry queue.

size is the amount of storage in use in the cache.

lm-cnt is the limit count defined for this cache. When the number of inactive elements exceeds this value, elements are purged from the cache until the limit is under control.

lm-size is the limit size defined for this cache. When the size of inactive elements exceeds this value, elements are purged from the cache until the limit is under control.

load is the number of loads performed on this cache since the cache was defined.

drop is the number of drops performed on this cache since the cache was defined. Elements are dropped from the cache when the cache strategy in effect causes elements to be purged.

flsh is the number of elements purged from the cache using explicit flush commands.

System Action:

None.

User Action:

None.

NCH712**No caches defined****Reason:**

A SHOW CACHE command has been issued, but there are no caches currently defined to the region.

System Action:

None.

User Action:

None.

NCH713**No matching caches found****Reason:**

A SHOW CACHE CACHE=xxx command has been issued, but no matching caches are defined to the region. CACHE=*name* can be specified to filter the list of caches shown. A specific or generic value (using * and ?) can be specified.

System Action:

None.

User Action:

None.

NCH720**Element-Type Num LdQ Th-F/B/N SlT-U/A Syn Cache****Reason:**

This is the title line of the SHOW CACHE ELEMTYP=* display.

System Action:

None.

User Action:

None.

NCH721

elmt-typ num LdQ thf/thb/thn SlT-U/slt-A Syn Cache

Reason:

This message forms part of the SHOW CACHE ELEMENTYP= display. A message is issued for each element type currently defined to the region.

elmt-typ is the element type name.

num is the number of elements in the cache for this element type, where the element is found in the cache divided by the total.

ldq is the number of element on the load queue, that is, waiting for a load thread to load the data into the cache.

thf is the number of free load threads, waiting for a load request.

thb is the number of busy load threads. A busy load thread is currently loading an element into the cache or not assigned.

thn is the number of non-assigned load threads. Non-assigned load threads are in between a CLOSE and a subsequent GETREQUEST or have started but not issued a GETREQUEST call to obtain new work.

slt-u is the number of hash slots in use. If *num* > *sltu*, this implies that different elements have hashed to the same hash slot.

slt-a is the number of hash slots allocated.

syn is the maximum length of the the hash synonym chain. Elements that hash to the same hash slot are chained together in a hash synonym chain.

cache is the cache name associated with this element type.

System Action:

None.

User Action:

None.

NCH722**No element types defined****Reason:**

A SHOW CACHE command has been issued, but there are no element types currently defined to the region.

System Action:

None.

User Action:

None.

NCH723**No matching element types found****Reason:**

A SHOW CACHE ELEMTYP=xxx command has been issued, but no matching element types have been defined to the region. An element type filter can be specified.

System Action:

None.

User Action:

Check that a specified element type mask is specified correctly. You can issue a "SHOW CACHE ELEMTYP=*" to list of element types currently defined.

NCH730

NCLID=xxxxxx. No assigned element

Reason:

This message forms part of the SHOW CACHE ELEMTYP= display. It is issued for any busy and non-assigned OML load thread. Typically, this should occur only for very short times.

System Action:

None.

User Action:

If repeated, SHOW CACHE ELEMTYP=xxx results in this message. This could indicate that the load thread is in trouble and is unable to issue a GETREQUEST call or terminate.

NCH731

NCLID=xxxxxx. Size=xxx. Writes=nnn. Loading element=xxxxxxx

Reason:

This message forms part of the SHOW CACHE ELEMTYP= display. It is issued for any busy OML load procedure that is currently loading an element into the cache. The size in bytes, number of writes issued so far, and the element name being loaded are shown.

System Action:

None.

User Action:

None.

NCH735**XPB=xxxxxxx. No assigned element****Reason:**

This message forms part of the SHOW CACHE ELEMENTYP= display. It is issued for any busy and non-assigned assembler-based load thread. Typically, this should occur only for very short times.

System Action:

None.

User Action:

If repeated, SHOW CACHE ELEMENTYP=xxx results in this message. This could indicate that the load thread is in trouble and is unable to issue a GETREQUEST call or terminate.

NDR001**DD=NMDRVCTL OPEN failure****Reason:**

The DD NMDRVCTL failed to open.

System Action:

System initialization is terminated.

User Action:

Provide a valid DD statement for DDName NMDRVCTL.

NDR002**Unrecognised operand****Reason:**

An unrecognized operand was encountered in the input read from NMDRVCTL. A following message identifies the input.

System Action:

System initialization is terminated.

User Action:

For a description of the valid syntax for the input, see the *Reference Guide*.

NDR003

PGM= name greater than 8 characters

Reason:

The program name specified on PGM= is longer than eight characters.

System Action:

System initialization is terminated.

User Action:

Specify a program name of one to eight characters in length.

NDR004

LIST= value invalid

Reason:

The LIST= operand was neither NO nor YES.

System Action:

System initialization is terminated.

User Action:

Specify a value of NO or YES for the LIST= operand.

NDR005

ERROR= value invalid

Reason:

The ERROR= operand must start with either R or U followed by one to five digits (for example, U4095).

System Action:

System initialization is terminated.

User Action:

Specify a valid value for the ERROR= operand.

NDR006**PARMSEP= value invalid****Reason:**

The PARMSEP= operand must be one character in length.

System Action:

System initialization is terminated.

User Action:

Specify a valid value for the PARMSEP= operand.

NDR007**PPREF= value invalid or too long****Reason:**

The PPREF= operand exceeds 1024 bytes in length.

System Action:

System initialization is terminated.

User Action:

Specify a value with a shorter length for the PPREF= operand.

NDR008**WAIT= value invalid****Reason:**

The WAIT= operand must be either ESM or VTAM.

System Action:

System initialization is terminated.

User Action:

Specify either ESM or VTAM for the WAIT= operand.

NDR009

PSUFF= value invalid or too long

Reason:

The PSUFF= operand exceeds 1024 bytes in length.

System Action:

System initialization is terminated.

User Action:

Specify a value with a shorter length for the PSUFF= operand.

NDR010

More than 1 parm on a control line

Reason:

A control line can have only one command.

System Action:

System initialization is terminated.

User Action:

Start commands on separate lines.

NDR011

***p1* operand unrecognised**

Reason:

The operand, *p1*, was not recognized.

System Action:

System initialization is terminated.

User Action:

For a list of valid operands, see the *Reference Guide*.

NDR012**< p1> operand duplicated****Reason:**

The operand, *p1*, occurred more than once in the processed statement.

System Action:

System initialization is terminated.

User Action:

Specify *p1* only once on the statement.

NDR013**< p1> operand invalid value****Reason:**

The operand, *p1*, was invalid.

System Action:

System initialization is terminated.

User Action:

Correct the operand.

For valid syntax, see the *Reference Guide*.

NDR014**Variable substitution not supported****Reason:**

Variable substitution was requested, but the operating system does not support this.

System Action:

System initialization is terminated.

User Action:

Either change the specification to SUBS=NO or upgrade your operating system.

NDR015

Invalid SUBS=... value

Reason:

The value for SUBS= must be either NO or YES.

System Action:

System initialization is terminated.

User Action:

Specify either NO or YES for SUBS=.

NDR016

Variable name not 1-16 characters

Reason:

The name of a variable must be 1 to 16 characters in length.

System Action:

System initialization is terminated.

User Action:

Specify a variable name of 1 to 16 characters.

NDR017

Variable name has bad characters

Reason:

The name of a variable must consist of the characters A to Z, \$, @, and #, with numerals allowable in all but the first character.

System Action:

System initialization is terminated.

User Action:

Specify a variable name with valid characters.

NDR018**Variable value too long****Reason:**

The value supplied for a variable exceeds the length of the variable name plus 1.

System Action:

System initialization is terminated.

User Action:

Specify a value of the correct length.

NDR019**Too many variables defined****Reason:**

The number of variables defined exceeds the limit of 20.

System Action:

System initialization is terminated.

User Action:

Do not specify more than 20 variables.

NDR020**Subs output buffer overflow****Reason:**

A buffer overflow condition occurred while calling the symbol substitution routine.

System Action:

System initialization is terminated.

User Action:

Increasing the region size, or decrease the number of variables for substitution.

NDR021

Parm syntax error at col *p1*

Reason:

A syntax error was detected in column *p1* of the input.

System Action:

System initialization is terminated.

User Action:

Correct the syntax.

For valid syntax, see the *Reference Guide*.

NDR022

Missing continuation

Reason:

A line ended with a continuation character, but EOF was encountered while attempting to read the continuation.

System Action:

System initialization is terminated.

User Action:

Either remove the continuation indicator, or provide the missing continuation line.

NDR099

p1

Reason:

This message follows an error message to echo the statement that was in error, *p1*.

System Action:

See the previous error message.

User Action:

See the previous error message.

NDR101**Waiting for WAIT= requirements to be satisfied****Reason:**

You specified WAIT=ESM, WAIT=VTAM or both, and the system is waiting for these events to occur.

System Action:

The system issues this message every 10 seconds until the events being waited on occur.

User Action:

None.

NDR102**SAF unavailable - SAFRC=*p1*, RACFRC=*p2*, RACFRE=*p3*****Reason:**

You specified WAIT=ESM, causing a RACROUTE REQUEST=STAT call to be issued. This call failed.

p1 is the SAF return code.

p2 is the RACF return code.

p3 is the RACF reason code.

System Action:

The system continues to wait until the ESM is available, issuing this message every 10 seconds.

User Action:

For an explanation of the codes in this message, see IBM's *Security Server RACROUTE Macro Reference*.

NDR103

VTAM unavailable - RC = *p1*

Reason:

You specified WAIT=VTAM, causing VTAM OPEN to be issued. This failed with return code *p1*.

System Action:

The system continues to wait until VTAM is available, issuing this message every 10 seconds.

User Action:

Review the return code to determine the problem.

For an explanation of the return code in this message, see IBM's *Communications Server: SNA Programming* book.

NDRV01

Invalid ALLOCATE parm combination

Reason:

The specified combination of parameters for requesting dynamic allocation is not valid.

System Action:

System initialization is terminated.

User Action:

Correct the parameters in the request.

Note: For valid combinations of the parameters to allocate a data set dynamically, see the *Reference Guide*.

NDRV02**No suitable ALLOC to CONCAT to****Reason:**

DDName=* was specified without a previous allocation to concatenate to.

System Action:

System initialization is terminated.

User Action:

Ensure that a DD=name statement precedes the DDName.

NDRV03**SYSOUT concatenation not allowed****Reason:**

A concatenation to a SYSOUT allocation was attempted. This is not valid.

System Action:

System initialization is terminated.

User Action:

Recode the statement.

NDRV04**TEMP DSN table overflow****Reason:**

More than four temporary data set names (that is, names starting with an ampersand (&)) were specified on an allocation.

System Action:

System initialization is terminated.

User Action:

Do not exceed four temporary data set names for an allocation.

NDRV05

TEMP DSN not found in table

Reason:

A temporary DSN has DISP=OLD without having been specified in another allocation with DISP=NEW.

System Action:

System initialization is terminated.

User Action:

Correct the temporary DSN specification.

NDRV99

p1

Reason:

This message follows an error message to echo the statement that was in error, *p1*.

System Action:

See the previous error message.

User Action:

See the previous error message.

NF0001**PACKET ANALYZER INITIALIZATION FAILED - p1****Reason:**

This message is issued during NMSSI region startup if the Packet Analyzer is requested. Initialization of the Packet Analyzer failed for one of the following reasons:

NOT SUPPORTED ON THIS OPERATING SYSTEM

The Packet Analyzer is supported on z/OS only.

XMS IS NOT ENABLED

The SSI startup parameter XMS (Cross-memory Services) is set to NO.
The Packet Analyzer requires XMS=YES.

LOAD FOR NMSSI057 FAILED

A required load module is missing from the load library.

System Action:

The NMSSI region terminates.

User Action:

Examine the reason, take corrective action, and retry.

NF0311**PACTL LEVEL=aaa COMMAND IGNORED, INVALID LEVEL****Reason:**

This message is issued in response to a PACTL command. It indicates that the level specified on that command is not a valid level.

Valid values for the LEVEL operand are:

2 or NOPACKETS

4 or NOSTATS

7 or STATSAMP

10 or FULL or ALL

System Action:

The PACTL command is ignored.

User Action:

Correct the command and retry.

NF0319

PACTL LEVEL=... COMMAND PROCESSED. NEW LEVEL SET

Reason:

This message is issued in response to a PACTL command. It indicates that the level specified on that command is set as the new active Packet Analyser processing level.

System Action:

The Packet Analyzer now processes at the newly-requested level.

User Action:

None.

NF0710

CPU: *P1* API: *P2* PKTS: *P3* EVT: *P4* SMF: *P5* UUID: *P6* TRC: *P7*

Reason:

This message is issued to the NMSSI log if the Packet Analyzer minute minder is activated. The message appears once every minute and provides statistics for the last minute.

The fields are as follows:

CPU: *P1* is the CPU time used in seconds.

API: *P2* is the number of database API requests received.

PKTS: *P3* is the number of TCP/IP packets received.

EVT: *P4* is the number of events received.

SMF: *P5* is the number of SMF events received.

UUID: *P6* is the number of update-userid requests received.

TRC: *P7* is the number of TCP/IP packets truncated because of segmentation constraints.

System Action:

None.

User Action:

None.

NF0711**DDB-U: 1% SDB-U: 2% TDB-U: 3%****Reason:**

This message is issued to the NMSSI log if the Packet Analyzer minute minder is activated. The message is produced once every minute and provides statistics for the last minute.

The fields are as follows:

DDB-U: 1%-The percentage-used for the dynamic database

SDB-U: 2%-The percentage-used for the synchronous database

TDB-U: 3%-The percentage-used for the trace database

System Action:

None.

User Action:

None.

NF0712

D/C: NQ: 1 DQ: 2 LS: 3 AW: 4 TW: 5 ST: 6 (%): 7

Reason:

This message is issued to the NMSSI log if the Packet Analyzer minute minder is activated. The message is produced once every minute and provides statistics for the last minute.

The statistics in this message relate to the decoupler, used to buffer TCP/IP packets and other events for processing.

The fields are as follows:

NQ: 1-The number of records enqueued to the decoupler

DQ: 2-The number of records dequeued from the decoupler

LS: 3-The number of records lost to buffer shortages

AW: 4-The number of actual waits for data

AT: 5-The number of timed waits for data

ST: 6-The number of decoupler segments touched

(%): 7-The percentage of decoupler segments touched, of the entire amount of decoupler segments

System Action:

None.

User Action:

None.

NF0713**S/T CPU: 1 TASK: 2 (3%) SRB: 4 (5%) M-SW: 6****Reason:**

This message is issued to the NMSSI log if the Packet Analyzer minute minder is activated. The message is produced once every minute and provides statistics for the last minute.

This specific message is produced only if the Packet Analyzer execution mode is ZIIP. The statistics in this message show the CPU time used by the Packet Analyzer, with a breakup between the time spent in Task mode and the time spent in SRB mode (which may be expended on a zIIP).

The fields are as follows:

CPU: 1-The total CPU time used by the Packet Analyzer

TASK: 2 (3%)-The CPU time and percentage of the total spent in Task mode

SRB: 4 (5%)-The CPU time and percentage of the total spent in SRB mode

M-SW: 6-The number of mode switches between Task and SRB mode

System Action:

None.

User Action:

None.

NF0714

PHTM: 1 ZONC: 2 ZNCT: 3 %-ZIIP: 4

Reason:

This message is issued to the NMSSI log if the Packet Analyzer minute minder is activated. The message is produced once every minute and provides statistics for the last minute.

This specific message is produced only if the Packet Analyzer execution mode is zIIP. The statistics in this message show the CPU time used as derived from operating system-maintained fields. These values can be used to determine whether zIIP-eligible processing is actually being performed on a zIIP.

The fields are as follows:

PHTM: 1-The total pre-emptable-SRB CPU time expended in the last minute

ZONC: 2-CPU time that, while zIIP-eligible, was expended on a normal CP

ZNCT: 3-Enclave CPU time executed on a zIIP

%-ZIIP: 4-The percentage of zIIP-eligible CPU time actually executed on a zIIP

System Action:

None.

User Action:

If the percentage of time on a zIIP is 0, there may be no zIIPs online.

If the percentage of time on a zIIP is less than 100, available zIIPs may be in use or WLM priorities may be preventing the Packet Analyzer from using a zIIP.

NF1001**NUMBER OF STACKS: CURR=*P1* HIST=*P2* ENABLED=*P3* REQUESTS=*P4*****Reason:**

This message is part of the SSI STATUS display and provides information regarding TCP/IP stacks and stack management requests:

P1 is the number of current known stacks.

P2 is the number of previously known stacks, that is, occurrences of stacks that have terminated since SSI initialization.

P3 is the number of current stacks that have packet analysis enabled.

P4 is the number of packet analysis enable requests.

System Action:

None.

User Action:

None.

NF1002**Packet processing disabled. Reason: *rrrrrr*****Reason:**

This message is produced as part of an 'SSI STATUS' command. It indicates that the Packet Analyser facility, activated in this SOLVE SSI region, is not currently processing TCP/IP packets.

The reason can be:

JCL PARM "PACKETS=NO"

The SOLVE SSI EXEC parm statement, or SSIIN data set, contains the statement 'PACKETS=NO'.

PACTL NOPACKETS

The PACTL command has been issued to the SOLVE SSI region, with the argument 'NOPACKETS'.

System Action:

None.

User Action:

If you want the SOLVESSI region packet analyser to process packets, you must restart the region and ensure that the JCL/SSIIN parameters do not include 'PACKETS=NO'.

NF1003

PACKET ANALYSER VERSION IS *aaa.bb*

Reason:

This message is part of the SSI STATUS display and provides information about Packet Analyzer.

It shows the Packet Analyzer version in the format *aaa.bb*.

aaa is the Packet Analyzer major version, for example, '116'.

bb is the Packet Analyzer minor version, for example, '00'.

Note: Leading zeroes are displayed.

System Action:

None.

User Action:

None.

NF1010

PACKET ANALYZER EXECUTION MODE IS: *mode*

Reason:

This message is produced as part of an SSI STATUS command. It shows the Packet Analyzer execution mode if the mode is not NORMAL.

The following mode values are available:

NORMAL - The Packet Analyzer is executing normally, that is, it is capturing packets and SMF events, and processing them.

RECORD - The Packet Analyzer is recording packets to a data set, which can be used for later playback.

PLAYBACK - The Packet Analyzer is in playback mode, that is, reading packets from a data set.

TEST - The Packet Analyzer is in test mode. No packet or SMF processing is performed.

System Action:

None.

User Action:

None.

NF1011**PACKET ANALYZER EXECUTION LEVEL IS: *level*****Reason:**

This message is produced as part of an SSI STATUS command. It shows the Packet Analyzer execution level if the execution level is not FULL.

The following level values are available:

FULL - The Packet Analyzer is executing normally. All packets are processed.

STATSAMP - The Packet Analyzer is processing 1 in n packets (for example, 1 in 10 packets) for statistics and scaling the statistics accordingly.

NOSTATS - The Packet Analyzer is processing packets but no statistics are gathered.

NOPACKETS - The Packet Analyzer is not processing packets. Only SMF events are processed.

System Action:

None.

User Action:

None.

NF1012

... processing. EVENTS: *aaa* PACKETS *ppp* TRACE: *ttt* STATS: *sss sss*

Reason:

This message is produced as part of an SSI STATUS command. It provides information about the execution of the Packet Analyzer if the execution level is not FULL.

The status of packets, events, tracing, and statistics collection are shown.

The fields and their meanings are as follows:

EVENTS: *aaa* - Indicates whether SMF events are processed.

PACKETS: *ppp* - Indicates whether packets are processed.

TRACE: *ttt* - Indicates whether trace facilities are available.

STATS: *sss sss* - Indicates whether statistics are collected or sampled.

System Action:

None.

User Action:

None.

NF1013

PACKET RECORDING IN PROGRESS FOR STACK: *sss* # PKTS: *aaa* # RECS: *bbb*

Reason:

This message is produced as part of an SSI STATUS command if the Packet Analyzer is executed in RECORD mode.

This message shows the stack for which packets are recorded, the number of packets recorded, and the number of records written to the record data set.

System Action:

None.

User Action:

None.

NF1014**PACKET PLAYBACK IN PROCESS. STATUS: *sss*****Reason:**

This message is produced as part of an SSI STATUS command if the Packet Analyzer is executed in PLAYBACK mode.

This message shows the current playback status. The following values are available:

NOT STARTED - Playback has not started.

PENDING START - Playback start has been requested and will commence shortly.

RUNNING - Playback is in progress.

FINISHED - Playback is complete.

UNKNOWN - Unable to determine playback status.

System Action:

None.

User Action:

None.

NF1018

ANALYZER SUBTASK EXECUTION MODE IS *aaa* (REQ: *bbb*)

Reason:

This message is produced as part of an SSI STATUS command and is also logged when the region starts.

This message shows the Packet Analyzer execution mode, as set by the PAEXMODE=*mode* SOLVE SSI parameter.

The current execution mode is shown. If this is not the same as the requested (or defaulted) mode, the requested mode is also shown. If this is the case, an NF1019 message follows this message and provides diagnostic information, except when the requested mode is BEST.

The modes are as follows:

TASK indicates that the Packet Analyzer is executing in task mode. (This is the default mode if no PAEXMODE parameter is specified)

ZIIP indicates that the Packet Analyzer is executing in SRB mode and can execute on a zIIP processor if eligible.

BEST indicates that the best available mode was requested. The actual mode will be TASK or ZIIP, depending on the availability of zIIP processors.

System Action:

None.

User Action:

If the requested mode is not the same as the actual mode and the requested mode was not BEST, use the diagnostic information in the following NF1019 message to determine the cause and then take appropriate action.

NF1019

... PAEXMODE STATUS INFORMATION. R0 (X): *aaa* R1: (X) *bbb*

Reason:

This message may be produced as part of an SSI STATUS command and logged when the region starts.

This message is produced if the actual and requested Packet Analyzer execution modes are not the same (see message NF1018 for the modes and their meaning).

This message shows diagnostic information about why the requested mode cannot be used.

The diagnostic information shows two hexadecimal values, R0 and R1 values.

The R0 value is the primary diagnostic code. For some codes, supplementary information is in the R1 value.

The R0 values are as follows:

01xxyy00 - The requested execution mode is not available. *xx* is the requested execution mode (00-task, 04-sup, 0C-ZIIP). *yy* is the supported modes as a bitmap (80-task, 40-sup, 10-ziip)

02000000 - zIIP mode was requested. It is supported by the system and zIIP processors are available; however, the enabling APAR is not applied. See your support representative to obtain the enabling APAR.

0A000000 - Unable to obtain required storage.

14000000 - Unable to load a required system service module (IEAVAPE).

15000000 - Unable to load a required system service module (IEAVDPE).

16000000 - Unable to load a required system service module (IEAVPSE).

17000000 - Unable to load a required system service module (IEAVRLS).

18000000 - Unable to load a required system service module (IEAVXFR).

1E0000rr - Pause element allocation 1 failed. *rr* is the IEAVAPE return code.

1F0000rr - Pause element allocation 2 failed. *rr* is the IEAVAPE return code.

280000rr - WLM registration failed. *rr* is the IWM4CON macro return code. The R1 value is the reason code, that is, the R1 value returned from the macro.

290000rr - WLM enclave creation failed. *rr* is the IWM4ECRE macro return code. The R1 value is the reason code, that is, the R1 value returned from the macro.

2A0000rr - WLM enclave zIIP enablement failed. *rr* is the workload manager zIIP enablement macro return code. The R1 value is the reason code, that is, the R1 value returned from the macro.

System Action:

None.

User Action:

The diagnostic information in this message can be used to determine why the requested execution mode is not used.

NF1101

Stack monitor enumeration complete

Reason:

This message is issued during SSI initialization to indicate that the SSI has successfully completed the TCP/IP stack discovery process.

System Action:

None.

User Action:

None.

NF1111

Stack monitor registration retry

Reason:

This message is issued during SSI initialization to indicate that the TCP/IP stack discovery process has failed and is being retried.

System Action:

The SSI retries every 5 seconds. This message is issued every minute. The retry process continues until a terminal failure occurs.

User Action:

If this message persists, contact Technical Support.

NF1121**Stack monitor registration failure R15= P1****Reason:**

This message is issued during SSI initialization to indicate that the TCP/IP stack discovery process has failed and may not be retried. The failure code (R15=*P1*) is displayed.

System Action:

Packet analysis for TCP/IP stacks is inoperative.

User Action:

This is an internal error. Contact Technical Support.

NF1122**Stack monitor enumeration failure R15= P1****Reason:**

This message is issued during SSI initialization to indicate that the TCP/IP stack discovery process has failed. The failure code (R15=*P1*) is displayed.

System Action:

Packet analysis for TCP/IP stacks is incomplete.

User Action:

This is an internal error. Contact Technical Support.

NF1301**STACK REFRESH REQUEST FOR STACK P1 ACCEPTED****Reason:**

The SSI STACK REFRESH command for the identified stack name (*P1*) was accepted.

System Action:

The internal representation of the TCP/IP stack interfaces and home addresses are rebuilt.

User Action:

None.

NF1401

NAME TYPE VERS SSID STATUS

Reason:

This is the header message for message NF1402 issued in response to the SSI SHOW STACKS command.

System Action:

None.

User Action:

None.

NF1402

P1 P2 P3 P4 P5

Reason:

This is the detail message issued in response to the SSI SHOW STACKS command. It provides the following details for a TCP/IP stack:

P1 is the stack name (the stack's STC/job name)

P2 is the stack type, IBM or TCPaccess.

P3 is the stack software version.

P4 is the SSID for the stack (TCPaccess only)

P5 indicates the packet analysis status for the stack:

- ANALYZE - Packet analysis is enabled.
- NOANALYZE - Packet analysis is disabled; the stack is not defined as a resource in the active system image.

System Action:

None.

User Action:

None.

NF1501**CONFIGURATION REFRESH COMPLETE. STACK: *p1*****Reason:**

A request to refresh the configuration information about the indicated stack is complete.

System Action:

Processing continues.

User Action:

None.

NF1502**CONFIGURATION CHANGE DETECTED. STACK: *p1*****Reason:**

A change was detected in the configuration of the indicated stack.

System Action:

The Packet Analyzer database is updated with the changed configuration details.

User Action:

None.

NF1580**UNIX SYSTEM SERVICES UNAVAILABLE: STACK=*P1*****Reason:**

UNIX System Services are unavailable. Interface configuration and other stack information cannot be obtained for the IBM stack (*P1*) shown in the message.

System Action:

Processing continues.

User Action:

Review the system log and SSILOG for related messages.

NF1581

ATTACH FAILED FOR SUBTASK: *p1* STACK: *p2*

Reason:

An attach for a module used to obtain configuration information from an IBM stack failed.

System Action:

The indicated stack is not hooked for packet processing.

User Action:

Review the system log and SSILOG for related messages.

NF1582

STACK CONFIGURATION HANDLER SUBTASK INIT FAILURE, STACK: *p1*

Reason:

The task used to obtain configuration information from an IBM stack failed. The most likely reason is a storage shortage.

System Action:

The indicated stack is not hooked for packet processing.

User Action:

Review the system log and SSILOG for related messages.

NF1583

STACK CONFIGURATION HANDLER MODULE INIT FAILURE, STACK: *p1*

Reason:

The module used to obtain configuration information from a CA TCPaccess stack failed. The most likely reason is a storage shortage.

System Action:

The indicated stack is not hooked for packet processing.

User Action:

Review the system log and SSILOG for related messages.

NF1591

**GET CONFIGURATION ERROR. USS ERROR: STACK=*p1* FUNC=*p2*
RETVAL=*p3* (X) RETCODE=*p4* (X) RSNCODE=*p5* (X)**

Reason:

An error occurred while attempting to obtain the configuration information for an IBM stack. A UNIX System Services (USS) error occurred. Diagnostic information is provided.

System Action:

The indicated stack is not hooked for packet processing.

User Action:

Review the system log and SSILOG for related messages.

NF1592

GET CONFIGURATION ERROR. TCPAXS ERROR: STACK=*p1* *diagnostic information*

Reason:

An error occurred while attempting to obtain the configuration information for a CA TCPaccess stack. Diagnostic information is provided.

System Action:

The stack is not hooked for packet processing.

User Action:

Review the system log and SSILOG for related messages.

NF1593

GET CONFIGURATION ERROR. STORAGE ERROR STACK=*p1* *diagnostic information*

Reason:

An error occurred while attempting to obtain the configuration information for a stack. A storage shortage occurred. Additional diagnostic information is provided.

System Action:

The stack is not hooked for packet processing.

User Action:

Increase the SSI region size and restart the SSI.

NF1594

GET CONFIGURATION ERROR. INTERNAL ERROR STACK=*p1* ERROR: *P2*

Reason:

An error occurred while attempting to obtain the configuration information for a stack. An internal error occurred. Additional diagnostic information is provided.

System Action:

The stack is not hooked for packet processing.

User Action:

Contact Technical Support and provide the following:

- All output from the SOLVESSI job
- The system log from the time of the ABEND

NF1692**SOCKET ERROR: STACK= P1 FUNC= P2 R15= P3 (X), R0= P4 (X)****Reason:**

An attempt to use the TCPaccess TLI interface failed. The message includes the following diagnostic data:

P1 is TCPaccess SSID.

P2 is the TLI macro name and/or function code, for example AOPEN.

P3 is the register 15 value in hex.

P4 is the register 0 value in hex.

System Action:

The socket request fails.

User Action:

R15/R0 values are documented in the TCPaccess Assembler API Programmers Reference manual. Use this information to resolve the error.

NF1693**STORAGE SHORTAGE****Reason:**

An attempt to use the TCPaccess TLI interface failed because there was insufficient storage to obtain the work areas required for the calls.

System Action:

The socket request fails.

User Action:

Review the SSILOG for other related messages. Increase the SSI region size and restart.

NF1M01

PACKET ANALYSIS FOR STACK P1 P2 BY USER P3 ON REGION P4

Reason:

Packet analysis for a stack has been enabled or disabled as a result of a stack management request from a region. In the message:

P1 is stack name.

P2 is either ENABLED or DISABLED.

P3 and *P4* are the user ID and region that issued the stack management request.

Note: The Packet Analyzer services all NetMaster regions in an LPAR. Packet analysis for a stack is required if any NetMaster region that is connected to the SOLVESSI has issued a management request.

A request to enable packet analysis for a stack from a NetMaster region will only take effect if packet analysis has not been enabled.

Similarly, a request to disable packet analysis for a stack from a NetMaster region will only take effect if no other region is requesting management of that stack.

This message indicates the first NetMaster region to enable packet analysis (for the stack) or the last to disable it.

System Action:

Packet analysis is enabled or disabled.

User Action:

None.

NF1M02

STACK P1 ENDED

Reason:

The Packet Analyzer has detected that a TCP/IP stack (*P1*) has ended.

System Action:

None. When the stack is restarted, packet analysis for the stack will be automatically resumed if this was previously enabled.

User Action:

None.

NF1M11**STACK P1 FAILURE P2 P3 P4****Reason:**

An attempt to enable or disable packet analysis has failed. In the message:

P1 is request type, either ENABLE or DISABLE

P2 is stack name

P3 is a return code

P4 is the failure reason, one of the following:

SEE PREVIOUS MESSAGE

STACK INACTIVE/UNHOOKABLE

INVALID TOKEN/NUMBER

API INACTIVE

UNKNOWN

System Action:

The request fails.

User Action:

If the reason is SEE PREVIOUS MESSAGE refer to the explanation of the previous message in the SSILOG. Other reasons represent an internal error that should be reported to Technical Support.

NF1M50

**CONN INFO REQ FOR STACK: *P1* COMPLETE. #CONN: *P2* #QD: *P3*
#NQNS *P4* #NQR: *P5***

Reason:

Warm start connection pickup for a stack is complete. This message shows the results of the pickup.

P1 is the stack name.

P2 is the number of existing connections found.

P3 is the number of connection information records queued to the Packet Analyzer database processor.

P4 is the number of connection information records not queued due to a storage shortage.

P5 is the number of connection information records not queued due to some other error.

System Action:

None.

User Action:

None.

NF1M51**CONN INFO REQ FOR STACK: P1 FAILED. REASON: P2****Reason:**

Warm start connection pickup for a stack failed. This message shows the failure reason.

Possible failure reasons are as follows:

ATTACH FAILED

The attach request for the information gathering subtask failed. For more information, see other SSILOG messages. (The subtask name is NMSSI05A.)

LOAD FOR EZBNMIFR FAILED

The Packet Analyzer is unable to load the EZBNMIFR module, used to obtain the information.

NO STORAGE FOR INITIAL RESPONSE BUFFER

The Packet Analyzer is unable to obtain storage for the results of the connection information request (for an initial buffer).

NO STORAGE FOR RETRY RESPONSE BUFFER

The Packet Analyzer is unable to obtain storage for the results of the connection information request (when a larger buffer is needed).

EZBNMIFR ERROR. RV, RC, RS: aa bb cc

The call to the EZBNMIFR module failed with the displayed return value, return code, and reason code.

SUBTASK TERMINATED. INFO: aa

The information gathering subtask terminated unexpectedly. The abend or return code are displayed.

SUBTASK TIMED OUT OR HUNG

The information gathering subtask took too long.

System Action:

None.

User Action:

None.

NF1M80

IPv6 CONFIGURATION IOCTL ERROR. STACK=*stackname*

Reason:

An error occurred while attempting to obtain IPv6 configuration information from an IBM stack.

The error means that the PTF for APAR PK11661 is not applied.

System Action:

IPv6 configuration information is not obtained.

User Action:

If you are using IPv6, apply the relevant PTF to your system.

NF1S91

STORAGE FAILURE, CANNOT CREATE KNOWN STACK P1

Reason:

An attempt to record details for a TCP/IP stack (*P1*) has failed as there is insufficient storage to obtain the workareas required for record.

System Action:

The stack is not recorded. Packet analysis for the stack cannot be enabled.

User Action:

Review the SSILOG for other related messages. Increase the SSI region size and restart.

NF4001**PACKET ANALYZER DEFAULT SMF WRITE ACTION IS 1****Reason:**

The PASMFWRITE SSI parameter was either specified as *1* or defaulted to this value. This means that whether or not SMF records are written for a connection default to this value if not overridden by a matching Application Definition (ADF) record.

System Action:

Processing continues.

User Action:

None.

NF4301**Obsolete calls from SMF exit or NetMaster: *P1*****Reason:**

An obsolete record was passed on a call from an SMF EXIT or a region. This indicates that an older version of SMF exits code is executing.

P1 is the number of obsolete calls since the previous message or since the SOLVE SSI started.

System Action:

The call is processed, but certain functions are ignored (such as updating byte counts).

User Action:

Contact Technical Support for advice about collecting diagnostics to identify which version of SMF exits are running.

NF4A01

NF4A01 Invalid function code passed - JOBNAME: 1 ASID: 2 FCODE 3

Reason:

A call from an SMF exit with job name 1 and ASID 2 contains an unsupported function code 3 .

System Action:

The call is rejected.

User Action:

Determine what is running in the calling address space and report this to Technical Support.

NF4C01

\$NMXEVT failed - R15: 1 R0: 2

Reason:

A \$NMXEVT call failed with return code 1 and feedback code 2.

System Action:

Processing continues.

User Action:

For R15=32 and R0=1, check that a SOLVE SSI providing the XEVT service has been started on the LPAR where this message was issued. Otherwise, contact Technical Support.

NF5010**PACKET ANALYZER 1 DATABASE PAGE STATISTICS FOLLOW...****Reason:**

This message is part of the response to a SHOW SSISTATS command. It introduces the information about the identified Packet Analyzer database.

The database name can be DYNAM (the dynamic database), SYNCH (the synchronous database), or TRACE (the trace database).

System Action:

None.

User Action:

None.

NF5011

label: value label: value label: value label: value

Reason:

This message is part of the response to a SHOW SSISTATS command. It provides information about page usage in various Packet Analyser databases. (The database is identified in the preceding NF5010 message).

Each message displays several fields.

label

Identifies the information displayed in a field. It has one of the following values:

TOT

Displays the total number of pages (blocks) available in the database.

AVL

Displays the number of available (free) blocks in the database.

CUS

Displays the current number of used blocks in the database.

CPC

Displays the current percentage of the database used.

HUS

Displays the highest number of blocks used at any time.

HPC

Displays the highest percentage used at any time.

GET

Displays the number of block GET requests.

FRE

Displays the number of block FREE requests.

GFT

Displays the number of GET requests that failed.

System Action:

None.

User Action:

None.

NF5020**PACKET ANALYZER TRACE DATABASE BUFFER STATISTICS...****Reason:**

This message is part of the response to a SHOW SSISTATS command. It introduces the information about the buffer pools for the Packet Analyzer trace database.

System Action:

None.

User Action:

None.

NF5021**SIZE B/P PAGES U-BUFF F-BUFF****Reason:**

This message is part of the response to a SHOW SSISTATS command. It displays the following headings for subsequent NF5022 messages:

SIZE

Indicates the buffer size.

B/P

Indicates the number of buffers per page.

PAGES

Indicates the number of pages currently allocated to this pool.

U-BUFF

Indicates the number of in-use buffers of this size.

F-BUFF

Indicates the number of free buffers of this size.

System Action:

None.

User Action:

None.

NF5022

size b/p pages u-buff f-buff

Reason:

This message is part of the response to a SHOW SSISTATS command. It displays information about a specific buffer pool for the Packet Analyzer trace database.

For information about what is displayed under each column, see the help for the NF5021 message.

System Action:

None.

User Action:

None.

NF5301

SSIDB ERROR: RC= P1 FDBK= P2 KEY= P3

Reason:

When reading the SSIDB, an error occurred. The return code (*P1*), Feedback (*P2*), and VSAM key (*P3*) are shown in hex.

System Action:

The file processing request fails.

User Action:

Contact Technical Support. The return code and feedback values are internal values and may not correspond to VSAM values.

NF5302**REFORMAT ERROR: FDBK= P1 ERRID= P2 KEY= P3****Reason:**

An attempt to convert an SSIDB record to an alternate format has failed. The message includes the following diagnostic data:

P1 is the feedback value from the conversion routine, shown in decimal and hex.

P2 is the internal ID of the field that caused the reformatting to fail. It is also shown in decimal and hex.

P3 is the VSAM record key in hex.

System Action:

The file processing request fails.

User Action:

This is an internal error. Contact Technical Support and provide them with the following information:

- The feedback, error ID, and VSAM key values, as reported.
- A hex display of the record. This can be produced using the IDCAMS PRINT function. For example:

```
//PRINT EXEC PGM=IDCAMS
//SYSPRINT DD SYSOUT=*
//SSIDB DD DISP=SHR,DSN=?prefix.SSIDB
//SYSIN DD *
PRINT INFILE(SSIDB) -
FROMKEY(X'hex key from message') -
COUNT(1) -
DUMP /*
```

NF5303**DB ADD ERROR: FDBK= P1 ERRID= P2 KEY= P3****Reason:**

An attempt to add a record to the SSI database has failed. The message includes the following diagnostic data:

P1 is the feedback value shown in decimal and hex.

P2 is the internal ID of the field that caused the reformatting to fail. It is also shown in decimal and hex.

P3 is the VSAM record key in hex.

System Action:

The SSI database processing request fails.

User Action:

This is an internal error. Contact Technical Support and provide them with the following information:

- The feedback, error ID, and VSAM key values, as reported.
- A hex display of the record. This can be produced using the IDCAMS PRINT function. For example:

```
//PRINT    EXEC PGM=IDCAMS
//SYSPRINT DD SYSOUT=*
//SSIDB    DD DISP=SHR,DSN=?prefix.SSIDB
//SYSIN    DD *
          PRINT INFILE(SSIDB) -
            FROMKEY(X'hex key from message') -
            COUNT(1) -
            DUMP /*
```

NF5311**PACKET ANALYZER STATIC DATABASE PROCESSING COMPLETE****Reason:**

During SSI initialization, records are retrieved from the SSIDB and are added to the SSI database. This message indicates that processing of the Packet Analyzer static database records from the SSIDB has completed without error.

System Action:

The population of the internal SSI database is complete.

User Action:

None.

NF5391**STORAGE SHORTAGE - INITIAL LOAD BYPASSED****Reason:**

During SSI initialization, records are retrieved from the SSIDB and are added to the SSI database. There was insufficient storage to obtain the work areas required for this function.

System Action:

The population of the internal SSI database is incomplete.

User Action:

Review the SSILOG for other related messages. Increase the SSI region size and restart.

NF5401

DEFAULT APPLICATION NAME DEFINITION RULE DEFINED

Reason:

During SSI initialization, the SSIDB file is read and Application Name Definition rules are loaded to the SSI database. During this process, the default rule, with order number 32767, was not processed. As a result, this message has been created. It usually occurs when the SSIDB is used for the first time (or has been deleted and redefined) because the default record cannot be deleted.

System Action:

SSI initialization continues.

User Action:

Application Name definition rules are maintained from a NetMaster region using the TCP/IP : Administration Menu, where all rules may be displayed and updated. All rules except the default rule may be deleted.

Display the default rule to ensure that the chosen values meet your requirements and update values as required.

NF5402**REFORMAT ERROR: FDBK= P1 ERRID= P2 KEY= P3****Reason:**

An attempt to convert an SSIDB record to an alternate format has failed. The message includes the following diagnostic data:

P1 is the feedback value from the conversion routine, shown in decimal and hex.

P2 is the internal ID of the field that caused the reformatting to fail. It is also shown in decimal and hex.

P3 is the VSAM record key in hex.

System Action:

The file processing request fails.

User Action:

This is an internal error. Contact Technical Support and provide them with the following information:

- The feedback, error ID, and VSAM key values, as reported.
- A hex display of the record. This can be produced using the IDCAMS PRINT function. For example:

```
//PRINT EXEC PGM=IDCAMS
//SYSPRINT DD SYSOUT=*
//SSIDB DD DISP=SHR,DSN=?prefix.SSIDB
//SYSIN DD *
PRINT INFILE(SSIDB) -
FROMKEY(X'hex key from message') -
COUNT(1) -
DUMP /*
```

NF5403

FILE ADD ERROR: RC= P1 FDBK= P2 KEY= P3

Reason:

An attempt to add a record to the SSIDB database has failed. The message includes the following diagnostic data:

P1 is the RPL return code value shown in decimal and hex.

P2 is the RPL feedback value shown in decimal and hex.

P3 is the VSAM record key in hex.

System Action:

The SSI database processing request fails.

User Action:

Contact Technical Support. The return code and feedback values are internal values and may not correspond to VSAM values.

NF5Z01

DB/DS 1/ 2 STORAGE IS AT 3%

Reason:

The Packet Analyser database (1) dataspace (2) is now at least the indicated percentage (3) full.

System Action:

None.

User Action:

If this message continues to appear, with ever-increasing percentages, you may want to stop and start the Packet Analyser NMSSI region, increasing the values of the database size parameters.

NF5Z02**DB/DS 1/ 2 STORAGE SHORTAGE RELIEVED****Reason:**

The Packet Analyser database (1) dataspace (2) storage has dropped below the threshold that produces NF5Z01 messages.

System Action:

None.

User Action:

None.

NF6180**STACK: *name* DOES NOT HAVE PTF FOR APAR PK11661 APPLIED****Reason:**

The message indicates that PTF must be applied for APAR PK1161. The APAR relates to enhancements made to IPv6 support.

If the SOLVE SSI region (with Packet Analyzer enabled) is not used by CA NetMaster Network Management for TCP/IP, you can ignore this message.

System Action:

IPv6 packet processing is disabled for the indicated stack.

User Action:

Apply the relevant maintenance to the indicated stack's libraries, and restart the stack.

NF7001

API EPS REGISTERED, NAME= P1

Reason:

This message is issued during SSI initialization, and as part of the SSI STATUS display. It provides information regarding the NetMaster Application Program Interface (API). The presence of this message indicates that the API is operational.

P1 is the name of the SSI endpoint used for the API.

System Action:

None.

User Action:

None.

NF7002

API EPS REGISTRATION FAILED,RC= P1, NAME= P2

Reason:

An attempt to register an SSI endpoint to provide the NetMaster Application Program Interface (API) has failed.

P1 is SSI EndPoint Services (EPS) return code.

P2 is the name of the SSI endpoint used for the API.

System Action:

The NetMaster API is unavailable.

User Action:

This is an internal error. Contact Technical Support.

NF7003**P1 ACTIVE API REQUEST(S)****Reason:**

This message is part of the SSI STATUS display and provides information regarding the NetMaster Application Program Interface (API). The message shows the total number (*P1*) of active API requests from all NetMaster regions.

System Action:

None.

User Action:

None.

NF7286

**APIREQ FORCED DISC: CID=*aa* NMID=*bb* MAP=*cc* ACT=*dd* FDBK=*ee*
ERRID=*ff/gg***

Reason:

This message is issued to the NMSSI log if an EPS connection from a region to the Packet Analyser component of NMSSI is dormant for more than five minutes. It indicates that the connection has been terminated by NMSSI.

The fields on the message can be used by Technical Support to diagnose problems.

Message NF7287 follows this message and provides more information.

System Action:

The EPS connection terminates.

User Action:

None.

NF7287

APIFDISC: FLGS=*aa* EPSF=*bb* EPF1=*cc* CNV#=*dd* SRCT=*ee* OMB#=*ff*

Reason:

This message is issued to the NMSSI log following an NF7286 message and provides additional data.

System Action:

See Message NF7286

User Action:

NFGL01

STARTING EIG SCAVENGE RUN...

Reason:

A scan has started to locate the Event control blocks that can be purged.

This message is produced by the Packet Analyzer. The message is written to the SSILOG dataset for the NMSSI region that is executing the Packet Analyzer.

System Action:

None.

User Action:

None.

NFGL03

ENDED EIG SCAVENGE RUN. DELETED: *nnn*

Reason:

A scan to locate Event control blocks that can be purged has ended, showing how many control blocks were purged (deleted).

This message is produced by the Packet Analyzer. The message is written to the SSILOG dataset for the NMSSI region that is executing the Packet Analyzer.

System Action:

None.

User Action:

None.

NFGZ01

EPS SERVICE REGISTERED. TYPE: *aaa* NAME: *bbb*

Reason:

This message is produced in response to the SSI STATUS command, if the Packet Analyser event facility is active, and shows that the EPS service for the Packet Analyzer event facility was registered. The service 'type' and 'name' are displayed.

System Action:

None.

User Action:

None.

NFGZ02

EPS SERVICE REGISTRATION FAILED. TYPE: *aaa* NAME: *bbb* RC: *ccc*

Reason:

This message is produced in response to the SSI STATUS command, if the Packet Analyser event facility is active, and shows that registration of the EPS service for the Packet Analyzer event facility failed. The service type and name are displayed, as well as the return code from the failed registration request.

System Action:

None.

User Action:

Contact your support representative.

NFGZ03

... ACTIVE REQUESTS: *nnn*

Reason:

This message is produced as part of the SSI STATUS command if the Packet Analyzer event facility is active. It follows the NFGZ01 message, and indicates the number of active requests for the service described in the preceding NFGZ01 message

System Action:

None.

User Action:

None.

NFSE01**PACKET INTERCEPT FOR STACK P1 TYPE P2 DISABLED,
REASON=SOLVSSI TERMIN ATION****Reason:**

Packet analysis for a TCP/IP stack has been disabled because the SOLVE SSI region has terminated. The stack name (*P1*) and type (*P2* - IBM or TCPaccess) is shown.

System Action:

IP packet analysis for the stack is disabled.

User Action:

None.

NFSF01**PACKET INTERCEPT FOR STACK P1 TYPE P2 DISABLED,
REASON=STACK TERMINATI ON****Reason:**

Packet analysis for a TCP/IP stack has been disabled because the stack has terminated. The stack name (*P1*) and type (*P2* - IBM or TCPaccess) is shown.

System Action:

IP packet analysis for the stack is disabled.

User Action:

None.

NFSI01

PACKET ANALYZER INITIALIZATION FAILED - P1

Reason:

A SOLVESSI region has been configured with the Packet Analyzer feature but initialization of the region has failed. The failure reason (*P1*) is shown:

FEATURE IS ALREADY ACTIVE

This indicates that the Packet Analyzer feature is active in another SOLVESSI region on this LPAR. Only one SOLVESSI region per LPAR may be configured with this feature.

System Action:

The SSI terminates.

User Action:

Amend the appropriate SOLVESSI parameter member to remove the PKTANALYZER SSI parameter. This parameter enables the Packet Analyzer feature.

NFSM01

PACKET INTERCEPT FOR STACK P1 TYPE P2 ENABLED

Reason:

Packet analysis for a TCP/IP stack has been enabled. The stack name (*P1*) and type (*P2* - IBM or TCPaccess) is shown.

System Action:

IP packet analysis for the stack is enabled.

User Action:

None.

NFSM90**SOLVESSI ABEND P1 TCPIP= P2 DT= P3 TM= P4****Reason:**

This message is written to the system console as part of an SVC dump title when a packet intercept for an IBM stack ABENDs during processing. The message text includes the abend completion code (*P1* - *Sxxx/Unnnn*), the IBM stack name (*P2*), the date (*P3*), and time of the ABEND (*P4*).

This message is followed by messages NFSM91 and NFSM92, both of which contain additional information describing the ABEND.

System Action:

Diagnostic data describing the ABEND is captured and the packet intercept is disabled.

User Action:

Contact Technical Support and provide the following:

- All output from the SOLVESSI job
- System log from the time of the ABEND
- SOLVESSI SVC dump
- Any SVC dumps for TCP/IP stacks that occurred at the time of the ABEND

NFSM91

SOLVESSI SVC DUMP P1 TCPIP= P2

Reason:

A packet intercept for an IBM stack abended during processing and an SVC dump was requested using the SDUMPX macro interface. The message text includes a description (*P1*) of the SDUMPX return code and the IBM stack name (*P2*).

The description (*P1*) of the SDUMPX return code will be one of the following:

CAPTURED

The SVC dump was successfully captured.

SUPPRESSED BY CHNGDUMP

The SVC dump was suppressed by CHNGDUMP.

SUPPRESSED BY SLIP NODUMP

The SVC dump was suppressed by SLIP NODUMP.

SUPPRESSED BY DAE

The SVC dump was suppressed by DAE.

FAILED RETCODE=X'xxxxxxxx'

The SVC dump request failed with the return code shown in the description.

System Action:

See message NFSM90.

User Action:

See message NFSM90.

NFSM92

**SOLVSSI ABEND P1 REASON P2 TCPIP= P3 PSW P4 ICD P5 ILC P6
AR/GR 0: P7/ P8 1: P9/ P10**

Reason:

A packet intercept for an IBM stack abended during processing and this multiline message contains information describing the ABEND. The message text includes the following:

P1 is the ABEND completion code (Sxxx/Unnnn)

P2 is the ABEND reason code

P3 is the IBM stack name

P4 is the PSW at the time of the ABEND

P5 is the interrupt code

P6 is the instruction length code

P7 to *P10* are a pair of access registers and general purpose registers at the time of the ABEND. These are repeated 8 times, once for each of the 8 pairs of registers 0 through 15.

System Action:

See message NFSM90.

User Action:

See message NFSM90.

NFSN01

PACKET INTERCEPT FOR STACK P1 TYPE P2 DISABLED, REASON= P3

Reason:

Packet analysis for a TCP/IP stack has been disabled. The stack name (*P1*), type (*P2* - IBM or TCPaccess) and reason (*P3*) are shown. Possible reasons are:

INTERCEPT ABENDED

An internal error has occurred.

INTERCEPT EXIT RETURNED NONZERO RC

An internal error has occurred.

SOLVESSI TERMINATION

The SOLVE SSI region that includes Packet Analyzer support has terminated.

DISABLE REQUEST

A request to disable packet analysis for this stack has been actioned.

System Action:

IP packet analysis for the stack is disabled.

User Action:

Review the message reason. The following reasons represent normal situations:

SOLVESSI TERMINATION

DISABLE REQUEST

The following reasons are abnormal situations:

INTERCEPT ABENDED

INTERCEPT EXIT RETURNED NONZERO RC

If these occur, contact Technical Support and provide the following:

- all output from the SOLVESSI job
- review the system log at the time of the error. Include any system dumps for the SOLVESSI or TCP/IP stacks that occur at the same time.

NFST01**PACKET ANALYZER FEATURE IS ACTIVE****Reason:**

This message is part of the SSI STATUS command when the SOLVESSI region is configured with the Packet Analyzer feature. It indicates that the feature is active.

System Action:

None.

User Action:

None.

NFST02**CTOKEN= P1 RTOKEN= P2****Reason:**

This message is part of the SSI STATUS command when the SOLVESSI region is configured with the Packet Analyzer feature. It includes information that may be required by your product supplier in the event of a product malfunction.

System Action:

None.

User Action:

None.

NIS001

IPSEC NMI INITIALIZATION FAILED - P1

Reason:

A SOLVE SSI region is configured with the IPsec Network Management Interface (IPSEC NMI) feature; however, initialization of the feature failed.

The failure reason (*P1*) is shown:

NOT SUPPORTED ON THIS OPERATING SYSTEM

Indicates that the IPsec Network Management Interface feature is not supported by the current operating system or release level. This feature requires z/OS V1R9 or a later release.

FEATURE IS ALREADY ACTIVE

Indicates that the IPsec Network Management Interface feature is active in another SOLVE SSI region on this LPAR. You can configure only one SOLVE SSI region per LPAR with this feature.

System Action:

The SSI terminates.

User Action:

Amend the appropriate SOLVE SSI parameter member to remove the IPSECNMI SSI parameter. This parameter enables the IPsec Network Management Interface feature.

NIS101

IPSEC NMI EPS REGISTERED, NAME=P1

Reason:

This message is issued during initialization of the SOLVE SSI region and is part of the SSI STATUS display. It provides information about the IPsec Network Management Interface (IPSEC NMI) feature. This message indicates that the feature is active and operational in the SOLVE SSI region.

P1 is the name of the SSI endpoint used for the IPSECNMI feature.

System Action:

None.

User Action:

None.

NIS102**IPSEC NMI EPS REGISTRATION FAILED, RC=*P1*, NAME=*P2*****Reason:**

An attempt to register an SSI endpoint to provide an interface to the IPsec Network Management Interface (IPSEC NMI) feature failed.

P1 is SSI EndPoint Services (EPS) return code.

P2 is the name of the SSI endpoint used for the API.

System Action:

The IPsec Network Management Interface feature is unavailable.

User Action:

This is an internal error. Contact Technical Support.

NIS103

P1 ACTIVE IPSEC NMI REQUEST(S), SUBTASK STATUS: P2

Reason:

This message provides information about the IPsec Network Management Interface (IPSEC NMI) feature. The message shows the total number (*P1*) of active Endpoint Services (EPS) requests from all CA NetMaster regions and the status (*P2*) of the IPSEC NMI subtask.

The following list shows the possible IPSEC NMI subtask status values and their meanings:

STARTED

Indicates that the subtask has successfully connected to the IPsec network management server.

STARTING

Indicates that the subtask is in the process of connecting to the IPsec network management server.

ATTACH-ERROR

Indicates that the subtask could not be attached.

INIT-ERROR

Indicates that the subtask failed to initialize successfully.

STOPPING

Indicates that the subtask has been posted to terminate.

STOPPED

Indicates that the subtask has ended.

System Action:

None.

User Action:

Investigate and perform action based on the status:

STARTED

No action is required. The subtask is connected successfully.

STARTING

Wait for a short time, then check the status again. If the status does not change to STARTED after a short time, ensure that the IPsec network management server is functioning properly. The IPsec network management server is implemented by the IKE daemon.

For information about diagnosing IKE daemon problems, see the *IBM z/OS Communications Server IP Diagnosis Guide*.

ATTACH-ERROR

The subtask could not be attached. This condition usually indicates an installation or implementation error (for example, the subtask load module is not in the load library), or region error (for example, there is insufficient virtual storage in the SOLVE SSI region).

Look for more error messages in the SOLVE SSI log, SOLVE SSI job log, and z/OS SYSLOG.

INIT-ERROR

The subtask failed to initialize successfully. This condition usually indicates a configuration error (for example, the SOLVE SSI region is not authorized to create a socket, the IKE daemon is not started, or the SOLVE SSI region is not authorized to connect to the IPsec network management server).

Authorization problems can occur if the OMVS segment for the IKE daemon or the SOLVE SSI region is not set up correctly.

Look for more error messages in the SOLVE SSI log, SOLVE SSI job log, and z/OS SYSLOG.

For information about how to set up an OMVS segment, see the *Installation Guide*.

STOPPING

The subtask has been posted to terminate. Either the SOLVE SSI region is shutting down, or an SSI command to reconnect to the IPsec network management server was issued and the subtask is being stopped and restarted.

STOPPED

The subtask has ended. Either the SOLVE SSI region is shutting down or the subtask ended unexpectedly (for example, ABEND). In the latter case, the subtask is reattached after a short delay (60 seconds).

For an ABEND, look for more error messages in the SOLVE SSI log, SOLVE SSI job log, and z/OS SYSLOG.

NIS281

EPSRQST: CID=*P1* NMID=*P2* FUNC=*P3* UCORR=*P4*

Reason:

This message precedes a dump of an IPsec Network Management Interface (IPSEC NMI) Endpoint Services (EPS) request buffer. The message is written when tracing of IPSEC NMI EPS requests and responses is enabled.

P1 is the EPS connection identifier.

P2 is the CA NetMaster region identifier.

P3 is the EPS function name.

P4 is the EPS connection correlator.

System Action:

None.

User Action:

None.

NIS282

EPSRESP: CID=*P1* NMID=*P2* FUNC=*P3*

Reason:

This message precedes a dump of an IPsec Network Management Interface (IPSEC NMI) Endpoint Services (EPS) response buffer. The message is written when tracing of IPSEC NMI EPS requests and responses is enabled.

P1 is the EPS connection identifier.

P2 is the CA NetMaster region identifier.

P3 is the EPS function name.

System Action:

None.

User Action:

None.

NIS283

+000 xxxxxxxx xxxxxxxx xxxxxxxx xxxxxxxx cccc cccc cccc cccc

Reason:

This message contains a hexadecimal and character dump of an IPSec Network Management Interface (IPSEC NMI) Endpoint Services (EPS) request or response buffer. The message is written when tracing of IPSEC NMI EPS requests and responses is enabled.

System Action:

None.

User Action:

None.

NIS390**P1 APPARENT STALLED IPSEC NMI REQUESTS****Reason:**

Requests queued to the SOLVE SSI IPSec Network Management Interface (IPSEC NMI) subtask are not being serviced in a timely manner. The subtask can be stalled.

P1 is the number of stalled requests.

System Action:

The SOLVE SSI region continues to monitor the IPSEC NMI subtask.

This message is written approximately every 60 seconds until no stalled requests are detected.

User Action:

Ensure that the dispatching priority of the SOLVE SSI region allows subtasks in the region to be dispatched when ready.

Ensure that the IPSec network management server is functioning properly. The IPSec network management server is implemented by the IKE daemon. For information about diagnosing IKE daemon problems, see the *IBM z/OS Communications Server IP Diagnosis Guide*.

For assistance, contact Technical Support.

NIS501

CONNECTED TO IPSEC NM SERVER

Reason:

The IPsec Network Management Interface (IPSEC NMI) feature is active in the SOLVE SSI region; the region is connected to the IPsec network management server.

System Action:

None.

User Action:

None.

NIS580

IPSEC NMI SUBTASK ATTACH FAILED (REFER TO LOG)

Reason:

The IPsec Network Management Interface (IPSEC NMI) feature is active in the SOLVE SSI region. The region attempted to attach a subtask in order to establish a connection to the IPsec network management server. The subtask attach failed.

System Action:

The operation is retried every 60 seconds.

User Action:

See the SSI log for other messages that describe the cause of the subtask attach error.

NIS581**IPSEC NMI SUBTASK INIT FAILED, RC: *P1* CODE: *P2* SUBCODE: *P3*****Reason:**

The IPsec Network Management Interface (IPSEC NMI) feature is active in the SOLVE SSI region. The region attached a subtask in order to establish a connection to the IPsec network management server. The subtask initialization failed.

P1 is the subtask return code.

P2 is the subtask error code and is one of the following values:

00 - The subtask ABENDED.

04 - The subtask engine cannot be initialized.

08 - The subtask invoked a UNIX System Services (USS) callable service and the service returned an error.

12 - The subtask made a request to the IPsec network management server and the server returned an error.

16 - Insufficient virtual storage is available in the SOLVE SSI region.

P3 is the subtask error subcode.

System Action:

For USS callable service errors and IPsec network management server errors, other messages are written to the SSI log that provide more information about the error.

The operation is retried every 60 seconds.

User Action:

See the SSI log for other messages that describe the cause of the subtask initialization error.

NIS582

IPSEC NMI SUBTASK TERMINATED, RC: *P1* CODE: *P2* SUBCODE: *P3*

Reason:

The IPsec Network Management Interface (IPSEC NMI) feature is active in the SOLVE SSI region. The region attached a subtask in order to establish a connection to the IPsec network management server. The subtask terminated.

P1 is the subtask return code.

P2 is the subtask error code and is one of the following values:

00 - It is an expected termination (for example, the SOLVE SSI region is stopping) or the subtask ABENDED.

04 - The subtask engine cannot be initialized.

08 - The subtask invoked a UNIX System Services (USS) callable service and the service returned an error.

12 - The subtask made a request to the IPsec network management server and the server returned an error.

16 - Insufficient virtual storage is available in the SOLVE SSI region. *P3* is the subtask error subcode.

System Action:

For USS callable service errors and IPsec network management server errors, other messages written to the SSI log provide more information about the error.

If it is an expected termination (for example, the SOLVE SSI region is stopping), no action is taken; otherwise, the SOLVE SSI region waits 60 seconds and then reattaches the subtask.

User Action:

See the SSI log for other messages that describe the cause of an unexpected subtask termination.

NIS583

USS ERROR, FUNCTION: *P1* RETVAL: *P2* RETCODE: *P3* RSNCODE: *P4*

Reason:

The IPsec Network Management Interface (IPSEC NMI) feature is active in the SOLVE SSI region. The region attached a subtask in order to establish a connection to the IPsec network management server.

The subtask invoked a UNIX System Services (USS) callable service and the service returned an error.

P1 is the USS callable service name.

P2 is the USS callable service return value.

P3 is the USS callable service return code.

P4 is the USS callable service reason code.

System Action:

The SOLVE SSI region waits 60 seconds and then reattaches the subtask.

User Action:

For more information about the error, see the z/OS publication *UNIX System Services Messages and Codes*.

NIS584

IPSEC NM SERVER IS NOT STARTED, RETVAL: *P1* RETCODE: *P2* RSNCODE: *P3*

Reason:

The IPsec Network Management Interface (IPSEC NMI) feature is active in the SOLVE SSI region. The region attached a subtask in order to establish a connection to the IPsec network management server.

The subtask invoked the BPX1CON UNIX System Services (USS) callable service to connect to the IPsec network management server and the service returned an error that indicates that the IPsec network management server is not started.

P1 is the BPX1CON USS callable service return value.

P2 is the BPX1CON USS callable service return code.

P3 is the BPX1CON USS callable service reason code.

System Action:

The operation is retried every 60 seconds.

User Action:

Start the IKE daemon.

NIS585**CONNECTION TO IPSEC NM SERVER TERMINATED, RETCODE: *P1*
RSNCODE: *P2*****Reason:**

The IPsec Network Management Interface (IPSEC NMI) feature is active in the SOLVE SSI region. The region attached a subtask in order to establish a connection to the IPsec network management server.

The connection to the IPsec network management server was terminated by the server.

P1 is the IPsec network management server termination return code (Errno value).

P2 is the IPsec network management server termination reason code (ErrnoJr value).

System Action:

The operation is retried every 60 seconds.

User Action:

For more information about the termination return and reason codes, see the z/OS publication *Communications Server IP and SNA Codes*.

NIS590

IPSEC NMI SUBTASK INITIALIZATION IS STALLED

Reason:

Initialization of the SOLVE SSI IPsec Network Management Interface (IPSEC NMI) subtask is not being completed in a timely manner. The subtask is in the process of connecting to the IPsec network management server.

System Action:

The SOLVE SSI region continues to monitor the IPSEC NMI subtask.

This message is written approximately every 60 seconds until the IPSEC NMI subtask connects to the IPsec network management server and subtask initialization completes.

User Action:

Ensure that the dispatching priority of the SOLVE SSI region allows subtasks in the region to be dispatched when ready.

Ensure that the IPsec network management server is functioning properly. The IPsec network management server is implemented by the IKE daemon. For information about diagnosing IKE daemon problems, see the *IBM z/OS Communications Server IP Diagnosis Guide*.

For assistance, contact Technical Support.

NISB81

NMIRQST: ADDR=*P1* LEN=*P2*

Reason:

This message precedes a dump of an IPsec network management server request buffer. The message is written when tracing of server requests and responses is enabled.

P1 is the address of the request buffer.

P2 is the length of the request buffer.

System Action:

None.

User Action:

None.

NISB82**NMIRESP: ADDR=*P1* LEN=*P2*****Reason:**

This message precedes a dump of an IPSec network management server response buffer. The message is written when tracing of server requests and responses is enabled.

P1 is the address of the response buffer.

P2 is the length of the response buffer.

System Action:

None.

User Action:

None.

NISB83**NMIREC: ADDR=*P1* LEN=*P2*****Reason:**

NIST000I

text

Reason:

This is a VTAM message returned in response to a VTAM command or delivered by the PPO interface.

System Action:

The action depends on the VTAM message.

User Action:

See IBM's Communications Server SNA Messages manual for your level of VTAM.

To determine the VTAM level, issue the **STATUS** command and see message N11421.

This message definition, NIST000I, is used for all VTAM message help requests. You can modify it using CAS to provide more specific help.

NM0001**OML PROCEDURE *name* FLUSHED, NOT EXECUTED DUE TO REGION TERMINATION****Reason:**

The named OML procedure was flushed before execution, as the region was terminated, for example, due to user logoff.

System Action:

None.

User Action:

None.

NM0050**PROCEDURE *name* NOT EXECUTED - *reason*****Reason:**

The named OML procedure was not executed for the given reason.

System Action:

The procedure is not executed.

User Action:

Correct the problem and resubmit the procedure for execution if required.

NM1002**DATA IS NOT A VALID *type*****Reason:**

Data supplied for a verb operand was not of the indicated type.

System Action:

An error is raised.

User Action:

Correct the supplied data.

NM1005

EXECUTION OF UNRECOGNISED VERB: *name* ATTEMPTED

Reason:

An OML compiled procedure attempted to execute the named verb, The named verb is not known in this SOLVE system. This error can only occur for an OML procedure loaded from object code, not source code.

System Action:

An error is raised.

User Action:

Check to see if the INCLUDE/EXCLUDE JCL parms or licence have disabled a required feature.

NM1010

ARGUMENT *number* TO BUILTIN FUNCTION *name* IS NOT VALID

Reason:

The indicated argument to the named built-in function is not a valid value.

System Action:

An error is raised.

User Action:

Correct the input value.

NM1011

EXTERNAL FUNCTION *name* NOT FOUND

Reason:

An attempt to call the named external function failed. The external function could not be found in the procedure library.

System Action:

An error is raised.

User Action:

Check the spelling of the function name. If correct, ensure that the function code is in the procedure library.

NM1012**LOAD/COMPILE OF EXTERNAL *type name* FAILED****Reason:**

An attempt to load or compile the indicated function or package failed.

System Action:

An error is raised.

User Action:

Check the error messages for the compilation failure reason. Correct the problem and execute the procedure again.

NM1013***name* IS NOT A *type*****Reason:**

After loading the named file, it was not of the required type (function or package).

System Action:

An error is raised.

User Action:

Ensure that the name of the requested function or package is correct.

NM1014***name* IS NCL, CANNOT CALL AS A FUNCTION****Reason:**

An attempt was made to perform a function call to an NCL procedure. NCL does not support user written functions.

System Action:

An error is raised.

User Action:

Check the requested function name.

NM1015

PACKAGE: *package-name* DOES NOT CONTAIN *function-name*

Reason:

The named package does not contain a first-level function of the indicated name.

System Action:

An error is raised.

User Action:

Check the requested function name.

NM1016

TARGET: *name* IN PACKAGE: *package* IS NOT 'FUNCTION'

Reason:

The named package contains a first-level procedure of the indicated name, however a FUNCTION was requested. A non-function (such as PROCEDURE) cannot be executed by a function call.

System Action:

An error is raised.

User Action:

Check the requested function name.

NM1019

EXECUTION OF UNRECOGNISED BUILTIN: *name* ATTEMPTED

Reason:

A compiled OML procedure attempted to execute the named builtin function. However, the named function is not known in this SOLVE system. This error can only occur for an OML procedure loaded from object code, not source code.

System Action:

An error is raised.

User Action:

Check to see if the INCLUDE/EXCLUDE JCL parms or licence have disabled a required feature.

NM1023**EXTERNAL PROCEDURE *name* NOT FOUND****Reason:**

An attempt to call the named external procedure failed. The external procedure could not be found in the procedure library.

System Action:

An error is raised.

User Action:

Check the spelling of the procedure name. If correct, ensure that the procedure code is in the procedure library.

NM1024**LOAD/COMPILE OF EXTERNAL *type name* FAILED****Reason:**

An attempt to load or compile the named procedure or package failed.

System Action:

An error is raised.

User Action:

Check the error messages for the reason that the compilation failed. Correct the problem and execute the procedure again.

NM1025***name* IS NOT A *type*****Reason:**

The named file was loaded. It was not of the required type (procedure or package).

System Action:

An error is raised.

User Action:

Check the name of the requested procedure or package.

NM1026

PACKAGE: *package-name* DOES NOT CONTAIN *procedure-name*

Reason:

The named package does not contain a first-level procedure with the indicated name.

System Action:

An error is raised.

User Action:

Check the name of the requested procedure.

NM1027

TARGET: *name* IN **PACKAGE:** *package* IS NOT A PROCEDURE

Reason:

The named package contains a first-level function of the indicated name, however a PROCEDURE was requested. A non-procedure (such as FUNCTION) cannot be executed by a procedure call.

System Action:

An error is raised.

User Action:

Check that the name of the requested procedure is correct.

NM1080

trace-text

Reason:

This is a trace message for OML procedures. It traces labels.

System Action:

None.

User Action:

None.

NM1081***trace-text*****Reason:**

This is a trace message for OML procedures. It traces OML statements.

System Action:

None.

User Action:

None.

NM1082***trace-text*****Reason:**

This is a trace message for OML procedures. It traces the entry into new OML procedures or functions.

System Action:

None.

User Action:

None.

NM1083

type value

Reason:

This is a trace message for OML procedures. It traces OML expression processing.

The values for expression type are:

>X>

The expression source is displayed

>L>

A literal value has been pushed

>V>

A variable value has been pushed

>O>

The result of a binary operator has been pushed

>P>

The result of a prefix (unary) operator has been pushed

>F>

A function result has been pushed

>>>

This is the expression final result

If the 'value' is a null character string then is is represented by the string '<NULL>'

System Action:

None.

User Action:

None.

NM2001***error-description*****Reason:**

This message provides a short description of an OML execution error.

System Action:

An error has been raised.

User Action:

Examine the message for the error reason and take appropriate corrective action.

NM2002**NO INFORMATION AVAILABLE****Reason:**

This message is used as the OML error description when no other message is available.

System Action:

An error has been raised.

User Action:

Use the error code and error location to determine the cause of the error.

NM3030***aaaaaaaa PROCESSING COMPLETE. NCLID bbbbbb*****Reason:**

NM3A01

OBJECT INSTANCE METHOD CANCELLED BY RETCODE *aaa* FROM PROCEDURE *bbbbbbbb*.

Reason:

The OML procedure *bbbbbbbb* set a return code *aaa* indicating that update of its target object instance was to be ignored. Execution of the system method routine is bypassed and the object instance is not updated in the repository.

System Action:

The message is returned to the client in the reply SDU.

User Action:

None.

NM3A02**OBJECT METHOD REPLY FAILED.****Reason:**

The Object Services generated reply to the client failed.

System Action:

The message is logged.

User Action:

Check the activity log for possible causes.

NM3A03**INSUFFICIENT STORAGE FOR OBJECT SERVICES REQUEST.****Reason:**

An Object Services request could not be processed due to insufficient virtual storage.

System Action:

The request is terminated.

User Action:

Look for possible causes of high storage utilisation. Increase virtual storage address space size.

NM3A04**OBJECT *aaaaaa* METHOD DATA INITIALIZATION FAILED.****Reason:**

Object Services could not initialize the *aaaaaa* method for an object request. This usually indicates a problem with building the Mapped Data Objects (MDOs) or may indicate a resource shortage.

System Action:

The method is not executed.

User Action:

Check the object maps are valid. Check the activity log for additional messages.

NM4011

VARIABLE NAME IS INVALID: *reason text*

Reason:

This message indicates that a variable name which was encountered during execution of an OML process is invalid. The text following the colon shows the reason why the variable name is invalid.

System Action:

An error is raised. If no relevant ON-BLOCK exists, the OML process is terminated.

User Action:

Correct the invalid variable name.

NM4012

VARIABLE NAME IS NOT A VALID MDO NAME

Reason:

This message indicates that the name passed for an MDO variable does not constitute a valid name for an MDO. This can be because the name contains invalid characters, or contains a name segment which is longer than 32 bytes.

System Action:

An error is raised. If no relevant ON-BLOCK exists, the OML process is terminated.

User Action:

Correct the MDO variable name.

NM4014**MDO DATA ASSIGNMENT FAILED, RC=*p1* FDBK=*p2*****Reason:**

An attempt was made to assign data to an MDO variable, but the assignment was rejected by Mapping Services.

p1 is the return code,

p2 is the feedback code from the MDO assignment.

System Action:

An error is raised. If no relevant ON-BLOCK exists, the OML process is terminated.

User Action:

For an explanation of the return and feedback codes, see the *NCL Reference Guide*. See system variables &ZMDORC and &ZMDOFDBK.

For programmers, to find out the reason for the rejection, change the statement to use the ASSIGN verb with CONTROL MDOCHK in effect. This change will cause more error information to be produced.

NM4015**SPECIFIED NCL KEYWORD IS NOT SUPPORTED BY OML****Reason:**

OML supports returning the value of many NCL system variables during substitution, for a PANEL or certain built-in functions. This error indicates that the variable being accessed is recognised as an NCL system variable, but is not one which OML supports.

System Action:

An error is raised. If no relevant ON-BLOCK exists, the OML process is terminated.

User Action:

Change the variable name to use the correct OML system variable name.

NM4017

VARIABLE: *variable name*

Reason:

This message is produced during processing of a DEBUG DISPLAY command. It shows the name of a variable which is included in the display. This message is followed by further messages which show the data for the variable.

System Action:

None.

User Action:

None.

NM4018

LENGTH: *aaaaaaaa* **MODFLD:** *bbbbbb* **ATTRS:** *ccc*

Reason:

This message is produced during processing of a DEBUG DISPLAY command. It shows the length of data contained in a variable (*aaaaaaaa*), the MODFLD number for the variable (*bbbbbb*), and attributes for the variable (*ccc*). The attribute value can contain the following values:

M - the variable is flagged as being modified (e.g. ASSIGN OPT=SETMOD)

E - the variable is flagged as being in error (e.g. ASSIGN OPT=SETERR)

O - the variable is flagged as being output (e.g. ASSIGN OPT=SETOUT)

System Action:

None.

User Action:

None.

NM4019**DATA:** *variable data***Reason:**

This message is produced during processing of a DEBUG DISPLAY command. It shows the data assigned to a variable. The data will be in the format designated by the FMT= operand on the DEBUG DISPLAY command. If FMT=CHAR is specified, the data is in character format and may be up to 256 bytes long. If FMT=HEX is specified, the data can be up to 256 bytes long (which is 128 bytes of the data in hex-expanded format). If FMT=DUMP is specified, a dump of the variable data follows, with message number NM4020.

System Action:

None.

User Action:

None.

NM4020

+ooo xxxxxxxx xxxxxxxx xxxxxxxx xxxxxxxx cccccccc

Reason:

This message is produced during processing of a DEBUG DISPLAY command. It shows the data assigned to a variable in hex dump format. ooo is the offset (in hexadecimal) in the variable, xxxxxxxx is the variable data in hex format, and cccccccc is the variable data in character format.

System Action:

None.

User Action:

None.

NM5021

RANGE= ONLY ALLOWED WITH VARIABLE INDEXED NAME

Reason:

An ASSIGN verb has specified the RANGE= operand with an MDO assignment, but the MDO name supplied does not support the RANGE= operand. The MDO name must be a variable indexed name (e.g. MDO=A.B.C{*})

System Action:

An error is raised. If no relevant ON-BLOCK exists, the OML process is terminated.

User Action:

Correct the MDO name or remove the RANGE= operand.

NM5022

SOURCE AND TARGET NAMES MUST BOTH BE VARIABLE INDEXED NAMES

Reason:

An ASSIGN verb has specified an MDO to MDO assignment, and one of the MDO names is variable indexed but the other is not. This is invalid. If a variable indexed name is specified, both names must be variable indexed.

System Action:

An error is raised. If no relevant ON-BLOCK exists, the OML process is terminated.

User Action:

Correct the MDO names and retry.

NM5023**TARGET MDO NAME MUST NOT BE VARIABLE INDEXED****Reason:**

An ASSIGN verb has specified the NOVALIDATE option on an assignment into an MDO variable, but the MDO name is variable indexed, which is invalid.

System Action:

An error is raised. If no relevant ON-BLOCK exists, the OML process is terminated.

User Action:

Correct the MDO name or remove the NOVALIDATE option and retry.

NM5201**FACILITY ONLY VALID FROM MSGPROC****Reason:**

An OML procedure has attempted to execute a MSGREAD, MSGCONT or MSGDEL verb, but the procedure is not executing as a MSGPROC. These verbs are only valid from a MSGPROC procedure.

System Action:

An error is raised. If no relevant ON-BLOCK exists, the procedure is terminated.

User Action:

Either remove the MSGREAD, MSGCONT or MSGDEL verb, or start the procedure as a MSGPROC using a PROFILE MSGPROC=*procname* command or defining the procedure as MSGPROC in the users UAMS definition.

NM5202

MDS ERROR ON \$MSG MDO; RC=*aa* FDBK=*bb* MSGPROC TERMINATED

Reason:

An OML procedure has attempted to execute a MSGREAD, or MSGCONT verb but the update of the \$MSG MDO has failed. The message shows the return code (*aa*) and feedback (*bb*) values returned from Mapping Services which describe the error.

System Action:

An error is raised. If no relevant ON-BLOCK exists, the procedure is terminated.

User Action:

Investigate the reason for the failure using the return code and feedback values.

NM5301

MDO=&\$INT. IS INVALID MDO NAME FOR INTREAD

Reason:

The &\$INT. MDO name cannot be used as the target of an INTREAD MDO= operation.

System Action:

The verb signals an error.

User Action:

Change the INTREAD statement to use some other MDO name.

NM5302

INTCONT ISSUED WHEN NO VALID MESSAGE CURRENT

Reason:

An INTCONT statement was issued when no message was available from an INTREAD statement.

System Action:

The verb signals an error.

User Action:

Check the procedure logic.

NM5401**INVALID USE OF PANEL STATEMENT****Reason:**

A PANEL statement was executed in an environment that does not support full-screen panels (for example, BSYS).

System Action:

The verb signals an error.

User Action:

Check the procedure logic.

NM5720**VARIABLE FIELDS/VARS LISTS ERROR - rrrrrrrr****Reason:**

A VARIABLE statement FIELDS or VARS *list* keywords error was detected. The reason for the error follows the dash (-).

System Action:

The verb signals an error.

User Action:

Correct the VARIABLE verb operands.

NM5762**FIELD NUMBER ACCESS INVALID FOR ENTRY CONTAINING A MAPPED DATA OBJECT****Reason:**

A VARIABLE statement attempted to access or update an entry that contains an MDO, using relative field access.

System Action:

The verb signals an error.

User Action:

Correct the VARIABLE verb operands.

NM5763

DATA LENGTH EXCEEDS MAXIMUM ALLOWABLE FOR AN ENTRY

Reason:

Source data for a VARTABLE statement exceeds the maximum length that can be stored in an entry.

System Action:

The verb signals an error.

User Action:

Correct the VARTABLE verb operands.

NM5A01

LOCKMAX LIMIT EXCEEDED

Reason:

The limit on the number of locks for a process has been reached.

System Action:

The lock request is not honored.

User Action:

Determine the number of currently active LOCKs using the SHOW LOCKS command and determine if the number of requests is excessive.

The default is 32767 locks per executing region.

NM5K01

BUFFERISE TOKENS FAILED

Reason:

An OML procedure has executed a PPI SEND or PPI ALERT verb with the VARS= operand specified. The total amount of data from the specified variables exceeds the maximum supported size.

System Action:

An error is raised. If no relevant ON Block exists the procedure is terminated.

User Action:

Reduce the amount of data to be sent.

NM5K02**MDS ERROR ASSIGNING DATA TO MDO****Reason:**

An OML procedure has executed a PPI RECEIVE verb with the MDO= operand specified. During assignment of the data to the MDO, Mapping Services encountered an error.

System Action:

An error is raised. If no relevant ON Block exists the procedure is terminated.

User Action:

Correct the mapping of the MDO.

NM5K03**PPI RECEIVE INVALID - PPI DEFINE NOT ISSUED****Reason:**

An OML procedure has executed a PPI RECEIVE verb to receive data via a PPI connection. The procedure currently has no connection to PPI.

System Action:

An error is raised. If no relevant ON Block exists the procedure is terminated.

User Action:

Ensure that a PPI DEFINE has been issued. If so, check that the return code from the PPI define indicated that the operation was successful.

NM5L01**FACILITY ONLY VALID FROM LOGPROC****Reason:**

A LOGREAD, LOGDEL, or LOGCONT statement was issued from an NCL process other than LOGPROC.

System Action:

The verb signals an error.

User Action:

These statements are not valid unless used in the LOGPROC procedure. Check that SYSPARMS LOGPROC=xxxx was used to start the procedure.

NM5L02

MDS ERROR ON \$LOG MDO; RC=aa FDBK=bb LOGPROC TERMINATED

Reason:

An OML procedure has attempted to execute a LOGREAD, or LOGCONT verb but the update of the \$MSG MDO has failed. The message *shows* the return code (aa) and feedback (bb) values returned from Mapping Services which describe the error.

System Action:

An error is raised. If no relevant ON-BLOCK exists, the procedure is terminated.

User Action:

Investigate the reason for the failure using the return code and feedback values.

NM5M01

INVALID MDO NAME FOR REQUEST

Reason:

The MDO supplied to an ENCODE or DECODE statement is invalid.

System Action:

None.

User Action:

Ensure that different source and target MDOs are used. Check the syntax of the MDO names and verify them against their respective MAP definitions.

NM5M02

MDS MAPPING FAILURE

Reason:

An internal MDS error has occurred.

System Action:

None.

User Action:

Contact your product support representative.

NM5M03**STACK OVERFLOW****Reason:**

The internal recursion stack limit was exceeded while processing an ENCODE or DECODE operation, possibly caused by too many segments in a compound name.

System Action:

None.

User Action:

Reduce number of name segments in mdo name. May require redefinition of the map.

NM5M04**INVALID ENCODE/DECODE SYNTAX****Reason:**

An ENCODE or DECODE statement has invalid syntax.

System Action:

None.

User Action:

Correct the statement and retry.

NM5M05**INVALID TRANSLATE OPERAND****Reason:**

The TRANSLATE= operand supplied to an ENCODE or DECODE statement is invalid.

System Action:

None.

User Action:

Check supported TRANSLATE operands, e.g. ISO, DEC, ASCII...

NM5M06

ENCODED STRING INVALID FOR TARGET MDO

Reason:

The encoded string cannot be assigned to the target MDO of an ENCODE statement, possibly due to its defined type.

System Action:

None.

User Action:

Check the type definition of the target MDO and rectify as appropriate.

NM5M07

MAP NOT FOUND

Reason:

The procedure has abended on an ENCODE or DECODE verb because an MDO was invalidly mapped because of one of the following:
. the map was not found on the mapping services database . it failed to load .
it did not successfully attach to the MDO because it mismatched the data in the MDO.

System Action:

Procedure is flushed.

User Action:

Ensure map exists, loads and correctly maps the underlying MDO data.

NM5M08

TARGET MDO IS INVALID

Reason:

The specified target mdo contains invalid data.

System Action:

None.

User Action:

Delete the invalid component, or use a new MDO.

NM5M20**ATF NOT AVAILABLE OR NOT LICENSED****Reason:**

An ENCODE or DECODE statement specified operands that indicate that ATF is to be used. However ATF is not available or is not licensed on this SOLVE system.

System Action:

An error is indicated.

User Action:

Check your SOLVE licence for ATF support.

NM5M21**UNKNOWN SOURCE CHARACTER SET NAME****Reason:**

An ENCODE or DECODE statement has a SRC_CHARSET operand that names a character set that is not recognised by ATF.

System Action:

An error is indicated.

User Action:

Check the character set name.

NM5M22**UNKNOWN TARGET CHARACTER SET NAME****Reason:**

An ENCODE or DECODE statement has a TGT_CHARSET operand that names a character set that is not recognised by ATF.

System Action:

An error is indicated.

User Action:

Check the character set name.

NM5T01

SECCALL EXIT INVALID WITHOUT SECURITY EXIT

Reason:

A SECCALL EXIT verb has been executed but the SOLVE system does not have a security exit to call.

System Action:

An error is raised. If no relevant ON-BLOCK exists, the OML process is terminated.

User Action:

If the SOLVE system should have a security exit, investigate why it is not active.

NM5T02

STRING IS LONGER THAN 256 CHARACTERS

Reason:

A SECCALL EXIT verb has been executed but one of the parameters to be passed is too long. The maximum length of any single parameter is 256 bytes.

System Action:

An error is raised. If no relevant ON-BLOCK exists, the OML process is terminated.

User Action:

Investigate why the parameter is too long.

NM6101

EDIT MASK ERROR: eeeeeee

Reason:

The input mask to the EDIT built-in function is not valid. The exact reason follows the colon.

System Action:

The function signals an error.

User Action:

Correct the EDIT function operands.

NM6102**NUMBER TOO LARGE FOR EDIT FIELD****Reason:**

The number supplied to the EDIT built-in function was too large for the number of integer positions in the edit mask.

System Action:

The function signals an error.

User Action:

Check and correct the edit mask or number.

NM6480**STCKFIX PARM *n* IS NOT A VALID OPERATION NAME****Reason:**

The indicated parameter number (*n*) to the STCKFIX function is not valid.

System Action:

The function signals an error.

User Action:

Correct the indicated function operand.

NM6481**STCKFIX PARM *n* ('*name*') NEEDS A FOLLOWING VALUE PARM****Reason:**

The indicated parameter number (*n*) (name also shown) requires a following value parameter.

System Action:

The function signals an error.

User Action:

Correct the indicated function operand.

NM6482

STCKFIX PARM *n* ('*name*') MUST BE A *type*

Reason:

The indicated parameter number (*n*) (name of preceding parameter also shown) must be data of one of the following types:

- STCK-VAL: An 8-byte binary STCK value
- NUMBER: A signed decimal integer in the range -10000 to 10000.
- TZOFF: A time zone offset value in the format *shhmm*, where
 - s* is +, -, E (meaning +), or W (meaning -)
 - hh* is an hours value from 00 to 15
 - mm* is a minutes value from 00 to 59
 - (maximum allowed is 1500).

System Action:

The function signals an error.

User Action:

Correct the indicated function operand.

NM6485**STCKGEN INPUT FMT/VALUE/RANGE INVALID****Reason:**

The input value to the STCKGEN function must be a date/time in one of the following formats:

- If the second parameter is omitted, or C (char):

yyyymmddhhmmss.fffff

The value can be shortened, as long as it has at least the date (*yyyymmdd*).

- If the second parameter is P (packed):

unsigned packed decimal bytes, exactly 10 bytes long, in the format:

x'yyyymmddhhmmssffffff'

This is the same as the return format from the STCKFMT function when the P option is used.

The value must be in the following range:

19000101000000.000000 to 20420917235347.370495

This is the defined range for a STCK value from *x'0000000000000000'* to *x'fffffffffffffff'*.

System Action:

The function signals an error.

User Action:

Correct the indicated function operand.

NM6901

SELSTR/REMSTR SEARCH CHARACTER IS NOT A SINGLE SBCS OR DBCS CHARACTER

Reason:

An OML SELSTR or REMSTR builtin function is being processed with CONTROL DBCS in effect and SYSPARMS DBCS=YES. The delimiter character supplied is not a single SBCS character and is not a single DBCS character enclosed by shift out and shift in.

System Action:

An error is raised.

User Action:

Check why the character was not a valid SBCS or DBCS character.

NM6D10

PARAMETER p TO ffffffff FUNCTION IS INVALID

Reason:

The indicated parameter number ('p') to the named Date-related function is not valid.

System Action:

The function signals an error.

User Action:

Correct the indicated function operand.

NM6J01

XOPT OPTION NAME UNKNOWN

Reason:

An OML JCLXOPT built-in function was called, but the specified name of the JCL XOPT option is not in the name table of the function.

System Action:

An error is raised.

User Action:

Check the name of the specified option.

NM6P01**PLEXSUB REQUIRES OS/390 OR BETTER****Reason:**

The PLEXSUB OML builtin function can only be used if the operating system is OS/390 or later (such as z/OS).

System Action:

The function signals an error.

User Action:

Do not use the PLEXSUB function in this environment.

NM6P02**PLEXSUB UNABLE TO LOAD ASASYMBM****Reason:**

The PLEXSUB OML builtin function could not load the MVS substitution service module, ASASYMBM.

System Action:

The function signals an error.

User Action:

Investigate why the ASASYMBM module is not accessible.

NM6P03**INVALID USER VARIABLE NAME FOR PLEXSUB****Reason:**

The PLEXSUB OML builtin function requires user variable names to be 1 to 16 characters long (not including the &), and the first character must be alpha or national, the remainder being alpha, numeric, or national.

System Action:

The function signals an error.

User Action:

Correct the user variable name.

NM6P04

PLEXSUB USER VARIABLE VALUE LONGER THAN &NAME

Reason:

The PLEXSUB OML builtin function requires user variable values to be no longer than the variable name including the leading &. (This is an MVS substitution service restriction).

System Action:

The function signals an error.

User Action:

Correct the user variable value. If a longer value is required, use a longer name.

NM6P05

ASASYMBM RETURN CODE WAS NON-ZERO (PLEXSUB)

Reason:

The PLEXSUB OML builtin function received a non-zero return code from the ASASYMBM MVS substitution service module.

System Action:

The function signals an error.

User Action:

Contact your support representative. Non-zero return codes should not occur.

NM6P06

ASASYMBM ABENDED (PLEXSUB)

Reason:

The ASASYMBM MVS substitution service module ABENDED whilst processing a request for the PLEXSUB function.

System Action:

The function signals an error.

User Action:

Contact your support representative. An ABEND should not occur.

NM6R01**RANDOM RANGE LT 1 OR GT 100000****Reason:**

The MIN and MAX operands of the RANDOM built-in function have a difference that is less than 1 or greater than 100000.

System Action:

The function signals an error.

User Action:

Correct the RANDOM function operands.

NM6R02**REMSTR CHARACTER MUST BE A SINGLE BYTE****Reason:**

An OML REMSTR builtin function has detected that the delimiter character supplied was not a single byte character.

System Action:

An error is raised.

User Action:

Check why the character was not a single byte character. The only situation in which the character can be longer is if CONTROL DBCS is in effect on a SOLVE system with SYSPARMS DBCS=YES, and the character is a single DBCS character enclosed by shift out and shift in.

NM6S01

SELSTR CHARACTER MUST BE A SINGLE BYTE

Reason:

An OML SELSTR builtin function has detected that the delimiter character supplied was not a single byte character.

System Action:

An error is raised.

User Action:

Check why the character was not a single byte character. The only situation in which the character can be longer is if CONTROL DBCS is in effect on a SOLVE system with SYSPARMS DBCS=YES, and the character is a single DBCS character enclosed by shift out and shift in.

NM9301

VARIABLE/MDO NAME TOO LONG TO SHARE TO NCL

Reason:

An attempt has been made to share a variable or MDO from OML to NCL but the name is too long to be valid in NCL. The maximum name length for a variable is 12. The maximum name length for an MDO is 12 excluding the period.

System Action:

An error is raised. If no relevant ON-BLOCK exists, the OML procedure is terminated.

User Action:

Change the name of the variable or avoid sharing it to NCL.

NM9302**VARIABLE NAME IS INVALID IN NCL, CANNOT BE SHARED****Reason:**

An attempt has been made to share a variable or MDO from OML to NCL but the name is not valid in NCL.

System Action:

An error is raised. If no relevant ON-BLOCK exists, the OML procedure is terminated.

User Action:

Change the name of the variable or avoid sharing it to NCL.

NM9303**VARIABLE NAME IS INVALID IN NCL, DATA LENGTH EXCEEDS 256 BYTES****Reason:**

An attempt has been made to share a variable from OML to NCL but the data contained in the variable is more than 256 bytes in length. This amount of data is not supported by NCL, so the request has been rejected.

System Action:

An error is raised. If no relevant ON-BLOCK exists, the OML procedure is terminated.

User Action:

Consider why the variable is being shared to NCL and why the variable has more than 256 bytes of data. If required, add logic to the OML procedure to limit the amount of data in the variable to 256 bytes.

NMAU0001

Call Id: *P1 P2*

Reason:

This message is a trace message displaying aspects of a call to the Audit API. It is used to display the following information:

- Calling parameters
- Validity of these parameters
- State of the Audit Event Listener
- Whether this event type was received
- Any errors calling the API remotely (if required)
- Returned message
- Return code

Each traced API call is given a unique ID so that associated messages can be grouped. This call ID is indicated by *P1*. The remainder of the message is contained in *P2*.

This message is written to the activity log if the Audit trace facility is enabled.

System Action:

None.

User Action:

To enable the Audit trace facility, specify **TRACE=YES** on the Audit API call or issue the command: **\$GLBL \$NMAUTRC YES**.

To disable the Audit trace facility, do *not* specify TRACE=YES on the Audit API call and ensure that the &GLBL\$NMAUTRC global variable is not set to YES by issuing the command: **\$GLBL \$NMAUTRC**.

NMAU0002**Audit Event Listener is not receiving *P1* events****Reason:**

The Audit API raised an Audit event of type *P1*, but the event was not received. This is because the Audit Event Listener is not profiled to receive this type of event.

System Action:

None.

User Action:

If you want this type of event audited, enable it through the AUDIT parameter group:

1. Enter **/PARMS** to access the list of Customizer parameter groups.
2. Enter **U** beside the AUDIT parameter group.
The parameter group opens for update.
3. Change the corresponding Event Type field from NO to one of the following values:
 - LOG if you want the audit events written to the activity log
 - SMF if you want the audit events raised as SMF records
 - BOTH if you want the audit events recorded in both the activity log and SMF
4. Press F6 (Action) to apply the changes.
The Audit Event Listener is profiled to listen to events of the required type.
5. Press F3 (File) to save these settings.
The parameter group is updated.

NMAU0003

Invalid value Parameter= *P1* Value= *P2* Reason= *P3*

Reason:

The Audit API was called with an invalid value, *P2*, for parameter *P1*. The reason why it is invalid is indicated by *P3*.

System Action:

The Audit API terminates before raising an audit event.

User Action:

See the Audit API appendix in this product's Reference Guide to determine the valid values for parameter *P1*.

NMAU0004

Events have already been raised for this minute

Reason:

The Audit system went to raise utilization events for the registered event counters. However, it discovered that this had already been done for the given minute.

System Action:

Utilization events are not raised for the registered counters.

User Action:

None.

NMAU0005

Event counter *P1* *P2*

Reason:

The Audit API has successfully performed action *P2* on the event counter identified by *P1*.

System Action:

None.

User Action:

None.

NMAU0006**Event counter *P1* not *P2*, Reason= *P3*****Reason:**

The Audit API failed to perform action *P2* on event counter *P1*. The reason for this failure is shown in *P3*.

System Action:

None.

User Action:

Review the activity log for any other error messages.

To trace calls to the Audit API, enable the Audit trace facility by specifying **TRACE=YES** on the Audit API call or by issuing the command: **\$GLBL \$NMAUTRC YES**.

To disable the Audit trace facility, do *not* specify TRACE=YES on the Audit API call and ensure that the &GLBL\$NMAUTRC global variable is not set to YES by issuing the command: **\$GLBL \$NMAUTRC**.

NMAU0007**Event counter *P1* set to *P2*****Reason:**

The Audit API has incremented an event counter identified by *P1* to the value *P2*.

System Action:

None.

User Action:

None.

NMAU0008

Event counter *P1* not incremented

Reason:

The Audit API failed to increment an event counter identified by *P1*.

System Action:

None.

User Action:

Review the activity log for any other error messages.

To enable the Audit trace facility, specify **TRACE=YES** on the Audit API call or issue the command: **\$GLBL \$NMAUTRC YES**.

To disable the Audit trace facility, do *not* specify TRACE=YES on the Audit API call and ensure that the &GLBL\$NMAUTRC global variable is not set to YES by issuing the command: **\$GLBL \$NMAUTRC**.

NMAU0009

Events raised for *P1* event counters

Reason:

The Audit API has raised events for *P1* event counters.

System Action:

None.

User Action:

None.

NMAU0010

Service procedure *P1* or a subsequent procedure does not exist.

Reason:

The Audit API attempted to execute service procedure *P1* while processing a counter. However, the service procedure, or a subsequent procedure called by the service procedure, does not exist.

System Action:

The Audit API disregards the service procedure for the current counter.

User Action:

Check your COMMANDS library and make sure this service procedure, and any other procedures it calls, exist.

NMAU0011

Audit Event Listener is not running

Reason:

The Audit API has detected that the Audit Event Listener is not running.

System Action:

No Audit events are recorded locally.

User Action:

If required, start the Audit Event Listener through the AUDIT parameter group:

1. Enter **/PARMS** to access the list of Customizer parameter groups.
2. Enter **U** beside the AUDIT parameter group.
The parameter group opens for update.
3. Change at least one Event Type field from NO to one of the following values:
 - LOG if you want the audit events written to the activity log
 - SMF if you want the audit events raised as SMF records
 - BOTH if you want the audit events recorded in both the activity log and SMF
4. Press F6 (Action) to apply the changes.
The Audit Event Listener starts.
5. Press F3 (File) to save these settings.
The parameter group is updated.

NMAU0013**P1 is disabled while utilization events are not being audited****Reason:**

A call was made to the Audit API requesting an option that is not permitted while the Audit Event Listener is not auditing utilization events.

System Action:

The Audit API ends with return code 8.

User Action:

Do not call the Audit API with this option while utilization events are not being audited.

If you want utilization events to be audited, enable them through the AUDIT parameter group:

1. Enter **/PARMS** to access the list of Customizer parameter groups.
2. Enter **U** beside the AUDIT parameter group.
The parameter group opens for update.
3. Change the Utilization Event Type field from NO to one of the following values:
 - LOG if you want the audit events written to the activity log
 - SMF if you want the audit events raised as SMF records
 - BOTH if you want the audit events recorded in both the activity log and SMF
4. Press F6 (Action) to apply the changes.
The Audit Event Listener is profiled to audit utilization events.
5. Press F3 (File) to save these settings.
The parameter group is updated.

NMAU0099

Audit API completed. RC= P1

Reason:

This informational message displays the completion code for an Audit API called from Command Entry.

System Action:

None.

User Action:

None.

NMAU0100

SMF Record Identifier for subtyped records is disabled

Reason:

The \$NM AUDIT parameter group has been actioned. It specifies that some event types should be written to SMF. However, the SMF parameter group has disabled the creation of subtyped records.

System Action:

The Audit Event Listener (\$NMAU01Z) will initialize successfully; however, no events are written to SMF until the SMF parameter group enables the creation of subtyped records.

User Action:

In the SMF parameter group, specify a nonzero value in the SMF Record Identifier (Subtyped) field. This value must be in the range 128 to 255.

Alternatively, if SMF records are not required, change the event type fields to specify either NO (do not audit) or LOG (only write to the activity log).

NMAU0101**Audit Event Listener initialization complete****Reason:**

The Audit Event Listener has successfully completed initialization and is now waiting to receive audit events.

System Action:

Audit event listening starts.

User Action:

None.

NMAU0102**Invalid value for parameter *P1* Value= *P2*****Reason:**

The Audit Event Listener started with an invalid parameter value.

System Action:

Audit Event Listener stops initializing.

User Action:

Provide a valid value for field *P1* in the AUDIT parameter group, and then action the parameter group to restart Audit Event Listener.

NMAU0103**The Audit Event Listener is already running****Reason:**

An Audit Event Listener (\$NMAU01Z) was started; however, a Listener is already running.

System Action:

The second Audit Event Listener terminates.

User Action:

Do not start an Audit Event Listener while one is running.

NMAU0104

Audit Event Listener is not active

Reason:

A command was issued to stop the Audit Event Listener; however, it is not active.

System Action:

None.

User Action:

None.

NMAU0105

Audit Event Listener stop requested

Reason:

A request was made to stop the Audit Event Listener.

System Action:

The Audit Event Listener terminates.

User Action:

None.

NMAU0106

Audit Event Listener ended

Reason:

The Audit Event Listener terminated normally.

System Action:

The Audit Event Listener terminates.

User Action:

None.

NMAU0107**Invalid time value****Reason:**

The field in error requires a time value in the format *hh.mm*

System Action:

Validation fails.

User Action:

Enter a valid time value in the format *hh.mm* and continue.

NMAU0108**P1****Reason:**

The Audit Event Listener has started and is documenting its runtime parameters.

System Action:

None.

User Action:

None.

NMAU0111

Configuration Event Object=*P1* Action=*P2* User=*P3* UTC Date=*P4* UTC Time=*P5*

Reason:

The region's AUDIT parameter group has the auditing of configuration events (such as changes to definitions) enabled to write to the activity log. This message indicates that the Audit Event Listener has received and logged a configuration event.

P1 is the object as "[objLocation:]objClass:objName[:objText]"

P2 is the action as "action[:actionText][:actionValue]"

P3 is the user as "userLocation:userId"

P4 is the UTC date of the event as *yyyymmdd*

P5 is the UTC time of the event as *hh:mm:ss.th*

System Action:

None.

User Action:

None.

NMAU0112

Procedural Event Object=*P1* Action=*P2* User=*P3* UTC Date=*P4* UTC Time=*P5*

Reason:

The region's AUDIT parameter group has the auditing of procedural events (such as actions performed at a monitor) enabled to write to the activity log. This message indicates that the Audit Event Listener has received and logged a procedural event.

P1 is the object as "[objLocation:]objClass:objName[:objText]"

P2 is the action as "action[:actionText][:actionValue]"

P3 is the user as "userLocation:userId"

P4 is the UTC date of the event as *yyyymmdd*

P5 is the UTC time of the event as *hh:mm:ss.th*

System Action:

None.

User Action:

None.

NMAU0113

Serviceability Event Object=*P1* Action=*P2* UTC Date=*P3* UTC Time=*P4*

Reason:

The region's AUDIT parameter group has the auditing of serviceability events (such as changes in the status of monitored resources) enabled to write to the activity log. This message indicates that the Audit Event Listener has received and logged a serviceability event.

P1 is the object as "[objLocation:]objClass:objName[:objText]"

P2 is the action as "action[:actionText][:actionValue]"

P3 is the UTC date of the event as *yyyymmdd*

P4 is the UTC time of the event as *hh:mm:ss.th*

System Action:

None.

User Action:

None.

NMAU0114

Utilization Event Object=*P1* Action=*P2* Value=*P3* Period=*P4* UTC Date=*P5* UTC Time=*P6*

Reason:

The region's AUDIT parameter group has the auditing of utilization events (such as statistics on activities) enabled to write to the activity log. This message indicates that the Audit Event Listener has received and logged a utilization event.

P1 is the object as "[objLocation:]objClass[:objName][:objText]"

P2 is the action as "action[:actionText]"

P3 is the value of the action as *actionValue*

P4 is the period for the event in minutes

P5 is the UTC date of the event as *yyyymmdd*

P6 is the UTC time of the event as *hh:mm:ss.th*

System Action:

None.

User Action:

None.

NMAU0115

Access Event Object=*P1* Action=*P2* User=*P3* UTC Date=*P4* UTC Time=*P5*

Reason:

The region's AUDIT parameter group has the auditing of access events (such as security activities) enabled to write to the activity log. This message indicates that the Audit Event Listener has received and logged an access event.

P1 is the object as "[objLocation:]objClass:objName[:objText]"

P2 is the action as "action[:actionText][:actionValue]"

P3 is the user as "userLocation:userId"

P4 is the UTC date of the event as *yyyymmdd*

P5 is the UTC time of the event as *hh:mm:ss.th*

System Action:

None.

User Action:

None.

NMAU0116

Application Event Object=*P1* Action=*P2* User=*P3* UTC Date=*P4* UTC Time=*P5*

Reason:

The region's AUDIT parameter group has the auditing of application events (such as activities generated by your applications) enabled to write to the activity log. This message indicates that the Audit Event Listener has received and logged an application event.

P1 is the object as "[objLocation:]objClass:objName[:objText]"

P2 is the action as "action[:actionText][:actionValue]"

P3 is the user as "userLocation:userId"

P4 is the UTC date of the event as *yyyymmdd*

P5 is the UTC time of the event as *hh:mm:ss.th*

System Action:

None.

User Action:

None.

NMAU0201**General Event Listener initialization complete****Reason:**

The Audit General Event Listener has successfully completed initialization and is now waiting to receive events.

System Action:

None.

User Action:

None.

NMAU0203**The General Event Listener is already running****Reason:**

An Audit General Event Listener (\$NMAU02Z) was started; however, a Listener is already running.

System Action:

The second General Event Listener terminates.

User Action:

Do not start a General Event Listener while one is running.

NMAU0204**General Event Listener is not active****Reason:**

A command was issued to stop the Audit General Event Listener; however, it is not active.

System Action:

None.

User Action:

None.

NMAU0205

General Event Listener stop requested

Reason:

A request was made to stop the Audit General Event Listener.

System Action:

The Audit General Event Listener terminates.

User Action:

None.

NMAU0206

General Event Listener ended

Reason:

The Audit General Event Listener terminated normally.

System Action:

The General Event Listener terminates.

User Action:

None.

NMAU0401

Full value must be an alphabetic string

Reason:

The value in the Full value field must contain alphabetic characters only. It must not contain any spaces, numbers, or special characters.

System Action:

CAS Table Entry Definition ends in error.

User Action:

Provide an alphabet-only string for Full value.

NMAU0402**Hex Value must be a 4-character hexadecimal value****Reason:**

The value in the Hex Value field must contain four hexadecimal characters: 0 to 9 and A to F.

System Action:

CAS Table Entry Definition ends in error.

User Action:

Provide a valid 4-character hexadecimal string for Hex Value.

NMAU0403**Hex Value must NOT be in the range 1000 to 1FFF****Reason:**

The range 1000 to 1FFF is reserved for customers to define their own Audit actions. Do not use this range.

System Action:

CAS Table Entry Definition ends in error.

User Action:

Provide a valid 4-character hexadecimal string that is not in the range 1000 to 1FFF.

NMAU0404**Hex Value must be in the range 1000 to 1FFF****Reason:**

User-defined Audit actions must be defined with a hexadecimal value in the range 1000 to 1FFF inclusive.

System Action:

CAS Table Entry Definition ends in error.

User Action:

Provide a valid 4-character hexadecimal string that is within the range 1000 to 1FFF.

NMCP0100

The Minute-Minder Listener is already running

Reason:

A Minute-Minder Listener (\$NMCP01Z) was started; however, a Listener is already running.

System Action:

The second Minute-Minder Listener terminates.

User Action:

Do not start a second Minute-Minder Listener while one is already running.

NMCP0101

~P1 must be a number between ~P2 and ~P3 inclusive.

Reason:

An invalid value for *P1* was supplied to the Minute-Minder Listener.

System Action:

The Minute-Minder Listener terminates.

User Action:

Start the Listener with a valid value for *P1*.

NMCP0102

LOCPU value must be less than HICPU value

Reason:

The Minute-Minder Listener was started with an incompatible LOCPU/HICPU combination. The LOCPU value must be less than the HICPU value.

System Action:

The Minute-Minder Listener terminates.

User Action:

Start the Listener with a valid LOCPU/HICPU combination.

NMCP0103**~P1 is not a valid data set name****Reason:**

The Minute-Minder Listener was started with an invalid data set name for the PMON unload data set.

System Action:

The Minute-Minder Listener terminates.

User Action:

Start the Listener with a valid data set name. The data set must be a PDS.

NMCP0110**Minute-Minder Listener started****Reason:**

The Minute-Minder Listener started successfully.

System Action:

The Minute-Minder Listener waits for CPU monitoring events.

User Action:

None.

NMCP0111**~P1 = ~P2****Reason:**

This message is issued when the Minute-Minder Listener starts successfully. It documents the parameters the Listener is using for its monitoring.

System Action:

The Minute-Minder Listener waits for CPU monitoring events.

User Action:

None.

NMCP0197

Minute-Minder Listener is not active

Reason:

A command was issued to stop the Minute-Minder Listener; however, it is not active.

System Action:

None.

User Action:

None.

NMCP0198

Minute-Minder Listener stop requested

Reason:

You requested the Minute-Minder Listener to stop.

System Action:

The Minute-Minder Listener terminates.

User Action:

None.

NMCP0199

Minute-Minder Listener ended

Reason:

The Minute-Minder Listener terminated normally.

System Action:

The Minute-Minder Listener terminates.

User Action:

None.

NN0001**OML I/O MANAGER INITIALIZATION COMPLETE****Reason:**

The OML I/O manager has successfully initialized.

System Action:

None.

User Action:

None.

NN0002**OML I/O MANAGER SUBTASK ABEND cccccccc - RESTARTING SUBTASK****Reason:**

The OML I/O manager has recovered from an I/O subtask abend. The abend code is shown in the message.

System Action:

The subtask is restarted.

User Action:

Examine the abend code and take corrective action if required.

NN0150**OML LIBRARY I/O ERROR PROC *pppppppp synad-information*****Reason:**

The OML I/O manager has detected an I/O error on a procedure library while attempting to load the named procedure. I/O error information is displayed.

System Action:

The load is retried.

User Action:

Examine the I/O error information and take corrective action if required.

NN0510

COMMAND REPLACEMENT FOR *pppp* FAILED, PROCEDURE NOT FOUND

Reason:

An OMLCTL CMDREPL command failed. The requested command procedure could not be found.

System Action:

The command replacement fails.

User Action:

Ensure that the command replacement procedure is in the COMMANDS library concatenation.

NN0511

TYPE MISMATCH FOR *pppp* IN LIBRARY *llll*

Reason:

An OML load request asked for a particular procedure type (eg FUNCTION). The loaded procedure type was not as expected.

System Action:

The load fails.

User Action:

Check that the procedure starts with the correct statement type, e.g., for a function, the FUNCTION statement.

NN0512

INVALID REQUEST FOR 'CALLONLY' PROCEDURE *pppp* IN LIBRARY *llll*

Reason:

An OML procedure that had the 'CALLONLY' attribute was loaded for a non-callonly requestor, for example, to be executed as a command.

System Action:

The load fails.

User Action:

CALLONLY procedures cannot be executed from OCS, etc. Check the requirement to execute the procedure in this manner.

NN0520**OLD VERSION OF *pppp* IN LIBRARY *////* PURGED FROM STORAGE****Reason:**

On OMLCTL UNLOAD command requested that a procedure be purged from storage. This message confirms the request has been done.

System Action:

None.

User Action:

None.

NN0521**OLD VERSION OF *pppp* IN LIBRARY *////* FLAGGED FOR PENDING UNLOAD****Reason:**

On OMLCTL UNLOAD command requested that a procedure be purged from storage. The procedure is currently in use and will be purged when its use count drops to 0. Any *new* requests for the procedure will trigger the loading of a new copy.

System Action:

None.

User Action:

None.

NN0524**PRELOAD COMPLETE FOR *pppp* IN LIBRARY *////*****Reason:**

An OMLCTL PRELOAD command has completed.

System Action:

None.

User Action:

None.

NN0525

COMMAND REPLACEMENT COMPLETE FOR *pppp*

Reason:

An OMLCTL CMDREPL command has completed. The command has been replaced by an OML procedure.

System Action:

None.

User Action:

None.

NN0527

COMMAND REPLACEMENT FAILED FOR *pppp* - PROCEDURE ALREADY IN STORAGE

Reason:

An OMLCTL CMDREPL command has failed. There is already a procedure of that command name loaded.

System Action:

None.

User Action:

Unload the old procedure if required and retry.

NN0528

UNLOAD NOT PERMITTED FOR COMMAND REPLACEMENT PROCEDURE *pppppppp*

Reason:

An OMLCTL UNLOAD command has failed. You cannot unload a command replacement procedure with this command.

System Action:

None.

User Action:

Use the OMLCTL CMDREPL OPT=UNLOAD command if necessary.

NN0529**PRELOAD FAILED FOR *pppp* IN LIBRARY *////* - ALREADY PRELOADED****Reason:**

On OMLCTL PRELOAD command requested preloading of a procedure that is already preloaded.

System Action:

The command is ignored.

User Action:

Use OMLCTL UNLOAD to unload the preloaded procedure if a new copy is to be loaded.

NN0530**CMDREPL FAILED FOR *pppp* - GLOBAL EQUATE/255 PROCS/NCL CMDREPL FOUND****Reason:**

An OMLCTL CMDREPL command failed for one of the following reasons:

- a global equate was found for the command
- 255 procedures were already loaded
- an NCL CMDREPL procedure was found

System Action:

The command is ignored.

User Action:

Use SHOW EQUATES, SHOW NCLSTAT, and SHOW OMLSTST to determine the cause of the problem.

NN0531

UNLOAD FAILED FOR *pppp* IN LIBRARY *////* - NOT LOADED

Reason:

An OMLCTL UNLOAD command failed. The requested procedure is not presently loaded.

System Action:

The command is ignored.

User Action:

None.

NN0532

CMDREPL UNLOAD FAIED FOR *pppp* - NOT FOUND

Reason:

An OMLCTL CMDREPL UNLOAD command failed. The requested procedure is not presently loaded.

System Action:

The command is ignored.

User Action:

None.

NN0533

CMDREPL UNLOAD FAIED FOR *pppp* - NOT A CMDREPL PROCEDURE

Reason:

An OMLCTL CMDREPL UNLOAD command failed. The requested procedure is not a CMDREPL procedure.

System Action:

The command is ignored.

User Action:

None.

NN0534**P1 OML PROCEDURE(S) UNLOADED BY GENERIC REQUEST****Reason:**

An UNLOAD PROCEDURE= (or OMLCTL UNLOAD) command has been issued specifying a generic procedure or DD name. This message shows the total OML procedures unloaded as a result of the command.

System Action:

The procedures are reloaded, as required.

User Action:

None.

NN1090**COMPILE FOR *pppp* IN LIBRARY *////* FAILED, UNABLE TO OBTAIN WORK AREAS****Reason:**

An OML compile/load failed due to a shortage of storage.

System Action:

The OML compile or load fails.

User Action:

Investigate the storage shortage.

NN1091**COMPILE FOR *pppp* IN LIBRARY *////* FAILED, OPEN ERROR: *rrrrrr*****Reason:**

An OML compile/load failed due to a problem opening the requested member. A reason is given.

System Action:

The OML compile or load fails.

User Action:

Investigate the reason for the failure.

NN1092

COMPILE FOR *pppp* IN LIBRARY *////* FAILED, SOURCE IS NCL

Reason:

An OML compile/load failed due to the requested member being NCL.

System Action:

The OML compile or load fails.

User Action:

Convert the source to OML and re-compile.

NN1099

RESTARTING COMPILE FOR *pppp* IN LIBRARY AFTER I/O ERROR

Reason:

An OML compile/load failed due to an I/O error. A second attempt is made to compile after closing and reopening the library.

Note: This message is logged only.

System Action:

A second attempt is made to load the procedure.

User Action:

None.

NN2001

E *srcloc* NO STATEMENTS FOUND IN SOURCE FILE

Reason:

During compilation of an OML procedure an end-of-file condition was encountered before any statements were found. *srcloc* shows the source location of the end of file.

System Action:

Compilation of the procedure fails.

User Action:

Add some statements to the file.

NN2002**E *srcloc* END OF FILE IN A NESTED STATEMENT****Reason:**

During compilation of an OML procedure an end-of-file condition was encountered during processing of a nested statement (eg IF/THEN/ELSE). *srcloc* shows the location of the statement in error

System Action:

Compilation of the procedure fails.

User Action:

Complete the nested statement.

NN2003**E *srcloc* END OF FILE WITH *aaa* OPEN DO GROUPS, *bbb* OPEN PROCEDURES/FUNCTIONS****Reason:**

During compilation of an OML procedure an end-of-file condition was encountered either:

- during processing of a DO group, or
- before the END statement for a PROCEDURE or FUNCTION was found.

srcloc shows the source location of the statement in error

aaa shows the number of DO groups which have not been terminated

bbb shows the number of PROCEDURES or FUNCTIONS which have not been terminated

System Action:

Compilation of the procedure fails.

User Action:

Add an END statement for each DO group, PROCEDURE or FUNCTION statement.

NN2004

E *srcloc* FIRST STATEMENT IN SOURCE IS NOT PROCEDURE OR FUNCTION

Reason:

The first statement in an OML procedure must be a PROCEDURE or FUNCTION statement. The procedure being compiled does not have *one* of these as the first statement. *srcloc* shows the source location of the statement in error.

System Action:

Compilation of the procedure fails.

User Action:

Add a PROCEDURE or FUNCTION statement as the first executable statement in the procedure. Also make sure a corresponding END statement exists.

NN2005

E *srcloc* STATEMENTS FOUND AFTER END OF OUTER PROCEDURE/FUNCTION

Reason:

During compilation of an OML procedure, statements were found after the END statement which terminated the source of the procedure or function. This is invalid. It indicates there may be incorrect pairing of DO/END statements. *srcloc* shows the source location of the statement in error.

System Action:

Compilation of the procedure fails.

User Action:

Check the pairing of DO/END statements. If the code was not to be included in the procedure, remove it from the source file, or enclose the code in comment delimiters (*/* comment */*).

NN2006**E *srcloc* LABELS NOT ALLOWED IN A NESTED STATEMENT****Reason:**

During compilation of an OML procedure a label was found on a statement which is nested (e.g. IF cond THEN LAB: IF). This is invalid. *srcloc* shows the source location of the statement in error

System Action:

Compilation of the procedure fails.

User Action:

Remove the label from the statement.

NN2007**E MORE THAN 16,000,000 STATEMENTS IN SOURCE****Reason:**

During compilation of an OML procedure more than 16,000,000 lines of source text were found. 16,000,000 is the maximum number allowed.

System Action:

Compilation of the procedure fails.

User Action:

Divide the source file into several source files, each with not more than 16,000,000 lines.

NN2008

W *srcloc* PROCEDURE STATEMENT INSERTED

Reason:

The first executable statement in an OML procedure was not a PROCEDURE statement, so one has been inserted automatically. A corresponding END statement will also be inserted at the end of the source. This This message is a warning only and does not cause compilation failure. *srcloc* shows the source location of the PROCEDURE statement.

System Action:

Compilation of the procedure continues.

User Action:

None.

NN2010

E *srcloc* ERROR IN *verbname* STATEMENT: *reason*

Reason:

During compilation of an OML procedure, a verb was encountered which had a compilation error.

srcloc shows the source location of the statement in error

verbname shows the name of the verb

reason shows the reason for the compilation failure

System Action:

Compilation of the procedure fails.

User Action:

Correct the syntax of the verb and retry.

NN2011**E *srcloc* INVALID OR UNRECOGNISED SOURCE TEXT****Reason:**

During compilation of an OML procedure, a statement was found which was not recognised as a valid OML statement type. *srcloc* shows the source location of the statement in error.

System Action:

Compilation of the procedure fails.

User Action:

Remove or correct the statement.

NN2015**E *srcloc varname* MAY NOT BE AN ASSIGNMENT TARGET VARIABLE****Reason:**

During compilation of an OML procedure, an assignment statement was found which attempted to update a system variable which cannot be updated.

srcloc shows the source location of the statement in error.

varname shows the name of the variable.

System Action:

Compilation of the procedure fails.

User Action:

Remove or correct the statement.

NN2016

E *srcloc varname* MAY NOT BE ASSIGNED A NULL VALUE

Reason:

During compilation of an OML procedure, an assignment statement was found which attempted to update a system variable with a null value. Null is not a valid value for the system variable.

srcloc shows the source location of the statement in error.

varname shows the name of the system variable.

System Action:

Compilation of the procedure fails.

User Action:

Remove or correct the statement.

NN2017

E *srcloc varname* NULL VARIABLE NAME INVALID FOR ASSIGNMENT

Reason:

During compilation of an OML procedure, an assignment statement was found which attempted to update a variable with a null name.

srcloc shows the source location of the statement in error.

varname shows the name of the variable.

System Action:

Compilation of the procedure fails.

User Action:

Remove or correct the statement.

NN2018**E *srcloc* WHEN STATEMENT EXPECTED****Reason:**

During compilation of an OML procedure, a SELECT statement was found without a following WHEN statement. The statement following a SELECT statement must always be a WHEN statement. *srcloc* shows the source location of the statement in error.

System Action:

Compilation of the procedure fails.

User Action:

Insert a WHEN statement following the SELECT statement.

NN2019**E *srcloc* WHEN or OTHERWISE STATEMENT EXPECTED****Reason:**

During compilation of an OML procedure, a WHEN statement was processed which was not followed by an allowable statement type. The statement following a WHEN statement must always be:

- another WHEN statement
- an OTHERWISE statement, or
- an END statement

srcloc shows the source location of the statement in error.

System Action:

Compilation of the procedure fails.

User Action:

Insert a WHEN, OTHERWISE or END statement following the WHEN statement. This error can also indicate incorrect DO/END pairing in the logic of the WHEN statement.

NN2020

E *srcloc* UNRECOGNISABLE STATEMENT

Reason:

During compilation of an OML procedure, a statement was encountered which was not recognisable as a valid verb or assignment statement. *srcloc* shows the source location of the statement in error.

System Action:

Compilation of the procedure fails.

User Action:

Correct the syntax of the statement, or remove it, or enclose it in comment delimiters (*/* */*).

NN2021

E *srcloc* UNRECOGNISED VERB

Reason:

During compilation of an OML procedure, a statement was encountered which was not a recognisable verb or assignment statement. The syntax of the statement indicates it may be a verb which is not supported by the system on which the compilation is taking place. *srcloc* shows the source location of the statement in error

System Action:

Compilation of the procedure fails.

User Action:

Correct the syntax of the statement, or remove it, or enclose it in comment delimiters (*/* */*). This error can be caused by an incorrectly spelt verb name. If the verb is valid but not supported by the system, use `%%OPTIONS DEFER` to avoid compilation errors. If the verb is encountered during execution an error will be raised.

NN2022**W *srcloc* UNRECOGNISED VERB: *verbname* - WILL CAUSE ERROR IF EXECUTED****Reason:**

During compilation of an OML procedure, a statement was encountered which was not recognisable as a valid verb or assignment statement. The syntax of the statement indicates it may be a verb which is not supported by the system on which compilation is taking place.

%%OPTIONS DEFER is in effect, so compilation does not fail for this error, but if the verb is encountered during execution an error will be raised. This message is sent as a warning of the situation.

srcloc shows the source location of the statement in error.

verbname shows the name of the verb.

System Action:

Compilation of the procedure continues.

User Action:

Make sure the verb name has been spelt correctly. If so, make sure the logic in the procedure will not execute the verb unless the verb is supported by the system (eg.if verb is an MAI verb, check that MAI is installed, using the ZFEATURE built-in function).

NN2023

E *srcloc* UNRECOGNISED VERB: *verbname* (%%OPTIONS DEFER IGNORED)

Reason:

During compilation of an OML procedure, a statement was encountered which was not recognisable as a valid verb or assignment statement. The syntax of the statement indicates it may be a verb which is not supported by the system on which the compilation is taking place.

%%OPTIONS DEFER is in effect, but is ignored because the compilation is producing executable object.

srcloc shows the source location of the statement in error.

verbname shows the name of the verb.

System Action:

Compilation of the procedure fails.

User Action:

Make sure the verb name is spelt correctly. If so, make sure the system is licensed for the feature to which the verb belongs.

NN2035

E *srcloc* INVALID IF STATEMENT SYNTAX OR MISSING THEN

Reason:

During compilation of an OML procedure, an IF statement was encountered which had invalid syntax or was not followed by a THEN statement. *srcloc* shows the source location of the statement in error.

System Action:

Compilation of the procedure fails.

User Action:

Correct the syntax of the statement, or insert a THEN statement after the conditional expression.

NN2036**E *srcloc* MISPLACED ELSE STATEMENT****Reason:**

During compilation of an OML procedure, an ELSE statement was encountered which was not preceded by an IF/THEN statement combination. *srcloc* shows the source location of the statement in error.

System Action:

Compilation of the procedure fails.

User Action:

Examine the preceding statements to locate the IF/THEN combination. If not found, insert them. If found, this could indicate incorrect DO/END pairing in the THEN logic.

NN2037**E *srcloc* ERROR IN WHEN STATEMENT: *reason*****Reason:**

During compilation of an OML procedure, a WHEN statement was encountered which was invalid.

srcloc shows the source location of the statement in error.

reason shows the reason for the WHEN statement being invalid.

System Action:

Compilation of the procedure fails.

User Action:

Correct the syntax of the WHEN statement and retry.

NN2038

E *srcloc* MISPLACED OTHERWISE STATEMENT

Reason:

During compilation of an OML procedure, an OTHERWISE statement was encountered which was not preceded by a WHEN statement. *srcloc* shows the source location of the statement in error.

System Action:

Compilation of the procedure fails.

User Action:

This could indicate incorrect DO/END pairing in the logic of the WHEN statement if the statements preceding the OTHERWISE statement contain a WHEN statement.

NN2040

E *srcloc* DO/SELECT STATEMENT NESTING LIMIT (250) EXCEEDED

Reason:

During compilation of an OML procedure, nesting of DO or SELECT statements exceeded the limit of 250 levels. *srcloc* shows the source location of the statement in error.

System Action:

Compilation of the procedure fails.

User Action:

Alter the logic of the procedure to avoid so many nested DO or SELECT statements.

NN2041**E *srcloc* INVALID DO STATEMENT SYNTAX****Reason:**

During compilation of an OML procedure, a DO statement was encountered which specified an unrecognised or duplicated keyword, or contained data after the DO expression. *srcloc* shows the source location of the statement in error.

System Action:

Compilation of the procedure fails.

User Action:

Correct the syntax of the DO statement and retry.

NN2042**E *srcloc* DO STATEMENT CONTROL VARIABLE NAME INVALID****Reason:**

During compilation of an OML procedure, a DO statement was encountered which specified a control variable, but the variable is not acceptable. Complex, global and system variables cannot be used. *srcloc* shows the source location of the statement in error.

System Action:

Compilation of the procedure fails.

User Action:

Choose a different control variable name.

NN2046

E *srcloc* ERROR IN *vername* STATEMENT: *reason*

Reason:

During compilation of an OML procedure, a GOTO or GOSUB statement was encountered which is invalid.

srcloc shows the source location of the statement in error.

vername shows the name of the verb (GOTO or GOSUB).

reason shows the reason the statement is invalid.

System Action:

Compilation of the procedure fails.

User Action:

Correct the statement and retry.

NN2047

E *srcloc* ERROR IN RETSUB STATEMENT: *reason*

Reason:

During compilation of an OML procedure, a RETSUB statement was encountered which is invalid.

srcloc shows the source location of the statement in error.

reason shows the reason the statement is invalid.

System Action:

Compilation of the procedure fails.

User Action:

Correct the statement and retry.

NN2048**E *srcloc* ERROR IN RETURN STATEMENT: *reason*****Reason:**

During compilation of an OML procedure, a RETURN statement was encountered which is invalid.

srcloc shows the source location of the statement in error.

reason shows the reason the statement is invalid.

System Action:

Compilation of the procedure fails.

User Action:

Correct the statement and retry.

NN2051**E *srcloc* ON NAME MISSING OR INVALID****Reason:**

During compilation of an OML procedure, an *ON* statement was encountered which specified a condition name which is not valid. *srcloc* shows the source location of the statement in error.

System Action:

Compilation of the procedure fails.

User Action:

Correct the condition name and retry.

NN2052

E *srcloc* INVALID SIGNAL NAME OR EXPRESSION

Reason:

During compilation of an OML procedure, a SIGNAL statement was encountered which specified a condition name which is not valid, or null. *srcloc* shows the source location of the statement in error.

System Action:

Compilation of the procedure fails.

User Action:

Correct the condition name by removing invalid characters. If it was null, add the condition name to the statement.

NN2053

E *srcloc* INVALID OR MISSING REVERT NAME

Reason:

During compilation of an OML procedure, a REVERT statement was encountered which specified a condition name which is not valid. *srcloc* shows the source location of the statement in error.

System Action:

Compilation of the procedure fails.

User Action:

Correct the condition name and retry.

NN2070**E *srcloc* END STATEMENT HAS INVALID LABEL REFERENCE: *labelname*****Reason:**

During compilation of an OML procedure, an END statement was encountered which specified a label name which is invalid.

srcloc shows the source location of the statement in error.

labelname shows the invalid label name.

System Action:

Compilation of the procedure fails.

User Action:

Correct the label name and retry.

NN2071**E *srcloc* NO ACTIVE DO GROUPS, PROCEDURES, OR FUNCTIONS FOR END STATEMENT TO CLOSE****Reason:**

During compilation of an OML procedure, an END statement was encountered but no corresponding DO, PROCEDURE, or FUNCTION statement exists. *srcloc* shows the source location of the statement in error.

System Action:

Compilation of the procedure fails.

User Action:

Remove the END statement or add the required DO, PROCEDURE, or FUNCTION statement.

NN2072

E *srcloc* LABEL ON END STATEMENT DOES NOT MATCH LABEL ON ASSOCIATED DO STATEMENT

Reason:

During compilation of an OML procedure, an END statement was encountered which specified a label name. The corresponding DO statement does not specify a label name or specifies a different label name. *srcloc* shows the source location of the statement in error.

System Action:

Compilation of the procedure fails.

User Action:

Correct the label name on either the DO statement or END statement. This error can also indicate incorrect DO/END pairing in the logic of the DO statement.

NN2073

E *srcloc* LABEL ON END STATEMENT DOES NOT MATCH LABEL ON ASSOCIATED PROCEDURE OR FUNCTION STATEMENT

Reason:

During compilation of an OML procedure, an END statement was encountered which specified a label name, but the corresponding PROCEDURE or FUNCTION statement specifies a different label name. *srcloc* shows the source location of the statement in error

System Action:

Compilation of the procedure fails.

User Action:

Correct the label name on either the PROCEDURE/FUNCTION statement or DO statement. This error can also indicate incorrect DO/END pairing in the procedure.

NN2074**E *srcloc* NO ACTIVE ITERATIVE DO GROUPS FOR *verbname* STATEMENT****Reason:**

During compilation of an OML procedure, a LEAVE or ITERATE statement was encountered which was not inside an iterative DO loop. LEAVE and ITERATE are only valid inside an iterative DO loop.

srcloc shows the source location of the statement in error.

verbname shows the verb name (LEAVE or ITERATE).

System Action:

Compilation of the procedure fails.

User Action:

Remove the LEAVE or ITERATE statement, or enclose it in an iterative DO loop.

NN2075**E *srcloc verbname* STATEMENT HAS INVALID LABEL REFERENCE: *labelname*****Reason:**

During compilation of an OML procedure, a LEAVE or ITERATE statement was encountered which specified a label name which is invalid.

srcloc shows the source location of the statement in error.

verbname shows the verb name (LEAVE or ITERATE).

System Action:

Compilation of the procedure fails.

User Action:

Correct the label name by removing invalid characters.

NN2076

E *srcloc* LABEL ON *verbname* STATEMENT DOES NOT MATCH LABEL ON ASSOCIATED ITERATIVE DO STATEMENT

Reason:

During compilation of an OML procedure, a LEAVE or ITERATE statement was encountered which specified a label name which does not match the label name on any preceding iterative DO statement which encloses the LEAVE or ITERATE statement.

srcloc shows the source location of the statement in error.

verbname shows the verb name (LEAVE or ITERATE).

System Action:

Compilation of the procedure fails.

User Action:

Correct the label name on either the iterative DO statement or the LEAVE or ITERATE statement.

NN2080

E *srcloc* INVALID NULL LENGTH QUOTED LABEL

Reason:

During compilation of an OML procedure, a quoted label name was encountered which was null. This is invalid. *srcloc* shows the source location of the statement in error.

System Action:

Compilation of the procedure fails.

User Action:

Correct the label name and retry.

NN2101**E *srcloc* *vername* VERB INVALID IN A *proctype*****Reason:**

During compilation of an OML procedure or function, a verb was encountered which is not supported in the specified procedure type.

srcloc shows the source location of the statement in error.

proctype shows the type of procedure (PROCEDURE or FUNCTION).

System Action:

Compilation of the procedure fails.

User Action:

Remove the verb from the procedure/function.

NN2110**E *srcloc* INVALID OPTION FOR *vername* VERB: *option*****Reason:**

During compilation of an OML procedure a verb was found to have an option specified that is not supported by that verb.

srcloc shows the source location of the statement in error.

vername shows the name of the verb.

option shows the option that was specified.

System Action:

Compilation of the procedure fails.

User Action:

Correct the option.

NN2130

E *srcloc* INVALID OPERAND FOR *verbname* VERB: *operand*

Reason:

During compilation of an OML procedure a verb was found to have an operand specified that is not supported by that verb.

srcloc shows the source location of the statement in error.

verbname shows the name of the verb.

operand shows the operand that was specified.

System Action:

Compilation of the procedure fails.

User Action:

Correct the operand.

NN2150

E *srcloc* NULL VALUE INVALID FOR *operand* OPERAND OF *verbname* VERB

Reason:

During compilation of an OML procedure a verb was found to have an operand specified which has a null value, but null is not a valid value for the operand.

srcloc shows the source location of the statement in error.

operand shows the operand which was specified.

verbname shows the name of the verb.

System Action:

Compilation of the procedure fails.

User Action:

Correct the operand.

NN2151**E *srcloc* CONSTANT VALUE REQUIRED FOR *operand* OPERAND OF *verbname* VERB****Reason:**

During compilation of an OML procedure a verb was found to have an operand specified which has a value which is not constant. The operand must be specified as a constant in the source.

srcloc shows the source location of the statement in error.

operand shows the operand which was specified.

verbname shows the name of the verb.

System Action:

Compilation of the procedure fails.

User Action:

Correct the operand.

NN2152**E *srcloc* KEYWORD NAME <*keyword*> INVALID FOR *operand* OPERAND OF *verbname* VERB****Reason:**

During compilation of an OML procedure a verb was found to have an operand specified which has a value which is not in the list of valid keywords for this operand.

srcloc shows the source location of the statement in error.

keyword shows the invalid keyword which was specified.

operand shows the operand which was specified.

verbname shows the name of the verb.

System Action:

Compilation of the procedure fails.

User Action:

Correct the keyword.

NN2153

E *srcloc* INVALID SOURCE TEXT FOUND AFTER *operand* OPERAND OF *verbn* VERB

Reason:

During compilation of an OML procedure a verb was found to have an operand specified which has an unexpected value following the expected value for this operand. For example, end of statement was expected but more text was found.

srcloc shows the source location of the statement in error.

operand shows the operand which was specified.

verbn shows the name of the verb.

System Action:

Compilation of the procedure fails.

User Action:

Remove the extraneous data.

NN2154

E *srcloc* MISSING CLOSING PARENTHESIS AFTER THE *operand* OPERAND OF *verbn* VERB

Reason:

During compilation of an OML procedure a verb was found to have an operand specified which has a variable list. The list has an opening parenthesis and no closing parenthesis.

srcloc shows the source location of the statement in error.

operand shows the operand which was specified.

verbn shows the name of the verb.

System Action:

Compilation of the procedure fails.

User Action:

Add a closing parenthesis to the variable list.

NN2155**E *srcloc* OMITTED VALUE FOR *operand* OPERAND OF *verbname* VERB****Reason:**

During compilation of an OML procedure a verb was found to have an operand specified which has a null value, but a null value is invalid for this operand.

srcloc shows the source location of the statement in error.

operand shows the operand which was specified.

verbname shows the name of the verb.

System Action:

Compilation of the procedure fails.

User Action:

Add the operand value.

NN2159**E *srcloc* RANGE START GREATER THAN END IN THE *operand* OPERAND OF *verbname* VERB****Reason:**

During compilation of an OML procedure, a verb was found to have an operand specified which has a numeric range specified. The first number in the range is greater than the second number in the range.

srcloc shows the source location of the statement in error.

operand shows the operand which was specified.

verbname shows the name of the verb.

System Action:

Compilation of the procedure fails.

User Action:

Change the range so that the second number is greater than the first number.

NN2160

E *srcloc* VARIABLE NAME SYNTAX ERROR: *reason*

Reason:

During compilation of an OML procedure, a verb was found to have an operand specified which has an invalid variable name.

srcloc shows the source location of the invalid variable name.

reason shows the reason that the variable name is invalid.

System Action:

Compilation of the procedure fails.

User Action:

Correct the invalid variable name.

NN2161

E *srcloc* VARIABLE NAME MISSING OR INVALID

Reason:

During compilation of an OML procedure, a verb was found to have an operand specified which should have a variable name but one has not been supplied, or the one supplied is invalid. *srcloc* shows the source location of the operand.

System Action:

Compilation of the procedure fails.

User Action:

Add the variable or correct the name.

NN2170**E *srcloc* TOO MANY ENTRIES IN LIST FOR *operand* OPERAND OF *vername* VERB****Reason:**

During compilation of an OML procedure, a verb was found to have an operand specified which allows a list of entries, but the number of entries in the list exceeds the number allowed for the operand.

srcloc shows the source location of the invalid statement.

operand shows the operand which was specified.

vername shows the name of the verb

System Action:

Compilation of the procedure fails.

User Action:

Reduce the number of entries in the list.

NN2171**E *srcloc* UNSUPPORTED DATA TYPE FOR *operand* OPERAND OF *vername* VERB (INTERNAL ERROR)****Reason:**

During compilation of an OML procedure, a verb was found to have an operand specified which supports a datatype which is not supported by the compiler.

srcloc shows the source location of the invalid statement.

operand shows the operand which was specified.

vername shows the name of the verb.

System Action:

Compilation of the procedure fails.

User Action:

Contact your product support representative.

NN2172

E *srcloc* DATA VALUE FOR *operand* OPERAND OF *verbname* VERB IS INVALID LENGTH

Reason:

During compilation of an OML procedure, a verb was found to have an operand specified that has a value which is either too long or too short.

srcloc shows the source location of the invalid statement.

operand shows the operand which was specified.

verbname shows the name of the verb.

System Action:

Compilation of the procedure fails.

User Action:

Correct the operand value.

NN2173

E *srcloc* NUMERIC VALUE FOR *operand* OPERAND OF *verbname* VERB IS NOT IN RANGE

Reason:

During compilation of an OML procedure, a verb was found to have an operand specified which has a numeric value which is either too low or too high.

srcloc shows the source location of the invalid statement.

operand shows the operand which was specified.

verbname shows the name of the verb.

System Action:

Compilation of the procedure fails.

User Action:

Correct the operand value.

NN2174**E *srcloc* VALUE FOR *operand* OPERAND OF *verbname* VERB IS NOT *datatype* TYPE****Reason:**

During compilation of an OML procedure, a verb was found to have an operand specified which is required to be a specific data type other than character, but it is not. For example, required type is integer but its value is not an integer.

srcloc shows the source location of the invalid statement.

operand shows the operand which was specified.

verbname shows the name of the verb.

datatype shows the required data type for the operand.

System Action:

Compilation of the procedure fails.

User Action:

Correct the operand value.

NN2175**E *srcloc* VALUE FOR *operand* OPERAND OF *verbname* VERB IS NOT A VALID *datatype*****Reason:**

During compilation of an OML procedure, a verb was found to have an operand specified that is required to be a specific character data type but it is not. For example, the name must be a PDS name but contains invalid characters.

srcloc shows the source location of the invalid statement.

operand shows the operand which was specified.

verbname shows the name of the verb.

datatype shows the required data type for the operand.

System Action:

Compilation of the procedure fails.

User Action:

Correct the operand value.

NN2176

E *srcloc* VALUE FOR *operand* OPERAND OF *verbname* VERB IS NOT VALID DATA

Reason:

During compilation of an OML procedure, a verb was found to have an operand specified which is required to be a specific data type but it is not that type.

srcloc shows the source location of the invalid statement.

operand shows the operand which was specified.

verbname shows the name of the verb.

System Action:

Compilation of the procedure fails.

User Action:

Correct the operand value.

NN2179

E *srcloc* VARIABLE NAME &*varname* IS NOT VALID FOR THE *operand* OPERAND OF THE *verbname* VERB

Reason:

During compilation of an OML procedure, a verb was found to have an operand specified which is required to be a specific type of variable name but it is a different type of variable name. For example, an MDO name is required but the name supplied is not a valid MDO name.

srcloc shows the source location of the invalid statement.

varname shows the variable name which was specified.

operand shows the operand which was specified.

verbname shows the name of the verb.

System Action:

Compilation of the procedure fails.

User Action:

Change the variable name to one of the required type.

NN2180**E *srcloc operand* OPERAND OF *verbname* VERB DUPLICATED****Reason:**

During compilation of an OML procedure, a verb was found to have an operand specified more than once, when this is not allowed.

srcloc shows the source location of the invalid statement.

operand shows the operand which was specified.

verbname shows the name of the verb.

System Action:

Compilation of the procedure fails.

User Action:

Remove all but one of the operand occurrences.

NN2181**E *srcloc operand* OPERAND/KEYWORD OF *verbname* VERB MUTUALLY EXCLUSIVE WITH EARLIER OPERAND****Reason:**

During compilation of an OML procedure, a verb was found to have an operand specified, which is not allowed to be specified due to the presence of an earlier operand.

srcloc shows the source location of the invalid statement.

operand shows the operand which was specified.

verbname shows the name of the verb.

System Action:

Compilation of the procedure fails.

User Action:

Determine which earlier operand is causing the problem and either remove it or remove the operand indicated in this message.

NN2182

E *srcloc* DUPLICATED *keyword* KEYWORD FOR *operand* OPERAND ON *verbname* VERB

Reason:

During compilation of an OML procedure, a verb was found to have an operand specified which allows a list of keywords. The named keyword occurs more than once in the list, which is not allowed.

srcloc shows the source location of the invalid statement.

keyword shows the keyword which has been duplicated.

operand shows the operand which was specified.

verbname shows the name of the verb.

System Action:

Compilation of the procedure fails.

User Action:

Remove all but one of the occurrences of the keyword.

NN2190

E *srcloc* INVALID SYNTAX FOUND IN *verbname* VERB

Reason:

During compilation of an OML procedure, a verb with invalid syntax was found.

srcloc shows the source location of the invalid statement.

verbname shows the name of the verb.

System Action:

Compilation of the procedure fails.

User Action:

Correct the syntax of the statement.

NN2191**E *srcloc* REQUIRED OPERANDS MISSING FOR *verbname* VERB****Reason:**

During compilation of an OML procedure, a verb was found that did not have all of the required operands specified.

srcloc shows the source location of the invalid statement.

verbname shows the name of the verb.

System Action:

Compilation of the procedure fails.

User Action:

Add the required operands.

NN2301**E *srcloc proctype* LABEL NOT UNIQUE WITHIN SCOPE: *procname*****Reason:**

During compilation of an OML procedure, a PROCEDURE or FUNCTION statement was encountered which specifies a name that has already been used within the current procedure or function.

srcloc shows the source location of the invalid statement.

proctype shows the procedure type (PROCEDURE or FUNCTION).

procname shows the name of the procedure or function.

System Action:

Compilation of the procedure fails.

User Action:

Change the name of the procedure or function to make it unique.

NN2302

E *srcloc proctype* STATEMENT CONTAINS INVALID OPERAND: *operand*

Reason:

During compilation of an OML procedure, a PROCEDURE or FUNCTION statement was encountered which specifies a name which has already been found within the current procedure or function.

srcloc shows the source location of the invalid statement.

proctype shows the procedure type (PROCEDURE or FUNCTION).

procname shows the name of the procedure or function.

System Action:

Compilation of the procedure fails.

User Action:

Change the name of the procedure or function to make it unique.

NN2303

E *srcloc proctype* STATEMENT CONTAINS DUPLICATE/CONFLICTING OPERANDS: *operand*

Reason:

During compilation of an OML procedure, a PROCEDURE or FUNCTION statement was encountered which specifies either a duplicate operand, or an operand which cannot be specified because of the presence of an earlier operand.

srcloc shows the source location of the invalid statement.

proctype shows the procedure type (PROCEDURE or FUNCTION).

operand shows the operand which is invalid.

System Action:

Compilation of the procedure fails.

User Action:

Change the operand.

NN2304**E *srcloc proctype* STATEMENT HAS CONFLICTING SHARED VAR LIST:
&*var*****Reason:**

During compilation of an OML procedure, a PROCEDURE or FUNCTION statement was encountered that specifies a shared variable list which contains conflicting variable names. For example, &A* and &AB* are specified. &AB* is unnecessary because of the presence of &A*.

srcloc shows the source location of the invalid statement.

proctype shows the procedure type (PROCEDURE or FUNCTION).

var shows the variable which conflicts with an earlier variable.

System Action:

Compilation of the procedure fails.

User Action:

Remove one of the variable names from the list.

NN2305**E *srcloc* INHERITS CLASS NAME MISSING, INVALID, DUPLICATED:
*class*****Reason:**

During compilation of an OML procedure, a CLASS statement was found that specified a list of object classes from which this class can inherit. Either no class name has been specified, or a name specified is invalid or has been duplicated.

srcloc shows the source location of the invalid statement.

class shows the class name which is invalid.

System Action:

Compilation of the procedure fails.

User Action:

Either add the required class name(s) or correct the one which is named in this message. The class name must be a valid PDS name up to 8 chars.

NN2306

E *srcloc* CALL STATEMENT CONTAINS INVALID OPERAND: *operand*

Reason:

During compilation of an OML procedure, a CALL statement was found that specified an unrecognised operand.

srcloc shows the source location of the invalid statement.

operand shows the operand which is unrecognised.

System Action:

Compilation of the procedure fails.

User Action:

Correct or remove the operand.

NN2307

E *srcloc* CALL STATEMENT CONTAINS DUPLICATE/CONFLICTING OPERANDS: *operand*

Reason:

During compilation of an OML procedure, a CALL statement was found that specified an operand which is duplicated or is invalid because of the existence of a previous operand.

srcloc shows the source location of the invalid statement.

operand shows the operand which is invalid or duplicated.

System Action:

Compilation of the procedure fails.

User Action:

Correct or remove the operand.

NN2308**E *srcloc* CALL STATEMENT HAS CONFLICTING SHARED VAR LIST: &*var*****Reason:**

During compilation of an OML procedure, a CALL statement was found that specifies a shared variable list which contains conflicting variable names. For example, &A* and &AB* are specified, &AB* is unnecessary because of the presence of &A*.

srcloc shows the source location of the invalid statement.

proctype shows the procedure type (PROCEDURE or FUNCTION).

var shows the variable which conflicts with an earlier variable.

System Action:

Compilation of the procedure fails.

User Action:

Remove one of the variable names from the list.

NN2309**E *srcloc* SHARE/NOSHARE MUST SPECIFY NO OR A VARIABLE LIST****Reason:**

During compilation of an OML procedure, a CALL statement was found that specified SHARE or NOSHARE but has no shared variable list. When SHARE or NOSHARE is specified, either NO or a variable list must also be specified.

srcloc shows the source location of the invalid statement.

System Action:

Compilation of the procedure fails.

User Action:

Following SHARE or NOSHARE, specify NO or a variable list.

NN2310

E *srcloc* NO MUST BE ONLY ENTRY IN SHARE LIST

Reason:

During compilation of an OML procedure, a CALL statement was found that specified SHARE or NOSHARE. The NO keyword was specified and also a variable list was specified. This is invalid. The NO keyword cannot be specified with a variable list. *srcloc* shows the source location of the invalid statement.

System Action:

Compilation of the procedure fails.

User Action:

Remove either the NO keyword or the variable list.

NN2350**E *srcloc* ERROR IN CALL STATEMENT: *reason*****Reason:**

During compilation of an OML procedure, a CALL statement was found that is invalid for the reason shown.

srcloc shows the source location of the invalid statement.

reason provides a description of the error:

INVALID OR MISSING TARGET NAME

The first symbol after 'CALL' is not PROC or PROCEDURE, and is not either a symbol, quoted string, or opening parenthesis (indicating an expression procedure name).

If the first symbol is 'PGM' or 'SUBSYS' this is also an error, as OML does not presently support calls to a user program or subsystem. (If you wish to call a procedure called 'PGM' or 'SUBSYS' then use 'CALL PROC(PGM)' or 'CALL PROC(SUBSYS)').

NULL STRING INVALID TARGET NAME

The syntax <CALL " ...> or <CALL PROC("> is not allowed, as a null string is not a valid procedure name.

NULL CONSTANT EXPRESSION INVALID TARGET NAME

The procedure name expression evaluated to a constant null value during compilation, and this is not a valid procedure name.

> 32000 ARGUMENTS

CALL supports a maximum of 32000 arguments.

PACKAGE NOTATION ONLY VALID FOR CALL PROCEDURE

Package notation (package:procedure) may not be specified when calling a program or subsystem.

System Action:

Compilation of the procedure fails.

User Action:

Correct the CALL statement.

NN2401

E *srcloc* INVALID SYNTAX IN "PARSE" STATEMENT: *token*

Reason:

During compilation of an OML PARSE statement, an invalid source token was found. *srcloc* shows the source location of the error.

System Action:

Compilation of the procedure fails.

User Action:

Correct the syntax of the PARSE statement.

NN2402

E *srcloc* UNSUPPORTED "PARSE" STATEMENT OPTION: *word*

Reason:

During compilation of an OML PARSE statement, an option that is not supported by OML was found.

word shows the option. The REXX PARSE statement options of EXTERNAL, NUMERIC, PULL, SOURCE, and VERSION are not supported by OML.

srcloc shows the source location of the error.

System Action:

Compilation of the procedure fails.

User Action:

Correct the syntax of the PARSE statement.

NN2403

E *srcloc* EXPECTED "WITH", FOUND: *token*

Reason:

During compilation of an OML PARSE statement with the VALUE option, invalid syntax was detected after the expression. *token* shows the invalid syntax.

System Action:

Compilation of the procedure fails.

User Action:

Correct the syntax of the PARSE statement.

NN2404

E *srcloc* EXPECTED VARIABLE NAME, FOUND: *token*

Reason:

During compilation of an OML PARSE or ARG statement with the VAR option, invalid syntax was detected where a variable name was expected. *token* shows the invalid syntax.

System Action:

Compilation of the procedure fails.

User Action:

Correct the syntax of the PARSE statement.

NN2410

E *srcloc* "PARSE" TEMPLATE ERROR *n*

Reason:

During compilation of an OML PARSE or ARG statement, an error in the template was found.

srcloc identifies the location in the source where the error was detected.

n is the error code:

- 1 - An unrecognizable template token was encountered.
- 2 - Following an equal sign (=), the next token was neither a left bracket '(' nor a valid symbol/number.
- 3 - Following a plus sign (+), the next token was neither a left parenthesis '(' nor a valid symbol/number.
- 4 - Following a plus sign (-), the next token was neither a left parenthesis '(' nor a valid symbol/number.
- 5 - Following an opening left parenthesis '(', the next token was not a variable name.
- 6 - Following a variable name, the next token was not a closing right parenthesis ')'.
- 7 - A number was expected at the indicated location. (The current token was a symbol but not a valid number.)
- 9 - A comma was encountered in a template, but the current statement is neither PARSE (UPPER) ARG nor ARG. A comma is valid only for PARSE ARG or ARG.

System Action:

Compilation of the procedure fails.

User Action:

Correct the syntax of the PARSE statement.

NN2420**E *srcloc* "PARSE" CANNOT SET SYSTEM VARIABLES: *varname*****Reason:**

During compilation of an OML PARSE or ARG statement, a template that had a system variable name was found.

srcloc identifies the location in the source where the error was detected.

varname is the system variable name that was found.

PARSE (or ARG) cannot set an OML system variable, even if the system variable is normally assignable.

System Action:

Compilation of the procedure fails.

User Action:

Correct the syntax of the PARSE statement.

NN2501**E *srcloc* EXPRESSION SYNTAX ERROR: *reason*****Reason:**

During compilation of an OML procedure, an expression was found that contains a syntax error.

srcloc shows the source location of the invalid statement.

reason shows the reason why the expression syntax is incorrect.

System Action:

Compilation of the procedure fails.

User Action:

Correct the syntax of the expression.

NN2502

E *srcloc* ERROR EVALUATING CONSTANT EXPRESSION: *reason*

Reason:

During compilation of an OML procedure, an expression was found that contains a constant section which could be evaluated during compilation but during evaluation an error occurred.

srcloc shows the source location of the invalid statement.

reason shows the reason that the evaluation failed.

System Action:

Compilation of the procedure fails.

User Action:

The expression results in processing which cannot be performed by OML. The action to take will be dependant on the reason given.

NN2510

W *srcloc* OPERATOR HAS CONSTANT ARGUMENTS

Reason:

During compilation of an OML procedure, an expression was found that contained a logical operation (for example, comparison of two numbers) with both arguments being constant. This message is sent as a warning because this usually indicates a programming error as the result will already be known, which means the code is redundant. *srcloc* shows the source location of the expression.

System Action:

Compilation of the procedure continues.

User Action:

Check the expression. If you want the expression to remain in this format, no action is required. This warning is only sent during compilation due to the OMLCHECK command.

NN2511**W *srcloc* CONSTANT EXPRESSION****Reason:**

During compilation of an OML procedure, an expression was found that contains only constant values. The expression is used for a function which would normally not have a constant value (e.g. IF 'A' = 'B'..). This warning message is sent because this usually indicates a programming error as the result will already be known, meaning the code is redundant. *srcloc* shows the source location of the expression.

System Action:

Compilation of the procedure continues.

User Action:

Check the expression. If you want the expression to remain in this format, no action is required. This warning is only sent during compilation due to the OMLCHECK command.

NN2570**E *srcloc* EXPRESSION TERM <term> reason****Reason:**

During compilation of an OML procedure, an expression was found that contained an invalid component. The component is invalid for the reason shown.

srcloc shows the source location of the expression.

term shows the component which is invalid.

reason shows the reason why the component is invalid.

System Action:

Compilation of the procedure fails.

User Action:

Correct the expression.

NN2901

linenum: text

Reason:

This message was sent during compilation of an OML procedure for OMLCHECK LIST=YES. It contains the listing of the procedure.

linenum shows the line number in the file.

text shows the source text for this line.

System Action:

None.

User Action:

None.

NN2902

%%INCLUDE START: *filename* LEVEL: *level*

Reason:

This message is sent during compilation of an OML procedure when a new %%INCLUDE *file* is being processed, if requested via OMLCHECK LIST=YES.

filename shows the source file name of the included file.

level shows the depth of %%INCLUDE processing for this file.

System Action:

None.

User Action:

None.

NN2903

%%INCLUDE END: *filename* LEVEL: *level*

Reason:

This message is sent during compilation of an OML procedure when the end of a %%INCLUDE file is encountered, if requested via OMLCHECK LIST=YES.

filename shows the source file name of the included file.

level shows the depth of %%INCLUDE processing for this file.

System Action:

None.

User Action:

None.

NN2910

E *srcloc* TOO MANY %%DEFINE REPLACEMENTS. CURRENT SYM: *symbol*

Reason:

During compilation of an OML procedure, the resolution of a symbol that was defined by %%DEFINE has caused more than 256 substitution passes to try to resolve the final *string*. This is considered to be an error because either a recursive definition has been entered or the string is so complex the author has no chance of understanding what the final string will be.

srcloc shows the source file location of the statement in error.

symbol shows the current %%DEFINED symbol being resolved.

System Action:

Compilation of the procedure fails.

User Action:

Correct the %%DEFINE definitions to avoid the recursive definition, or make the definitions easier to understand.

NN2911

E *srcloc* %%DEFINE REPLACEMENT OVERFLOW, CURRENT SYM: *symbol*

Reason:

During compilation of an OML procedure, a string defined by %%DEFINE has been resolved, but the resulting string is more than 255 bytes long. The maximum length allowed is 255.

srcloc shows the source location of the statement in error.

symbol shows the name of the symbol being resolved when the error occurred.

System Action:

Compilation of the procedure fails.

User Action:

Redefine the %%DEFINES to make sure the final string length cannot be more than 255 bytes.

NN2920

E *srcloc* UNCLOSED COMMENT IN PREPROCESSOR STATEMENT

Reason:

During compilation of an OML procedure, a preprocessor statement (that is, a statement starting with %%, for example %%DEFINE) was found to have a comment which was not closed by */. *srcloc* shows the source location of the statement in error.

System Action:

Compilation of the procedure fails.

User Action:

Add a closing */ to the comment.

NN2921**E *srcloc* INVALID SYNTAX IN PREPROCESSOR STATEMENT****Reason:**

During compilation of an OML procedure, a preprocessor statement (that is, a statement starting with `%%`, for example `%%DEFINE`) was found to have invalid syntax. *srcloc* shows the source location of the statement in error.

System Action:

Compilation of the procedure fails.

User Action:

Correct the statement.

NN2922**E *srcloc* UNRECOGNISED WORD <word> IN PREPROCESSOR STATEMENT****Reason:**

During compilation of an OML procedure, a preprocessor statement (that is, a statement starting with `%%`, for example `%%DEFINE`) was found to have unrecognised word.

srcloc shows the source location of the statement in error.

word shows the word which is not recognised.

System Action:

Compilation of the procedure fails.

User Action:

Correct the statement.

NN2923

E *srcloc* UNCLOSED QUOTED STRING IN PREPROCESSOR STATEMENT

Reason:

During compilation of an OML procedure, a preprocessor statement (that is, a statement starting with `%%`, for example `%%DEFINE`) was found to have a quoted string which with no closing quote. *srcloc* shows the source location of the statement in error.

System Action:

Compilation of the procedure fails.

User Action:

Add a closing quote to the string.

NN2924

E *srcloc* UNPAIRED DBCS STRING IN PREPROCESSOR STATEMENT

Reason:

During compilation of an OML procedure, a preprocessor statement (that is, a statement starting with `%%`, for example `%%DEFINE`) was found to have unpaired DBCS shift characters. *srcloc* shows the source location of the statement in error.

System Action:

Compilation of the procedure fails.

User Action:

Ensure that DBCS shift characters are correctly paired.

NN2930

E *srcloc* EOF WHILE CONCATENATING LINES

Reason:

During compilation of an OML procedure, end-of-file (EOF) was encountered whilst concatenating lines that end with `'\'`.

System Action:

Compilation of the procedure fails.

User Action:

Remove any redundant `'\'` character from the end of the last source line.

NN2931**E *srcloc* INCLUDE FILE EOF WHILE CONCATENATING LINES****Reason:**

During compilation of an OML procedure, end-of-file (EOF) in an included file (%%INCLUDE) was encountered whilst concatenating lines that end with '\.

System Action:

Compilation of the procedure fails.

User Action:

Remove any redundant '\ character from the end of the include file source line.

NN2932**E *srcloc* BUFFER OVERFLOW WHILE CONCATENATING LINES****Reason:**

During compilation of an OML procedure, a set of concatenated lines has exceeded the maximum allowable buffer length. This length is 4000 characters.

System Action:

Compilation of the procedure fails.

User Action:

reduce the number of consecutive concatenated lines.

NN2933**E *srcloc* TOO MANY SOURCE LINES WHILE CONCATENATING LINES****Reason:**

During compilation of an OML procedure, a set of concatenated lines has exceeded the maximum allowable number of lines. This limit is 100 lines.

System Action:

Compilation of the procedure fails.

User Action:

Reduce the number of consecutive concatenated lines.

NN2950

E *srcloc* MISSING SYMBOL ON %%%DEFINE/%%%UNDEFINE STATEMENT

Reason:

During compilation of an OML procedure, a %%%DEFINE or %%%UNDEFINE statement was found which did not specify the symbol to be DEFINEd or UNDEFINEd. *srcloc* shows the source location of the statement in error.

System Action:

Compilation of the procedure fails.

User Action:

Add the string to the statement.

NN2951

E *srcloc* INVALID %%%DEFINE/%%%UNDEFINE SYMBOL: *symbol*

Reason:

During compilation of an OML procedure, a %%%DEFINE or %%%UNDEFINE statement specified a symbol which was either too long, contained invalid characters or was numeric.

srcloc shows the source location of the statement in error.

symbol shows the invalid symbol.

System Action:

Compilation of the procedure fails.

User Action:

Correct the symbol.

NN2955**E *srcloc* PREVIOUSLY %%DEFINED SYMBOL: *symbol*****Reason:**

During compilation of an OML procedure, a %%DEFINE statement specified a symbol which had already been defined using %%DEFINE.

srcloc shows the source location of the statement in error.

symbol shows the symbol.

System Action:

Compilation of the procedure fails.

User Action:

Check that the symbol names are correct. If so, insert a %%UNDEFINE statement before the statement in error.

NN2956**E *srcloc* %%DEFINE VALUE TOO LONG****Reason:**

During compilation of an OML procedure, a %%DEFINE statement specified a replacement value which was too long.

The limit for a %%define replacement value is approximately 4000 characters.

srcloc shows the source location of the statement in error.

System Action:

Compilation of the procedure fails.

User Action:

Reduce the length of the %%DEFINE replacement text.

NN2958

E *srcloc* DATA AFTER %%UNDEFINE SYMBOL

Reason:

During compilation of an OML procedure, a %%UNDEFINE statement was found that had data after the symbol to be %%UNDEFINEd. *srcloc* shows the source location of the statement in error.

System Action:

Compilation of the procedure fails.

User Action:

Remove the data following the symbol name or enclose it in comment delimiters (*/* comment */*).

NN2959

W *srcloc* SYMBOL NOT DEFINED, %%UNDEFINE IGNORED: *symbol*

Reason:

During compilation of an OML procedure, a %%UNDEFINE statement was found that specified the name of a symbol which had not been %%DEFINEd.

srcloc shows the source location of the statement in error.

symbol shows the name of the symbol.

System Action:

Compilation of the procedure continues.

User Action:

This is a warning message that only appears during compilation for an OMLCHECK command. Check that the symbol name is correct, and if a corresponding %%DEFINE has been omitted. Remove the %%UNDEFINE statement if it is not required.

NN2960**E *srcloc* MISSING OR INVALID %%INCLUDE FILE NAME****Reason:**

During compilation of an OML procedure, a %%INCLUDE statement was found that has no include file name, or an invalid include file name. *srcloc* shows the source location of the statement in error.

System Action:

Compilation of the procedure fails.

User Action:

If the name has been omitted, add it to the statement. If it is present make sure it is a valid PDS name which is up to 8 characters in length.

NN2961**E *srcloc* INVALID SYNTAX IN %%INCLUDE STATEMENT****Reason:**

During compilation of an OML procedure, a %%INCLUDE statement was found that has data after the include file name. *srcloc* shows the source location of the statement in error.

System Action:

Compilation of the procedure fails.

User Action:

Remove the data after the include file name or enclose it in comment delimiters (*/* comment */*).

NN2962

E *srcloc* TOO MANY %%%INCLUDE STATEMENTS

Reason:

During compilation of an OML procedure, the number of %%%INCLUDE statements found was more than 256. *srcloc* shows the source location of the statement in error.

System Action:

Compilation of the procedure fails.

User Action:

Restructure the procedure to use 256 %%%INCLUDEs or less.

NN2963

E *srcloc* %%%INCLUDE FILE: *filename* OPEN FAILED

Reason:

During compilation of an OML procedure, the specified %%%INCLUDE file could not be opened.

srcloc shows the source location of the statement in error.

filename shows the name of the file.

System Action:

Compilation of the procedure fails.

User Action:

Check that the name of the procedure is spelt correctly (this error could indicate a non-existent file was specified). Check the library concatenation used by your userID to ensure the required library is present.

NN2970**E *srcloc* MORE THAN 1 %%PTF STATEMENT FOUND****Reason:**

During compilation of an OML procedure, more than one %%PTF statement was found. This statement is used to record the maintenance level of a procedure. There can only be one maintenance level, therefore only one %%PTF statement is allowed per procedure. *srcloc* shows the source location of the statement in error.

System Action:

Compilation of the procedure fails.

User Action:

Remove the unnecessary %%PTF statement(s).

NN2971**E *srcloc* INVALID PTF NAME ON %%PTF STATEMENT****Reason:**

During compilation of an OML procedure, a %%PTF statement was found which specified an invalid PTF name. The name must be a PDS name up to 8 characters in length. *srcloc* shows the source location of the statement in error.

System Action:

Compilation of the procedure fails.

User Action:

Correct the PTF name.

NN2990

E *srcloc* INVALID SOURCE TOKEN: *reason*

Reason:

During compilation of an OML procedure, an invalid token was found, the reason is shown.

srcloc shows the source location of the token.

reason shows the reason why the token is invalid.

System Action:

Compilation of the procedure fails.

User Action:

Correct the token to make it valid.

NN2991

W *srcloc* QUOTED STRING CROSSES LINES

Reason:

During compilation of an OML procedure, a quoted string was found which starts and ends on different lines. This warning message is sent to warn of the possibility that this is an accident. This message is only produced if the compilation is for an OMLCHECK command. *srcloc* shows the source location of the quoted string.

System Action:

Compilation of the procedure continues.

User Action:

Check if this is deliberate. If so, no further action is required.

NN2998**E ABEND *abend* READING FILE: *filename*****Reason:**

During compilation of an OML procedure, an abend occurred while the named file was being read.

System Action:

Compilation of the procedure is aborted immediately.

User Action:

Investigate the reason for the abend.

NN2999**E I/O ERROR READING FILE: *filename*****Reason:**

During compilation of an OML procedure, an I/O error occurred while the named file was being read.

System Action:

Compilation of the procedure is aborted immediately.

User Action:

Investigate the reason for the I/O error.

NN3032**E *srcloc* GOTO/GOSUB ERROR: *reason*****Reason:**

During compilation of an OML procedure a GOTO or GOSUB statement was found to be invalid for the reason shown.

srcloc shows the source location of the statement in error.

reason shows the reason that the statement is invalid.

System Action:

Compilation of the procedure fails.

User Action:

Correct the GOTO or GOSUB statement.

NN3038

E *srcloc* CALL ERROR: *reason*

Reason:

During compilation of an OML procedure, a CALL statement was found to be invalid for the reason shown.

srcloc shows the source location of the statement in error.

reason shows the reason why the statement is invalid.

System Action:

Compilation of the procedure fails.

User Action:

Correct the CALL statement.

NN3040

E *srcloc* SIGNAL ERROR: *reason*

Reason:

During compilation of an OML procedure, a SIGNAL statement was found to be invalid. The reason is shown.

srcloc shows the source location of the statement in error.

reason shows the reason why the statement is invalid.

System Action:

Compilation of the procedure fails.

User Action:

Correct the SIGNAL statement.

NN3501**E *srcloc* FUNCTION CALL TARGET *funcname* IS A PROCEDURE****Reason:**

During compilation of an OML procedure, a function call was found but the target name is actually the name of a PROCEDURE. The target of a function call must be a FUNCTION.

srcloc shows the source location of the statement in error.

funcname shows the name of the target function.

System Action:

Compilation of the procedure fails.

User Action:

Correct the function name or change the target procedure to that of a function.

NN3502**E *srcloc* FUNCTION CALL TARGET *funcname* IS NOT A VALID EXTERNAL NAME****Reason:**

During compilation of an OML procedure, a function call was found. The target name was not found in the source file, and is not a valid PDS name and as such is invalid.

srcloc shows the source location of the statement in error.

funcname shows the name of the target function.

System Action:

Compilation of the procedure fails.

User Action:

Correct the function name.

NN3503

E *srcloc* INCORRECT NUMBER OF ARGUMENTS TO BUILTIN FUNCTION: *funcname*

Reason:

During compilation of an OML procedure, a built-in function call was found. The number of arguments specified is more than 32000.

srcloc shows the source location of the statement in error.

funcname shows the name of the target function.

System Action:

Compilation of the procedure fails.

User Action:

Reduce the number of arguments on the call.

NN3504

E *srcloc* INVALID CONSTANT ARGUMENT *argnum* TO BUILTIN FUNCTION: *funcname*

Reason:

During compilation of an OML procedure, a built-in function call was found. The named argument is invalid.

srcloc shows the source location of the statement in error.

argnum shows the argument number of the invalid argument.

funcname shows the name of the target function.

System Action:

Compilation of the procedure fails.

User Action:

Correct the argument.

NN3505

**E *srcloc* NULL ARGUMENT *argnum* INVALID FOR BUILTIN FUNCTION:
*funcname***

Reason:

During compilation of an OML procedure, a built-in function call was found.
The specified argument is null. This is not allowed.

srcloc shows the source location of the statement in error.

argnum shows the argument number of the invalid argument.

funcname shows the name of the target function.

System Action:

Compilation of the procedure fails.

User Action:

Correct the argument.

NN8501

E OBJECT LOAD OF *pppp* FAILED, REASON CODE *rrr*

Reason:

An OML object load failed. The reason code provides a precise indication of the error.

Some of the error codes are:

001 to 011 - Invalid object header record(s) (generally meaning that the object has been edited, or file-transferred with ASCII conversion, etc).

012 - Object version mismatch. This object was compiled on an incompatible version of Management Services.

013 to 029 - See 001 to 011 above.

040 or 042 - Invalid record sentinel. Could indicate that the object has been ASCII/EBCDIC translated.

501 - Storage shortage.

606 - See 012 above.

802 or 803 - Invalid checksum, indicating possible file transfer with ASCII translation, or tampering or editing of the object.

804 - Unexpected end-of-file condition.

805 - I/Oabend.

806 - Unrecoverable I/O error.

807 - Not EOF when expected.

808 - Unrecoverable I/O error orabend.

810 - Invalid record sentinel. Could indicate that the object has been ASCII/EBCDIC translated.

All other error codes indicate internal failures or errors.

System Action:

The object load fails.

User Action:

Examine the error code and take corrective action if possible.

NN8550**E OBJECT LOAD OF *pppp* FAILED, SYSVAR: *nnnn* ERROR: *eeee*****Reason:**

An OML object load failed. A problem was encountered while resolving a system variable.

System Action:

The object load fails.

User Action:

Examine the error description and take corrective action if possible.

NN8551**E OBJECT LOAD OF *pppp* FAILED, BIF: *nnnn* ERROR: *eeee*****Reason:**

An OML object load failed. A problem was encountered while resolving a built-in function.

System Action:

The object load fails.

User Action:

Examine the error description and take corrective action if possible.

NN8552**E OBJECT LOAD OF *pppp* FAILED, VERB: *nnnn* ERROR: *eeee*****Reason:**

An OML object load failed. A problem was encountered while resolving a verb.

System Action:

The object load fails.

User Action:

Examine the error description and take corrective action if possible.

NN8553

E OBJECT LOAD OF *pppp* FAILED, VERB: *nnnn* ARG: *aaaa* ERROR: *eeee*

Reason:

An OML object load failed. A problem was encountered while resolving a verb argument (operand).

System Action:

The object load fails.

User Action:

Examine the error description and take corrective action if possible.

NN8554

E OBJECT LOAD OF *pppp* FAILED, VERB: *nnnn* ARG: *aaaa* KWD: *kkkk* ERROR: *eeee*

Reason:

An OML object load failed. A problem was encountered while resolving a verb argument (operand) keyword.

System Action:

The object load fails.

User Action:

Examine the error description and take corrective action if possible.

NN8557

W *pppp* REFERENCES UNKNOWN SYSTEM VARIABLE: *nnnn*

Reason:

This is a warning message. During object loading, an unrecognised system variable name was found. If the statement(s) referencing it are executed, an error will occur.

System Action:

The object load continues.

User Action:

Ensure that this will not cause a runtime problem.

NN8558**W *pppp* REFERENCES UNKNOWN BUILTIN FUNCTION: *nnnn*****Reason:**

This is a warning message. During object loading, an unrecognised built-in function name was found. If the statement(s) referencing it are executed, an error will occur.

System Action:

The object load continues.

User Action:

Ensure that this will not cause a runtime problem.

NN8559**W *pppp* REFERENCES UNKNOWN VERB: *nnnn*****Reason:**

This is a warning message. During object loading, an unrecognised verb name was found. If the statement(s) referencing it are executed, an error will occur.

System Action:

The object load continues.

User Action:

Ensure that this will not cause a runtime problem.

NN8599**E COMPILER STORAGE SHORTAGE, OBJECT RELOAD FAILED****Reason:**

An OML object reload failed due to a storage shortage.

System Action:

The object load fails.

User Action:

Investigate the storage shortage.

NN9120

E COMPILER STORAGE SHORTAGE, UNABLE TO CONTINUE

Reason:

The OML compiler has encountered a fatal storage shortage.

System Action:

The compile fails.

User Action:

Investigate the storage shortage.

NN9201

OML COMPILE OF *pppp* IN LIBRARY *////* HAS ERRORS/WARNINGS:

Reason:

The OML compiler has detected errors or warnings while compiling a procedure. This message precedes the actual error messages.

System Action:

The compile error and warning messages follow.

User Action:

Examine the messages and take appropriate action.

NN9320

E COMPILER STORAGE SHORTAGE, UNABLE TO CONTINUE

Reason:

The OML compiler has encountered a fatal storage shortage.

System Action:

The compile fails.

User Action:

Investigate the storage shortage.

NNL201**SYSTEM I/O MANAGER INITIALIZATION COMPLETE****Reason:**

The system I/O manager, used to load NCL procedures, has initialized successfully.

System Action:

None.

User Action:

None.

NNL202**SYSTEM I/O MANAGER SUBTASK ABEND - RESTARTING SUBTASK****Reason:**

This message indicates an unexpected subtask abend by a system I/O subtask.

System Action:

An attempt is made to restart the subtask.

User Action:

Determine the reason for the abend from the operating system log. Contact your product support representative.

NNL950**LIBRARY I/O ERROR PROC *procname synad-information*****Reason:**

An I/O error was encountered whilst loading the indicated NCL procedure. I/O error information, as obtained by the SYNADAF function is displayed.

System Action:

The system will retry the load, if possible.

User Action:

None, unless the problem persists. If it does, investigate the problem.

NP0001

TNG API INITIALIZED

Reason:

The CA Common Services API has initialized successfully.

System Action:

None.

User Action:

None.

NP0010

DEFAULT OUTPUT DESCRIPTOR (TNGPRINT) ADDED SUCCESSFULLY

Reason:

The CA Common Services API has defined a JES output descriptor of SYSOUT CLASS=A for use by the API's C modules for STDOUT, SYSPRINT.

System Action:

None.

User Action:

If you want to override this definition, include an OUTPUT statement in your JCL.

NP0011

DEFAULT OUTPUT DESCRIPTOR (TNGPRINT) NOT ADDED, DUPLICATE

Reason:

The CA Common Services API has attempted to define a JES output descriptor for use by the API's C modules for STDOUT, SYSPRINT. A definition for TNGPRINT already exists in the JCL.

System Action:

None.

User Action:

None.

NP0012**DEFAULT OUTPUT DESCRIPTOR (TNGPRINT) NOT ADDED, ERROR RC (HEX): P1 REASON (DEC): P2 KEY IN ERROR (HEX): P3****Reason:**

The CA Common Services API has attempted to define a JES output descriptor for use by the API's C modules for STDOUT, SYSPRINT. The dynamic allocation failed with the return code and reason indicated.

System Action:

None.

User Action:

Use the dynamic allocation reason code to determine the error. Use the /DAIR shortcut to view information about reason codes.

NPH401**Unable to get the Process Extension****Reason:**

NetView pipe emulation has terminated due to an internal error in the PIPEHELP facility.

System Action:

The PIPE command terminates.

User Action:

Contact Computer Associates Technical Support.

NPH402

P1 P2

Reason:

NetView pipe emulation Extended Trace (TRACE) was specified.

P1 is the NCL ID.

P2 is the trace data.

System Action:

None.

User Action:

Contact Computer Associates Technical Support.

NPH403

P1 P2

Reason:

NetView pipe emulation Extended Trace (TRACE) was specified.

P1 is the NCL ID.

P2 is the trace data.

System Action:

None.

User Action:

Contact Computer Associates Technical Support.

NPH410**Stage P1 reads input from stream P2, " P3"****Reason:**

NetView pipe emulation DEBUG 1 option was specified and/or the pipe stage (DEBUG) option was specified.

P1 is the stage number.

P2 is the stream number.

P3 are the first 16 characters read from the input stream.

System Action:

None.

User Action:

None.

NPH411**Stage P1 writes output to stream P2, " P3"****Reason:**

NetView pipe emulation DEBUG 1 option was specified and/or the pipe stage (DEBUG) option was specified.

P1 is the stage number.

P2 is the stream number.

P3 are the first 16 characters written to the output stream.

System Action:

None.

User Action:

None.

NQ0080

MQ INTERFACE SETUP FAILURE: code - extra-data

Reason:

The IBM MQ interface cannot be initialized because of the reason indicated by the code and extra data.

1 - DISABLED BY JCL PARM

Indicates that the MQI JCL parameter was set to (or defaulted to) N, meaning that the MQ interface was not wanted.

2 - LOAD FOR INTERFACE MODULE mmmmmmmm FAILED

Indicates that the MQ interface was unable to load a module that is required to access the IBM MQ facility. The module must be link edited and installed in the region's load library.

3 - INTERFACE MODULE mmmmmmmm RETURNED NON-ZERO COMPLETION CODE: cc Indicates that the module that provides the interface to the IBM MQ facility was unable to set up the interface.

System Action:

None.

User Action:

For reason code 1, no action is necessary.

For reason code 2, ensure that the relevant module is set up.

For reason code 3, contact Technical Support.

NQ0310

MQ INTERFACE INSTALLED AND AVAILABLE

Reason:

This message is part of the response to a STATUS command.

It indicates that the interface to the IBM MQ facility is installed and available for use.

System Action:

None.

User Action:

None.

NQ0311**MQ INTERFACE UNAVAILABLE. REASON: rrrrrrr****Reason:**

This message is part of the response to a STATUS command.

It indicates that the MQ interface was not initialized because of the displayed reason:

DISABLED BY JCL PARM

Indicates that the MQI JCL parameter specified or defaulted to N.

LOAD FOR API FAILED (SEE LOG)

Indicates that the requested IBM MQ API module could not be loaded.

API I/F MODULE RETURNED NZ RC (SEE LOG)

Indicates that the requested IBM MQ API module returned an error.

UNKNOWN

Indicates that the reason is not known.

System Action:

None.

User Action:

None.

NQ0312**MQ INTERFACE STATUS UNKNOWN****Reason:**

This message is part of the response to a STATUS command.

It indicates that the status of the MQ interface is not known.

System Action:

None.

User Action:

None.

NQ0410

MQ INTERFACE USER LIST FOLLOWS

Reason:

This message is part of the response to a SHOW MQ command.
It introduces the list of MQ API users.

System Action:

None.

User Action:

None.

NQ0411

NCLID USERID QMGR

Reason:

This message is part of the response to a SHOW MQ command.
It provides column headings for the NQ0415 message:
NCLID identifies the process.
USERID identifies the user of the process.
QMGR identifies the MQ queue manager to which the process is connected.

System Action:

None.

User Action:

None.

NQ0412**ID LST-FUNC CC RS T NAME****Reason:**

This message is part of the response to a SHOW MQ DETAILS command.

It provides column headings for the NQ0416 message:

ID identifies the open object.

LST-FUNC identifies the last MQ function operated on this object.

CC displays the last MQ API completion code for this object.

RS displays the last MQ API reason code for this object.

T identifies the object type:

L for namelist

M for qmgr (queue manager)

P for process

Q for queue

? for unknown

NAME displays the object name.

System Action:

None.

User Action:

None.

NQ0415**nclid userid qmgr****Reason:**

This message is part of the response to a SHOW MQ command.

It provides information about an MQ API user.

For column descriptions, see the NQ0411 message.

System Action:

None.

User Action:

None.

NQ0416

id lst-func cc rs t name

Reason:

This message is part of the response to a SHOW MQ DETAILS command.
It provides information about an open path for an MQ API user.
For column descriptions, see the NQ0412 message.

System Action:

None.

User Action:

None.

NQ1080

MDO PROCESSING ERROR. RC: rr ARG: a KEY: k OFFSET (DEC): o

Reason:

This message is issued when the MQ verb encounters an error while processing an MDO that contains message descriptor information, or PUT or GET message options.

The fields describe the error.

System Action:

The process is terminated.

User Action:

Correct the error.

NQ1081**GET TARGET MDO ASSIGN ERROR. RC: rr****Reason:**

This message is issued when the MQ GET verb encounters an error while processing an MDO that is nominated as the return MDO.

The MDO assignment return code is shown.

System Action:

The process is terminated.

User Action:

Correct the error.

NQ1082**GET TARGET MDO MAP CONNECT ERROR. RC: rr****Reason:**

This message is issued when the MQ GET verb encounters an error while processing an MDO that is nominated as the return MDO.

The MDO map connection return code is shown.

System Action:

The process is terminated.

User Action:

Correct the error.

NQ1181

MDO SETUP ERROR. RC: rrr ARG: aaa R0: aaa

Reason:

This message is issued when an MQ INQUIRE or MQ SET verb encounters an error while setting up an MDO.

The fields describe the error.

System Action:

The process is terminated.

User Action:

Correct the error.

NQ1182

INCORRECT MAP FOR "SET" MDO. MDO NAME: aaa - EXPECTED: bbb

Reason:

An MQ SET verb nominated an MDO that is not mapped by the correct map.

The fields describe the error.

System Action:

The process is terminated.

User Action:

Correct the error.

NQ1183

NUMERIC ATTR CODE: aaa NOT VALID

Reason:

An MQ SET or MQ INQUIRE verb specified the NATTR parameter with an invalid numeric attribute value, aaa .

System Action:

The process is terminated.

User Action:

Correct the error.

NQ1184**DUPLICATE NUMERIC ATTR CODE: aaa****Reason:**

An MQ SET or MQ INQUIRE verb specified the NATTR parameter with the following numeric attribute value duplicated: aaa .

System Action:

The process is terminated.

User Action:

Correct the error.

NQ1185**MDO KEY NOT VALID FOR "SET" OF THIS OBJECT: aaa****Reason:**

An MQ SET verb specified the MDO parameter, but the indicated MDO key, aaa , is not a valid settable attribute.

System Action:

The process is terminated.

User Action:

Correct the error.

NQ1186**MDO FLD LEN FOR aaa ATTR: bbb IS INVALID: ccc****Reason:**

An MQ SET verb specified the MDO parameter, but the indicated MDO field (type (CHAR/NUMERIC) and key shown) is not valid data.

System Action:

The process is terminated.

User Action:

Correct the error.

NQ1187

INSUFFICIENT VARIABLES PROVIDED IN "VARS" LIST

Reason:

An MQ INQUIRE or MQ SET verb specified the VARS parameter with not enough variables to set the values of the attributes specified in the ATTR or NATTR parameter.

System Action:

The process is terminated.

User Action:

Correct the error.

NQ1188

VAR DATA LEN FOR aaa ATTR: bbb IS INVALID: ccc

Reason:

An MQ SET verb specified the VARS parameter, but the indicated data (type (CHAR/NUMERIC) and attribute code shown) is not valid data.

System Action:

The process is terminated.

User Action:

Correct the error.

NQ1189

MDO aaa FAILURE. RC: bbb FB: ccc

Reason:

An MQ INQUIRE verb specified the MDO parameter, but either the assignment of data or the map connection failed.

System Action:

The process is terminated.

User Action:

Correct the error.

NQ2090**MQ INTERFACE SUBTASK UNEXPECTED TERMINATION. REQUEST IN
PROGRESS: rrrr****Reason:**

An MQ API subtask terminated unexpectedly.

It displays the NCL ID (if known) or the request name that was in progress.

System Action:

None.

User Action:

None.

NQ2091**TERMINATION TYPE AND INFO: iii****Reason:**

An MQ API subtask terminated unexpectedly.

It provides the subtask termination information, such as the ABEND code.

System Action:

None.

User Action:

None.

NQ2092**REFER TO PRECEDING N15Z.. MESSAGES FOR PSW/REGS****Reason:**

An MQ API subtask terminated unexpectedly.

Preceding N15Znn messages provide information about the termination.

System Action:

None.

User Action:

Review the N15Znn messages to determine the action.

NQ4280

LOAD FOR MQ I/F MODULE: mmmmmmmm FAILED. RC: rrr CODE: ccc

Reason:

The MQI JCL parameter is set to D or Y, but the region cannot load a required MQ interface module.

mmmmmmmm identifies the module.

rrr displays the internal load facility return code.

ccc displays the system return code.

System Action:

The MQ interface is not activated.

User Action:

Ensure that the relevant MQ load libraries are available to the region through STEPLIB, JOBLIB, LPA, or LINKLIST.

NR0080

LOAD FOR REXX INTERFACE MODULE: mmmmmmmm FAILED, INFO: *iiiiii*

Reason:

This message is logged during NetMaster initialization if a required module related to the REXX interface could not be loaded.

The load failure codes are displayed.

System Action:

Initialization continues. The REXX facility will not be available.

User Action:

Check that the NetMaster load library has not been corrupted.

NR0310**SYSTEM CONFIGURED WITH REXX INTERFACE****Reason:**

This message is in response to a STATUS command, and indicates that this NetMaster system has the REXX interface available.

System Action:

None.

User Action:

None.

NR0410**EXECUTING REXX PROCESS LIST FOLLOWS****Reason:**

This message is the first response message for a SHOW REXX command.

System Action:

Rexx process list messages follow.

User Action:

None.

NR0411**ID BASEPROC CURRENT LEV W TYPE USERID ENV HELPID PG PRI****Reason:**

This message is the heading line for the response to a SHOW REXX command.

The column headings are:

ID

The process identification number

BASEPROC

The original procedure name

CURRENT

The currently executing (top) procedure name

LEV

The external call nesting level W The user window number

TYPE

The process type:

CMD

The process is executing as a command

FUNC

The process is executing as a function

SUBRTN

The process is executing as a subroutine

SERVER

The process is executing as a server

USERID

The owning user id

ENV

The 'Environment' that this REXX process is executing in

HELPID

The associated 'REXXHELP' process identifier

PG

The performance group that this process is executing in

PRI

The priority within the performance group.

System Action:

None.

User Action:

None.

NR0412

id baseproc current lev w type userid env helpid pg pri

Reason:

This message is the first detail line listing a REXX process in response to a SHOW REXX command.

Refer to the description of NR0411 for column headings and meanings.

System Action:

None.

User Action:

None.

NR0413

..... *description*

Reason:

This message is the second detail line listing a REXX process in response to a SHOW REXX command.

This message indicates the status of the process:

EXECUTING LINE ### *ttttttttt*

The process is presently executing. The source line number and text currently executing is displayed

EXECUTING LINE ###, FORCED IDLE

The process is presently being forced to wait due to performance controls. The source line number that is about to execute is displayed

PROCESSING...

The process is presently executing, but the exact statement is indeterminate

LOADING...

The process is presently loading a procedure.\

System Action:

None.

User Action:

None.

NR0430**NAME LIBRARY S/O STATUS USERS TOT-USE UID/AUSE****Reason:**

This message is the first heading line for the response to a SHOW REXXSTAT command.

The column headings are:

NAME

The procedure name

LIBRARY

The library (DDname) that the procedure was loaded from

S/O

SRC or OBJ indicating source or object.

STATUS

The procedure status:

LOADING

The procedure is loading

P-UNLOAD

The procedure is pending unload

PRELOAD

The procedure has been preloaded

AUTOSHR

The procedure is presently in use

PRIVATE

The procedure was privately loaded:

PRV-NCLT Private load (NCLTEST mode)

PRV-REQ Private internal request

PRV-CHK Private load for RXCHECK command

PRV-OFLD Private load for RXCTL OFFLOAD command

USERS

The current number of active users of the procedure

TOT-USE

The total number of uses of this procedure since it was loaded.

UID/AUSE

If loaded privately, the userid that requested the load

If STATUS is 'RETAIN', the 'aged' use count.

System Action:

None.

User Action:

None.

NR0431

ASHR>RTN RTN>ASHR LD-TIME LD-CPU

Reason:

This message is the second heading line for the response to a SHOW REXXSTAT command.

The column headings are:

ASHR>RTN

The number of times the procedure moved from AUTOSHR status to RETAIN status

RTN>ASHR

The number of times the procedure moved from RETAIN status to AUTOSHR status

LD-TIME

The elapsed time the procedure took to load

LD-CPU

The CPU time expended loading the procedure

System Action:

None.

User Action:

None.

NR0432**SRCLINES SRC-BLKS CODE-KB STG-KB****Reason:**

This message is the third heading line for the response to a SHOW REXXSTAT command.

The column headings are:

SRCLINES

The number of source lines in the procedure

SRC-BLKS

The number of blocks used to hold relevant (Non-comment) source lines

CODE-KB

The size of the compiled code.

STG-KB

The total size of the compiled procedure in storage.

System Action:

None.

User Action:

None.

NR0435***name library s/o status users tot-use uid/ause*****Reason:**

This message is the third detail line for the response to a SHOW REXXSTAT command.

Refer to message NR0432 for column headings and descriptions.

System Action:

None.

User Action:

None.

NR0440**ITEM... VALUE ITEM... VALUE ITEM... VALUE****Reason:**

This message is the heading line for the second part of the response to a SHOW REXXSTAT command.

The column headings are:

ITEM...

A statistics item name (see below)

VALUE

The value for the named item

The following items can occur:

NUM PRELOAD

The current number of preloaded procedures

KB PRELOAD

The current storage occupied by preloaded procedures

NUM AUTOSHR

The current number of autoshared procedures

KB AUTOSHR

The current storage occupied by autoshared procedures

NUM RETAINED

The current number of retained procedures

KB RETAINED

The current storage occupied by retained procedures

RETAIN LIM (K)

The retain limit set by SYSPARMS RXRETAIN

NUM PRIVATE

The current number of privately loaded procedures

KB PRIVATE

The current storage occupied by privately loaded procedures

TOT EXECREQ

The total number of 'execution' requests

FAST EXECREQ

The number of execution requests handled by an already-loaded, usable procedure

SLOW EXECREQ

The number of execution requests that could not be handled by an already-loaded, usable procedure

TOT EXECDROP

The number of 'execution completed' requests

EXEC FROM PRLD

The number of execution requests satisfied by a preloaded procedure

EXEC FROM ASHR

The number of execution requests satisfied by an autoshared procedure

EXEC FROM RETN

The number of execution requests satisfied by a retained procedure

EXEC LOAD SHR

the number of execution requests that used a shareable procedure

EXEC LOAD PVT

The number of execution requests that used a private procedure copy

EXEC TOT LOAD

The total number of loads done as a result of an execution request

MOVE AS -> RT

The total number of procedures moved from the autoshare list to the retain list

MOVE RT -> AS

The total number of procedures moved from the retain list to the autoshare list

DROP RT

The total number of procedures dropped from the retain list due to overflow

NR1020

OLD VERSION OF *pppp* IN LIBRARY //// PURGED FROM STORAGE

Reason:

An UNLOAD PROCEDURE command requested that a REXX procedure be purged from storage. This message confirms that the request is complete.

System Action:

None.

User Action:

None.

NR1021

OLD VERSION OF *pppp* IN LIBRARY //// FLAGGED FOR PENDING UNLOAD

Reason:

An UNLOAD PROCEDURE command requested that a REXX procedure be purged from storage. The procedure is in use and will be purged when its use count drops to 0. Any new requests for the procedure will load a new copy.

System Action:

None.

User Action:

None.

NR1024

PRELOAD COMPLETE FOR *pppp* IN LIBRARY *llll*

Reason:

A LOAD PROCEDURE command for a REXX procedure is complete.

System Action:

None.

User Action:

None.

NR1029

PRELOAD FAILED FOR *pppp* IN LIBRARY *llll* - ALREADY PRELOADED

Reason:

A LOAD PROCEDURE command requested preloading of a REXX procedure has failed because the procedure is already preloaded.

System Action:

The command is ignored.

User Action:

Use UNLOAD PROCEDURE to unload the preloaded procedure if you want to load a new copy.

NR1031

UNLOAD FAILED FOR *pppp* IN LIBRARY *llll* - NOT LOADED

Reason:

An UNLOAD PROCEDURE command failed. The requested REXX procedure is not loaded.

System Action:

The command is ignored.

User Action:

None.

NR1034***nnnn* REXX PROCEDURE(S) UNLOADED BY GENERIC REQUEST****Reason:**

A UNLOAD PROCEDURE command with generic operands was entered. This message indicates the number of REXX procedures unloaded as a result.

System Action:

None.

User Action:

None.

NR1101**REXX COMPILE OF *pppp* IN LIBRARY *////* HAS ERRORS/WARNINGS:****Reason:**

The REXX compiler has detected errors or warnings while compiling a procedure. This message precedes the actual error messages.

System Action:

The compile error and warning messages follow.

User Action:

Examine the messages and take appropriate action.

NR1190**SOURCE OPEN ERROR: CODE: *cccc* DESC: *description*****Reason:**

The REXX compiler attempted to open a file to compile it. An error occurred. The message includes a description of the error.

System Action:

The REXX compile fails.

User Action:

Examine the messages and take appropriate action.

NR1191

IBM-FORMAT REXX OBJECT NOT SUPPORTED

Reason:

The REXX compiler opened a file to compile it. The data in the file appears to be IBM- format REXX object code.

This format of object code is not supported by the NetMaster REXX facility. Obtain the source of the REXX program and make that available to NetMaster.

System Action:

The REXX compile fails.

User Action:

Locate the source code for the REXX program and make it available to NetMaster.

NR1199

REXX COMPILE OF *ppp* IN LIBRARY *///* FAILED DUE TO FATAL STORAGE SHORTAGE

Reason:

The REXX compiler was unable to compile the requested program because there was not enough storage.

System Action:

The REXX compilation fails.

User Action:

Increase the storage available to the region.

NR1201

nnnnn: source line

Reason:

This is a REXX source line. It is written by the REXX compiler during compilation of a REXX program if a listing is requested.

System Action:

None.

User Action:

None.

NR1210**WARNING - CONTINUED QUOTED STRING(S) REPAIRED****Reason:**

This message indicates that the REXX loader/compiler has repaired a suspect source construct.

The specific correction is to add closing quotes, opening quotes, concatenation operators, and continuation commas to successive lines in the source where a quoted string that crossed lines was detected.

This repair is done only if the SYSPARMS RXQSFIX parameter is set to YES, or the overriding RXCTL OFFLOAD or RXCHECK command QSFIX=YES operand is specified.

REXX normally does not allow a quoted string to cross lines. However the IBM REXX interpreters do, as long as the resulting quoted string (including leading and possibly trailing blanks) does not exceed the REXX limit of 250 characters.

The GREXX compiler does not allow this. The NetMaster interface to GREXX tries to help run REXX source unchanged by repairing the source as follows:

From

```
SAY 'this is
    a string
    that crosses
    lines...'
```

To

```
SAY 'this is' ||,
'    a string' ||,
'    that crosses' ||,
'    lines...'
```

This will create valid REXX source in all cases.

Note: There is one circumstance where the resulting REXX source, while syntactically correct, may not execute correctly. If the repaired string has a REXX operator of higher precedence than concatenate (||), the resulting expression is processed in the wrong order. Since the only operators of higher precedence are all arithmetic operators, and numbers are not normally in quoted strings(or that long), this case is not likely to occur.

System Action:

None.

User Action:

None.

NR1280**GREXX COMPILER RETURNED RC: *cc*****Reason:**

This message is written at the end of a REXX compile if the GREXX compiler returned a non-zero return code, but no other error messages were written.

This can occur if an internal error occurs in the GREXX compiler.

System Action:

None.

User Action:

Contact Technical Support.

NR1281**SOURCE COMPILE STORAGE SHORTAGE, CODE: *ccc*****Reason:**

This message is written if a REXX compile fails due to a severe storage shortage.

The values of *ccc* (the code) are:

1

Basic control block storage

2

Object code output area storage

3

Source pointer array storage

4

Source blocks area storage

System Action:

None.

User Action:

Increase the amount of storage available to the region.

NR1282

I/O ABEND: cccccc

Reason:

This message is written if a REXX compile fails due to an abend while reading the source.

System Action:

The compile is terminated.

User Action:

Investigate the abend and correct the problem.

NR1283

I/O ERROR. REFER TO LOG FOR DETAILS

Reason:

This message is written if a REXX compile fails due to an I/O error while reading the source.

System Action:

The compile is terminated.

User Action:

Investigate the error and correct the problem.

NR1284

ERROR *nnn* ...

Reason:

This message is written when the REXX compiler detects an error in the REXX source.

If the source location is available, this message will contain line and column numbers that may help identify the exact location of the error.

It will be followed by an NR1285 message with more information.

System Action:

Depending on options, the compile may proceed to identify further errors.

User Action:

Correct the error in the REXX source.

NR1286***text*****Reason:**

This message is written when the REXX compiler detects an error in the REXX source.

This message contains additional GREXX compiler error information.

For information about this message, see the IBM REXX manuals.

System Action:

Depending on options, the compile may proceed to identify further errors.

User Action:

Correct the error in the REXX source.

NR1301

REXX OBJECT LOAD FAILED, REASON CODE *rrr*

Reason:

A REXX object load failed. The reason code provides a precise indication of the error.

Some of the reason codes are:

001 to 011 - Invalid object header record(s) (generally meaning that the object has been edited or file-transferred with ASCII conversion, etc.).

012 - Object version mismatch. This object was compiled on an incompatible version of NetMaster services.

013 to 029 - See 001 to 011 above.

040 or 042 - Invalid record sentinel. Could indicate that the object has been ASCII/EBCDIC translated.

110 to 113 - Storage shortage.

802 or 803 - Invalid checksum, indicating possible file transfer with ASCII translation, or tampering or editing of the object.

804 - Unexpected end-of-file condition.

805 - I/Oabend.

806 - Unrecoverable I/O error.

807 - Not EOF when expected.

808 - Unrecoverable I/O error orabend.

810 - Invalid record sentinel. Could indicate that the object has been ASCII/EBCDIC translated.

All other reason codes indicate internal failures or errors.

System Action:

The object load fails.

User Action:

Examine the error code and take corrective action if possible.

NR1390

STORAGE SHORTAGE, OBJECT RELOAD FAILED**Reason:**

A REXX object load failed. A fatal storage shortage occurred.

System Action:

The object load fails.

User Action:

Increase the region size.

NR2080

REXX PROCESS START FAILED (*rc,i1,i2*) description**Reason:**

This message is returned to a requestor of a REXX process (and may be subsequently displayed) when a problem is detected during scheduling of a REXX process.

The fields in the message are return code (*rc*), information codes 1 and 2 (*i1* and *i2*), and a short description.

The possible values are:

<i>rc</i>	<i>i1</i>	<i>i2</i>	<i>description</i>
08	10	00	INVALID REXX PROCEDURE NAME
08	12	00	INVALID REXX ENVIRONMENT NAME
08	30	00	INPUT PARAMETER TOO LONG
08	31	00	INPUT STACK RECORD TOO LONG
08	32	00	PARAMETER EXIT ABORTED EXECUTION
12	20	00	NO STORAGE FOR REXX CONTROL BLOCKS
12	21	00	NO STORAGE FOR INPUT PARAMETERS
12	22	00	NO STORAGE FOR INPUT STACK

<i>rc</i>	<i>i1</i>	<i>i2</i>	<i>description</i>
12	23	00	COMMAND MUST HAVE MAX 1 PARAMETER
16	01	00	REXX FACILITY NOT AVAILABLE
16	02	00	REXX FACILITY NOT INITIALIZED
16	03	00	SYSTEM IN SHUTDOWN

System Action:

The requested REXX procedure is not executed.

User Action:

Examine the error information, correct the problem, and retry.

NR2590**UNSUPPORTED OPTION: oooo****Reason:**

This message is displayed when a REXX program executes an OPTIONS statement that contains an unsupported option.

Generally, the REXX language requires the implementation to ignore unrecognized or unsupported options.

However, this implementation will raise an error on the following options:

ETMODE
EXMODE

These options are not supported, as they imply that the execution environment is able to understand DBCS (Double-Byte character set) encodings.

Presently, NetMaster REXX does not support DBCS.

System Action:

A REXX error is signaled.

User Action:

Correct the OPTIONS statement.

NR2591**SYNTAX ERROR IN OPTION: ooooo****Reason:**

This message is displayed when a REXX program executes an OPTIONS statement that contains a recognized option, but the syntax of the option is not valid.

System Action:

A REXX error is signaled.

User Action:

Correct the OPTIONS statement.

NR2D80**REXX PROXY SUBTASK ATTACH FAILURE. SEE LOG****Reason:**

This message is issued when a REXX process requests a function that requires a subtask to be attached.

The subtask attach has failed. The NetMaster log will have additional information.

System Action:

The request fails.

User Action:

Examine the NetMaster log for further information.

NR2D81

REXX PROXY SUBTASK INITIALIZATION FAILURE. SEE LOG

Reason:

This message is issued when a REXX process requests a function that requires a subtask to be attached.

The subtask was attached, but failed to initialize. Additional information will be written to the NetMaster log

System Action:

The request fails.

User Action:

Examine the NetMaster log for further information.

NR2D82

REXX PROXY SUBTASK ABNORMAL TERMINATION. SEE LOG

Reason:

This message is issued when a REXX process requests a function that is processed by a subtask.

The subtask has abnormally terminated. Additional information will be written to the NetMaster log, including register contents, etc.

System Action:

The request fails.

User Action:

Examine the NetMaster log for further information.

NR2D90

**N/S EXTE RTN CALLED. *aaa/bbb/ccc* ENV/FUNC: *ddd* ILOADMOD: *eee*
N/S RTN: *fff***

Reason:

This message is issued when a REXX process has issued either a command that is handled by an external program, or a function or procedure call that is handled by an external program.

The external program, executing in a separate subtask, has attempted to call a support routine (defined by the TSO/E REXX assembler API), that NetMaster REXX does not support.

The message contains the following information:

aaa

Base (top)REXX procedure name

bbb

Current REXX procedure name

ccc

Line number in current REXX procedure

ddd

SUBCOMN environment or external function name

eee

Load module that was caller

fff

Logical name of the unsupported API entry point

System Action:

The API request fails with an appropriate error return code.

User Action:

Report this to your product support representative.

Note: The supported API routines and actual functions supported in those routines are documented in the NetMaster REXX Guide.

NR2D91

**N/S EXTE FUNC CALLED. *aaa/bbb/ccc* ENV/FUNC: *ddd* ILOADMOD: *eee*
RTN: *ffff* N/S FUNC: *ggg***

Reason:

This message is issued when a REXX process has issued either a command that is handled by an external program, or a function or procedure call that is handled by an external program.

The external program, executing in a separate subtask, has attempted to call a support routine (defined by the TSO/E REXX assembler API), that NetMaster REXX supported, but the specific function requested is not supported.

The message contains the following information:

aaa

Base (top)REXX procedure name

bbb

Current REXX procedure name

ccc

Line number in current REXX procedure

ddd

SUBCOMN environment or external function name

eee

Load module that was caller

fff

Logical name of the requested API entry point

ggg

The unsupported function name requested

System Action:

The API request fails with an appropriate error return code.

User Action:

Report this to your product support representative.

Note: The supported API routines and actual functions supported in those routines are documented in the NetMaster REXX Guide.

NR2D99

EXTE RTN CALL TRACE. *aaa/bbb/ccc* ILOADMOD: *ddd* RTN: *eee* FUNC: *fff*

Reason:

This message is issued when a REXX process has issued either a command that is handled by an external program, or a function or procedure call that is handled by an external program.

The message traces the request. This allows you to see exactly what functions are used by the external program.

The message contains the following information:

aaa

Base (top)REXX procedure name

bbb

Current REXX procedure name

ccc

Line number in current REXX procedure

ddd

Load module that was called

eee

API routine name

fff

Function requested

System Action:

None.

User Action:

None.

NR3001

NR3101

RXCTL *oooooooo* PROCESSED, RC: *rr*

Reason:

This message indicates that the requested RXCTL command (HI, HE, HT, RT, TS, TE) was processed.

The function return code is shown. If 0, the request has worked.

System Action:

The request function may have been performed.

User Action:

None.

NR3102

oooooooo PROCESSED, RC: *rr*

Reason:

This message indicates that the requested REXX command (HI, HE, HT, RT, TS, TE) was processed.

The function return code is shown. If 0, the request has worked.

System Action:

The request function may have been performed.

User Action:

None.

NR3103

RXCTL ooooooooo PROCESSED

Reason:

This message indicates that the requested RXCTL command (DEFINE) was processed.

System Action:

The request function has been performed.

User Action:

None.

NR3120

REXX OFFLOAD REQUEST QUEUED FOR *mmmmmmmm*

Reason:

This message indicates that a RXCTL OFFLOAD command has been issued, and the requested member has been queued for processing by the OFFLOAD processor.

System Action:

A REXX offload compile will run shortly.

User Action:

None.

NR3160**REXX OFFLOAD COMMENCED FOR *mmmmmmmm*****Reason:**

This message indicates that a specific REXX OFFLOAD request that was queued is now being processed.

System Action:

None.

User Action:

None.

NR3161**REXX OFFLOAD SUCCESSFUL FOR *mmmmmmmm* FROM LIB *aaaaaaa* TO LIB *bbbbbbb*****Reason:**

This message indicates that a specific REXX OFFLOAD request that was queued has completed successfully. The object has been written to the indicated library.

System Action:

None.

User Action:

None.

NR3162

**REXX OFFLOAD FAILED FOR *mmmmmmmm* FROM LIB *aaaaaaaa* TO
LIB *bbbbbbbb- rrr***

Reason:

This message indicates that a specific REXX OFFLOAD request that was queued has failed.

The following are possible reasons:

STORAGE SHORTAGE
OUTPUT LIBRARY NOT ALLOCATED
OUTPUT LIBRARY NOT RECFM=F/FB
OUTPUT LIBRARY NOT LRECL=80
COMPILE FAILED
MEMBER LOADED FROM OBJECT
OUTPUT LIBRARY DID NOT OPEN
OUTPUT MEMBER DID NOT OPEN
WRITE ERROR ON OUTPUT LIBRARY
FINAL WRITE ERROR ON OUTPUT LIBRARY
OUTPUT MEMBER CLOSE ERROR

System Action:

No output object is written.

User Action:

Correct the error and retry.

NR3180**RXCTL DEFINE *aaa=bbb* FAILED - *ccc*****Reason:**

This message indicates that a request to define a new SUBCOM handler or external function has failed.

The following are possible reasons:

SUBCMD ENVIRONMENT ALREADY DEFINED

The requested subcommand environment is already defined, either as a standard one supported by Netmaster, or a previous RXCTL DEFINE command has defined it (the SHOW RXSUBCOM command will show a list of defined environments).

LOAD MODULE NOT FOUND

The nominated load module is not available to NetMaster.

NO SPARE SUBCMD TABLE ENTRIES

There are no more entries in the subcommand table. Contact your support representative.

FUNCTION NAME ALREADY DEFINED BY USER

The nominated function has already been defined by a previous RXCTL DEFINE command.

FUNCTION NAME DEFINED BY SYSTEM

The nominated function is provided by NetMaster. It cannot be externally defined (use the SHOW RXFUNC command to obtain a list of defined functions).

System Action:

The command is ignored.

User Action:

Correct the error and retry.

NR3191

RXCTL 00000000 NOT PRESENTLY AVAILABLE

Reason:

This message indicates that the requested RXCTL command is not presently supported.

System Action:

The requested function is not performed.

User Action:

None.

NR3192

00000000 NOT PRESENTLY AVAILABLE

Reason:

This message indicates that the requested REXX command is not presently supported.

System Action:

The requested function is not performed.

User Action:

None.

NR3201

REXX ENVIRONMENT: eeee ffff

Reason:

This message indicates that a REXX environment has been processed as requested.

System Action:

The requested RXENV function has been performed.

User Action:

None.

NR3280

REXX ENVIRONMENT: eeee NOT ADDED, ALREADY DEFINED.

Reason:

This message indicates that a REXX environment that was to be added already exists.

System Action:

The RXENV command is ignored.

User Action:

Use the RXENV REPLACE command instead.

NR3281

REXX ENVIRONMENT: eeee NOT DELETED, NOT DEFINED.

Reason:

This message indicates that a REXX environment that was to be deleted was not defined.

System Action:

The RXENV command is ignored.

User Action:

If the name was misspelled, correct the spelling and retry.

NR3282

REXX ENVIRONMENT: eeee NOT SET AS DEFAULT, NOT DEFINED

Reason:

This message indicates that a REXX environment could not be set as the default environment, as it is not defined.

System Action:

The RXENV command is ignored.

User Action:

Check the environment list (use SH RXENV) and define the environment if required.

NR3289

INVALID ENVIRONMENT NAME: eeeeeee

Reason:

This message indicates that a REXX environment name supplied on the RXENV command was not valid.

An environment name must be a valid MVS-style PDS member name, the first character A-Z, @, #, or \$, and the rest A-Z, 0-9, @, #, or \$, with a maximum length of eight characters and no embedded blanks.

The RXENV DEFAULT command also allows a name of .SYSTEM.

System Action:

The RXENV command is ignored.

User Action:

Correct the environment name.

NR3301

OMLCHECK OF mmmmmmmm (LIB=////////) HAD ee ERRORS, ww WARNINGS

Reason:

A RXCHECK command has been processed. This message shows the result. This message is produced if no errors or warnings were detected.

System Action:

None.

User Action:

None.

NR3302

RXCHECK OF *mmmmmmmm* (LIB=*////////*) HAD *ee* ERRORS, *ww* WARNINGS

Reason:

A RXCHECK command has been processed. This message shows the result. This message is produced if warnings were found (but no errors).

System Action:

None.

User Action:

None.

NR3303

RXCHECK OF *mmmmmmmm* (LIB=*////////*) HAD *ee* ERRORS, *ww* WARNINGS

Reason:

A RXCHECK command has been processed. This message shows the result. This message is produced if errors were found.

System Action:

None.

User Action:

None.

NR3310

TYPE=*ttt* **SRCLINES=***nnnn* **CODE-STG=***nnnK*

Reason:

A RXCHECK command has been processed. This message is produced if STATS was specified.

The message shows the type of code loaded (SRC or OBJ), the number of lines in the member, and the amount of storage needed.

System Action:

None.

User Action:

None.

NR3311

LOADTIME=*ttt.ttt* **LOADCPU=***ccc.ccc*

Reason:

A RXCHECK command has been processed. This message is produced if STATS was specified.

The message shows the elapsed and CPU times taken to perform the load and compile.

System Action:

None.

User Action:

None.

NR3501**RXSERV *aaaaaa* SERVER=*bbbbbb* PROCESSED SUCCESSFULLY****Reason:**

An RXSERV command has been processed. The option and server name are indicated. The requested action has been performed.

System Action:

None.

User Action:

None.

NR3502**RXSERV *aaaaaa* SERVER=*bbbbbb* FAILED. RC:*cc* R0: *dd* R1: *ee*****Reason:**

An RXSERV command has been processed. The option and server name are indicated. The requested action failed.

Diagnostic information is presented.

System Action:

The requested action is not performed.

User Action:

Investigate the cause and retry.

NR4080

IDENTIFY SETUP ERROR... IDENTIFY FAILED

Reason:

An error occurred during REXX interface initialization.

An attempt to identify an entry point for a REXX interface routine failed. The most likely cause is that another program in the region has loaded a standard REXX routine, thus preventing the NetMaster replacement routines from being identified.

This error should not cause problems, unless user-written external programs use the LOAD or LINK macro to obtain the address of REXX interface programs. Programs that use the REXX external vector table are not affected.

System Action:

REXX initialization continues.

User Action:

None.

NR7080

REXX SERVER: *aaaa* ID: *bbbbbb* FAILED TO START. REASON: *cccc*

Reason:

A request was made to start a REXX server. However, it failed to start. The reason will be a short message. The descriptions of these reasons can be found under the help for message NR2080.

System Action:

The requested server is not started (and is no longer defined).

User Action:

Investigate the cause and retry.

NR7081**REXX SERVER: *aaaa* ID: *bbbbbb* TERMINATED DUE TO REXX
PROCEDURE TERMINATIO N****Reason:**

A REXX Server has terminated. The termination was because the REXX procedure that is executing as the server has terminated. This includes cases where the REXX procedure had a fatal error.

System Action:

The requested server terminates (and is no longer defined).

User Action:

Ensure that the REXX procedure terminated as expected. If the procedure terminated with an error, correct the cause of the error and restart the server.

NR7082**REXX SERVER: *aaaa* ID: *bbbbbb* DID NOT INITIALIZE IN ALLOWED
TIME****Reason:**

A REXX Server failed to initialize in a timely manner.

A REXX server procedure is allowed 10 seconds from when it is started until it issues the first ADDRESS NM REXXSERV GETREQ command.

If the procedure exceeds this limit, it will be terminated and the server deleted.

System Action:

The requested server terminates (and is no longer defined).

User Action:

Ensure that the REXX procedure initializes quickly. It should quickly enter the main processing loop and issue the REXXSERV GETREQ command as soon as possible.

NR8A81

GRXEXCOM ERROR. RC: *rr* SHVCODE: *cc* SHVRET: *rr* NAME: *nnnn*

Reason:

A REXXHELP verb received an error from the GRXEXCOM variable access utility. Error information is provided.

System Action:

An OML error is signaled.

User Action:

Contact Technical Support.

NR9903

Error within P1, line P2, program is unreadable

Reason:

The language processor could not read the format of the exec.

System Action:

Processing terminates.

User Action:

Check the format of the exec you are passing.

NR9904

Error within P1, line P2, program interrupted

Reason:

The system halted the execution of a REXX program because of an error or by user request.

System Action:

Unless the attention interrupt is intercepted by a 'signal on halt' clause, the REXX exec terminates.

User Action:

If an error caused the termination, check other error messages issued and correct the problem.

NR9905**Error within P1, line P2, system resources exhausted****Reason:**

While attempting to execute a REXX program, the language processor was unable to obtain the storage it needed to continue execution.

System Action:

Processing terminates.

User Action:

Check how the program obtains and frees storage. Either increase the size of the external data queue, or increase the amount of storage available to the program.

NR9906**Error within P1, line P2, unmatched "/" or quote****Reason:**

A comment or a literal string was started but never finished. This may be detected at the end of the program or INTERPRET instruction (for comments) or at the end of a line (for strings).

System Action:

Processing terminates.

User Action:

Examine the REXX program and correct the string.

NR9907

Error within P1, line P2, WHEN or OTHERWISE expected

Reason:

Within a SELECT construct, at least one WHEN construct (and possibly an OTHERWISE clause) is expected. If any other instruction is found (or no WHEN construct is found before OTHERWISE) then this message results. This is commonly caused by forgetting the DO and END around the list of instructions following a WHEN.

System Action:

Processing terminates.

User Action:

Examine the REXX program and correct the error.

NR9908

Error within P1, line P2, unexpected THEN or ELSE

Reason:

A THEN or an ELSE has been found that does not match a corresponding IF (or WHEN) clause. This error often occurs because of a missing END or DO...END in part of a complex IF...THEN...ELSE construct.

System Action:

Processing terminates.

User Action:

Examine the program and correct the error.

NR9909**Error within P1, line P2, unexpected WHEN or OTHERWISE****Reason:**

A WHEN or OTHERWISE has been found outside a SELECT construct. It may have been enclosed unintentionally in a DO ... END construct by leaving off an END instruction, or an attempt may have been made to branch to it with a SIGNAL instruction, which cannot work as a SELECT is terminated by a SIGNAL.

System Action:

Processing terminates.

User Action:

Examine your program and fix the part in error.

NR9910**Error within P1, line P2, unexpected or unmatched END****Reason:**

There are more ENDS in the program than DOs and SELECTs, or the ENDS are wrongly placed so they do not match the DOs and SELECTs. It may be useful to use TRACE SCAN to show the structure of the program and more easily locate the error. A common cause of this error is if you use the signal instruction to jump into the middle of this loop. This error is also generated if an END immediately follows a THEN or an ELSE.

System Action:

Processing terminates.

User Action:

Examine the incorrect line and correct the REXX program.

NR9911

Error within P1, line P2, control stack full

Reason:

An implementation limit of levels of nesting of control structures (DO...END,IF...THEN... ELSE, and so on) has been exceeded. This error might be caused by a looping INTERPRET instruction. It might also be caused by infinite recursive calls.

System Action:

Processing terminates.

User Action:

Examine the incorrect line and fix the program.

NR9912

Error within P1, line P2, clause > 500 characters

Reason:

There may be an implementation restriction that limits the length of the internal representation of a clause. This message is generated if this limit is exceeded.

System Action:

Processing terminates.

User Action:

Reduce the length of literal and hexadecimal strings that exceed the documented limits.

NR9913

Error within P1, line P2, invalid character in program

Reason:

The program includes a character outside the literal quoted string that is neither alphanumeric nor one of the acceptable special characters.

System Action:

Processing terminates.

User Action:

Examine the incorrect line and correct the invalid character.

NR9914**Error within P1, line P2, incomplete DO/SELECT/IF****Reason:**

On reaching the end of the program (or the end of the string in an INTERPRET instruction), it has been detected that there is a DO or SELECT without a matching END or an IF that is not followed by a THEN clause to execute.

System Action:

Processing terminates.

User Action:

Find the unbalanced DO or SELECT and correct it.

NR9915**Error within P1, line P2, invalid hexadecimal or binary string****Reason:**

Hex constants may not have leading or trailing blanks and may only have embedded blanks at byte boundaries. Only the digits 0-9 and the letters A-F, a-f are allowed. Binary strings can only have blanks added at the boundaries of groups of four binary digits, and only the digits 0 and 1 are allowed.

The error may also be caused by following a literal string by the one character symbol "x" when the string is not intended to be taken as a hexadecimal specification, or by the symbol "b" when the string is not intended to be taken as a binary specification. Use the explicit concatenation operator, "|", in this situation to concatenate the string to the value of the symbol.

System Action:

Processing terminates.

User Action:

Locate the error on the line and correct it.

NR9916

Error within P1, line P2, label not found

Reason:

A SIGNAL instruction has been executed (or an event occurred for which a trap was set) and the specified label cannot be found in the program.

System Action:

Processing terminates.

User Action:

Correct the error and rerun the program.

NR9917

Error within P1, line P2, unexpected PROCEDURE

Reason:

A PROCEDURE instruction was encountered which was not the first instruction executed after a CALL or function invocation. A possible cause of this is "dropping through" into an internal routine rather than invoking it properly.

System Action:

Processing terminates.

User Action:

Examine the incorrect line, correct the problem, and rerun.

NR9918

Error within P1, line P2, THEN expected

Reason:

All IF and WHEN clauses in REXX must be followed by a THEN clause. Some other clause was found when a THEN was expected.

System Action:

Processing terminates.

User Action:

Examine the line and correct the error.

NR9919**Error within P1, line P2, string or symbol expected****Reason:**

Following either the keyword CALL or the sequence SIGNAL ON or SIGNAL OFF, a literal string or a symbol was expected but neither was found.

System Action:

Processing terminates.

User Action:

Add the literal string or symbol that is needed.

NR9920**Error within P1, line P2, symbol expected****Reason:**

In the clauses END, ITERATE, LEAVE, NUMERIC, PARSE, and PROCEDURE a symbol can be expected. Either it was not present when required, or some other token was found. Alternatively, the DROP and EXPOSE options of PROCEDURE expect a list of symbols. Some other token was found.

System Action:

Processing terminates.

User Action:

Correct the REXX program and rerun.

NR9921**Error within P1, line P2, invalid data on end of clause****Reason:**

A clause such as SELECT or NOP is followed by some token other than a comment.

System Action:

Processing terminates.

User Action:

Correct the line and rerun the REXX program.

NR9922

Error within P1, line P2, invalid character string

Reason:

This error results if a literal string contains character codes that are not valid in a particular implementation. This might be because some characters are invalid or because the character set is extended in some way and certain character combinations are not allowed.

System Action:

Processing terminates.

User Action:

Examine the line and correct the error.

NR9924

Error within P1, line P2, invalid TRACE request

Reason:

The setting specified on a TRACE instruction (or as the argument to the TRACE built-in function) starts with a character that does not match one of the valid TRACE settings. This error is also raised if an attempt is made to request TRACE SCAN when inside any kind of control construct.

System Action:

Processing terminates.

User Action:

Correct the line and rerun the REXX program.

NR9925

Error within P1, line P2, invalid sub-keyword found

Reason:

An unexpected token has been found in the position in an expression where a particular sub-keyword was expected.

System Action:

Processing terminates.

User Action:

Correct the line and rerun the REXX program.

NR9926**Error within P1, line P2, invalid whole number****Reason:**

The expression for DIGITS or FUZZ in the NUMERIC instruction, or a parsing positional parameter, or a repetition phrase of a DO clause, or the right-hand term of the power("**") operator, did not evaluate to a whole number (or is greater than the implementation limit, for these uses). This error is also raised if a negative repetition count is found in a DO clause.

System Action:

Processing terminates.

User Action:

Correct the line and rerun the REXX program.

NR9927**Error within P1, line P2, invalid DO syntax****Reason:**

A syntax error has been found in the DO instruction. This may have occurred because you used the TO, BY, or FOR sub-keywords twice, or because you used these sub-keywords when no control variable was specified.

System Action:

Processing terminates.

User Action:

Correct the line and rerun the REXX program.

NR9928

Error within P1, line P2, invalid LEAVE or ITERATE

Reason:

A LEAVE or ITERATE instruction was encountered in an invalid position. Either no loop is active, or the name specified on the instruction does not match the control variable of any active loop. Note that because internal routine calls and the INTERPRET instruction protect DO loops, they become inactive. A common cause of this error is if you attempt to use the SIGNAL instruction to transfer control within or into the loop.

System Action:

Processing terminates.

User Action:

Fix the problem on the line and rerun the REXX program.

NR9929

Error within P1, line P2, environment name too long

Reason:

The environment name specified by the ADDRESS instruction is longer than permitted for the system under which REXX is running.

System Action:

Processing terminates.

User Action:

Correct the problem and rerun the REXX program.

NR9930**Error within P1, line P2, name or string > 250 characters****Reason:**

This error results if there is an implementation limit on the length of a variable name or label name (or on the length of a literal string), and this limit is exceeded.

System Action:

Processing terminates.

User Action:

Fix the error and rerun the REXX program.

NR9931**Error within P1, line P2, name starts with numeric or "."****Reason:**

A value has been assigned to a variable whose name starts with a numeric digit or a period. This is not allowed because it would enable numeric constants to be redefined.

System Action:

Processing terminates.

User Action:

Correct the error and rerun the REXX program.

NR9932**Error within P1, line P2, invalid use of stem****Reason:**

A stem has been used in an invalid way. For example, assigning a value to the environmental variable stem (MSG. = 'abc') in an AOF MSG rule is not allowed.

System Action:

Processing terminates.

User Action:

Correct the error and rerun the REXX program.

NR9933

Error within P1, line P2, invalid expression result

Reason:

The result of an expression in an instruction was found to be invalid in the particular context in which it was used. This may be because of an illegal FUZZ or DIGITS value in a NUMERIC instruction. (FUZZ may not become larger than DIGITS.)

System Action:

Processing terminates.

User Action:

Correct the error and rerun the REXX program.

NR9934

Error within P1, line P2, logical value not 0 or 1

Reason:

The expression in an IF, WHEN, DO WHILE, or DO UNTIL phrase must result in a 0 or a 1, as must any term operated on by a logical operator.

System Action:

Processing terminates.

User Action:

Correct the error and rerun the REXX program.

NR9935**Error within P1, line P2, invalid expression****Reason:**

This message results from a grammatical error in an expression, such as ending it with an operator or having two operators adjacent with nothing in between. It may also result from a missing expression when one is required. A common error is to include special characters in an intended character expression without enclosing them in quotes.

System Action:

Processing terminates.

User Action:

Correct the error and rerun the REXX program.

NR9936**Error within P1, line P2, unmatched "(" in expression****Reason:**

This error results from not pairing parentheses correctly within an expression. There are more left parentheses than right parentheses.

System Action:

Processing terminates.

User Action:

Examine the line and fix the problem. Then rerun.

NR9937**Error within P1, line P2, unexpected "," or ")"****Reason:**

Either a comma has been found outside a function invocation, or there are too many right parentheses in an expression.

System Action:

Processing terminates.

User Action:

Examine the line and fix the problem.

NR9938

Error within P1, line P2, invalid template or pattern

Reason:

Within a parsing template, a special character that is not allowed has been found, or the syntax of a variable pattern is incorrect. This error may also be raised if the WITH sub- keyword is omitted in a PARSE VALUE instruction.

System Action:

Processing terminates.

User Action:

Examine the program and fix the problem.

NR9939

Error within P1, line P2, evaluation stack overflow

Reason:

The expression is too complex to be evaluated by the language processor. There are too many nested parentheses, functions, and so on.

System Action:

Processing terminates.

User Action:

Examine the program and simplify the expression.

NR9940

Error within P1, line P2, incorrect call to routine

Reason:

The specified built-in or external routine does exist but it has been used incorrectly. Either invalid arguments were passed to the routine or the program invoked was not compatible with the REXX language processor, or more than an implementation-limited number of arguments were passed to the routine.

System Action:

Processing terminates.

User Action:

Examine the statement calling the routine and correct it.

NR9941**Error within P1, line P2, bad arithmetic conversion****Reason:**

One of the terms involved in an arithmetic operation is not a valid number, or its exponent exceeds the implementation limit.

System Action:

Processing terminates.

User Action:

Examine the program and correct the problem.

NR9942**Error within P1, line P2, arithmetic overflow/underflow****Reason:**

The result of an arithmetic operation requires an exponent that is outside the range supported by the implementation. This can happen during evaluation of an expression (commonly an attempt to divide a number by 0), or possibly during the stepping of a DO loop control variable.

System Action:

Processing terminates.

User Action:

Examine the program and correct the error.

NR9943

Error within P1, line P2, routine not found

Reason:

A function has been invoked within an expression (or a subroutine was invoked by CALL) but it cannot be found. No label with the specified name exists in the program. It is not the name of a built-in function, and the language processor has been unable to locate it externally. The name has probably been mistyped, or it is possible that a symbol or literal string is adjacent to a "(" when it was meant to be separated by a blank or some other operator.

System Action:

Processing terminates.

User Action:

Examine the program and correct the error.

NR9944

Error within P1, line P2, function did not return data

Reason:

An external function has been invoked within an expression, but even though it appeared to end without error, it did not return data for use within the expression.

System Action:

Processing terminates.

User Action:

Examine the program and correct the error.

NR9945**Error within P1, line P2, no data specified on function RETURN****Reason:**

The program has been called as a function, but an attempt is being made (by RETURN) to return without passing back any data.

System Action:

Processing terminates.

User Action:

Examine the program and correct the error.

NR9946**Error within P1, line P2, invalid variable reference****Reason:**

An attempt to indirectly reference a variable is invalid. This would most likely occur on an EXPOSE or INTERPRET instruction; for example, "EXPOSE (Y)" where Y is a number. This error may also occur when you attempt to drop an AOF environmental variable. AOF environmental variables (for example, MSG.TEXT) cannot be dropped. It may also occur if you attempt to reference an AOF environmental variable that is not defined, for example MSG.GLORF.

System Action:

Processing terminates.

User Action:

Examine the program and correct the error.

NR9948

Error within P1, line P2, failure in system service

Reason:

A system service used by the REXX language processor (such as stream input or output) has failed to work correctly and hence normal execution cannot continue.

System Action:

Processing terminates.

User Action:

Examine the program and correct the error.

NR9949

Error within P1, line P2, interpreter error

Reason:

Implementations of the REXX language will normally carry out internal self-consistency checks during execution. This message indicates that some kind of severe error has been detected within the language processor or execution process.

System Action:

Processing terminates.

User Action:

Contact Technical Support for further assistance.

NR9964**Error within P1, line P2, unimplemented feature****Reason:**

The program has used a REXX language feature which is not supported by this version of the REXX interpreter. Code 64 is an extended error code used only by this REXX implementation.

System Action:

Processing terminates.

User Action:

Check documentation for support of the feature. Change REXX program to bypass use of the feature.

NR9966**Error within P1, line P2, invalid use of ampersand****Reason:**

The program has used the ampersand as a prefix to a symbol. The REXX interpreter does not allow this.

System Action:

Processing terminates.

User Action:

Correct the error and rerun the program.

NR9967**Error within P1, line P2, duplicate label****Reason:**

The program has defined the same label name twice.

System Action:

Processing terminates.

User Action:

Change the label on one of the two statements.

NR9968

Error within P1, line P2, function name > 32 characters

Reason:

The program has defined or referenced a function whose name exceeds the maximum function name length of 32 characters.

System Action:

Processing terminates.

User Action:

Change the function name to a shorter name.

NR9969

Error within P1, line P2, function has too few args

Reason:

The program has called a function that requires more arguments than specified on the function call.

System Action:

Processing terminates.

User Action:

Add the necessary arguments to the function call. Check documentation for the specified function.

NR9970

Error within P1, line P2, function has too many args

Reason:

The REXX program has called a function that requires fewer arguments than specified on the function call.

System Action:

Processing terminates.

User Action:

Remove the superfluous arguments to the function call. Check documentation for the specified function.

NR9971**Error within P1, line P2, code version downlevel, recompile****Reason:**

The REXX program was compiled with a version of the REXX interpreter that is lower than the version used to execute the program.

System Action:

Processing terminates.

User Action:

This error should only occur when executing a precompiled, saved version of a program. If this is so, you should recompile and then re-execute the program. If not, contact Technical Support for further assistance.

NR9972**Error within P1, line P2, function returned unassigned stem data****Reason:**

A REXX function written in assembler has returned incorrect data.

System Action:

Processing terminates.

User Action:

Contact Technical Support for further assistance.

NR9973**Error within P1, line P2, record reference exceeds variable value****Reason:**

This is an internal, implementation-specific error.

System Action:

Processing terminates.

User Action:

Contact Technical Support for further assistance.

NR9975

Error within P1, line P2, ELSE needs semicolon

Reason:

This is an internal, implementation-specific error.

System Action:

Processing terminates.

User Action:

Contact Technical Support for further assistance.

NR9976

Error within P1, line P2, variable value too long

Reason:

The REXX program attempted to assign a value to a variable. The string value exceeded the maximum allowed length.

System Action:

Processing terminates.

User Action:

Shorten the string value.

NR9977

Error within P1, line P2, code area full

Reason:

The REXX program could not be compiled. The target code area is not large enough to hold the result of the compiled program.

System Action:

Processing terminates.

User Action:

Shorten the REXX program by dividing it into subroutines, and store these as separate members.

NR9978**Error within P1, line P2, user function failed (code in RC)****Reason:**

A function returned with a non-zero value in R15. The RC variable will contain the value returned in R15.

System Action:

Processing terminates.

User Action:

If this error was caused by a user-written function, correct the error. If this error was caused by a CA-supplied function, contact Technical Support for further assistance.

NR9979**Error within P1, line P2, invalid assign to array****Reason:**

This is an internal implementation-specific error.

System Action:

Processing terminates.

User Action:

Please contact Technical Support to obtain additional assistance.

NR9981**Error within P1, line P2, not supported within INTERPRET****Reason:**

The REXX program executed an INTERPRET instruction that contained a REXX structure not supported in INTERPRET.

System Action:

Processing terminates.

User Action:

Modify the interpreted code.

NR9982

Error within P1, line P2, Array/Table boundary exceeded

Reason:

The REXX program was attempting to store an element of an array. The element number was larger than the declared dimension of the array.

System Action:

Processing terminates.

User Action:

Contact Technical Support for further assistance.

NR9983

Error within P1, line P2, code block too large, Eval stack full

Reason:

If this occurs during the compile phase, then the program is using a structure too complex for the compiler to handle. This could occur if a SELECT statement has too many WHEN clauses or there are too many nested control structures.

System Action:

Processing terminates.

User Action:

Reduce the complexity of the flagged structure and retry the compile.

NR9984

Error within P1, line P2, too many symbols, Symbol table full

Reason:

If this occurs during the compile phase, then the program is using too many symbols and the symbol table has overflowed.

System Action:

Processing terminates.

User Action:

Reduce the number of symbols used by the program and retry the compile.

NR9985**Error within P1, line P2, invalid use of extended variable type****Reason:**

The REXX program has attempted to use a variable in a manner that is not supported. This could occur if a global variable is used as the control variable in a controlled repetitive loop; for example, DO GLOBAL.I = 1 TO 10.

System Action:

Processing terminates.

User Action:

Modify the REXX program so that it does not use a global variable as the loop control variable.

NR9986**Error within P1, line P2, invalid symbol****Reason:**

A global symbol whose derived name exceeds the global variable symbol length limit of 50 characters has been used.

System Action:

Processing terminates.

User Action:

Check the incorrect statement and determine which symbol substitution caused the derived name of a global variable to exceed the specified limit. Modify the program to use a shorter derived name.

NR9987**Error within P1, line P2, invalid internal object****Reason:**

This is an internal, implementation-specific error.

System Action:

Processing terminates.

User Action:

Contact Technical Support for further assistance.

NR9988

Error within P1, line P2, interpreter stack error

Reason:

This is an internal, implementation-specific error.

System Action:

Processing terminates.

User Action:

Contact Technical Support for further assistance.

NR9989

Error within P1, line P2, procedures nested too deep (>250)

Reason:

Procedure function call nesting has exceeded 250 levels.

System Action:

Processing terminates.

User Action:

Examine the program and correct the problem.

NS0101

NMSSI TERMINATING - UNRECOGNISED OR UNSUPPORTED OPERATING SYSTEM

Reason:

This message is issued by the NMSSI program if it cannot recognise or does not support the current operating system.

System Action:

NMSSI terminates.

User Action:

If the operating system is not MVS (any variant), MSP (any variant), or VOS3, then NMSSI cannot be used. If it is one of these, contact your support representative.

NS0103**NMSSI TERMINATING - NOT RUNNING AUTHORISED.****Reason:**

The NMSSI program must run APF authorised. As it is not, it terminates.

System Action:

NMSSI terminates.

User Action:

Ensure that all libraries in the STEPLIB for the NMSSI job are APF authorised.

NS0104**NMSSI TERMINATING - PARM ERROR.****Reason:**

An error was detected in the NMSSI startup parameters.

System Action:

NMSSI terminates.

User Action:

Examine the preceding error messages that describe the PARM error and correct the erroneous parameter.

NS0105**NMSSI TERMINATING - ESTAE SETUP FAILURE.****Reason:**

NMSSI encountered an error whilst attempting to establish ESTAE protection.

System Action:

NMSSI terminates.

User Action:

Contact your product support representative.

NS0106

NMSSI TERMINATING - REQUIRED MODULE LOAD FAILURE.

Reason:

The NMSSI program was unable to load a required supplementary load module.

System Action:

NMSSI terminates.

User Action:

Examine the job log for preceding system messages that contain the name of the load module that failed to load. Contact your product support representative.

NS0107

NMSSI TERMINATING - UNABLE TO OBTAIN STORAGE.

Reason:

The NMSSI program was unable to obtain required virtual storage.

System Action:

NMSSI terminates.

User Action:

Check the region size of the NMSSI job. Contact your product support representative.

NS0201

SSIIN: *data-line*

Reason:

This message shows a line of input read from SSIIN.

System Action:

None.

User Action:

None, unless followed by a parm error message. In this case this line will aid determination of the error.

NS0202**JCL PARM:** *parm-data***Reason:**

This message displays the data obtained from the JCL PARM.

System Action:

None

User Action:

None, unless followed by a PARM error message. In this case the information in this message may aid in repair of the error.

NS0203**ERROR IN ABOVE PARMS AT POSITION *loc* - *reason*.****Reason:**

This message is produced when a parm error is detected during NMSSI initialization.

loc is the position in the previously displayed line from SSIIN (NS0201) or JCL parm (NS0202).

reason is a description of the error, which in most cases is self-explanatory. The list of reasons follows, divided into groups related to the stages of the syntax checking:

Parameter recognition/decoding

UNRECOGNISED PARAMETER
LIST NOT SUPPORTED FOR THIS PARM
QUOTED DATA NOT SUPPORTED FOR THIS PARM
QUOTED DATA REQUIRED FOR THIS PARM

Parameter value checking/decoding

VALUE NOT YES/NO
VALUE NOT YES/NO/*
INVALID/OMITTED PARAMETER NAME
INVALID/OMITTED PARAMETER VALUE
INVALID PARENTHESED DATA
PARAMETER VALUE TOO LONG
NO DATA AFTER OPEN QUOTE
NO CLOSING QUOTE
INVALID QUOTED STRING
NULL QUOTED STRING
INVALID NAME
INVALID NUMBER
NUMBER NOT IN RANGE
HEX STRING TOO LONG
INVALID HEX STRING
INCORRECT NUMBER OF SUBPARMS
DESCRIPTION TOO LONG

Logical value checking

XMS NOT SUPPORTED, YES NOT ALLOWED

XMS=YES was specified on the system which does not support XMS.

VALUE NOT LOG/OPER

CMDENV parameter can only specify LOG or OPER value.

ALREADY PROCESSED SOLVEJOB RESTRICTIONS

SOLVEJOB=* ALREADY PROCESSED

DUPLICATE SOLVEJOB NAME

TOO MANY SOLVEJOB NAMES

SOLVEJOB specification incorrect.

INVALID PFKEY NUMBER

TERMACCESS PFKEY specified is out of range (1–24).

UNUSABLE PFKEY NUMBER

TERMACCESS PFKEY specified is reserved.

DUPLICATE PFKEY NUMBER

TERMACCESS PFKEY specified is already used.

INVALID NMID VALUE

TERMACCESS NMID specified is invalid.

DUPLICATE NMID VALUE

TERMACCESS NMID specified is already used.

ENF CODE NOT NUMERIC

ENFADD/ENFDEL value is not numeric.

ENF CODE NOT IN RANGE

ENFADD/ENFDEL value specified is not in the range of 1–255.

IPSMF=119 NOT SUPPORTED

SMF record 119 processing was requested on the system which does not support it (pre zOS 1.2).

INVALID TCP/IP SERVER NAME

The TCP/IP server name specified by TCPIPSVR is either invalid or specifies unknown TCP/IP server.

System Action:

The NMSSI terminates.

User Action:

Correct the erroneous parameter.

NS0204

WARNING: JCL PARM P1 IS OBSOLETE AND HAS BEEN IGNORED

Reason:

This message indicates that an obsolete parameter (*P1*) was specified. The parameter has been ignored.

System Action:

None.

User Action:

Update your SSI run JCL to remove the obsolete parameter.

NS0209

***nnn* ERRORS IN SSIIN OR JCL PARM.**

Reason:

If NMSSI detects any parameter errors during initialization, this message displays with the total number of errors found.

System Action:

NMSSI terminates.

User Action:

Examine the previous parameter error messages for details about the errors. Correct the errors and restart the NMSSI job.

NS0502

INITIALIZATION CALL TO *nnnnnnnn* FAILED.

Reason:

During NMSSI initialization, a call to the load module *nnnnnnnn* failed.

This may be a message describing the reason for the failure preceding this one (written to the system console or in the SSI log).

System Action:

NMSSI terminates.

User Action:

Examine the WTO messages and SSI log for a message describing the reason for the initialization failure, and follow the advice in the help for that message.

NS0503**INITIALIZATION CALL TO *nnnnnnnn* FAILED.****Reason:**

During NMSSI initialization, an initialize call to the named load module failed.

System Action:

NMSSI terminates.

User Action:

Contact your product support representative.

NS0504**INITIALIZATION CALL TO *nnnnnnnn* FAILED.****Reason:**

During NMSSI initialization, an initialize call to the named load module failed.

System Action:

NMSSI terminates

User Action:

Contact your product support representative.

NS0510**SSI BASIC INITIALIZATION COMPLETE.****Reason:**

The SOLVE SSI has completed basic initialization.

System Action:

NMSSI enters SSI setup initialization.

User Action:

None.

NS1001

SOLVE SUBSYSTEM INITIALIZATION COMPLETE FOR *ssss*.

Reason:

This message indicates that NMSSI has completed initialization, *ssss* is the SSID being used.

System Action:

NMSSI facilities (eg PPI) are now available.

User Action:

None.

NS1090

PRE-INIT CALL TO *mmmmmmmm* RETURNED R15=*rrrr*.

Reason:

NMSSI initialization has failed due to an initialization module returning a non-zero return code.

System Action:

NMSSI terminates.

User Action:

Examine the NMSSI log for a previous error message and correct the problem if possible. If you cannot resolve the problem, contact Technical Support.

NS1091

PASS 1 CALL TO *mmmmmmmm* RETURNED R15=*cccc*.

Reason:

An NMSSI initialization module returned a non-zero return code.

System Action:

NMSSI terminates.

User Action:

Examine the NMSSI log for an error message that may precede this message. If possible, correct the problem. If you cannot resolve the problem, contact Technical Support.

NS1092

PASS 2 CALL TO *mmmmmmmm* RETURNED R15=cccc.

Reason:

An NMSSI initialization module has returned a non-zero return code.

System Action:

NMSSI terminates.

User Action:

Examine the NMSSI log for an error message preceding this message and correct the problem if possible. If unable to correct the problem, contact Technical Support.

NS1095

SWAP-IN OF SSCTSSVT POINTER FAILED.

Reason:

During NMSSI initialization, an attempt to connect the NMSSI control blocks to the nominated SSID failed.

System Action:

NMSSI terminates.

User Action:

Investigate for use of the same SSID by other third-party software that was initializing at the same time (the storage has been altered since NMSSI checked that it was zero during initialization).

If necessary, assign a different SSID to NMSSI.

NS1101

SSID: ssss UNUSABLE - reason.

Reason:

NMSSI initialization is unable to use the SSID nominated in the initialization parameters, The reasons that can occur are:

In use Elsewhere

The SSID appears to be in use by another NMSSI or SOLVE job (running AOM).

Not in System Table (Not Found)

The SSID has not been defined to the operating system (for example, for MVS in IEFSSNxx in SYS1.PARMLIB). (If on MVS/ESA 5.2 or later (including OS/390), this may indicate that the ADDSSID startup parameter is set to 'NO')

Validation failure (1)

Attempts to validate the SSVT pointed to by the SSCVT failed. (see below)

Validation failure (2)

Attempts to validate the control block pointed to by SSCTSUSE failed. (see below)

Version Mismatch

The SSVT appears to be last-used by an older version of NMSSI. (see below)

Auto-add failed, IEFSSI RC: *n*

An attempt to automatically add the SSID when it was not found (using the MVS/ESA IEFSSI service) failed with the displayed return code.

The validation failures or version mismatch messages can occur when an SSID that was in use by one version of NMSSI or by SOLVE (for AOM) is nominated as the SSID to use in a later version of NMSSI.

New versions of NMSSI may be unable to reuse SSIDs used by previous versions of NMSSI, or by AOM, unless an IPL is performed.

In this case you should use a different SSID. One can be temporarily inserted using the NMAOMSSC program or, on MVS/ESA 5.2 the new SETSSI MVS command.

System Action:

NMSSI will either terminate or prompt the operator for action, depending on the setting of the PROMPT initialization parameter.

User Action:

Respond to message NS1102 (if PROMPT=YES) or correct the NMSSI startup parameter (SSID) and restart NMSSI.

NS1102

REPLY 'RETRY', 'END', OR NEW SUBSYSTEM ID.

Reason:

This message follows message NS1101 if PROMPT=YES is in effect. It is a WTOR message that can be replied to by the operator.

System Action:

NMSSI waits for a reply.

User Action:

Reply with either the word 'RETRY', meaning that NMSSI will have another attempt to use the current SSID, 'END' meaning that NMSSI will terminate, or any other valid 1-4 character SSID meaning that NMSSI will attempt to use that SSID.

NS1103

REPLY WAS: rrrrr

Reason:

This message shows the reply to the previous NS1102 WTOR message.

System Action:

Processing of the reply commences.

User Action:

None.

NS1104

INVALID REPLY: rrrrr

Reason:

This message indicates that the reply to the previous NS1102 WTOR was not valid. It was not 'RETRY', 'END', or a valid 1-4 character SSID.

System Action:

Message NS1102 is reissued and can be replied to again.

User Action:

Reply to the next NS1102 message with a valid response. Refer to message NS1102 for the correct responses.

NS1105

SSID: ssss NOT FOUND, AUTOMATICALLY DEFINED

Reason:

This message indicates that the SSID nominated in the NMSSI startup parameter file was not found in the list of defined SSIDs in this system. The system is at least MVS/ESA 5.2, and the startup parameter ADDSSID was set to YES. The SSID has been successfully defined to MVS and SSI initialization continues.

The SSID remains defined until the next IPL. It should be defined to MVS in the IEFSSNxx SYS1.PARMLIB member.

System Action:

NMSSI initialization continues using the indicated SSID.

User Action:

The SSID should be added to the SYS1.PARMLIB IEFSSNxx member.

NS1201**CLEANUP OF OLD CONTROL BLOCK STRUCTURE FOR SSID: *ssss*
COMPLETE****Reason:**

NMSSI initialization found an old control block structure connected to the SSID that it is using. It has successfully cleaned this structure. (The previous NMSSI must have abnormally terminated).

System Action:

NMSSI initialization continues.

User Action:

None.

NS1202**CLEANUP OF OLD CONTROL BLOCK STRUCTURE FOR SSID: *P1* FAILED -
P2 ILE= *P3*.****Reason:**

SSI initialization found an old control block structure connected to the nominated SSID (*P1*). It was unable to clean up this structure for the nominated reason (*P2*). The initialization list entry (ILE) module that detected the error is shown (*P3*). This message usually indicates that the previous SSI abnormally terminated.

System Action:

The SSI will terminate.

User Action:

Use a different SSID when restarting the SSI or IPL the system to refresh the SSI structure.

NS1301

SSI \$AB SETUP FOR SSID: *ssss* FAILED - *reason*.

Reason:

NMSSI initialization was unable to construct important SSI control blocks. The reasons are as follows:

\$AB GETMAIN failed

NMSSI was unable to obtain SQA storage for a mandatory control block.

Swap of SSCTCUSE failed

SSCTSUSE was not zero when attempting to set it.

System LXRES failed abend *cccc R15 nnnnn*

Attempt to obtain a SYSTEM linkage index failed as indicated.

Unable to locate free SVC number

There are no free SVC numbers in the SVC Table for NMSSI to use for a service SVC.

IEFSSREQ front- end setup failure

An attempt to insert a special front-end to a system service failed.

Error in IEAVG700: ABEND *aaaaaaa R15 bbbbbbbb*

A call to the MVS service routine IEAVG700 failed as indicated.

System Action:

NMSSI terminates.

User Action:

Contact Technical Support.

NS1401

SSI \$VT SETUP FOR SSID: *ssss* FAILED - *reason*.

Reason:

NMSSI was unable to construct the SSI control block structure for the nominated reason:

\$VT GETMAIN failed

an SQA GETMAIN for storage for the control block failed.

System Action:

NMSSI terminates.

User Action:

Contact your product support representative.

NS1501

UNABLE TO OBTAIN STORAGE LENGTH *////* FROM SUBPOOL *ppp* WHILE BUILDING SSI FOR *ssss*.

Reason:

NMSSI initialization was unable to obtain required storage as described in the message while setting up important SSI data structures.

System Action:

NMSSI terminates.

User Action:

Contact Technical Support.

NS1601

CROSS-MEMORY ENVIRONMENT ESTABLISHED.

Reason:

The NMSSI cross-memory environment has been successfully established.

System Action:

NMSSI will use cross-memory services for service functions.

User Action:

None.

NS1602

SERVICE SVC ENVIRONMENT ESTABLISHED. SVC NUMBER *nnn*.

Reason:

The NMSSI service SVC environment has been established. The SVC number that it found (a free one) is displayed.

System Action:

NMSSI will use SVCs to perform service functions, not cross-memory services.

User Action:

None.

NS1690

GETMAIN FAILURE WHILE BUILDING CROSS-MEMORY ENVIRONMENT FOR SSI: *ssss*

Reason:

The NMSSI initialization has failed while attempting to construct control blocks for the cross-memory support environment.

System Action:

NMSSI terminates.

User Action:

Contact Technical Support.

NS1691

UPDATE OF SERVICE SVC ADDRESS FAILED FOR SSI: *ssss*.

Reason:

NMSSI initialization failed when trying to set up its service SVC.

System Action:

NMSSI terminates.

User Action:

Contact Technical Support.

NS1A01**SSI ANCHOR BLOCK CREATED****Reason:**

NMSSI has created Customer Vector Table, also called SAB (SSI Anchor Block).

System Action:

NMSSI initialization continues.

User Action:

None

NS1A02**SSI ANCHOR BLOCK PRESENT****Reason:**

NMSSI has detected the presence of Customer Vector Table, also called SAB (SSI Anchor Block).

System Action:

NMSSI initialization continues.

User Action:

None

NS1A03**SSWANCHA LINK FAILED****Reason:**

NMSSI initialization encountered errors during Customer Vector Table (SAB) creation.

System Action:

NMSSI initialization terminates.

User Action:

Check for any errors in the NetMaster installation load libraries setup. Check for Contents Supervisor messages on the NMSSI job log. Contact Technical Support if the problem persists.

NS1A04

SAB CREATION FAILED, REASON= P1

Reason:

NMSSI initialization encountered errors during Customer Vector Table (SAB) creation. *P1* is the reason code returned by the creation routine.

System Action:

NMSSI initialization terminates.

User Action:

Contact Technical Support if the problem persists.

NS1A05

SAB NOT CREATED

Reason:

The module performing *ssi status* detected that Customer Vector Table (SAB) was not created. This indicates that neither SSI nor any other NetMaster function requiring or creating SAB has executed yet.

System Action:

Processing continues.

User Action:

Make sure to start NMSSI if needed.

NS1A06

SSWANCHL ERRORS.

Reason:

The module performing *ssi status* received an error indication from the routine providing information about the Customer Vector Table (SAB).

System Action:

Processing continues.

User Action:

Contact Technical Support.

NS1A11**SAB CREATED AT ADDR: P1 BY: P2 ON: P3 AT: P4****Reason:**

Customer Vector Table (SAB) is located at memory address *P1*.

P2 is the name of the routine which created it.

P3 is the date of creation.

P4 is the time of creation.

System Action:

ssi status command processing continues.

User Action:

None

NS1E01**SOLVE SSI STOPPED AT EOT/EOM. SSID ssss****Reason:**

The NMSSI Subsystem Interface has detected that the NMSSI job has terminated abnormally. It stops all SSI processing and writes this message to the console.

System Action:

NMSSI Subsystem Interface functions are disabled.

User Action:

Examine the NMSSI ABEND reasons and restart NMSSI if required.

NS1E90

ABEND aaaaaaaa PSW bbbbbbbb-ccccccc ICD dd ILC e

Reason:

The NMSSI EOT/EOM module has had an internal ABEND during processing. This message contains indicative information.

System Action:

EOM/EOT processing terminates.

User Action:

Contact your product support representative. Note that this message is only produced if using a supplied debugging facility.

NS1E91

Rxx-Ryy aaaaaaaa bbbbbbbb ccccccc ddddddd

Reason:

This message follows message NS1E90 and contains further debugging information.

System Action:

EOM/EOT processing is terminated.

User Action:

see message NS1E90.

NS1H90

ABEND aaaaaaaa PSW bbbbbbbb-ccccccc ICD dd ILC e

Reason:

This message is a diagnostic ABEND message issued by an NMSSI component.

System Action:

NMSSI continues.

User Action:

Contact your product support representative. This message only appears if debugging facilities have been enabled.

NS1H91

Rxx-Ryy aaaaaaaaa bbbbbbbb ccccccc dddddddd

Reason:

Additional debugging information. See message NS1H90.

System Action:

User Action:

See message NS1L01.

NS1Y01***WARNING - *nnnn* INCOMING ATTENTIONS LOST****Reason:**

This message is written to the SSI log when the NMSSI attention processor finds that attention events were lost due to queue overflow. The number of attention events lost since the last attention was received is displayed.

System Action:

Processing continues. Terminals might be locked and might need to be reset and an interrupt key re-pressed.

User Action:

If this message occurs frequently, contact your local support office.

NS1Z01***nnnn* \$ETM BLOCKS ALLOCATED.****Reason:**

This message contains NMSSI statistics information. *nnnn* is the number of 4K blocks of storage allocated for end-of-task or end-of-memory notification control blocks, (the storage is allocated in (E)CSA).

System Action:

None.

User Action:

None.

NS1Z02

***aaaa* M/T GETMAINS, *bbbb* M/T FREEMAINS, *cccc*K M/T STG (SP0-127)**

Reason:

This message contains NMSSI statistics information.

aaaa is the number of GETMAIN macros issued by the NMSSI maintask.

bbbb is the number of FREEMAIN macros issued by the NMSSI maintask.

cccc is the current total amount of GETMAIN storage owned by the NMSSI maintask in subpools 0 to 127.

System Action:

None.

User Action:

None.

NS1Z03

***nnnn* XM CALLS TO SUP-STATE PC MANAGER.**

Reason:

This message contains NMSSI statistics information. *nnnn* is the number of cross- memory calls made to processing routines in the NMSSI address space for authorised callers.

System Action:

None.

User Action:

None.

NS1Z04***nnnn* XM CALLS TO ANY-STATE PC MANAGER.****Reason:**

This message contains NMSSI statistics. *nnnn* is the number of cross-memory calls made to service routines in the NMSSI address space for unauthorised callers.

System Action:

None.

User Action:

None.

NS1Z05***nnnn* SRB CALLS TO ANY-STATE SRB MANAGER.****Reason:**

This message contains NMSSI statistics. *nnnn* is the number of calls made using SRB scheduling to service routines in the NMSSI address space.

System Action:

None.

User Action:

None.

NS1Z06***nnnn* OF ABOVE CALLS DID NOT WAIT FOR LOCAL LOCK.****Reason:**

This message contains NMSSI statistics. *nnnn* is the total number of calls from messages NS1Z03, NS1Z04, and NS1Z05 that did not need to wait on the local lock for the NMSSI address space being available.

System Action:

None.

User Action:

None.

NS1Z07

***nnnn* OF ABOVE CALLS WAITED FOR LOCAL LOCK, BUT NOT TIMED.**

Reason:

This message contains NMSSI statistics. *nnnn* is the total number of calls from messages NS1Z03, NS1Z04, and NS1Z05 that needed to wait for the local lock, but due to a storage shortage were unable to obtain storage for accounting areas to enable the delay to be timed.

System Action:

None.

User Action:

If this number is consistently non-zero, contact your product support representative.

NS1Z08

***nnnn* OF ABOVE CALLS WAITED FOR LOCAL LOCK, TIMED...**

Reason:

This message contains NMSSI statistics. *nnnn* refers to the total number of calls from messages NS1Z03, NS1Z04, and NS1Z05 that waited for the local lock, and were able to obtain delay information.

System Action:

None.

User Action:

See message NS1Z09, following, for time statistics.

NS1Z09

... TOTAL WAIT *aaaa* SECONDS, AVG WAIT *bbbb* SECONDS.

Reason:

The message contains NMSSI statistics.

aaaa is the total wait time for all timed local lock requests, from messages NS1Z03, NS0Z04, and NZ0Z05.

bbbb is the average wait time for the timed requests.

System Action:

None.

User Action:

None.

NS2001

NO OPTION SPECIFIED ON 'SSI' COMMAND.

Reason:

An entered 'SSI' command contained no option.

System Action:

The command is ignored.

User Action:

Add a valid option to the command and try again.

NS2002

INVALID OPTION: '*ooo*' SPECIFIED ON 'SSI' COMMAND.

Reason:

An invalid SSI command option was entered.

System Action:

The command is ignored.

User Action:

Correct the command and try again.

NS2010

SSI STOP COMMAND IGNORED - SSI IS INITIALIZING.

Reason:

The SSI STOP command cannot be used until NMSSI initialization is complete (after message NS1001 has been issued).

System Action:

The command is ignored.

User Action:

If NMSSI initialization is stalled, check for an outstanding WTOR (NS1102). You can reply END to that message.

NS2011

SSI STOP COMMAND IGNORED - SSI ALREADY SHUTTING DOWN.

Reason:

An SSI STOP command has been entered, but NMSSI is already shutting down due to a previous SSI STOP command.

System Action:

The command is ignored.

User Action:

None. NMSSI will stop shortly.

NS2019

SSI STOP COMMAND ACKNOWLEDGED.

Reason:

An SSI STOP command has been entered. NMSSI has entered shutdown and will stop shortly.

System Action:

NMSSI commences shutdown processing.

User Action:

None.

NS2020

USER uuuuuuuu AT nnnnnnnn SOLVE LU / / / / / / / / SIGNED OFF SOLVE SSI

Reason:

A user of NMSSI entered a SSI SIGNOFF command. The user has been signed off.

System Action:

The user is signed off from NMSSI.

User Action:

None.

NS2021

SSI SIGNOFF NOT ALLOWED, USER uuuuuuuu NOT CANCELLABLE.

Reason:

A user has attempted to sign off from a permanent SSI userid.

System Action:

None. The signoff request is ignored.

User Action:

None.

NS2030

SOLVE SUBSYSTEM INTERFACE (NMSSI) STATUS...

Reason:

A SSI STATUS command has been entered. This is the first response message.

System Action:

Status messages follow.

User Action:

None.

NS2031

VERSION: *vvvv* GEN LEVEL: *pppp* STATUS: *ssss*

Reason:

The message displays information about NMSSI in response to an SSI STATUS command.

vvvv is the NMSSI version.

pppp is the NMSSI GEN level.

ssss is the NMSSI status as follows:

starting - NMSSI is initialising.

stopping - NMSSI is shutting down.

active - NMSSI is active.

unknown - NMSSI status is indeterminate.

System Action:

None.

User Action:

None.

NS2032

SSID: *ssss* JOB: *jjjj* OPSYS: *oooo* *vvvv* SYSNAME: *nnnn*

Reason:

The message displays information about NMSSI in response to a SSI STATUS command.

ssss is the NMSSI SSID.

jjjj is the NMSSI jobname.

oooo is the operating system name.

vvvv is the operating system version.

nnnn is the system name.

System Action:

None.

User Action:

None.

NS2033**NO ACTIVE SOLVE CONNECTIONS****Reason:**

The message displays information about NMSSI in response to a SSI STATUS command. It indicates that there is no active connection to a SOLVE or NetMaster region.

System Action:

None.

User Action:

None.

NS2034**CONNECTED TO SOLVE. NMID *iiii* JOB: *jjjj* DOMAIN: *dddd*****Reason:**

The message displays information about NMSSI in response to a SSI STATUS command. It indicates that a connection to a SOLVE or NetMaster region is active.

iiii is the NMID of the region.

jjjj is the job name of the region.

dddd is the domain ID of the region.

System Action:

None.

User Action:

None.

NS2035

CROSS MEMORY SERVICES IN USE, LX: xxxxxxxx

Reason:

The message displays information about NMSSI in response to a SSI STATUS command. It indicates that NMSSI is using cross memory services. The linkage index assigned to this NMSSI is also displayed.

System Action:

None.

User Action:

None.

NS2036

SERVICE SVC IN USE, SVC nnn

Reason:

The message displays information about NMSSI in response to a SSI STATUS command, It indicates that a service SVC environment is in use and shows the SVC number.

System Action:

None.

User Action:

None.

NS2037

DD SUBSYS SUPPORT IS ACTIVE

Reason:

This message is issued in response to a SSI STATUS command, and indicates that DD SUBSYS is supported by this NMSSI.

System Action:

None.

User Action:

None.

NS2038**IOS ATTENTION EXIT INSTALLED, INDEX: xxx****Reason:**

This message is issued in response to a SSI STATUS command, and indicates that an attention exit has been installed to process attention requests from terminals and CTCas. The index assigned is also shown.

System Action:

None.

User Action:

None.

NS2039**DATE: yyyy/mm/dd TIME: hh:mm:ss.th TIMEZONE OFFSET: shhmm****Reason:**

This message is issued in response to a SSI STATUS command, and provides the current local date and time for the SSI region, as well as the local time offset from GMT/UTC.

System Action:

None.

User Action:

None.

NS2040**SSI UNIQUE VALUE: xxxxxxxx****Reason:**

This message is issued in response to a SSI STATUS command, and provides the unique value assigned to this SSI region on startup.

(Note that the value is the hardware clock value as at region startup).

System Action:

None.

User Action:

None.

NS2101

NMSSI SHUTDOWN IN PROGRESS FOR SSID=*ssss*

Reason:

This message indicates that NMSSI shutdown has commenced following the issue of an SSI STOP command.

System Action:

NMSSI termination commences.

User Action:

None.

NS2102

NMSSI SHUTDOWN COMPLETE FOR SSID=*ssss*

Reason:

This message indicates that NMSSI shutdown is complete.

System Action:

NMSSI terminates.

User Action:

None.

NS2C30

LINK TO SELF DETECTED, AMNAME=*aaaaaaaa* PATHID=*bbbbbbbb*

Reason:

This message is issued when an NMSSI EPS link initialises and EPS detects that this NMSSI region is both sides of the link.

System Action:

The EPS link is ignored.

User Action:

Investigate the link definition to see why both ends refer to the same NMSSI region.

NS2C31**SIMILAR ENDPOINTS DETECTED T=aaa N=bbb OTS=ccc NTS=ddd****Reason:**

T=Type N=Name OTS=Old Time Stamp NTS=New Time Stamp

This message is issued when NMSSI EPS obtains a remote endpoint definition that is similar to one already defined, differing only in timestamp. This generally indicates two product regions using the same ACB name.

Values of the Type field:

- 0 SSI internal
- 1 SSI
- 2 XCF
- 3 CTC
- 4 UDP
- 5 VTAM

System Action:

EPS processing continues. This is a warning message.

User Action:

Investigate why the indicated endpoints have the same name and correct as appropriate.

NS2G01**SSI ENDPOINTS LIST FOLLOWS...****Reason:**

This message is a response to the SHOW SSIEPS command indicating that a list of endpoints follows.

System Action:

None.

User Action:

None.

NS2G10**NTYP NAME EPID SUP-CLAS VERS FLAGS VIA/LOST HOPS****Reason:**

This message is a response to the SHOW SSIEPS command providing column headings for following NS2G20 messages.

The columns are:

NTYPE

The endpoint name type (SOLV or SSI)

NAME

The endpoint name (SOLVE ACB name or NMSSI sysname and ssid)

EPID

The assigned endpoint id

SUP-CLAS

A bitmap of supported EPS classes

VERS

The SOLVE or NMSSI version

FLAGS

Various flags

VIA/LOST

The epid that messages are routed via, or the time the connectivity was lost

HOPS

The current hop count to this endpoint

System Action:

None.

User Action:

None.

NS2G11

NMID JOBNAME SYSNAME PRI-ACB MSLEVL DMN SSID

Reason:

This message is a response to the SHOW SSIEPS command providing column headings for following NS2G21 messages.

The columns are:

NMID

The SOLVE NMID

JOBNAME

The jobname

SYSNAME

The system name

PRI- ACB

The primary ACB

MSLEVL

The Management Services level

DMN

The SOLVE domain id

SSID

The NMSSI ssid

System Action:

INVALID OPERANDS ON SHOW SSIEPS COMMAND

Reason:

This message is a response to the SHOW SSIEPS command indicating that invalid operands were entered.

System Action:

The command is ignored.

User Action:

Correct the command and retry.

NS2S01

UNABLE TO OBTAIN SOLVE COMMS BUFFERS

Reason:

This message is issued during NMSSI initialization if insufficient storage is available for SOLVE communications buffers.

System Action:

NMSSI terminates.

User Action:

Increase the NMSSI region size.

NS2U01

**SSI:SOLVE INTERFACE COMMS BUFFER SHORTAGE SSID=*ssss*
SOLVE=*nnnnnnnnnnnnnn***

Reason:

This message is issued if NMSSI is unable to obtain a buffer to use to send data to a connected SOLVE system. The NMSSI SSID and the SOLVE NMID are displayed in the message.

System Action:

NMSSI retries the request after a short delay.

User Action:

If this message is issued frequently, check the dispatching priorities of the SOLVE region(s) and NMSSI region.

NS2V01

SSI CONNECTED TO SOLVE J=*jjjj* ID=*iiii* DMN=*dddd*.

Reason:

NMSSI has connected to a SOLVE system.

jjjj is the jobname of the SOLVE system.

iiii is the NMID.

dddd is the domain id.

System Action:

NMSSI can now accept commands from the connected SOLVE system.

User Action:

None.

NS2V02

SSI CONNECTION TO SOLVE LOST

Reason:

The SSI connection to the connected SOLVE job has been lost. The SOLVE system might have been terminated or a SYSPARMS SSID=NO command was entered.

System Action:

NMSSI continues processing. SOLVE might reconnect.

User Action:

Determine why the connection was lost and reestablish it if necessary.

NS2V99

SSI CONNECTION TO SOLVE TERMINATED BY SHUTDOWN, J=jjjjjjj

Reason:

NMSSI is terminating and has force disconnected the active connection to a SOLVE system. The SOLVE jobname is displayed.

System Action:

NMSSI is terminating. SSI commands cannot be issued from the previously connected SOLVE system.

User Action:

None. NMSSI has been deliberately stopped (by the SSI STOP command)

NS3001**PPI CANNOT BE ACTIVATED, ENQ FAILED.****Reason:**

NMSSI startup parameters contained the PPI=YES parameter. However, an attempt to activate PPI support failed as there is another NMSSI job in the system providing PPI services. Only one PPI server can be active in the system at once.

System Action:

NMSSI terminates.

User Action:

Change the PPI=YES parameter in one of the NMSSI jobs. Only one PPI service provider is necessary.

NS3101***PPI SSCVT INSERTED.****Reason:**

This message indicates that the special *PPI SSCVT has been inserted to allow NMSSI to supply PPI services

System Action:

None.

User Action:

None.

NS3110***nnnn* PPI RECEIVERS DEFINED.****Reason:**

This message displays NMSSI/PPI statistics. *nnnn* is the number of PPI receivers that are defined. This count includes inactive receivers.

System Action:

None.

User Action:

None.

NS3111

***nnnn* PPI STORAGE POOL GETMAINS ISSUED.**

Reason:

This is an NMSSI/PPI statistics message. *nnnn* is the number of GETMAIN instructions issued for storage in the PPI data buffer pool.

System Action:

None.

User Action:

None.

NS3112

***nnnn* PPI STORAGE POOL FREEMAINS ISSUED.**

Reason:

The is an NMSSI/PPI statistics message. *nnnn* is the number of FREEMAIN macro instructions issued during management of the PPI data buffer pool.

System Action:

None.

User Action:

None.

NS3113

***nnnn* PPI BUFFERS ALLOCATED OUT OF STORAGE POOL.**

Reason:

This is an NMSSSI/PPI statistics message. *nnnn* is the number of PPI data buffers allocated out of the PPI storage pool.

System Action:

None.

User Action:

None.

NS3114***nnnn* OVERSIZE PPI BUFFERS GETMAINED.****Reason:**

This is an NMSSI/PPI statistics message. *nnnn* is the number of PPI data buffers that had to be GETMAINED as they were too long for the PPI storage pool.

System Action:

None.

User Action:

None.

NS3115***nnnn* OVERSIZE PPI BUFFERS FREEMAINED.****Reason:**

This is an NMSSI/PPI statistics message. *nnnn* is the number of oversize PPI data buffers that have been FREEMAINED after delivery to the receiver.

System Action:

None.

User Action:

None.

NS3116***nnnn* WAS LARGEST OVERSIZE PPI BUFFER FOUND.****Reason:**

This is an NMSSI/PPI statistics message. *nnnn* is the length of the largest GETMAINED buffer found.

System Action:

None.

User Action:

None.

NS3130

PPI SERVICES ARE AVAILABLE.

Reason:

This message is issued in response to an SSI STATUS command, and indicates that this NMSSI is providing PPI services.

System Action:

None.

User Action:

None.

NS3180

ERROR - *PPI SSCVT SSCTSSVT NOT 0.

Reason:

During NMSSI PPI initialization, an SSCT for *PPI was found, but the SSCTSSVT pointer was not 0.

System Action:

NMSSI terminates.

User Action:

Contact Technical Support.

NS3181

ERROR - GETMAIN FOR *PPI SSCVT FAILED.

Reason:

During NMSSI PPI initialization, NMSSI was unable to GETMAIN storage for an SSCVT for PPI.

System Action:

NMSSI terminates.

User Action:

Contact Technical Support.

NS3182**ERROR - DUPLICATE *PPI SSCVT FOUND.****Reason:**

During NMSSI PPI initialization, a duplicate *PPI SSCVT was found.

System Action:

NMSSI terminates.

User Action:

Contact Technical Support.

NS3183**ERROR - IEFSSI MACRO RC: *rrr* R0: *xxxxxxxx* INSERTING *PPI SSCVT****Reason:**

During NMSSI PPI initialization, an attempt to insert the *PPI SSCVT using the IEFSSI macro failed. The return and reason codes are displayed.

System Action:

NMSSI terminates.

User Action:

Contact Technical Support.

NS3184**ERROR - COULD NOT FIND *PPI SSCVT AFTER IEFSSI MACRO****Reason:**

During NMSSI PPI initialization, the IEFSSI macro was used to insert the *PPI sscvt; however after this the *PPI SSCVT could not be located.

System Action:

NMSSI terminates.

User Action:

Contact Technical Support.

NS3201

***nnn* INACTIVE GEN-NAME PPI RECEIVERS RECLAIMED**

Reason:

This message is written to the NMSSI log whenever the generated name scavenger facility has reclaimed inactive PPI receivers that have been named using the 'get unique name' facility. The message shows how many names were reclaimed in the last pass of the list of receivers.

Refer to the PPIINATO and PPIREUSE SSI startup parameters for more information regarding PPI receiver id reuse.

System Action:

None.

User Action:

None.

NS3580

PPI RC=90 MOD=xx REAS=*snnnnnn* - RPB FOLLOWS...

Reason:

This message is issued (via WTO) when the NMSSI initialization parameter PPIRC90T is set to YES, and a PPI API user is due to receive a return code 90. The information in this message mirrors the information returned to the caller in register 0. The message is followed by a dump of the RPB.

System Action:

The PPI caller receives a return code of 90 in the RPB return code field and additional debugging information in R0.

User Action:

Determine the cause for the return code 90 and correct it.

NS3581

RPB +nnn aaaaaaaa bbbbbbbb ccccccc ddddddd

Reason:

This message follows message NS3580 and provides additional debugging information about the PPI return code 90. This information is a hexadecimal dump of the PPI RPB.

System Action:

None.

User Action:

See message NS3581.

NS3582

END

Reason:

This message signifies the end of the PPI RC90 debugging messages.

System Action:

None.

User Action:

None.

NS3590

ABEND aaaaaaaa PSW bbbbbbbb-ccccccc ICD dd ILC e

Reason:

This is a diagnostic message from NMSSI. It provides ABEND information.

Note that this message is issued in the context of a PPI user's address space. It is WTO'd.

System Action:

NMSSI continues.

User Action:

Provide the diagnostic information to your product support representative. Note that this message is only produced if NMSSI internal debugging facilities are enabled.

NS3591

Rxx-Ryy aaaaaaaaa bbbbbbbb ccccccc ddddddd

Reason:

This message follows the NS3590 message and contains additional debugging information.

System Action:

Refer to message NS3590.

User Action:

Refer to message NS3590.

NS3901

NAME STATUS JOBNAME ASID AUTH Q-LIMIT CUR-QUE TOT-QUE

Reason:

This is a header message for the SHOW PPIUSERS command output. It maps the contents of the NS3903 message. Columns are:

NAME - The PPI receiver name.

STATUS - The PPI receiver status, ACTIVE or INACTIVE.

JOBNAME - The jobname of an active PPI receiver.

ASID - The ASID of an active PPI receiver.

AUTH - The APF authorisation requirement for sending to this PPI receiver.

Q-LIMIT - The queue limit of the PPI receiver

CUR-QUE - The number of messages currently queued to this PPI receiver.

TOT-QUE - The total number of messages queued to this PPI receiver.

System Action:

None.

User Action:

None.

NS3902**CUR-KBS TOT-KBS****Reason:**

This is a second header message for output from the SHOW PPIUSERS command. It maps message NS3904.

The headings are:

CUR-KBS - The current storage (in Kbytes) occupied by currently queued messages.

TOT-KBS - The total amount of storage (in Kbytes) occupied by all queued messages.

System Action:

None.

User Action:

None.

NS3903

data data data data ...

NS3990

COMMAND CANNOT BE PROCESSED AT THIS TIME.

Reason:

A SHOW PPIUSERS command was entered when the NMSSI was initialising or terminating.

System Action:

The command is ignored.

User Action:

None.

NS3991

PPI NOT ACTIVE, CANNOT PROCESS COMMAND.

Reason:

A SHOW PPIUSERS command was entered, but this NMSSI job is not providing PPI services.

System Action:

The command is ignored.

User Action:

None.

NS3992**INVALID SHOW PPIUSERS NAME****Reason:**

A SHOW PPIUSERS=*name* command was entered. The name specified is not a valid PPI receiver name.

System Action:

The command is ignored.

User Action:

Correct the name operand and retry the operation.

NS3993**DUPLICATED INACT PARAMETER ON SHOW PPIUSERS****Reason:**

A SHOW PPIUSERS command was entered, The INACT parameter was specified more than once.

System Action:

The command is ignored.

User Action:

Correct the duplicate operand and retry the operation.

NS3994**UNRECOGNISED PARAMETER ON SHOW PPIUSERS.****Reason:**

A SHOW PPIUSERS command was entered, but an unrecognised operand was supplied.

System Action:

The command is ignored.

User Action:

Correct the unrecognised operand and retry the operation.

NS4001

FUNCTION NAME PARAMETER NOT PROVIDED.

Reason:

A DD SUBSYS DD statement referring to an active NMSSI that is providing DD SUBSYS services does not have a second parameter with the function name. DD statements that use the NMSSI DD SUBSYS facility must have a SUBSYS=(*ssid,function,other,parms*) parameter.

System Action:

A JCL error is raised.

User Action:

Correct the DD SUBSYS statement.

NS4002

FUNCTION NAME PARAMETER NOT 1 TO 8 CHARS.

Reason:

A DD SUBSYS JCL statement that refers to an NMSSI subsystem name does not have a valid function name parameter after the subsystem name. The function parameter must be a 1 to 8 character name.

System Action:

A JCL error is raised.

User Action:

Correct the DD SUBSYS JCL statement.

NS4003

INVALID FUNCTION NAME: *name*

Reason:

A DD SUBSYS JCL statement referring to an active NMSSI subsystem has an unrecognised DD SUBSYS function name. Check the NMSSI DD SUBSYS documentation for a list of valid function names.

System Action:

A JCL error is raised.

User Action:

Correct the DD SUBSYS JCL statement.

NS4004**WRONG NUMBER OF PARMS FOR FUNCTION: *function*****Reason:**

A DD SUBSYS JCL statement referring to an active NMSSI subsystem has an invalid number of parameters for the requested function.

System Action:

A JCL error is raised.

User Action:

Correct the DD SUBSYS JCL statement.

NS4005**INVALID RC: *rc* FROM FUNCTION: *function*****Reason:**

A DD SUBSYS function has returned an invalid return code to the NMSSI DD SUBSYS manager.

System Action:

A JCL error is raised.

User Action:

Report the error to your SOLVE support representative.

NS4006**GENERAL C/I FAILURE.****Reason:**

This message is only issued for the NMSSI DD SUBSYS function under exceptional circumstances, for example SSI shutdown, when no other specific message has been issued.

System Action:

A JCL error is raised.

User Action:

If the error occurs repeatedly, report it to your SOLVE support representative.

NS4007

GENERAL ALLOCATION FAILURE.

Reason:

This message is produced by the NMSSI DD SUBSYS support modules under exceptional circumstances.

System Action:

An allocation failure will occur for the job.

User Action:

If the error occurs repeatedly, contact your SOLVE support representative.

NS4008

GETMAIN FAILURE IN ALLOCATION.

Reason:

An NMSSI DD SUBSYS function has been unable to obtain storage to process an allocation request.

System Action:

The subsystem dataset fails allocation, leading to a job step initialization failure.

User Action:

Investigate the reason for the storage shortage.

NS4050**OPEN ERROR *rc* FOR DDNAME: *ddname* (SSID *ssid*).****Reason:**

An open failure occurred on an NMSSI DD SUBSYS dataset. The *ddname* and *ssid* are displayed in the message.

The error codes are:

- 1 - SSI inactive.
- 2 - internal error.
- 3 - internal error.
- 4 - invalid ACB MACRF1 (should not happen when opening a DCB).
- 5 - invalid ACB MACRF2 (should not happen when opening a DCB).
- 6 - invalid ACB MACRF3 (should not happen when opening a DCB).
- 7 - open for input not allowed.
- 8 - open for output not allowed.
- 9 - open for update not allowed.
- 10 - open sequential not allowed.
- 11 - open addressed not allowed.
- 12 - open direct not allowed.
- 13 - internal error.
- 14 - internal error.
- 15 - internal error.
- 16 - GETMAIN failure.

System Action:

None.

User Action:

None.

NS4081

SUBSYSTEM *ssss* NOT ACTIVE.

Reason:

A DD SUBSYS JCL statement referring to an NMSSI subsystem was being processed while the SSI was not active.

System Action:

A JCL or allocation error is raised.

User Action:

Restart the NMSSI subsystem.

NS4090

ABEND *abcode* PSW *ppppppppp-ppppppppp* ICD *cc* ILC *l*

Reason:

An ABEND occurred whilst processing a DD SUBSYS statement that referred to an NMSSI subsystem.

System Action:

A JCL, allocation, or open error is raised.

User Action:

Contact your SOLVE support representative.

NS4091

Raa-Rbb dddddddd dddddddd dddddddd dddddddd

Reason:

This message follows message NS4090 and provides additional debugging information.

System Action:

See message NS4090,

User Action:

See message NS4090.

NS4199**ACCESS ERROR ON *ddname*****Reason:**

A DD SUBSYS DD statement has had an I/O operation attempted on it but a control block validation test has failed. Reasons for the failure can include:

- The NMSSI program has been stopped since the dataset was allocated or opened. (Even if restarted, this error will occur).
- A new version of NMSSI has been started.

This message is followed by a USER ABEND U0001.

System Action:

The program issuing the I/O request is abended with a U0001 user abend.

User Action:

Determine why the NMSSI program was stopped.

NS4201**INVALID COPY PARAMETER.****Reason:**

A DD SUBSYS statement using the COPY facility to copy all records to another dataset had an invalid COPY operand.

The COPY operand must be a valid 1 to 8 character DDname.

System Action:

A JCL error is raised.

User Action:

Correct the COPY operand.

NS4202

INVALID FILTER PARAMETER.

Reason:

A DD SUBSYS statement using the FILTER facility had an invalid FILTER operand.

The FILTER operand must be in the format `FILTER=pgm`, `FILTER=(pgm)`, or `FILTER=(pgm,parm)` where both *pgm* and *parm* are 1 to 8 character values.

System Action:

A JCL error is raised.

User Action:

Correct the FILTER operand.

NS4203

COPY TO SAME DDNAME INVALID

Reason:

A DD SUBSYS statement using the COPY facility had the same DDname for the COPY target as this DD statement.

This is not valid.

System Action:

A JCL error is raised.

User Action:

Correct the COPY operand to use a different target DDname.

NS4250

DDNAME: *ddname* OPEN FAILED, COPY DDNAME *ddname* NOT DEFINED

Reason:

A DD SUBSYS statement using the COPY facility could not be opened as the nominated COPY DDname was not defined in the JCL.

System Action:

The open is failed with an ABEND 013-C0.

User Action:

Ensure that the nominated COPY DDNAME is defined.

NS4251

DDNAME: *ddname* OPEN FAILED, GETMAIN FOR COPY DCB FAILED

Reason:

A DD SUBSYS statement using the COPY facility could not be opened as insufficient storage was available to obtain storage for the COPY DCB.

System Action:

The open is failed with an ABEND 013-C0.

User Action:

Ensure that sufficient storage is available in the region.

NS4252

DDNAME: *ddname* OPEN FAILED, COPY INTERNAL ERROR *rc*.

Reason:

A DD SUBSYS statement using the COPY facility could not be opened. During OPEN processing of the COPY dataset, an internal error occurred:

04 - ESTAE setup failed.

08 - GETMAIN failure.

12 - ESTAE driven.

System Action:

The OPEN is failed with an ABEND 013-C0.

User Action:

Contact your SOLVE support office.

NS4253

DDNAME: *ddname* OPEN FAILED, COPY DCB OPEN ERROR *rc*.

Reason:

A DD SUBSYS statement using the COPY facility could not be opened. The COPY dataset OPEN failed. The only return code is 04 which means that the OPEN of the COPY dataset failed.

System Action:

The OPEN fails with an ABEND 013-C0.

User Action:

Contact your SOLVE support office.

NS4254

DDNAME: *ddname* OPEN FAILED, GETMAIN FOR COPY IOA FAILED.

Reason:

A DD SUBSYS statement using the COPY facility could not be opened. A GETMAIN to obtain storage for an I/O area for the COPY dataset failed.

System Action:

The OPEN fails with an 013-C0 ABEND.

User Action:

Ensure that there is sufficient storage available to the job.

NS4255

DDNAME: *ddname* OPEN FAILED, LOAD FOR FILTER PGM *pgmname* FAILED.

Reason:

A DD SUBSYS statement using the FILTER facility failed to open. The user-specified FILTER program could not be loaded.

System Action:

The OPEN fails with an ABEND 013-C0.

User Action:

Ensure that the FILTER program is available on either a step library, the linklist, or in LPA. If the job step is authorised, the filter program MUST be loaded from an APF authorised library.

NS4256

DDNAME: *ddname* OPEN FAILED, GETMAIN FOR FILTER PLIST FAILED.

Reason:

A DD SUBSYS statement using the FILTER facility could not be opened. Storage could not be obtained for the FILTER program parameter lists.

System Action:

The OPEN is failed with an ABEND 013-C0.

User Action:

Ensure that sufficient storage is available in the region.

NS4257

DDNAME: *ddname* OPEN FAILED, FILTER INTERNAL ERROR *rc*.

Reason:

A DD SUBSYS statement using the FILTER facility could not be opened. An internal error occurred:

04 - ESTAE setup failed.

08 - GETMAIN failure.

12 - ESTAE driven (User FILTER program probably ABENDED).

System Action:

The OPEN is failed with an ABEND 013-C0.

User Action:

Contact your SOLVE support office.

NS4258

DDNAME: *ddname* OPEN FAILED, FILTER EXIT RETURN CODE *rc*.

Reason:

A DD SUBSYS statement using the FILTER option could not be opened. The FILTER program returned a non-zero return code on the Initialise call.

System Action:

The OPEN is failed with an ABEND 013-C0.

User Action:

Determine why the FILTER program returned a non-zero return code.

NS4290

ABEND *abcode* PSW *aaaaaaaa-bbbbbbbb* ICD *cc* ILC *d*

Reason:

This message is produced if an ABEND occurs during DD SUBSYS processing when the FILTER option is being used. It contains debugging information.

System Action:

The abend is retried and an error returned to the caller.

User Action:

Contact your SOLVE support office with the message details.

NS4291

Raa-Rbb *aaaaaaaa bbbbbbbb ccccccc dddddddd*

Reason:

This message follows message NS4290 and contains additional debugging information.

System Action:

See message NS4290.

User Action:

See message NS4290.

NS4A01

NULL PPISEND PARAMETER.

Reason:

This message indicates that a null parameter was supplied on a DD SUBSYS JCL statement using the PPISEND option.

System Action:

A JCL error is raised.

User Action:

Correct or remove the null parameter.

NS4A02

INVALID PPISEND PARAMETER: parm

Reason:

This message is the result of a DD SUBSYS JCL statement that contains an unrecognised parameter for the PPISEND service.

System Action:

A JCL error is raised.

User Action:

Correct the DD SUBSYS JCL statement.

NS4A03

DUPLICATE PPISEND PARAMETER.

Reason:

A DD SUBSYS JCL statement using the PPISEND function has a duplicated parameter.

System Action:

A JCL error is raised.

User Action:

Correct the DD SUBSYS JCL statement.

NS4A04

INVALID TARGET.

Reason:

A DD SUBSYS JCL statement using the PPISEND option has an invalid TARGET name specified.

The TARGET name must be a valid PPI receiver name.

System Action:

A JCL error is raised.

User Action:

Correct the target name.

NS4A05**INVALID SOURCE.****Reason:**

A DD SUBSYS JCL statement using the PPISEND option has an invalid value specified for the SOURCE operand.

The value must be a valid PPI receiver/sender name or one of the special values: *JOB, *STEP, *PSTEP.

System Action:

A JCL error is raised.

User Action:

Correct the DD statement.

NS4A06**TARGET NOT SPECIFIED.****Reason:**

A DD SUBSYS statement using the PPISEND option did not have a TARGET operand specified.

The TARGET operand is mandatory, to specify the target PPI receiver.

System Action:

A JCL error is raised.

User Action:

Correct the DD statement to add a TARGET operand.

NS4A07

INVALID QFULL.

Reason:

A DD SUBSYS statement using the PPISEND option has an invalid value for the QFULL operand.

Valid values for the QFULL operand are ERROR (default) and IGNORE.

System Action:

A JCL error is raised.

User Action:

Correct the QFULL operand.

NS4A08

INVALID BASE.

Reason:

A DD SUBSYS statement using the PPISEND option has an invalid value for the BASE operand.

The BASE value must be a number from 1 to 32760.

System Action:

A JCL error is raised.

User Action:

Correct the BASE operand.

NS4A50

DDNAME: ddname OPEN FAILED, LOAD FOR CNMNETV FAILED.

Reason:

A DD SUBSYS JCL statement using the PPISEND facility could not be opened as the CNMNETV PPI module could not be loaded.

System Action:

The open fails with an ABEND 013-C0.

User Action:

Determine why CNMNETV could not be loaded. A step library may be necessary.

NS4A51

DDNAME: *ddname* OPEN FAILED, GETMAIN FAILED.

Reason:

A DD SUBSYS DD statement using the PPISEND facility failed. A GETMAIN macro instruction to obtain storage failed.

System Action:

The OPEN is failed with an ABEND 013-C0

User Action:

Determine the reason for the storage shortage.

NS4A52

DDNAME: *ddname* OPEN FAILED, PPI FUNC=*aa* RC=*bb*. (*reason*)

Reason:

A DD SUBSYS JCL statement using the PPISEND facility failed to open. A PPI error occurred. The PPI function code and return code are shown. These codes can be looked up in the SOLVE user reference PPI chapters. Common return codes are decoded with a reason: PPI NOT ACTIVE (return code 24) RECEIVER UNDEFINED (return code 26)

System Action:

The OPEN fails with an ABEND 013-C0.

User Action:

Correct the problem and restart the affected job.

NS4A53

DDNAME: *ddname* OPEN FAILED, INTERNAL ERROR *rr*.

Reason:

A DD SUBSYS DD statement OPEN failed, for an internal reason:

04 - ESTAE failure.

08 - GETMAIN failure.

12 - ESTAE driven

System Action:

None.

User Action:

Contact your product support representative.

NS4A90

ABEND *abcode* PSW *aaaaaaaa-bbbbbbbb* ICD *cc* ILC *d*

Reason:

This message is produced if an ABEND occurs during DD SUBSYS processing for the PPISEND function. IT contains debugging information.

System Action:

The abend is retried and an error returned to the caller.

User Action:

Contact your product support representative with the message details.

NS4A91

Raa-Rbb aaaaaaaaa bbbbbbbb ccccccc dddddddd

Reason:

This message follows message NS4A90 and contains additional debugging information.

System Action:

See message NS4A90.

User Action:

See message NS4A90.

NS4C01**NULL WTO PARAMETER.****Reason:**

This message is produced if an invalid DD SUBSYS Parameter for the WTO function is found. A null parameter (for example 2 adjacent commas in the SUBSYS parameter) was found.

System Action:

A JCL error occurs.

User Action:

Correct the DD SUBSYS JCL statement.

NS4C02**INVALID WTO PARAMETER: *parm*****Reason:**

This message is produced if a DD SUBSYS JCL statement using the WTO option has an invalid or unrecognised parameter. The parameter in error is displayed.

System Action:

A JCL error is raised.

User Action:

Correct the DD SUBSYS JCL statement.

NS4C03**DUPLICATE WTO PARAMETER.****Reason:**

A DD SUBSYS DD statement using the WTO option has a duplicated parameter.

System Action:

A JCL error is raised.

User Action:

Correct the DD SUBSYS JCL statement.

NS4C04

INVALID ROUTCDE.

Reason:

A DD SUBSYS statement using the WTO option has an invalid ROUTCDE parameter. The ROUTCDE parameter must be a parenthesised list of numbers from 1 to 16 or 1 to 128 (MVS/XA 2.2 or higher).

System Action:

A JCL error is raised.

User Action:

Correct the DD SUBSYS JCL statement.

NS4C05

INVALID DESC.

Reason:

A DD SUBSYS statement using the WTO option has an invalid DESC parameter. The DESC parameter must be a parenthesised list of 1 to 16 numbers, each from 1 to 16.

System Action:

A JCL error is raised.

User Action:

Correct the DD SUBSYS JCL statement,

NS4C06**INVALID PREFIX.****Reason:**

A DD SUBSYS statement using the WTO option has an invalid value for the PREFIX operand.

The prefix must be a character string from 1 to 12 characters in length, or NO to suppress the prefix.

System Action:

A JCL error is raised.

User Action:

Correct the PREFIX value.

NS4C07**INVALID BASE.****Reason:**

A DD SUBSYS statement using the WTO option has an invalid value for the BASE operand.

The BASE value must be a number from 1 to 32760.

System Action:

A JCL error is raised.

User Action:

Correct the BASE operand.

NS4E01**NULL PPIRECV PARAMETER.****Reason:**

A DD SUBSYS statement using the PPIRECV option has a null parameter.

System Action:

A JCL error is raised.

User Action:

Correct the DD statement.

NS4E02

INVALID PPIRECV PARAMETER: *parm*

Reason:

A DD SUBSYS statement with the PPIRECV option has an invalid or unrecognised parameter specified.

System Action:

A JCL error is raised.

User Action:

Correct the invalid parameter. It may be misspelt.

NS4E03

DUPLICATE PPIRECV PARAMETER.

Reason:

A DD SUBSYS statement with the PPIRECV option has had a parameter duplicated.

System Action:

A JCL error is raised.

User Action:

Correct the DD statement.

NS4E04

INVALID ID.

Reason:

A DD SUBSYS DD statement for the PPIRECV parameter has an invalid value specified for the ID parameter.

The ID value must be a valid PPI receiver name.

System Action:

A JCL error is raised.

User Action:

Correct the receiver id.

NS4E05**INVALID APF.****Reason:**

A DD SUBSYS statement with the PPIRECV option has an invalid value for the APF option specified.

The value must be NO or YES.

System Action:

A JCL error is raised.

User Action:

Correct the APF parameter.

NS4E06**INVALID IQEMPTY.****Reason:**

A DD SUBSYS statement for the PPIRECV option has an invalid value for the IQEMPTY operand.

The IQEMPTY option can have values of EOF, WAIT, or (WAIT,*n*)

System Action:

A JCL error is raised.

User Action:

Correct the IQEMPTY option.

NS4E07

INVALID QEMPTY.

Reason:

A DD SUBSYS statement using the PPIRECV option has an invalid value specified for the QEMPTY parameter.

Valid values for the QEMPTY parameter are EOF, WAIT, and (WAIT,*n*).

System Action:

A JCL error is raised.

User Action:

Correct the QEMPTY operand.

NS4E08

INVALID MAXQUEUE.

Reason:

A DD SUBSYS statement using the PPIRECV option has an invalid value for the MAXQUEUE operand.

A MAXQUEUE value is a number from 1 to 9999.

System Action:

A JCL error is raised.

User Action:

Correct the MAXQUEUE option.

NS4E09

ID NOT SPECIFIED.

Reason:

A DD SUBSYS statement using the PPIRECV option does not include an ID operand. This operand is mandatory; it sets the PPI receiver name.

System Action:

A JCL error is raised.

User Action:

Add the ID operand to the DD statement SUBSYS parameters.

NS4E50

DDNAME: *ddname* OPEN FAILED, LOAD FOR CNMNETV FAILED.

Reason:

A DD SUBSYS statement for the PPIRECV option failed to open. The CNMNETV module could not be loaded.

System Action:

The OPEN fails with an ABEND 013-C0.

User Action:

Ensure that the CNMNETV module is available in the step library or the system linklist, or in LPALIB.

NS4E51

DDNAME: *ddname* OPEN FAILED, GETMAIN FAILED.

Reason:

A DD SUBSYS statement using the PPIRECV option failed to open, as a GETMAIN for storage failed.

System Action:

The open fails with an ABEND 013-C0.

User Action:

Ensure that sufficient storage is allocated to the region.

NS4E52

DDNAME: *ddname* OPEN FAILED, PPI FUNC=*fc* RC=*rc*. (*reason*)

Reason:

A DD SUBSYS statement using the PPIRECV option failed to open. PPI returned an unexpected return code.

Some of the return codes have an additional reason appended.

System Action:

The OPEN fails with an ABEND 013-C0.

User Action:

Determine the reason for the PPI return code.

NS4E53

DDNAME: *ddname* OPEN FAILED, INTERNAL ERROR *rr*.

Reason:

A DD SUBSYS statement using the PPIRECV option OPEN failed. An internal error occurred. The errors are:

- 4 - ESTAE failed.
- 8 - GETMAIN failed.
- 12 - ESTAE driven.

System Action:

The OPEN fails with an ABEND 013-C0.

User Action:

Contact your SOLVE product support office.

NS4E90

ABEND *abcode* PSW *aaaaaaaa-bbbbbbbb* ICD *cc* ILC *d*

Reason:

This message is produced if an ABEND occurs during DD SUBSYS processing for the PPIRECV function. It contains debugging information.

System Action:

The abend is retried and an error returned to the caller.

User Action:

Contact your SOLVE support office with the message details.

NS4E91

Raa-Rbb *aaaaaaaa bbbbbbbb ccccccc ddddddd*

Reason:

This message follows message NS4E90 and contains additional debugging information.

System Action:

See message NS4E90.

User Action:

See message NS4E90.

NS4G01**NULL USER PARAMETER.****Reason:**

A DD SUBSYS statement using the USER option has a null parameter.

System Action:

A JCL error is raised.

User Action:

Correct the DD statement.

NS4G02**INVALID USER PARAMETER: *parm*****Reason:**

A DD SUBSYS statement with the USER option has an invalid or unrecognised parameter specified.

System Action:

A JCL error is raised.

User Action:

Correct the invalid parameter. It may be misspelt.

NS4G03

DUPLICATE USER PARAMETER.

Reason:

A DD SUBSYS statement with the USER option has had a parameter duplicated.

System Action:

A JCL error is raised.

User Action:

Correct the DD statement.

NS4G04

INVALID PROGRAM.

Reason:

A DD SUBSYS DD statement for the USER option has an invalid value specified for the PROGRAM parameter.

The PROGRAM operand must be a valid 1 to 8 character program name.

System Action:

A JCL error is raised.

User Action:

Correct the program name.

NS4G05

INVALID PARM.

Reason:

A DD SUBSYS statement with the USER option has an invalid value for the PARM parameter specified.

The value must be a valid 1 to 8 character name.

System Action:

A JCL error is raised.

User Action:

Correct the PARM parameter.

NS4G06**PROGRAM NOT SPECIFIED.****Reason:**

A DD SUBSYS statement using the USER option does not include a PROGRAM operand. This operand is mandatory; it sets the name of the user program to call.

System Action:

A JCL error is raised.

User Action:

Add the PROGRAM operand to the DD statement SUBSYS parameters.

NS4G50**DDNAME: *ddname* OPEN FAILED, LOAD FOR *program* FAILED.****Reason:**

A DD SUBSYS statement for the USER option failed to open. The indicated user program module could not be loaded.

System Action:

The OPEN fails with an ABEND 013-C0.

User Action:

Ensure that the user program is available in the step library or the system linklist, or in LPALIB. If the program opening the dataset is APF authorised, the specified program MUST come from an APF library.

NS4G51**DDNAME: *ddname* OPEN FAILED, GETMAIN FAILED.****Reason:**

A DD SUBSYS statement using the USER option failed to open, as a GETMAIN for storage failed.

System Action:

The open fails with an ABEND 013-C0.

User Action:

Ensure that sufficient storage is allocated to the region.

NS4G52

DDNAME: *ddname* OPEN FAILED, INTERNAL ERROR *rr*.

Reason:

A DD SUBSYS statement using the USER option OPEN failed. An internal error occurred. The errors are:

- 4 - ESTAE failed.
- 8 - GETMAIN failed.
- 12 - ESTAE driven.

System Action:

The OPEN fails with an ABEND 013-C0.

User Action:

Contact your SOLVE product support office.

NS4G53

DDNAME: *ddname* OPEN FAILED, USER EXIT RETURN CODE *rc*.

Reason:

A DD SUBSYS statement using the USER option failed to open. The user program returned the indicated return code on the OPEN call.

System Action:

The OPEN fails with an ABEND 013-C0

User Action:

Determine why the user program returned a non-zero return code.

NS4G90

ABEND *abcode* PSW *aaaaaaaa-bbbbbbbb* ICD *cc* ILC *d*

Reason:

This message is produced if an ABEND occurs during DD SUBSYS processing for the USER function. It contains debugging information.

System Action:

The abend is retried and an error returned to the caller.

User Action:

Contact your SOLVE support office with the message details.

NS4G91

Raa-Rbb aaaaaaaa bbbbbbbb ccccccc dddddddd

Reason:

This message follows message NS4G90 and contains additional debugging information.

System Action:

See message NS4G90.

User Action:

See message NS4G90.

NS4X01

ENF facility is active

Reason:

This message is issued in response to a SSI STATUS command if the NMSSI ENF facility is active (that is, the NMSSI startup parameter ENF=YES was specified). It indicates that the facility is active.

System Action:

None

User Action:

None

NS4X02

Codes: *code code code*

Reason:

This message is issued in response to an SSI STATUS command if the NMSSI ENF facility is active (that is, the NMSSI startup parameter ENF=YES was specified). It shows a list of the ENF codes that are being monitored.

System Action:

None

User Action:

None

NS4X10

ENF statistics follow

Reason:

This message is issued in response to a SHOW SSISTATS command, and indicates that NMSSI ENF facility statistics follow.

System Action:

Further ENF messages follow.

User Action:

None

NS4X11

NAME TYPE TOKEN #-EVENTS #-ERRORS

Reason:

This message is issued in response to a SHOW SSISTATS command, and provides column headings for the following NS4X12 messages.

The column headings are:

#

The event code

NAME

The event name

TYPE

The event type, either TASK or SRB

TOKEN

The token assigned by ENF when the NMSSI ENF exit was registered

#- EVENTS

The number of occurrences of this event

#-ERRORS

The number of times an error occurred during event processing

System Action:

NS4X12 messages follow.

User Action:

None

NS4X12***statistics*****Reason:**

This message is issued in response to a SHOW SSISTATS command, and provides statistical information about ENF events that NMSSI handles.

The column headings are documented under the message NS4X11.

System Action:

None

User Action:

None

NS4X19

LAST ERROR: RC: *aa* R0: *bbbbbbbb* R1:*cccccccc*

Reason:

This message is issued in response to a SHOW SSISTATS command, and provides details about the last error that occurred when processing the event described by the previous NS4X12 message.

System Action:

None

User Action:

None

NS4X90

ENF DEFINE for event event-name failed, RC (HEX) *rc*, MODE: *mode*

Reason:

This message is issued during NMSSI initialization if an error occurs during registration of an ENF event listener.

Information describing the event and error is displayed.

System Action:

NMSSI terminates.

User Action:

Contact your product support office and supply the information contained in this message.

NS4X91

GETMAIN failure for ENF work pool

Reason:

This message is issued during NMSSI initialization if an error occurs when requesting storage for a work pool for ENF message processing.

System Action:

NMSSI terminates.

User Action:

Check the region size for the NMSSI region.

NS4Z01

SSI ENF FUNCTION UNSUPPORTED IN THIS OPERATING SYSTEM

Reason:

During NMSSI startup, the parameter ENF=YES was processed; however, the ENF facility is not supported on this operating system.

System Action:

NMSSI terminates.

User Action:

Remove the ENF=YES initialization parameter.

NS4Z02**SSI ENF function requires XMS=YES****Reason:**

During NMSSI startup, the parameter ENF=YES was processed. However, the XMS parameter was set to NO. Use of the ENF function requires XMS=YES.

System Action:

NMSSI terminates.

User Action:

Remove the ENF=YES initialization parameter, or add the XMS=YES initialization parameter.

NS4Z10**ENFADD/ENFDEL CODE: ccc not supported; ignored****Reason:**

During NMSSI startup, an ENFADD or ENFDEL initialization parameter was processed. The ENF code on the parameter was valid, but is not supported by this release of NMSSI. The parameter is ignored.

System Action:

The ENFADD or ENFDEL parameter is ignored.

User Action:

Remove the ENFADD or ENFDEL parameter from the NMSSI initialization statements.

NS6021**USERID NODE TYPE NMTP SOLVE-LU****Reason:**

This message is the title line for the SHOW SSIUSERS display. This display shows information about all logged on SSI users. Refer to message NS6022 for more information about this display.

System Action:

None.

User Action:

None.

NS6022

aaaaaaaa bbbbbbbb cccc dddd eeeeeeee

Reason:

This message is the detail display of the SHOW SSIUSERS display. Each line of the display shows information about a user who is logged on to the SSI. The meanings of the fields are as follows:

aaaaaaaa - the userid of the user. The userid might be generated by the SSI if the user is a background region user, or is the SOLVE userid of the user.

bbbbbbbb - the node from which the user is logged on. This name might be generated by the SSI for background SSI users, or might be the NCLID of the NCL process within SOLVE which has issued an SSI command, or might be the LUNAME of the terminal on which the SOLVE user who issued an SSI command is logged on.

cccc - the type of user. This will be NUSR if the user is logged on to the SSI from SOLVE, or will be the background region type if the user is an SSI background region user.

dddd - the environment type if the user is logged on from SOLVE (for example, VTOP if OCS, PROC if dependent environment)

eeeeeeee - the LU (terminal) if the user is logged on from SOLVE

System Action:

None.

User Action:

None.

NS6051

SSI STATISTICS FOLLOW...

Reason:

This message is the first response message to the SHOW SSISTATS command. Other statistics messages follow.

System Action:

None.

User Action:

None.

NS6059**UNABLE TO PRODUCE SSI STATISTICS AT THIS TIME.****Reason:**

This message is issued if NMSSI is unable to produce statistics in response to the SHOW SSISTATS command. This message is issued if the SSI is initialising or terminating.

System Action:

The command is ignored.

User Action:

None.

NS6A01**NO DEVICE ADDRESS SPECIFIED ON 'ATTACH' COMMAND****Reason:**

An ATTACH command has been entered to cause a terminal to be connected to the SSI, but no device address has been supplied.

System Action:

The command is rejected.

User Action:

Enter the ATTACH command with the address of the required device. The device address must be 3 hexadecimal characters that are the channel address of the device.

NS6A02**INVALID DEVICE ADDRESS: *aaaaaaaa*****Reason:**

An ATTACH command has been entered to cause a terminal to be attached to the SSI, but the device address supplied on the ATTACH command is not valid.

System Action:

The command is rejected.

User Action:

Enter the command again with a valid device address. The device address is 3 hexadecimal characters, which are the channel address of the device.

NS6A03

UNRECOGNISED OPERAND: aaaaaaaaaaaaaaaaaa

Reason:

An ATTACH command has been entered to cause a terminal to be attached to the SSI, but an operand specified on the ATTACH command is not recognised as being a valid operand.

System Action:

The command is rejected.

User Action:

Correct the operand which is incorrect, and re-enter the command.

NS6A04

DUPLICATED OPERAND: aaaaaaaaaaaaaaaaaa

Reason:

An ATTACH command has been entered to cause a terminal to be attached to the SSI, but an operand on the ATTACH command has been entered twice.

System Action:

The command is rejected.

User Action:

Remove one of the duplicated operand occurrences and retry the command.

NS6A05

MUTUALLY EXCLUSIVE OPERAND: aaaaaaaaaaaaaaaaaa

Reason:

An ATTACH command has been entered to cause a terminal to be attached to the SSI, but two of the operands on the ATTACH command are mutually exclusive.

System Action:

The command is rejected.

User Action:

Correct the command by removing one of the operands, and retry.

NS6A06**ATTACH USER DATA TOO LONG****Reason:**

An ATTACH command has been entered to cause a terminal to be attached to the SSI, but the amount of user data supplied on the DATA= operand exceeds the maximum allowable amount.

System Action:

The command is rejected.

User Action:

Re-enter the command with less user data. The maximum length of user data is 32 bytes.

NS6A07**INVALID AUTOLOG= OPERAND: aaaaaaaaaaaaaaaaaaaaaa****Reason:**

An ATTACH command has been entered to cause a terminal to be attached to the SSI, but the AUTOLOG= operand specifies an invalid value.

System Action:

The command is rejected.

User Action:

Correct the command and retry. The valid values for AUTOLOG are YES and NO.

NS6A08**INVALID NAME= OPERAND: aaaaaaaaaaaaaaaaaaaaaa****Reason:**

An ATTACH command has been entered to cause a terminal to be attached to the SSI, but the NAME= operand specifies an invalid value.

System Action:

The command is rejected.

User Action:

Correct the command and retry. The NAME= operand value must conform to standard PDS member name conventions.

NS6A09

DEVICE ADDRESS: *aaa* ALREADY ATTACHED

Reason:

An ATTACH command has been entered to cause a terminal to be attached to the SSI, but the device address specified represents a device which is already connected to the SSI.

System Action:

The command is rejected.

User Action:

Correct the device address and retry the command.

NS6A10

TERMINAL NAME: *aaaaaaaa* ALREADY IN USE FOR DEVICE: *bbb*

Reason:

An ATTACH command has been entered to cause a terminal to be attached to the SSI, but the name specified on the NAME= operand of the ATTACH command matches the name assigned to a device which is already connected to the SSI.

System Action:

The command is rejected.

User Action:

Re-enter the command, using a different device name.

NS6A11

ATTACH STARTED FOR DEVICE: *aaa*

Reason:

An ATTACH command has been entered to cause a terminal to be attached to the SSI. The command has been successfully processed.

System Action:

The SSI will attempt to attach the device.

User Action:

None. Subsequent messages will indicate the success or otherwise of the attempt to attach the device.

NS6A12**NO NAME PROVIDED ON ATTACH COMMAND, TPREFIX+ADDRESS
CREATE 9-CHAR DEFAULT NAME P=ppppp A=aaaa****Reason:**

An ATTACH command has been entered to cause a terminal to be attached to the SSI, and no name was specified on the command. However the terminal address is 4-digits (no leading 0), and the terminal prefix value has 5 characters. The resulting name has 9 characters and is too long.

System Action:

The command is rejected.

User Action:

Re-enter the command providing a specific terminal name.

NS6A99**TERMINAL SUPPORT DISABLED. COMMAND IGNORED****Reason:**

You entered an ATTACH command to attach a terminal to the SSI, but the SSI is not capable of attaching any terminals.

System Action:

The command is rejected.

User Action:

Investigate the reason for the inability of the SSI to attach terminals. The support of terminals requires the TERMINALS=YES SSI startup parameter, or terminal support may be disabled due to failure of the initialization of the terminal attention exit.

NS6B01

NO DEVICE ADDRESS SPECIFIED ON 'DETACH' COMMAND

Reason:

A DETACH command has been entered to detach a terminal from the SSI, but no device address has been supplied to identify which terminal is to be detached.

System Action:

The command is rejected.

User Action:

Re-enter the command with the device address as the only operand.

NS6B02

INVALID DEVICE ADDRESS: *aaaaaaaa*

Reason:

A DETACH command has been entered to detach a terminal from the SSI, but the device address supplied is not valid.

System Action:

The command is rejected.

User Action:

The device address must be from 001 to FFF inclusive. Correct the device address and retry the command.

NS6B03

UNRECOGNISED OPERAND: *aaaaaaaaaaaaaaaaaaaaaa*

Reason:

A DETACH command has been entered to detach a terminal from the SSI, but an unrecognised operand has been detected on the DETACH command.

System Action:

The command is rejected.

User Action:

The only operand valid on the DETACH command is the device address. Correct the command and retry.

NS6B04**DEVICE: *aaa* ALREADY DETACHING****Reason:**

A DETACH command has been entered to detach a terminal from the SSI, but the device is already detaching.

System Action:

The terminal will soon be detached.

User Action:

None.

NS6B05**DETACH OF DEVICE: *aaa* FAILED DUE TO STORAGE SHORTAGE****Reason:**

A DETACH command has been entered to detach a terminal from the SSI, but a storage shortage has prevented NMSSI from processing the detach request.

System Action:

The device is not detached.

User Action:

Investigate the cause of the storage shortage.

NS6B06**DEVICE ADDRESS: *aaa* NOT ATTACHED****Reason:**

A DETACH command has been entered to detach a terminal from the SSI, but the device address specified does not represent a terminal which is currently attached to the SSI.

System Action:

The command is rejected.

User Action:

Correct the device address and retry the command.

NS6B07

DETACH STARTED FOR DEVICE: *aaa*

Reason:

A DETACH command has been entered to detach a terminal from the SSI, and the command has been processed successfully.

System Action:

The specified terminal will be detached from the SSI.

User Action:

None. Message NS6F01 will appear when the detach processing has completed.

NS6B08

DETACH STARTED FOR *aaaaaa* DEVICES

Reason:

A DETACH ALL command has been entered to detach all terminals from the SSI. The command has been processed successfully. *aaaaaa* shows the number of terminals which are to be detached.

System Action:

All terminals attached to the SSI will be detached.

User Action:

None. Message NS6F01 will appear for every terminal that is detached.

NS6B99**TERMINAL SUPPORT DISABLED. COMMAND IGNORED****Reason:**

You entered a DETACH command to detach a terminal from the SSI, but the SSI is not capable of supporting attached terminals.

System Action:

The command is rejected.

User Action:

Investigate the reason for the inability of the SSI to attach terminals. The support of terminals requires the TERMINALS=YES SSI startup parameter, or terminal support may be disabled due to the failure of the initialization of the terminal attention exit.

NS6C01**DYNALLOC FAILURE FOR DEVICE: *aaa* R15: *bbbb* ERR: *cccc* INFO: *dddd*
- NOT ATTACHED****Reason:**

During processing of an ATTACH command, a DYNALLOC macro is issued to perform dynamic allocation of the terminal using its channel address. The DYNALLOC macro has completed with r15 non-zero, indicating an error has occurred which prevented successful allocation of the device.

aaa - is the channel address of the device

bbbb - is the r15 value on return from the DYNALLOC macro

cccc - shows the Dynamic Allocation Interface Routine (DAIR) return code for the allocation request.

dddd - shows further qualifying information about the allocation request.

System Action:

The terminal will go through deallocation steps to ensure no trace of the failed allocation remains.

User Action:

Investigate the reason for the dynamic allocation failure using the DAIR return code.

NS6C02

DEVTYPE FAILURE FOR DEVICE: *aaa* R15: *bbbb* - NOT ATTACHED

Reason:

During ATTACH processing to attach a terminal to the SSI, a DEVTYPE macro is issued by the SSI to attempt to identify the specified device to ensure it is a supported device. The DEVTYPE macro has failed with R15 set as shown.

System Action:

The SSI will perform deallocation of the terminal to clear any remaining knowledge of the failed attach request.

User Action:

Investigate the failure of the DEVTYPE macro, using the R15 value to identify why the macro failed.

NS6C03

WRONG DEVTYPE FOR DEVICE: *aaa* TYPE: *bbbb* - NOT ATTACHED

Reason:

During processing of an ATTACH request, the SSI issues a DEVTYPE macro to attempt to identify the device as being a supported device type. The information returned by the DEVTYPE macro indicates the device is not one which is supported by the SSI.

System Action:

The SSI will perform deallocation of the device to remove any remaining knowledge of the failed ATTACH request.

User Action:

The SSI only supports terminals attached to Local Non-SNA control units. If the device is a terminal attached to a Local Non-SNA control unit, contact SOLVE product support and supply them with the value of the returned devtype value '*bbbb*'.

NS6C04**OPEN ABEND FOR DEVICE: *aaa* CODE: *bbbb* - NOT ATTACHED****Reason:**

During processing of an ATTACH request, an OPEN macro is issued to open communication between the SSI and the terminal. An ABEND has occurred during processing of the OPEN macro. The code *bbbb* shows the abend code.

System Action:

The SSI will perform deallocation of the device to remove all knowledge of the failed attach attempt.

User Action:

Investigate the reason for the abend, using the abend code supplied in this message.

NS6C05**OPEN FAILED FOR DEVICE: *aaa* - NOT ATTACHED****Reason:**

During processing of an ATTACH request, an OPEN macro is issued to open communications with the terminal. The OPEN request has failed.

System Action:

The SSI will perform deallocation processing to remove all knowledge of the failed request.

User Action:

Retry the ATTACH command. If the problem persists, contact your product support representative.

NS6C06

ATTACH COMPLETE FOR DEVICE: *aaa*

Reason:

An ATTACH command has been entered to cause a terminal to be attached to the SSI. The attach processing has completed successfully and the terminal is now under SSI control.

System Action:

If AUTOLOG=NO was specified on the ATTACH command, the terminal will be sent the SSI LOGO. If AUTOLOG=YES was specified on the ATTACH command, the terminal will be passed to SOLVE.

User Action:

None.

NS6C07

DEVICE ALLOCATION ERROR - ADDRESS *aaa* REQUESTED, ADDRESS *bbb* RETURNED

Reason:

An ATTACH command has been entered to cause a terminal to be attached to the SSI. The Dynamic Allocation requested device address '*aaa*' but the device with address '*bbb*' was returned. This could indicate that a product such as Systems Managed Storage has returned a different device.

System Action:

The device is unallocated.

User Action:

Investigate the reason for the different device being returned. NMSSI does not allow the address to be different.

NS6D01**STORAGE SHORTAGE DURING PROCESSING FOR aaaaaaaa INPUT DISCARDED****Reason:**

A storage shortage has occurred during processing of input from SSI terminal *aaaaaaa*.

System Action:

The input is discarded. The terminal remains connected to NMSSI.

User Action:

Investigate the reason for the storage shortage condition.

NS6D02***WARNING* - aaaaaa TERMINAL ATTENTIONS LOST****Reason:**

When input is available from a terminal connected to NMSSI, an attention interrupt occurs which causes NMSSI to take action to retrieve the input from the terminal. This message is sent to the SSI log if NMSSI could not be notified of the attention interrupt.

System Action:

The input is not retrieved from the terminal.

User Action:

Report this problem to your SOLVE support representative.

NS6E01**NO SOLVE SYSTEM ASSIGNED TO THIS FUNCTION KEY****Reason:**

A request has been made to pass a terminal which is under NMSSI control to a SOLVE system, but the function key pressed is not assigned to a SOLVE system.

System Action:

The request to pass the terminal to SOLVE is rejected.

User Action:

Use function keys that have an active SOLVE assignment.

NS6E02

SOLVE NOT ACTIVE, ID=xxxxxxxxxxxx

Reason:

A request has been made to pass a terminal from NMSSI control to SOLVE. However, the requested SOLVE system is not presently connected to the NMSSI that owns the terminal. This might be because the SOLVE system is not active.

System Action:

The request to connect to SOLVE is ignored.

User Action:

Investigate why the requested SOLVE system is not active or not connected to an NMSSI.

NS6E03

SOLVE DISCONNECTED OR REFUSED TERMINAL

Reason:

A terminal which is connected to a SOLVE system via NMSSI has been returned to NMSSI control because the SOLVE system disconnected from NMSSI or refused the terminal session.

System Action:

The terminal is returned to NMSSI control.

User Action:

Investigate the reason for the termination of communication between NMSSI and SOLVE.

NS6E04**CONNECTION TO SOLVE CANCELLED, ID=xxxxxxxxxxxx****Reason:**

A session with a SOLVE system was cancelled by pressing PF03/PF15 in the NMSSI menu, which cancelled the current SOLVE session.

System Action:

The terminal is returned to NMSSI control.

User Action:

None. A user action caused this message.

NS6E05**SOLVE DISCONNECTED OR DROPPED TERMINAL****Reason:**

A terminal which is connected to a SOLVE system via NMSSI has been returned to NMSSI control because the SOLVE system disconnected from NMSSI or dropped the terminal session.

System Action:

The terminal is returned to NMSSI control.

User Action:

Investigate the reason for the termination of communication between NMSSI and SOLVE.

NS6E06

CONNECTION TO SOLVE FAILED, RC=*rr* ID=xxxxxxxxxxxx

Reason:

A session with a SOLVE system could not be established. The return code values are:

04 - unknown target SOLVE system

08 - storage shortage

12 - internal error

16 - internal error

20 - internal error

24 - internal error

System Action:

The terminal is returned to NMSSI control.

User Action:

If the return code indicates an internal error, contact your product support office.

NS6E07

SOLVE REFUSED CONNECTION, ID=xxxxxxxxxxxx

Reason:

A session with a SOLVE system was refused by SOLVE.

System Action:

The terminal is returned to NMSSI control.

User Action:

Contact your product support office.

NS6E09**READ OF INPUT FAILED****Reason:**

An error occurred while attempting to read input from a terminal.

System Action:

The terminal stays under NMSSI control.

User Action:

Attempt the operation again. If the failure persists, contact your product support office.

NS6E10**READ OF INPUT FOR TERMINAL *ttttttt* FAILED****Reason:**

An error occurred while attempting to read input for the named terminal.

System Action:

The input is ignored.

User Action:

Report this problem to your SOLVE product support representative.

NS6E90**TERMINAL: *ttttttt* UNEXP STATE=*aa* ACTION=*bb*****Reason:**

An internal processing error occurred during processing of the named terminal.

System Action:

The terminal is discarded.

User Action:

Contact your product support office.

NS6E91

TERMINAL: *ttttttt* STATE=*aa* ACTION=*bb* - NO ROUTINE

Reason:

An internal processing error occurred during processing of the named terminal.

System Action:

The terminal is discarded.

User Action:

Contact your product support office.

NS6E92

STORAGE SHORTAGE DURING PROCESSING FOR *aaaaaaaa* TERMINAL DISCARDED

Reason:

A storage shortage has occurred during processing of input from terminal *aaaaaaaa*. This has caused NMSSI to discard the terminal.

System Action:

The terminal is discarded.

User Action:

Investigate the cause of the storage shortage condition.

NS6F01

DETACH COMPLETE FOR DEVICE: *aaa*

Reason:

This message signifies the completion of detach processing for a terminal which has been attached to the SSI. This may indicate normal detach processing, initiated by the terminal user, or may indicate that cleanup after an unsuccessful attach request has been completed.

System Action:

None.

User Action:

None.

NS6H01**ATTACHED TERMINAL SUPPORT IS ACTIVE.****Reason:**

This message is part of the SSI STATUS display. It indicates that support for SSI attached terminals is active. This message does not appear if the support of attached terminals is not enabled.

System Action:

None.

User Action:

None.

NS6J01**ADDR NAME DDNAME STATUS I/O-ERR CUR-OWNER AUTOLOG****Reason:**

This message is the title line of the SHOW SSITERMS display. It shows column headings for the detail lines of the display. Refer to the description of message NS6J02 for more information about the display.

System Action:

None.

User Action:

None.

NS6J02

aaa bbbbbbbb cccccc ddddddd eee fff ggg

Reason:

This message is the detail line of the SHOW SSITERMS display. It shows information about each terminal which is under SSI control, or is connected to SOLVE via the SSI. The meanings of each field is as follows:

aaa - the channel address of the terminal

bbbbbbbb - the symbolic name assigned to the terminal either by the SSI or specified in the ATTACH command

ccccc - the DDname assigned by the system during the dynamic allocation of the device by the SSI

ddddddd - the status of the terminal. This shows if the terminal is connected to the SSI, in the process of attaching or detaching, or is currently logged on to SOLVE.

eee - indicates if the terminal has encountered any I/O errors

fff - indicates if the terminal is currently under control of the SSI or a SOLVE system and which one

ggg - indicates if the terminal was attached to the SSI with the AUTOLOG option, which causes the terminal to be immediately passed to SOLVE

System Action:

None.

User Action:

None.

NS6J03**SOLVE STATUS****Reason:**

This message is another title line of the SHOW SSITERMS display. It shows column headings for the detail lines of the display. Refer to the description of message NS6J04 for more information about the display.

System Action:

None.

User Action:

None.

NS6J04***aaaaa bbbbb*****Reason:**

This message is another detail line of the SHOW SSITERMS display. It shows the status of a SOLVE connection for the terminal described in the previous NS6J02 message.

The first field is the ACB name of a SOLVE system, the second is the status of the connection, which can have the following values:

STARTING - the terminal is presently connection to the SOLVE system

IN-SESSION - the terminal has a session with the SOLVE system

ENDED - the terminal has disconnected from the SOLVE system, however this has not been acknowledged yet

System Action:

None.

User Action:

None.

NS6J91**TERMINAL SUPPORT NOT ACTIVE, CANNOT PROCESS COMMAND****Reason:**

A SHOW SSITERMS command has been entered to display the status of all terminals connected to the SSI, but the SSI is not capable of attaching terminals.

System Action:

None.

User Action:

Investigate why the SSI does not support terminal attachment.

NS6L01

TERMINAL PANEL DEFINITION ERRORS, SEE LOG

Reason:

This message is issued during NMSSI startup if errors are detected while compiling the panel definitions for the Non-VTAM terminal management feature.

It indicates that there are errors in the definitions and that details can be found on the SSI LOG.

System Action:

NMSSI terminates.

User Action:

Examine the error messages on the SSILOG dataset.

NS6L02

P: pppppppp S: ssssssss L: llll ERROR: error-desc

Reason:

This message is issued during NMSSI startup if errors are detected while compiling the panel definitions for the Non-VTAM terminal management feature.

This message is logged and describes the error.

System Action:

NMSSI terminates.

User Action:

Report the error(s) to your product support office.

NS6X01**INVALID COMMAND CODE SENT TO aaaaaaaa : CODE X'bb'****Reason:**

A 3270 datastream has been sent to terminal *aaaaaaa*. The command code (the first byte in the datastream) is not supported by NMSSI.

System Action:

The datastream is not sent to the terminal.

User Action:

Check if the command code is valid for a local Non-SNA terminal. If so report the problem to your SOLVE product support representative.

NS6X02**OUTBOUND I/O REQUEST FOR aaaaaaaa - bbbbbbbb****Reason:**

This message is the first message produced for an I/O trace where NMSSI is sending data to a terminal. This message shows the terminal name and a description of the I/O request.

System Action:

None.

User Action:

This message is followed by NS6X03, NS6X04, NS6X05, NS6X06 and NS6X07 messages. These messages contain more information about the I/O request. Terminal I/O tracing can be enabled using the TERMDEBUG NMSSI startup parameter.

NS6X03

+off hexdata hexdata hexdata hexdata char char char char

Reason:

This message is preceded by NS6X02. This is a hexadecimal dump of the data sent to the terminal.

System Action:

None.

User Action:

None.

NS6X04

CCW FOR REQUEST:

Reason:

This message is part of an outbound I/O terminal trace where NMSSI is sending data to a terminal. This message preceeds a hexadecimal dump of the CCW used for the I/O operation.

System Action:

None.

User Action:

This message is followed by NS6X05, which contains a hexadecimal dump of the CCW. If the command requires a chained command, two CCWs are used, and are chained together. In this case the hexadecimal dump shows both CCWs, which are consecutive in storage.

NS6X05

+off hexdata hexdata hexdata hexdata char char char char

Reason:

This message is preceded by NS6X04. This is a hexadecimal dump of the CCW used in the I/O operation.

System Action:

None.

User Action:

None.

NS6X06**IOB FOR REQUEST:****Reason:**

This message is part of an outbound I/O terminal trace where NMSSI is sending data to a terminal. This message preceeds a hexadecimal dump of the IOB used for the I/O operation.

System Action:

None.

User Action:

This message is followed by NS6X05, which contains a hexadecimal dump of the IOB.

NS6X07

+off hexdata hexdata hexdata hexdata char char char char

Reason:

This message is preceded by NS6X06. This is a hexadecimal dump of the IOB used in the I/O operation.

System Action:

None.

User Action:

None.

NS6X08

I/O RESULTS FOR *aaaaaaaa*

Reason:

This message is the produced on completion of I/O to a terminal which is being traced by NMSSI. It is the first in a series of messages which provide information about the results of the I/O operation.

System Action:

None.

User Action:

This message is followed by NS6X09, NS6X10, NS6X11, NS6X12 and NS6X13 messages. These messages contain more information about the results of the I/O request. Refer to these messages for more information.

NS6X09

+off hexdata hexdata hexdata hexdata char char char char

Reason:

This message is preceded by NS6X08. This is a hexadecimal dump of the data sent from the terminal to NMSSI as a result of the I/O operation.

System Action:

None.

User Action:

None.

NS6X10**CCW AFTER I/O COMPLETION:****Reason:**

This message is produced when I/O completes for a terminal which is being traced by NMSSI. This message is followed by a hexadecimal dump of the CCW used for the operation.

System Action:

None.

User Action:

This message is followed by NS6X11, which contains the hexadecimal dump of the CCW used for the operation. If the command required a chained command, two CCWs are used, and are chained together. In this case the hexadecimal dump shows both CCWs, which are consecutive in storage.

NS6X11

+off hexdata hexdata hexdata hexdata char char char char

Reason:

This message is preceded by NS6X10. This is a hexadecimal dump of the CCW after the I/O operation has completed.

System Action:

None.

User Action:

None.

NS6X12

IOB AFTER I/O COMPLETION:

Reason:

This message is produced when I/O completes for a terminal which is being traced by NMSSI. This message is followed by a hexadecimal dump of the IOB used for the operation.

System Action:

None.

User Action:

This message is followed by NS6X13, which contains the hexadecimal dump of the IOB used for the operation.

NS6X13

+off hexdata hexdata hexdata hexdata char char char char

Reason:

This message is preceded by NS6X10. This is a hexadecimal dump of the IOB after the I/O operation has completed.

System Action:

None.

User Action:

None.

NS6X14

NO DATA WAS RETURNED FOR THIS OPERATION

Reason:

This message is produced when I/O completes for a terminal which is being traced by NMSSI. This message indicates that the I/O operation did not result in the terminal sending data to NMSSI.

System Action:

None.

User Action:

None.

NS7050**UNABLE TO OBTAIN \$AXE POOL STORAGE.****Reason:**

During SSI initialization with attached terminal support enabled, the SSI attempts to initialize several items to allow handling of attention interrupts which represent changes in terminal state, for example, power on, key pressed.

This process involves the use of temporary storage, crucial to the operation of the attention exit, but the GETMAIN for the required amount of storage has failed.

System Action:

The attention interrupt exit and attached terminal support are disabled.

User Action:

Investigate the reason for the storage shortage that caused the GETMAIN failure.

NS7051**UNABLE TO INSERT I/O ATTENTION EXIT****Reason:**

During SSI initialization with terminal or ctca support enabled, the SSI attempts to insert an attention interrupt handler into the system's interrupt handler table.

The attempt to insert the SSI attention interrupt routine information into the system's interrupt table has failed, because the table is of a limited size and all available space has been used.

System Action:

NMSSI terminates.

User Action:

Investigate the usage of the interrupt table.

NS7090

ABEND aaaaaaaaa PSW bbbbbbbb-ccccccc ICD dd ILC e

Reason:

This is a diagnostic message from NMSSI. It provides ABEND information.

Note that this message is issued in the context of a PPI user's address space.
It is WTO'd.

System Action:

NMSSI continues.

User Action:

Provide the diagnostic information to your product support representative.
Note that this message is only produced if NMSSI internal debugging facilities are enabled.

NS7091

Rxx-Ryy aaaaaaaaa bbbbbbbb ccccccc ddddddd

Reason:

This message follows the NS7090 message and contains additional debugging information.

System Action:

Refer to message NS7090.

User Action:

Refer to message NS7090.

NS7092

ABEND aaaaaaaa PSW bbbbbbbb-ccccccc ICD dd ILC e

Reason:

This is a diagnostic message from NMSSI. It provides ABEND information.

Note that this message is issued in the context of a PPI user's address space. It is WTO'd.

System Action:

NMSSI continues.

User Action:

Provide the diagnostic information to your product support representative. Note that this message is only produced if NMSSI internal debugging facilities are enabled.

NS7093

Rxx-Ryy aaaaaaaa bbbbbbbb ccccccc ddddddd

Reason:

This message follows the NS7092 message and contains additional debugging information.

System Action:

Refer to message NS7092.

User Action:

Refer to message NS7092.

NS8701

UNRECOGNISED CIBVERB VALUE X'vvvv' RECEIVED.

Reason:

A command input buffer (CIB) was received from a QEDIT operation. The CIBVERB field contained an invalid verb code.

System Action:

The CIB is ignored.

User Action:

Report the problem to your product support representative.

NS8702

PARAMETERS ON 'START' COMMAND IGNORED.

Reason:

NMSSI was started using the 'START' operating system command. Parameters were specified on this command. NMSSI does not allow parameters to be specified in this way.

System Action:

The parameters are ignored.

User Action:

If you need to specify overriding parameters when starting NMSSI, use the JCL EXEC statement PARM field.

NS8703

'STOP' COMMAND NOT SUPPORTED.

Reason:

The operating system 'STOP' ('P') command is not supported by NMSSI.

System Action:

The command is ignored.

User Action:

Use the 'F *jobname*,SSI STOP' command to stop NMSSI.

NS8999

SOLVE SSI TERMINATED *yyyy/mm/dd*.

Reason:

The SOLVE Subsystem Interface has terminated. This message informs the operator, and is the last message on the SSI log.

System Action:

The SSI terminates.

User Action:

None.

NS8A01**SSI ENVIRONMENT TERMINATED FOR *uuuu* AT *nnnn*.****Reason:**

This message is written to the SSI log when an SSI user environment is terminated.

uuuu is the userid.

nnnn is the terminal name.

System Action:

None.

User Action:

None.

NS8D01**COMMAND: *cccc* - IS NOT VALID.****Reason:**

The entered command is not a valid NMSSI command.

System Action:

The command is ignored.

User Action:

Correct and re-enter the command.

NS8D02**COMMAND: *cccc* - IS AMBIGUOUS.****Reason:**

The entered command name does not uniquely identify an NMSSI command. For example, 'S' could be 'SSI' or 'SHOW'.

System Action:

The command is ignored.

User Action:

Correct and re-enter the command.

NS8D03

COMMAND STARTING WITH: *text* - TOO LONG, TRUNCATED.

Reason:

The command entered to NMSSI was longer than 256 characters.

System Action:

The command is ignored.

User Action:

Correct and re-enter the command.

NS8F01

MISSING OR INVALID PARAMETER ON 'SHOW' COMMAND.

Reason:

The SHOW command entered to NMSSI did not contain a SHOW operand.

System Action:

The command is ignored.

User Action:

Correct and re-enter the command.

NS8F02

UNRECOGNISED PARAMETER: *pppp* SPECIFIED ON 'SHOW' COMMAND.

Reason:

The entered SHOW command for NMSSI contained an unrecognised operand.

System Action:

The command is ignored.

User Action:

Correct and re-enter the command.

NS9501

NMSSI ABEND *ccc* SSID=*iii* JN=*jjj* DT=*yyyyddd* TM=*hhmmsssth***

Reason:

This message is written to the system console when an NMSSI region or job ABENDs. The message contains the abend code, SSID, jobname, date, and time of the abend.

System Action:

NMSSI takes a formatted dump and a system dump. This message is followed by the NS9502 and NS9503 messages with additional information.

User Action:

Contact your support office with the details of the ABEND.

NS9502

SRC= *P1* PRD= *P2* REL= *P3* SP= *P4* ABC= *P5*

Reason:

This message is written to the system console when an NMSSI region or job ABENDs. It follows the NS9501 message and contains information about the abend. The fields are:

SRC= *P1* - The source of the abend information. *P1* is either: AB - meaning that the information in this and the NS9503 message was derived from the PSW and registers at the time of the abend, or SE - meaning that the information was derived from the registers and PSW from the NMSSI primary RB

PRD= *P2* - The product name (normally NMSSI)

REL= *P3* - The product internal release level

SP= *P4* - The product service pack level

ABC= *P5* - The ABEND code:

S-*xxx* for a SYSTEM abend

U-*nnn* for a user abend

N-*aaa-bb* for an internal NMSSI abend

System Action:

See message NS9501.

User Action:

See message NS9501.

NS9503

ALM=aaa ALO=bbb ACS=ccc ACO=ddd LLM=eee LCS=fff

Reason:

This message is written to the system console when an NMSSI region or job ABENDs. It follows the NS9502 message and contains information about the abend. The fields are:

ALM=aaa - The ABEND load module

ALO=bbb - The offset within the ABEND load module

ACS=ccc - The ABEND CSECT, if it could be identified

ACO=ddd - The offset within the ABEND CSECT, if the CSECT could be identified

LLM=eee - The last apparent active load module

LCS=fff - The last apparent CSECT

System Action:

See message NS9501.

User Action:

See message NS9501.

NSC001

UNIX SHELL interface active, NAME= P1

Reason:

The UNIX interface provided by the SSI is now active and may be used by SOLVE regions. The EPS service name that SOLVE regions will use to connect to this is *P1*.

System Action:

Processing continues.

User Action:

None required.

NSC002**Unable to obtain RACROUTE workarea****Reason:**

The UNIX interface attempted to obtain storage for a RACROUTE workarea and was unsuccessful.

System Action:

Processing continues. The PROGRAM and HOME definitions which may be present are not used, that is, the default program /bin/sh is executed with no home directory.

User Action:

Check the storage allocated to the SSI region.

NSC003**RACROUTE EXTRACT call failed - RC= P1, RS= P2****Reason:**

A RACROUTE EXTRACT call made by the UNIX interface failed with return code *P1* and reason *P2* .

System Action:

Processing continues. The PROGRAM and HOME definitions, which may be present, are not used. The default program /bin/sh is executed with no home directory.

User Action:

Check the return and reason codes in the Security Server (RACF) Messages and Codes manual.

NSC091

UNIX not available on this operating system

Reason:

The UNIX interface is available only on OS/390 release 2.5 or higher.

System Action:

SSI initialization continues without UNIX support.

User Action:

Remove the UNIX=YES parameter from the SSI startup deck if UNIX support is not required, or run the SSI on OS/390 2.5 or higher.

NSC092

UNIX facility requires SSI run in supervisor state

Reason:

The UNIX interface must run in supervisor state, but another startup parameter has prevented this.

System Action:

The SSI terminates.

User Action:

Check the SSI startup deck for other parameters that may conflict with running the UNIX interface.

NSC093

UNIX facility not started - already active in another region

Reason:

The UNIX interface is already being provided by an SSI running in another region on the same OS/390 system.

System Action:

SSI initialization continues without UNIX support.

User Action:

Remove the UNIX=YES parameter from the SSI startup deck for this SSI, or terminate the other SSI region.

NSC201**\$UXB for CONNECT request follows:****Reason:**

This message precedes a dump of a connect request buffer when a trace of connect activity for the UNIX interface is requested.

System Action:

Processing continues.

User Action:

None.

NSC203**\$UXB for CONNECT response follows:****Reason:**

This message precedes a dump of a connect response buffer when a trace of connect activity for the UNIX interface is requested.

System Action:

Processing continues.

User Action:

None.

NSC204**P1: Starting conversation thread****Reason:**

The UNIX interface EPS exit is about to start a conversation thread to manage an incoming connection request. This message is issued when a trace of connection activity is requested.

P1 is a unique path identifier for this caller.

System Action:

Processing continues.

User Action:

None.

NSC205

P1: Conversation DISCONNECT received

Reason:

The UNIX interface EPS exit has received a DISCONNECT request from a client. This message is issued when a trace of connection activity is requested.

P1 is a unique path identifier for this caller.

System Action:

Processing continues.

User Action:

None.

NSC206

P1: \$UXB for SEND request follows:

Reason:

This message precedes a dump of a SEND request buffer when a trace of command activity for the UNIX interface is requested.

P1 is a unique path identifier for this caller.

System Action:

Processing continues.

User Action:

None.

NSC207**P1: \$UXB for SEND response follows:****Reason:**

This message precedes a dump of a SEND response buffer when a trace of command responses for the UNIX interface is requested.

P1 is a unique path identifier for this caller.

System Action:

Processing continues.

User Action:

None.

NSC301**P1: Conversation thread started****Reason:**

A UNIX interface conversation thread has been started to manage an EPS conversation from an incoming connection request. This message is issued when a trace of module flow is requested.

P1 is a unique path identifier for this caller.

System Action:

Processing continues.

User Action:

None.

NSC302

P1: Return code from RACROUTE call: P2

Reason:

The UNIX interface conversation manager has issued a RACROUTE call to extract an individual caller's OMVS definition. This message is issued when a trace of module flow is requested and UNIXSEPUSER=YES was specified.

P1 is a unique path identifier for this caller.

System Action:

If *P2* is 0, the user's OMVS segment values for PROGRAM and HOME is used; otherwise PROGRAM value defaults to /bin/sh and no HOME value.

User Action:

If *P2* is non-zero, see the Security Server (RACF) Messages and Codes manual.

NSC303

P1: Return code from attach of UNIX owning task: P2

Reason:

P2 was the return code returned to the UNIX interface conversation manager from an ATTACH of the UNIX owning task. This message is issued if a trace of module flow is requested.

P1 is a unique path identifier for this caller.

System Action:

If *P2* is 0, processing on behalf of the caller continues; otherwise the thread terminates and the caller receives a return code indicating that initialization failed.

User Action:

If *P2* is non-zero, see the MVS Assembler Services Reference for an explanation of return codes from the ATTACH macro.

NSC304**P1: UNIX subtask failed to initialize****Reason:**

The UNIX subtask ABENDED during initialization. This message is issued if a trace of module flow is requested.

P1 is a unique path identifier for this caller.

System Action:

The thread terminates and the caller receives a return code indicating that subtask initialization failed.

User Action:

See the system log for messages relating to subtask termination.

NSC305**P1: UNIX subtask initialized****Reason:**

The UNIX subtask has successfully initialized. This message is issued if a trace of module flow is requested.

P1 is a unique path identifier for this caller.

System Action:

Processing continues.

User Action:

None.

NSC306

P1: Waiting for DISC or subtask termination

Reason:

The UNIX conversation manager is waiting for the client to disconnect or the subtask to terminate. This message is issued if a trace of module flow is requested.

P1 is a unique path identifier for this caller.

System Action:

Processing continues.

User Action:

None.

NSC307

P1: Client DISCONNECTED

Reason:

The UNIX client has disconnected (normally from a CLOSE). This message is issued if a trace of module flow is requested.

P1 is a unique path identifier for this caller.

System Action:

The subtask is notified to perform an orderly termination, after which the conversation thread is terminated.

User Action:

None.

NSC308**P1: Subtask terminated****Reason:**

The UNIX subtask has terminated. This message is issued if a trace of module flow is requested.

P1 is a unique path identifier for this caller.

System Action:

The conversation thread is terminated.

User Action:

See the system log for further messages relating to subtask activity.

NSC309**P1: Conversation thread terminated****Reason:**

The UNIX conversation thread has terminated. This message is issued if a trace of module flow is requested.

P1 is a unique path identifier for this caller.

System Action:

The conversation thread is terminated.

User Action:

None.

NSC402**STDIN task entered****Reason:**

The STDIN task has been started for a UNIX client. This message is issued when a trace of module flow is requested.

System Action:

Processing continues.

User Action:

None.

NSC403

BPX1SEC call failed

Reason:

Separate user signon was requested and the call to UNIX to create a separate security environment failed. This message is issued only if a trace of module flow is requested.

System Action:

Processing for the UNIX client is terminated.

User Action:

Check the &SYS.UNIX.CALL, &SYS.UNIX.RETCODE, and &SYS.UNIX.REASCODE system variables returned to the calling program for more information.

NSC404

BPX1SPN call failed

Reason:

The call to start the UNIX SHELL failed. This message is issued only if a trace of module flow is requested.

System Action:

Processing for the UNIX client is terminated.

User Action:

Check the &SYS.UNIX.CALL, &SYS.UNIX.RETCODE, and &SYS.UNIX.REASCODE system variables returned to the calling program for more information.

NSC405**ATTACH of output subtask failed****Reason:**

An attempt to attach the subtask to read results from the SHELL failed. This message is issued only if a trace of module flow is requested.

System Action:

Processing for the UNIX client is terminated.

User Action:

Check system log for any other messages relating to the failure.

NSC406**Output subtask initialized****Reason:**

The subtask to read results from the SHELL has initialized. This message is issued only if a trace of module flow is requested.

System Action:

Processing continues.

User Action:

None.

NSC407**Output subtask terminated****Reason:**

The subtask to read results from the SHELL has terminated during initialization. This message is issued only if a trace of module flow is requested.

System Action:

Processing for the client is terminated.

User Action:

Check the system log for any other messages relating to the problem.

NSC408

Client disconnected

Reason:

The client has closed the connection prior to initialization completing. This message is issued only if a trace of module flow is requested.

System Action:

Processing for the client is terminated.

User Action:

Check client program in SOLVE to determine the reason for disconnection.

NSC409

STDIN subtask initialized

Reason:

The subtask to write commands to the SHELL has initialized. This message is issued only if a trace of module flow is requested.

System Action:

Processing continues.

User Action:

None.

NSC410

Writing command to SHELL

Reason:

A command is about to be written to the UNIX SHELL for execution. This message is issued only if a trace of module flow is requested.

System Action:

Processing continues.

User Action:

None.

NSC411**Writing of command to SHELL failed****Reason:**

An attempt to write a command to the UNIX SHELL failed. This message is issued only if a trace of module flow is requested.

System Action:

Processing continues.

User Action:

Check the &SYS.UNIX.RETCODE and &SYS.UNIX.RETVAL system variables returned to the calling program in SOLVE.

NSC412**Sending chaser to SHELL...****Reason:**

A chaser command is about to be written to the UNIX SHELL to delineate the end of command response for the SHELL output task. This message is issued only if a trace of module flow is requested.

System Action:

Processing continues.

User Action:

None.

NSC413**Writing of chaser to SHELL failed****Reason:**

An attempt to write a chaser to the UNIX SHELL failed. This message is issued only if a trace of module flow is requested.

System Action:

Processing continues.

User Action:

Check the &SYS.UNIX.RETCODE and &SYS.UNIX.RETVAL system variables returned to the calling program in SOLVE.

NSC414

Command response queued

Reason:

A response from issuing a command to the UNIX SHELL has been queued to the distribution task. This message is issued only if a trace of module flow is requested.

System Action:

Processing continues.

User Action:

None.

NSC415

Stopping SHELL

Reason:

An exit command is about to be issued to the UNIX SHELL to have it terminate. This message is issued only if a trace of module flow is requested.

System Action:

Processing continues.

User Action:

None.

NSC416

SHELL stopped

Reason:

The SHELL has terminated normally. This message is issued only if a trace of module flow is requested.

System Action:

Processing continues.

User Action:

None.

NSC417**Waiting for output s/t termination****Reason:**

The STDIN task is waiting for the output subtask to terminate. This message is issued only if a trace of module flow is requested.

System Action:

The STDIN task waits for the output subtask's termination ECB to be posted.

User Action:

None.

NSC418**Output subtask DETACHed****Reason:**

The output subtask has been detached as part of the STDIN subtask termination. This message is issued only if a trace of module flow is requested.

System Action:

Processing continues.

User Action:

None.

NSC419**STDIN subtask terminated****Reason:**

The STDIN subtask has terminated. This message is issued only if a trace of module flow is requested.

System Action:

The STDIN subtask exits.

User Action:

None.

NSC501

Output subtask entered

Reason:

The output task has been started for a UNIX client. This message is issued when a trace of module flow is requested.

System Action:

Processing continues.

User Action:

None.

NSC503

Output subtask initialized

Reason:

The output task has initialized successfully. This message is issued only when a trace of module flow is requested.

System Action:

Processing continues.

User Action:

None.

NSC504

Output subtask about to issue SELECT

Reason:

The output task is about to issue a UNIX SELECT call. This message is issued only when a trace of module flow is requested.

System Action:

Processing continues.

User Action:

None.

NSC505**Buffers to free****Reason:**

The output task has buffers queued to it from the distribution thread to be freed. This message is issued only when a trace of module flow is requested.

System Action:

Processing continues.

User Action:

None.

NSC506**Reading from STDERR****Reason:**

The output task is about to read from the UNIX SHELL's STDERR. This message is issued only when a trace of module flow is requested.

System Action:

Processing continues.

User Action:

None.

NSC507**Reading from STDOUT****Reason:**

The output task is about to read from the UNIX SHELL's STDOUT. This message is issued only when a trace of module flow is requested.

System Action:

Processing continues.

User Action:

None.

NSC508

Closing STDOUT

Reason:

The output task is about to close the PIPE from the UNIX SHELL's STDOUT. This message is issued only when a trace of module flow is requested.

System Action:

Processing continues.

User Action:

None.

NSC509

Closing STDERR

Reason:

The output task is about to close the PIPE from the UNIX SHELL's STDERR. This message is issued only when a trace of module flow is requested.

System Action:

Processing continues.

User Action:

None.

NSC510

End-of-data

Reason:

The output task has detected end-of-data from a SHELL command response. This message is issued only when a trace of module flow is requested.

System Action:

Processing continues.

User Action:

None.

NSC511**Data being queued****Reason:**

The output task is about to queue a SHELL command response to the distribution thread. This message is issued only when a trace of module flow is requested.

System Action:

Processing continues.

User Action:

None.

NSC512**Output subtask terminating****Reason:**

The output task is about to terminate. This message is issued only when a trace of module flow is requested.

System Action:

Processing continues.

User Action:

None.

NSC601**P1: \$UXB for command response follows:****Reason:**

This message precedes a dump of a command response buffer when a trace command of responses for the UNIX interface is requested.

P1 is a unique path identifier for this caller.

System Action:

Processing continues.

User Action:

None.

NSC603

P1: Return code P2 from EPS SEND of command response

Reason:

P2 was the return code returned to the UNIX interface message distribution manager from an EPS SEND of a command response. This message is issued if a trace of module flow is requested.

P1 is a unique path identifier for this caller.

System Action:

Processing continues.

User Action:

If *P2* is non-zero, there may be a problem with the EPS connection to the client.

NSC604

P1: \$UXB for SHELL data follows:

Reason:

This message precedes a dump of a SHELL data buffer when a trace of data for the UNIX interface is requested.

P1 is a unique path identifier for this caller.

System Action:

Processing continues.

User Action:

None.

NSC605**P1: Return code P2 from EPS SEND of SHELL data****Reason:**

P2 was the return code returned to the UNIX interface message distribution manager from an EPS SEND of SHELL data. This message is issued if a trace of module flow is requested.

P1 is a unique path identifier for this caller.

System Action:

Processing continues.

User Action:

If *P2* is non-zero, there may be a problem with the EPS connection to the client.

NSD201**SSIDB STATUS: P1****Reason:**

This message is issued as part of the SSI STATUS command. It shows the status of the SSIDB file. The status (*P1*) is shown as a text string that includes one or more of the following values:

OPEN - The file is open.

CLOSED - The file is closed.

OPEN ERROR - An attempt to open the file failed.

INIT ERROR - The file was opened and found to be empty. An attempt to create an initial control record failed.

STRING SHORTAGES - One or more string shortages have been detected since the file was opened.

System Action:

None.

User Action:

The normal status will be OPEN. For all other status values, review the SSI log for earlier errors regarding DD=SSIDB. Use the SSI SHOW VFS command to display current file details, for example the current number of string shortages.

NSD202

ONE OR MORE FILE REQUESTS SUSPENDED

Reason:

This message is issued as part of the SSI STATUS command. It indicates that one or more requests to access an SSI data set have been suspended due to a record contention problem.

System Action:

None.

User Action:

None.

NSD211

***ERROR* SYSTEM NAME MISMATCH ON SSIDB DATA SET, FOUND SYSNAME= P1**

Reason:

The SSIDB data set is opened during SSI initialization, and a control record is read. The control record indicates that the SSIDB data set is in use on another system name (LPAR). The SSIDB may not be shared between LPARs. The message indicates the system name that last opened the data set (P1).
Note: During normal SSI termination, the control record is updated to clear the system name to allow the data set to be used on another LPAR. This message may occur if the file was not closed when last used on the indicated system name.

System Action:

SSI initialization fails.

User Action:

Do the following to reset the system name in the SSIDB control record:

1. Start the SSI on the indicated system using this data set.
2. Terminate the SSI.

NSD212

***ERROR* VSAM P1 ERROR PROCESSING CONTROL RECORD, RC= P2
FDBK= P3 DD= P4**

Reason:

During open or close processing of an SSI data set that requires control records to be read or rewritten, an error occurred when processing the control record. In the message:

P1 is the record action: GET: the error occurred during file open processing when reading the control record. PUT: the error occurred during file close processing when writing the control record.

P2 is the VSAM return code, in hex.

P3 is the VSAM feedback code, in hex.

P4 is the DD name.

System Action:

If the error occurs at file open, SSI initialization fails.

User Action:

Refer to the VSAM Programming manual to determine the meaning of the feedback from the message and the appropriate course of corrective action.

NSD291

SSIDB HAS NOT BEEN OPENED

Reason:

This message is issued as part of the SSI STATUS command. It indicates that the SSIDB dataset has not yet been opened.

System Action:

None.

User Action:

None.

NSD292

SSIDB IS NOT IN USE

Reason:

This message is issued as part of the SSI STATUS command. It indicates that the SSIDB dataset is not in use in the NMSSI configuration.

System Action:

None.

User Action:

None.

NSDC01

DDNAME KEYLEN MAXREC STRNO BUFND BUFNI STRSH EC F2 TIME STAMP

Reason:

This is the heading line for the SSI SHOW VFS command. It is followed by detail lines (NSDC02), one for each data set. Refer to NSDC02 for a description of the fields displayed.

System Action:

None.

User Action:

None.

NSDC02**P1 P2 P3 P4 P5 P6 P7 P8 P9 P10****Reason:**

This is the detail line for the SSI SHOW VFS command and shows the details for a single file. The fields, which match the column headings in message NSDC01, are:

P1 - the DD name

P2 - the key length

P3 - the maximum record size

P4 - the number of VSAM strings

P5 - the number of VSAM data buffers

P6 - the number of VSAM index buffers

P7 - the number of times that a VSAM string shortage has occurred

P8 - the VSAM open error code, in hex

P9 - file status flags, in hex (Internal use only)

P10 - the VSAM system time stamp (Internal use only)

System Action:

None.

User Action:

None.

NSDV02***WARNING* VSAM STRING SHORTAGE FOR DD= P1****Reason:**

This message indicates that one or more VSAM string shortages has occurred for the indicated DD name (*P1*).

System Action:

Processing is suspended for that request until sufficient resources are available.

User Action:

The SSI SHOW VFS command can be used to determine the total number of string shortages that have occurred. A large number indicates that system tuning is required to avoid significantly impacting performance. Contact your product supplier.

NSDV04

***ERROR* VSAM PHYSICAL I/O ERROR FDBK= P1 DETECTED ON DD=
P2**

Reason:

During processing of the VSAM file, a VSAM macro return code indicated a physical error had occurred. The message provides the corresponding RPL feedback code (P1 in hex), and DD name (P2).

System Action:

The file processing request fails.

User Action:

Refer to the VSAM Programming manual to determine the meaning of the feedback from the message and the appropriate course of corrective action.

NSDV05

***INFO* P1**

Reason:

This message is issued as a result of a physical I/O error on a VSAM data set on an MVS (or equivalent) system. It will be preceded by message NSDV04. The information contained in the message is as returned by VSAM (P1) in the form: *yyddd,hhmmssst,rbaaddr ,d-or-i,volser,jobname ,j*

System Action:

The file I/O request fails.

User Action:

Refer to message NSDV04.

NSDX01***WARNING* VSAM ACB OPEN ERROR, CODE= P1 DD= P2 PROCESSING CONTINUES****Reason:**

When opening a VSAM file, the open was successful but one or more warning messages were issued by VSAM. The feedback code (**P1** in hex), and DD name (**P2**) are shown.

System Action:

Processing continues.

User Action:

Refer to the VSAM Programming manual to determine the meaning of the feedback from the message and the appropriate course of corrective action.

NSDX02***ERROR* VSAM ACB OPEN ERROR, CODE= P1 DD= P2****Reason:**

When opening a VSAM file, the open was unsuccessful. The feedback code (*P1* in hex), and DD name (*P2*) are shown.

System Action:

The file processing request fails.

User Action:

Refer to the VSAM Programming manual to determine the meaning of the feedback from the message and the appropriate course of corrective action.

NSDX03

***ERROR* VSAM PUT ERROR WRITING INITIAL RECORD, CODE= P2
DD= P3**

Reason:

If a system VSAM file is opened and found to be empty, an initial control record is created and written to the file. The attempt to write the record was unsuccessful. The feedback code (P1 in hex), and DD name (P2) are shown.

System Action:

The file processing request fails.

User Action:

Refer to the VSAM Programming manual to determine the meaning of the feedback from the message and the appropriate course of corrective action.

NSDX04

***ERROR* VSAM P1 ERROR PROCESSING CONTROL RECORD, CODE= P2
DD= P3**

Reason:

At attempt to read (P1 =GET) or write (P1 =PUT) a control record to or from a system VSAM file was unsuccessful. The feedback code (P2 in hex) and DD name (P3) are shown.

System Action:

The file processing request fails.

User Action:

Refer to the VSAM Programming manual to determine the meaning of the feedback from the message and the appropriate course of corrective action.

NSDX11***ERROR* VSAM VSAM OPEN ERROR ON DD= P1 - P2****Reason:**

A system VSAM file was successfully opened but a file attribute is inconsistent with the file's requirements. The DD name (*P1*) and reason (*P2*) are shown. Possible reasons are:

INVALID KEYLENGTH - The VSAM cluster is defined with an incorrect key length.

INVALID RELATIVE KEY POSITION - The VSAM cluster is defined with a non-zero relative key position.

INVALID MAXIMUM RECORD LENGTH - The VSAM cluster is defined with a maximum record length that is too large.

System Action:

The file processing request fails.

User Action:

Refer to the VSAM Programming manual to determine the meaning of the feedback from the message and the appropriate course of corrective action.

NSM001**The SMF record would not be written due to the security check****Reason:**

The OML SMFWRITE verb was called with OPT=TEST, or the SMFTRACE system parameter was set to YES. The message indicates that user security check will fail if the call is not made in TEST mode, and the record will not be written to SMF in normal operation.

Security check can fail for one of the following reasons:

Security exit is not installed

Security exit is installed but does not grant permission to the user

System Action:

The SMF record is dumped to the activity log.

User Action:

If you want to write SMF records from the same environment by the same user and the security exit (NCLEX01) is not installed, install it. Otherwise, change the user authorization or move the procedure to the background system.

NSN001

SNANMI INITIALIZATION FAILED - *P1*

Reason:

A SOLVE SSI region is configured with the SNA Network Management Interface (SNANMI) feature; however, initialization of the region failed.

The failure reason (*P1*) is shown:

NOT SUPPORTED ON THIS OPERATING SYSTEM

Indicates that the SNA Network Management Interface feature is not supported by the current operating system or release level. This feature requires z/OS V1R5 or a later release.

FEATURE IS ALREADY ACTIVE

Indicates that the SNA Network Management Interface feature is active in another SOLVE SSI region on this LPAR. You can configure only one SOLVE SSI region per LPAR with this feature.

System Action:

The SSI terminates.

User Action:

Amend the appropriate SOLVE SSI parameter member to remove the SNANMI SSI parameter. This parameter enables the SNA Network Management Interface feature.

NSN101

SNANMI EPS REGISTERED, NAME=*P1*

Reason:

This message is issued during initialization of the SOLVE SSI region and as part of the SSI STATUS display. It provides information about the SNA Network Management Interface (SNANMI) feature. This message indicates that the feature is active and operational in the SOLVE SSI region.

P1 is the name of the SSI endpoint used for the SNANMI feature.

System Action:

None.

User Action:

None.

NSN102**SNANMI EPS REGISTRATION FAILED, RC=*P1*, NAME=*P2*****Reason:**

An attempt to register an SSI endpoint to provide an interface to the SNA Network Management Interface (SNANMI) feature failed.

P1 is SSI EndPoint Services (EPS) return code.

P2 is the name of the SSI endpoint used for the API.

System Action:

The SNA Network Management Interface feature is unavailable.

User Action:

This is an internal error. Contact Technical Support.

NSN103**P1 ACTIVE SNANMI REQUEST(S), SUBTASK STATUS: P2****Reason:**

This message is part of the SSI STATUS display and provides information about the SNA Network Management Interface (SNANMI) feature. The message shows the total number (*P1*) of active Endpoint Services (EPS) requests from all CA NetMaster regions and the status (*P2*) of the SNANMI subtask.

Possible SNANMI subtask status values and their meanings:

STARTED The SSI SNANMI facility is enabled and has successfully connected to the VTAM SNAMGMT server.

STARTING The subtask is in the process of connecting to the VTAM SNAMGMT server.

ATTACH-ERROR The subtask could not be attached.

INIT-ERROR The subtask failed to successfully initialize.

STOPPING The subtask has been posted to terminate.

STOPPED The subtask has ended.

System Action:

None.

User Action:

Investigate the status, as follows.

STARTED No action required, subtask is successfully connected.

STARTING Wait for a short time, then check the status again.

ATTACH-ERROR The subtask could not be attached.

This usually indicates an install/implementation error (for example, the subtask load module is not in the load library) or region error (for example, there is insufficient virtual storage in the NetMaster SSI (NMSSI) NetMaster SSI (NMSSI) region).

Look for more error messages on the NMSSI log, NMSSI joblog, and z/OS syslog.

INIT-ERROR The subtask failed to successfully initialize.

This usually indicates a configuration error (for example, the NMSSI region is not authorized to create a socket; the VTAMSNAMGMT server is not started; the NMSSI region is not authorized to connect to the VTAM SNAMGMT server).

Use command *D NET,VTAMOPTS,OPTION=SNAMGMT* to display the SNAMGMT server status.

Authorization problems occur if the OMVS segment for the VTAM or NMSSI tasks is not correctly set up.

Look for more error messages on the NMSSI log, NMSSI joblog, and z/OS syslog. Errors related to OMVS authority for VTAM will appear on the joblog of the VTAM (NET) task.

See the Install Guide for the OMVS authorization steps.

STOPPING The subtask has been posted to terminate.

Either the NMSSI region is shutting down, or an SSI command to reconnect to the VTAM SNAMGMT server was issued and the subtask is being stopped and restarted.

STOPPED The subtask has ended.

Either the NMSSI region is shutting down or the subtask ended unexpectedly (for example ABEND). In the latter case the subtask is reattached after a short delay

(60 seconds).

For an abend, look for more error messages on the NMSSI log, NMSSI joblog, and z/OS syslog.

NSN281

EPSRQST: CID=*P1* NMID=*P2* FUNC=*P3* UCORR=*P4*

Reason:

This message precedes a dump of an SNA Network Management Interface (SNANMI) Endpoint Services (EPS) request buffer when tracing of SNANMI EPS requests and responses is enabled.

P1 is the EPS connection identifier.

P2 is the CA NetMaster region identifier.

P3 is the EPS function name.

P4 is the EPS connection correlator.

System Action:

None.

User Action:

None.

NSN282

EPSRESP: CID=*P1* NMID=*P2* FUNC=*P3*

Reason:

This message precedes a dump of a SNA Network Management Interface (SNANMI) Endpoint Services (EPS) response buffer when tracing of SNANMI EPS requests and responses is enabled.

P1 is the EPS connection identifier.

P2 is the CA NetMaster region identifier.

P3 is the EPS function name.

System Action:

None.

User Action:

None.

NSN283

+000 xxxxxxxx xxxxxxxx xxxxxxxx xxxxxxxx cccc cccc cccc cccc

Reason:

This message contains a hexadecimal and character dump of an SNA Network Management Interface (SNANMI) Endpoint Services (EPS) request or response buffer. The message is written when tracing of server requests and responses is enabled.

System Action:

None.

User Action:

None.

NSN390**P1 APPARENT STALLED SNANMI REQUESTS****Reason:**

Requests queued to the SOLVE SSI SNA Network Management Interface (SNANMI) subtask are not being serviced in a timely manner. The subtask may be stalled.

P1 is the number of stalled requests detected.

System Action:

The SOLVE SSI region continues to monitor the SNANMI subtask.

This message is written approximately every 60 seconds until stalled requests are not detected.

User Action:

Ensure that the dispatching priority of the SOLVE SSI region allows subtasks in the region to be dispatched when ready.

Ensure that the VTAM SNAMGMT server is functioning properly.

If the problem persists, contact Technical Support.

NSN501**CONNECTED TO VTAM SNAMGMT SERVER, LEVEL: P1 FLAGS: P2****Reason:**

The SNA Network Management Interface (SNANMI) feature is active in the SOLVE SSI region; the region is connected to the VTAM SNAMGMT server.

P1 is the VTAM SNAMGMT server release level.

P2 is the VTAM SNAMGMT server functions supported flags.

System Action:

None.

User Action:

None.

NSN580

SNANMI SUBTASK ATTACH FAILED (REFER TO LOG)

Reason:

The SNA Network Management Interface (SNANMI) feature is active in the SOLVE SSI region. The region attempted to attach a subtask under which a connection to the VTAM SNAMGMT server cannot be made. The subtask attach failed.

System Action:

The operation is retried every 60 seconds.

User Action:

See the SSI log for other messages that describe the cause of the subtask attach error.

NSN581**SNANMI SUBTASK INIT FAILED, RC: *P1* CODE: *P2* SUBCODE: *P3*****Reason:**

The SNA Network Management Interface (SNANMI) feature is active in the SOLVE SSI region. The region attached a subtask under which a connection to the VTAM SNAMGMT server cannot be made. The subtask initialization failed.

P1 is the subtask return code.

P2 is the subtask error code and is one of the following values:

00-The subtask abended.

04-The subtask engine cannot be initialized.

08-The subtask invoked a UNIX System Services (USS) callable service and the service returned an error.

12-The subtask made a request to the VTAM SNAMGMT server and the server returned an error.

16-Insufficient virtual storage is available in the SOLVE SSI region.

P3 is the subtask error subcode.

System Action:

For USS callable service errors and VTAM SNAMGMT server errors, other messages are written to the SSI log that provides more information about the error.

The operation is retried every 60 seconds.

User Action:

See the SSI log for other messages that describe the cause of the subtask initialization error.

NSN582

SNANMI SUBTASK TERMINATED, RC: *P1* CODE: *P2* SUBCODE: *P3*

Reason:

The SNA Network Management Interface (SNANMI) feature is active in the SOLVE SSI region. The region attached a subtask under which a connection to the VTAM SNAMGMT server cannot be made. The subtask terminated.

P1 is the subtask return code.

P2 is the subtask error code and is one of the following values:

00-It is an expected termination (for example, the SOLVE SSI region is stopping) or the subtask abended.

04-The subtask engine cannot be initialized.

08-The subtask invoked a UNIX System Services (USS) callable service and the service returned an error.

12-The subtask made a request to the VTAM SNAMGMT server and the server returned an error.

16-Insufficient virtual storage is available in the SOLVE SSI region. *P3* is the subtask error subcode.

System Action:

For USS callable service errors and VTAM SNAMGMT server errors, other messages are written to the SSI log that provides more information about the error.

If it is an expected termination (for example, the SOLVE SSI region is stopping), no action is taken; otherwise, the SOLVE SSI region waits 60 seconds and then reattaches the subtask.

User Action:

See the SSI log for other messages that describe the cause of an unexpected subtask termination.

NSN583

USS ERROR, FUNCTION: *P1* RETVAL: *P2* RETCODE: *P3* RSNCODE: *P4*

Reason:

The SNA Network Management Interface (SNANMI) feature is active in the SOLVE SSI region. The region attached a subtask under which a connection to the VTAM SNAMGMT server cannot be made.

The subtask invoked a UNIX System Services (USS) callable service and the service returned an error.

P1 is the USS callable service name.

P2 is the USS callable service return value.

P3 is the USS callable service return code.

P4 is the USS callable service reason code.

System Action:

The SOLVE SSI region waits 60 seconds and then reattaches the subtask.

User Action:

For more information about the error, see the z/OS publication *UNIX System Services Messages and Codes*.

NSN584

VTAM SNAMGMT SERVER IS NOT STARTED, RETVAL: *P1* RETCODE: *P2* RSNCODE: *P3*

Reason:

The SNA Network Management Interface (SNANMI) feature is active in the SOLVE SSI region. The region attached a subtask under which a connection to the VTAM SNAMGMT server cannot be made.

The subtask invoked the BPX1CON UNIX System Services (USS) callable service to connect to the VTAM SNAMGMT server and the service returned an error that indicates that the VTAM SNAMGMT server is not started.

P1 is the BPX1CON USS callable service return value.

P2 is the BPX1CON USS callable service return code.

P3 is the BPX1CON USS callable service reason code.

System Action:

The operation is retried every 60 seconds.

User Action:

Use the MODIFY VTAMOPTS command to start the VTAM SNAMGMT server.

For more information about the SNAMGMT VTAM start option, see the z/OS publication *Communications Server SNA Resource Definition Reference*.

NSN585**CONNECTION TO VTAM SNAMGMT SERVER TERMINATED, RETCODE: P1
RSNCODE: P2****Reason:**

The SNA Network Management Interface (SNANMI) feature is active in the SOLVE SSI region. The region attached a subtask under which a connection to the VTAM SNAMGMT server cannot be made.

VTAM terminated the SOLVE SSI region connection to the VTAM SNAMGMT server.

P1 is the VTAM SNAMGMT server termination return code (Errno value). *P2* is the VTAM SNAMGMT server termination reason code (ErrnoJr value).

System Action:

The operation is retried every 60 seconds.

User Action:

For more information about the termination return and reason codes, see the z/OS publication *Communications Server IP and SNA Codes*.

NSNB81**NMIRQST: ADDR=P1 LEN=P2****Reason:**

This message precedes a dump of an SNA Network Management Interface (SNANMI) VTAM SNAMGMT server request buffer when a trace of the SNANMI VTAM SNAMGMT server requests and responses is enabled.

P1 is the address of the VTAM SNAMGMT request buffer.

P2 is the length of the VTAM SNAMGMT request buffer.

System Action:

None.

User Action:

None.

NSNB82

NMIRESP: ADDR=*P1* LEN=*P2*

Reason:

This message precedes a dump of an SNA Network Management Interface (SNANMI) VTAM SNAMGMT server response buffer when a trace of the SNANMI VTAM SNAMGMT server requests and responses is enabled.

P1 is the address of the VTAM SNAMGMT response buffer.

P2 is the length of the VTAM SNAMGMT response buffer.

System Action:

None.

User Action:

None.

NSNB83

NMIREC: ADDR=*P1* LEN=*P2*

Reason:

This message precedes a dump of an SNA Network Management Interface (SNANMI) VTAM SNAMGMT server record buffer when a trace of the SNANMI VTAM SNAMGMT server requests and responses is enabled.

P1 is the address of the VTAM SNAMGMT record buffer.

P2 is the length of the VTAM SNAMGMT record buffer.

System Action:

None.

User Action:

None.

NSNB84

+0000 xxxxxxxx xxxxxxxx xxxxxxxx xxxxxxxx *cccccccccccccccc*

Reason:

This message contains a hexadecimal and character dump of an SNA Network Management Interface (SNANMI) VTAM SNAMGMT server request or response buffer. The message is written when tracing of server requests and responses is enabled.

System Action:

None.

User Action:

None.

NSX210

UNKNOWN USERID: uuuuuuuuu

Reason:

This message indicates that the NMSAF security exit has failed NetMaster user logon. The indicated user ID is unknown to NetMaster and no modelling could be performed.
The user ID is known to the external security system.

System Action:

The NetMaster logon fails.

User Action:

Log on using a valid user ID.

NSX211

STORAGE SHORTAGE

Reason:

This message indicates that the NMSAF security exit has failed NetMaster user logon. A shortage of storage prevented the exit from obtaining required control blocks.

System Action:

The NetMaster logon fails.

User Action:

Allow the NetMaster region to obtain more storage.

NSX212

TSO AUTO LOGON (NO PASSWORD) NOT ALLOWED

Reason:

This message indicates that the NMSAF security exit has failed NetMaster user logon. The logon request was from TSO (using the NMLOGON TSO command). The NMSAF exit parameter file has disabled auto-logon from TSO. A user ID and password must be provided.

System Action:

The NetMaster logon fails. The normal NetMaster logon panel is presented (this message is displayed there). Enter a user ID and password on this panel.

User Action:

Log on with a valid user ID and password.

NSX213**PASSWORD REQUIRED FOR ROF LOGON****Reason:**

This message indicates that the NMSAF security exit has failed CA NetMaster user logon. The logon request was from ROF (the Remote Operator Facility) using the SIGNON command or an implied signon caused by use of the ROUTE command.

The target CA NetMaster is using the NMSAF security exit, and the initialization parameter file has set an option that requires ROF logons to supply a password.

System Action:

The ROF logon to CA NetMaster fails.

User Action:

Use the SIGNON command with the PASSWORD=*password* operand to sign on to the target CA NetMaster.

Note: The PASSWORD operand of the SIGNON command is not echoed to the panel or the CA NetMaster log.

NSX219**LOGON FOR USERID: uuuuuuuuu DENIED BY SECURITY EXIT (TYPE N/S)****Reason:**

This message indicates that the NMSAF security exit has failed NetMaster user logon. The source of the logon request is not supported by the NMSAF exit. Unsupported types include NetView CONNECT.

System Action:

The logon to NetMaster fails.

User Action:

This message is unlikely to appear unless you are using an unsupported NetMaster feature. Thus there is no specific user action. If this message does occur, contact Technical Support.

NSX220

PASSWORD CHANGE PREVENTED BY SECURITY EXIT

Reason:

This message indicates that the NMSAF security exit has prevented use of the Password Change function.
The NMSAF initialization file contained a parameter that has disabled password change.
The NetMaster administrator has made this decision.

System Action:

The attempt to change a password fails.

User Action:

Contact your NetMaster administrator to determine why password change is not supported.
Possible reasons include:
- The external security system cannot handle password changes from NetMaster. - A password change on this MVS system may not propagate to other MVS systems.

NSX251

USERID: uuuuuuuu SAF ERROR RC=aa RRET=bb RREA=cc

Reason:

This message indicates that the NMSAF security exit has encountered an unexpected SAF (RACROUTE) error.
The RACROUTE macro SAF return code (aa), RACF return code (bb), and RACF reason code (cc) are displayed.

System Action:

The current NMSAF exit request fails. Requests include user logon, password change, and so on.

User Action:

Contact Technical Support with the following information:
- The request being attempted (logon, logoff, password change, and so on)
- The text of this message
- whether the problem is transient or permanent
It may also be helpful to restart NetMaster with NMSAF tracing enabled. This will help pinpoint the problem.

NSX252**USERID: uuuuuuuu NOT DEFINED TO SECURITY SYSTEM****Reason:**

This message indicates that the NMSAF security exit has been asked to verify a user but the user ID is not known to the external security system.

System Action:

The logon request fails.

User Action:

Retry the logon request with a valid user ID.

NSX253**USERID: uuuuuuuu REVOKED****Reason:**

This message indicates that the NMSAF security exit has been asked to verify a user, but the user ID has had all access revoked by the security administrator.

System Action:

The logon request fails.

User Action:

Contact your security administrator.

NSX254

USERID: uuuuuuuu PASSWORD HAS EXPIRED

Reason:

This message indicates that the NMSAF security exit has been asked to verify a user, and the user ID's password has expired.

System Action:

The logon request is accepted, and a password change panel is presented. If password change has been disabled by the NetMaster administrator, the logon request is rejected.

User Action:

If the password change panel is presented, change your password. If password change has been inhibited, you will need to change your password using other facilities and attempt to log on to NetMaster again.

NSX255

USERID: uuuuuuuu PASSWORD INVALID

Reason:

This message indicates that the NMSAF security exit has been asked to verify a user, and the user ID's password is not correct. This could be a logon request or a password change request, in which case the supplied current password is not correct.

System Action:

The logon or password change request fails.

User Action:

Retry the request with the correct password.

NSX256**USERID: uuuuuuuu NEW PASSWORD INVALID****Reason:**

This message indicates that the NMSAF security exit has been asked to change a password for a user.
The supplied new password is invalid

System Action:

The password change request fails.

User Action:

Retry the password change request with the correct password.
The new password may be invalid due to installation restrictions.

NSX271**SECCALL CALL INVALID OR MISSING PARM 1****Reason:**

This message indicates that an &SECCALL CALL request to the NMSAF security exit failed due to a missing or invalid first parameter.

System Action:

The &SECCALL CALL request fails.

User Action:

Correct the NCL procedure and retry.

NSX272**SECCALL CALL UNRECOGNISED PARM 1****Reason:**

This message indicates that an &SECCALL CALL request to the NMSAF security exit failed due to an unrecognized first parameter.

System Action:

The &SECCALL CALL request fails.

User Action:

Correct the NCL procedure and retry.

NSX273

SECCALL CALL OPTION: 0000 NOT SUPPORTED BY THIS EXIT

Reason:

This message indicates that an &SECCALL CALL request to the NMSAF security exit failed.

The supplied parameter (request code) was recognized, but is not supported by this version of the NMSAF exit.

System Action:

The &SECCALL CALL request fails.

User Action:

Correct the NCL procedure and retry.

NSX281

GETMAIN FOR WORKAREA FAILED

Reason:

This message indicates that the NMAF security exit was unable to initialize due to a shortage of storage.

System Action:

NetMaster will terminate.

User Action:

Provide a larger below-the-line region size for NetMaster.

NSX282

NetMaster version not at least V5.0

Reason:

This message indicates that the NMSAF security exit was unable to initialize because the NetMaster version is prior to V5.0.

System Action:

NetMaster will terminate.

User Action:

Do not attempt to use the NMSAF security exit with earlier versions of NetMaster.

NSX283**ERRORS IN SXCTL FILE****Reason:**

This message indicates that the NMAF security exit was unable to initialize because of errors in the SXCTL input parameter file.
This message will be preceded by other messages detailing the errors.

System Action:

NetMaster will terminate.

User Action:

Correct the SXCTL file parameters.

NSX284**NETMASTER NOT APF AUTHORIZED****Reason:**

This message indicates that the NMSAF security exit was unable to initialize because the NetMaster region is not APF-authorized.

System Action:

NetMaster will terminate.

User Action:

Ensure the NetMaster load libraries are all APF authorized.
Also ensure any other load libraries in the STEPLIB concatenation are also APF authorized.

NSX285**UNSUPPORTED SAF LEVEL****Reason:**

This message indicates that the NMAF security exit was unable to initialize because the level of SAF (System Authorisation Facility) is not at least 1.9.

System Action:

NetMaster will terminate.

User Action:

Verify the level of SAF support in MVS.
MVS (RACF) SAF 1.9 or later has been in use since at least 1991.

NSX286

REGION RACROUTE TOKENXTR FAILED

Reason:

This message indicates that the NMAF security exit was unable to initialize because the a RACROUTE TOKENEXTR request failed.

System Action:

NetMaster will terminate.

User Action:

This message should not occur. However, non-IBM security systems may not correctly support the RACROUTE TOKENEXTR request.

Restart NetMaster. If the problem persists, add the following parameters to the SXCTL file:

TRACE=YES TRACESAF=YES

Also add an SXTRACE DD statement to the NetMaster JCL.

Send the diagnostic output from the trace to Technical Support. You should also provide details about the security product that you are using.

NSX290

SECURITY EXIT INTERNAL FAILURE: cccccccc

Reason:

This message indicates that the NMSAF security exit has detected an internal error.

This message displays the error code and is followed by additional diagnostic messages.

The exit then ABENDs, and NetMaster also ABENDs with a NetMaster internal abend code 268-01.

System Action:

After writing additional diagnostic messages, the security exit ABENDs, and NetMaster also ABENDs with an internal abend code 268-01.

User Action:

Contact Technical Support.

NSX291

MODULE: mmmmmmmm **VERSION:** vvvv **PTF:** pppppp **ASM D/T:** yyyymmddhhmm

Reason:

This message follows the NSX290 message and provides additional diagnostic information.

System Action:

Refer to message NSX290.

User Action:

Refer to message NSX290.

NSX292

OFFSET: oooo additional information

Reason:

This message follows the NSX290 message and provides additional diagnostic information.

System Action:

Refer to message NSX290.

User Action:

Refer to message NSX290.

NSX293

Rxx-Ryy aaaaaaaa bbbbbbbb ccccccc dddddddd

Reason:

This message follows the NSX290 message and provides additional diagnostic information.

System Action:

Refer to message NSX290.

User Action:

Refer to message NSX290.

NSX380

UNRECOGNISED PARM: pppppppp location

Reason:

This message is produced during processing of the SXCTL parameter file by the NMSAF security exit.

The indicated value is not recognised as a valid parameter.

The location in the source file is also indicated.

System Action:

Parameter validation continues. Following this, NetMaster terminates.

User Action:

Correct the incorrect SXCTL line.

NSX381

PARM: pppppppppppp VALUE NOT NO/YES: vvvvvvvv location

Reason:

This message is produced during processing of the SXCTL parameter file by the NMSAF security exit.

The indicated parameter requires a NO or YES as the value.

The location in the source file is also indicated.

System Action:

Parameter validation continues. Following this, NetMaster terminates.

User Action:

Correct the incorrect SXCTL line.

NSX382**PARM: pppppppppppp INVALID VALUE: vvvvvvvv location****Reason:**

This message is produced during processing of the SXCTL parameter file by the NMSAF security exit.

The indicated parameter value is not valid.

The location in the source file is also indicated.

System Action:

Parameter validation continues. Following this, NetMaster terminates.

User Action:

Correct the incorrect SXCTL.

NSX383**PARM: pppppppppppp INVALID NAME: vvvvvvvv location****Reason:**

This message is produced during processing of the SXCTL parameter file by the NMSAF security exit.

The indicated parameter value is not valid. This parameter requires a valid name. A valid name is a 1-8 character value, the first character being alphabetic or national (@,#,\$) and the remainder being alphanumeric or national.

A null value (meaning 'omitted') can be indicated by using a value of a single dash (-). This is the only otherwise invalid value permitted.

The location in the source file is also indicated.

System Action:

Parameter validation continues. Following this, NetMaster terminates.

User Action:

Correct the incorrect SXCTL line.

NSX384

PARM: pppppppppppp INVALID USERNAME: vvvvvvvv location

Reason:

This message is produced during processing of the SXCTL parameter file by the NMSAF security exit.

The indicated parameter value is not valid. This parameter requires a valid user name. A valid user name is a 1-8 character value with all characters being alphanumeric or national (@,#,\$).

A null value (meaning 'omitted') can be indicated by using a value of a single dash (-). This is the only otherwise invalid value permitted.

The location in the source file is also indicated.

System Action:

Parameter validation continues. Following this, NetMaster terminates.

User Action:

Correct the incorrect SXCTL line.

NSX387

PARM: pppppppppppp INVALID RESOURCE: vvvvvvvv location

Reason:

This message is produced during processing of the SXCTL parameter file by the NMSAF security exit.

The indicated parameter value is not valid. This parameter requires a valid resource. A resource name is a 1-20 character value. The exact syntax of this value is set by the security system.

The location in the source file is also indicated.

System Action:

Parameter validation continues. Following this, NetMaster terminates.

User Action:

Correct the incorrect SXCTL line.

NSX388**PARM: pppppppppppp INVALID MODEL: vvvvvvvv location****Reason:**

This message is produced during processing of the SXCTL parameter file by the NMSAF security exit.

The indicated parameter value is not valid. This parameter requires a valid model. A model name has the same syntax as a name. Refer to message NSX383 for the rules.

The location in the source file is also indicated.

System Action:

Parameter validation continues. Following this, NetMaster terminates.

User Action:

Correct the incorrect SXCTL line.

NSX389**MODEL LIST OVERFLOW location****Reason:**

This message is produced during processing of the SXCTL parameter file by the NMSAF security exit.

The number of entries in the MODELGROUP list has been exceeded.

The location in the source file is also indicated.

System Action:

Parameter validation continues. Following this, NetMaster terminates.

User Action:

Reduce the number of MODELGROUP entries.

NSX390

OPEN ABEND ON SXCTL

Reason:

This message is produced during processing of the SXCTL parameter file by the NMSAF security exit.
An ABEND occurred when opening the SXCTL file.

System Action:

NetMaster terminates.

User Action:

Examine other JOBLIG message for the ABEND messages and correct the problem.
Restart NetMaster.

NSX391

I/O ERROR ON SXCTL

Reason:

This message is produced during processing of the SXCTL parameter file by the NMSAF security exit.
An I/O error occurred while reading the SXCTL file.

System Action:

NetMaster terminates.

User Action:

Ensure the SXCTL file is valid and accessible.

NSX910**UNKNOWN USERID: uuuuuuuuu****Reason:**

The NMSAF security exit has failed user logon. The indicated user ID is unknown to the region, and no modeling could be performed.

The user ID is known to the external security system.

System Action:

The logon fails.

User Action:

Log on using a valid user ID.

NSX911**STORAGE SHORTAGE****Reason:**

The NMSAF security exit has failed user logon. A shortage of storage prevented the exit from obtaining the required control blocks.

System Action:

The logon fails.

User Action:

Allow the NetMaster region to obtain more storage.

NSX912**TSO AUTO LOGON (NO PASSWORD) NOT ALLOWED****Reason:**

The NMSAF security exit has failed user logon. The logon request was from TSO (using the NMLOGON TSO command).

The NMSAF exit parameter file has disabled auto-logon from TSO. A user ID and password must be provided.

System Action:

The logon fails. A logon panel is presented.

User Action:

Log on with a valid user ID and password.

NSX913

PASSWORD REQUIRED FOR ROF LOGON

Reason:

The NMSAF security exit has failed user logon. The logon request was from ROF (Remote Operator Facility) using the SIGNON command or an implied signon caused by use of the ROUTE command.

The target region is using the NMSAF security exit, and the initialization parameter file has set an option that requires ROF logons to supply a password.

System Action:

The ROF logon to the region fails.

User Action:

Use the SIGNON command with the PASSWORD=password operand to sign on to the target region.

Note: The PASSWORD operand of the SIGNON command is not echoed to the panel or the activity log.

NSX919

LOGON FOR USERID: uuuuuuuuu DENIED BY SECURITY EXIT (TYPE N/S)

Reason:

The NMSAF security exit has failed user logon. The source of the logon request is not supported by the NMSAF exit.

Unsupported types include NetView CONNECT.

Note: This message can appear if you are using an unsupported feature.

System Action:

The logon to the region fails.

User Action:

For assistance, contact Technical Support at [HYPERLINK "http://ca.com/support" http://ca.com/support](http://ca.com/support).

NSX920**PASSWORD CHANGE PREVENTED BY SECURITY EXIT****Reason:**

The NMSAF security exit has prevented the use of the Password Change function.

The NMSAF initialization file contained a parameter that has disabled password change.

System Action:

The attempt to change a password fails.

User Action:

Contact your region administrator to determine why password change is disabled.

The following reasons are possible:

The external security system cannot handle password changes from the region.

A password change on this MVS system may not propagate to other MVS systems.

NSX951

USERID: uuuuuuuu SAF ERROR RC=aa RRET=bb RREA=cc

Reason:

The NMSAF security exit has encountered an unexpected SAF (RACROUTE) error.

The RACROUTE macro SAF return code (aa), RACF return code (bb), and RACF reason code (cc) are displayed.

System Action:

The NMSAF exit request fails. Requests include user logon, password change, and so on.

User Action:

For assistance, contact Technical Support with the following information:

The request being attempted (logon, logoff, password change, and so on)

The text of this message

Whether the problem is transient or permanent

Restarting the region with NMSAF tracing enabled can help to pinpoint the problem.

NSX952

USERID: uuuuuuuu NOT DEFINED TO SECURITY SYSTEM

Reason:

The NMSAF security exit has been asked to verify a user whose ID is not known to the external security system.

System Action:

The logon request fails.

User Action:

Retry the logon request with a valid user ID.

NSX953**USERID: uuuuuuuu REVOKED****Reason:**

The NMSAF security exit has been asked to verify a user, but the security administrator has revoked all access for the user ID.

System Action:

The logon request fails.

User Action:

Contact your security administrator.

NSX954**USERID: uuuuuuuu PASSWORD HAS EXPIRED****Reason:**

The NMSAF security exit has been asked to verify a user, but the password specified with the user ID has expired.

System Action:

The logon request is accepted, and a password change panel is presented.

If password change has been disabled by the region administrator, the logon request is rejected.

User Action:

If the password change panel is presented, change your password.

If password change is disabled, you have to change your password using other facilities and attempt to log on to the region again.

NSX955

USERID: uuuuuuuu PASSWORD INVALID

Reason:

The NMSAF security exit has been asked to verify a user, but the password specified with the user ID is not correct.

This could be a logon request or a password change request, in which the specified current password is not correct.

System Action:

The logon or password change request fails.

User Action:

Retry the request with the correct password.

NSX956

USERID: uuuuuuuu NEW PASSWORD INVALID

Reason:

The NMSAF security exit has been asked to change a password for a user.
The supplied new password is invalid.

System Action:

The password change request fails.

User Action:

The new password may be invalid due to site restrictions.
Retry the password change request with a correct password.

NSX971**SECCALL CALL INVALID OR MISSING PARM 1****Reason:**

An &SECCALL CALL request to the NMSAF security exit failed due to a missing or invalid first parameter.

System Action:

The &SECCALL CALL request fails.

User Action:

Correct the NCL procedure, and retry.

NSX972**SECCALL CALL UNRECOGNISED PARM 1****Reason:**

An &SECCALL CALL request to the NMSAF security exit failed due to an unrecognized first parameter.

System Action:

The &SECCALL CALL request fails.

User Action:

Correct the NCL procedure, and retry.

NSX973**SECCALL CALL OPTION: oooo NOT SUPPORTED BY THIS EXIT****Reason:**

An &SECCALL CALL request to the NMSAF security exit failed.

The supplied parameter (request code) was recognized but is not supported by this version of the exit.

System Action:

The &SECCALL CALL request fails.

User Action:

Correct the NCL procedure, and retry.

NSX974

SECURITY CALL: sssssssssssssssssss NOT SUPPORTED BY FULL SECURITY EXIT

Reason:

An &SECCALL CALL request to the NMSAF security exit failed.

The supplied parameter (request code) was recognized but is not supported by this version of the exit.

System Action:

The &SECCALL CALL request fails.

User Action:

Correct the NCL procedure, and retry.

NSX981

GETMAIN FOR WORKAREA FAILED

Reason:

The NMAF security exit cannot initialize due to a shortage of storage.

System Action:

The region terminates.

User Action:

Provide a larger below-the-line region size for the region.

NSX982

NetMaster version not at least V5.0

Reason:

The NMSAF security exit cannot initialize because the NetMaster version is prior to V5.0.

System Action:

The region terminates.

User Action:

Do not attempt to use the NMSAF security exit with earlier versions of NetMaster.

NSX983**ERRORS IN SXCTL FILE****Reason:**

The NMAF security exit cannot initialize because of errors in the SXCTL input parameter file.

This message is preceded by other messages detailing the errors.

System Action:

The region terminates.

User Action:

Correct the SXCTL parameters.

NSX984**NETMASTER NOT APF AUTHORIZED****Reason:**

The NMSAF security exit cannot initialize because the region is not APF-authorized.

System Action:

The region terminates.

User Action:

Ensure that the following load libraries are APF-authorized:

NetMaster load libraries

Other load libraries in the STEPLIB concatenation

NSX985

UNSUPPORTED SAF LEVEL

Reason:

The NMSAF security exit cannot initialize because the level of SAF (system authorization facility) is earlier than 1.9.

System Action:

The region terminates.

User Action:

Verify the level of SAF support.

NSX986

REGION RACROUTE TOKENXTR FAILED

Reason:

The NMSAF security exit cannot initialize because a RACROUTE TOKENEXTR request failed.

This message should not occur. However, non-IBM security systems may not support the RACROUTE TOKENEXTR request correctly.

System Action:

The region terminates.

User Action:

Restart the region. If the problem persists, add the following parameters to the SXCTL file:

TRACE=YES

TRACESAF=YES

Also, add an SXTRACE DD statement to the region JCL job.

Contact Technical Support with the diagnostic output from the trace and details about the security product you are using.

NSX990**SECURITY EXIT INTERNAL FAILURE: cccccccc****Reason:**

The NMSAF security exit has an internal error.

This message displays the error code and is followed by additional diagnostic messages.

System Action:

After writing additional diagnostic messages, the security exit abends. The region also abends with an internal ABEND code 268-01.

User Action:

For assistance, contact Technical Support at [HYPERLINK](http://ca.com/support) "http://ca.com/support" <http://ca.com/support>.

NSX991**MODULE: mmmmmmmm VERSION: vvvv PTF: pppppp ASM D/T: yyyymmddhhmm****Reason:**

System Action:

See the NSX290 message.

User Action:

See the NSX290 message.

NSXA01

FTS WAITING ON DATASETS

Reason:

This message indicates that an inbound File Transfer request is waiting for exclusive use of a dataset.

The name of the dataset is indicated in a following NSXA02 message.

System Action:

The File Transmission Request will wait until the dataset is available.

User Action:

Determine the cause of the dataset contention.

NSXA02**DSN=dddd****Reason:**

This message follows an NSXA01 or NSXA03 message, and indicates the name of the dataset referred to in those messages

System Action:

See Messages NSXA01 and NSXA03.

User Action:

See Messages NSXA01 and NSXA03.

NSXA03**DATASET NOW AVAILABLE****Reason:**

This message indicates that an inbound File Transfer request that was previously waiting for exclusive control of a dataset can now continue. The name of the dataset is indicated in a following NSXA02 message.

System Action:

The File Transmission Request continues.

User Action:

None.

NSXA81**INCORRECT NETMASTER VERSION DETECTED****Reason:**

The NMSECDSN exit detects an unsupported version of NetMaster. This exit cannot be used with versions prior to NetMaster Version 7.0.

System Action:

The ALLOCATE request will fail unconditionally.

User Action:

Do not use the NMSECDSN exit with an incorrect version of NetMaster.

NSXA82

NO USER CORRELATOR FOUND

Reason:

This message is produced by the NMSECDSN exit during processing of an ALLOCATE command when invalid parameters are detected.

The most likely explanation for this is the use of the NMSECDSN exit when not using the NetMaster SAF security exit (As specified by the NetMaster JCL parm SEC=NMSAF).

System Action:

The ALLOCATE command fails unconditionally.

User Action:

Ensure that the correct security exit is in use.

NSXA83

INVALID USER CORRELATOR

Reason:

This message is produced by the NMSECDSN exit during processing of an ALLOCATE command when invalid parameters are detected.

The most likely explanation for this is the use of the NMSECDSN exit when not using the NetMaster SAF security exit (As specified by the NetMaster JCL parm SEC=NMSAF).

System Action:

The ALLOCATE command fails unconditionally.

User Action:

Ensure that the correct security exit is in use.

NSXA84**INVALID ACEE****Reason:**

This message is produced by the NMSECDSN exit during processing of an ALLOCATE command when invalid parameters are detected.

The most likely explanation for this is the use of the NMSECDSN exit when not using the NetMaster SAF security exit (As specified by the NetMaster JCL parm SEC=NMSAF).

System Action:

The ALLOCATE command fails unconditionally.

User Action:

Ensure that the correct security exit is in use.

NSXB81**NO USER CORRELATOR FOUND****Reason:**

This message is produced by the NMSECDSS exit during processing of a request when invalid parameters are detected.

The most likely explanation for this is the use of the NMSECDSS exit when not using the NetMaster SAF security exit (As specified by the NetMaster JCL parm SEC=NMSAF).

System Action:

The Dataset Services request fails unconditionally.

User Action:

Ensure that the correct security exit is in use.

NSXB82

INVALID USER CORRELATOR

Reason:

This message is produced by the NMSECDSS exit during processing of a Dataset Services request when invalid parameters are detected. The most likely explanation for this is the use of the NMSECDSS exit when not using the NetMaster SAF security exit (As specified by the NetMaster JCL parm SEC=NMSAF).

System Action:

The Dataset Services request fails unconditionally.

User Action:

Ensure that the correct security exit is in use.

NSXB83

INVALID GLOBAL AREA

Reason:

This message is produced by the NMSECDSS exit during processing of a Dataset Services request when invalid parameters are detected. The most likely explanation for this is the use of the NMSECDSS exit when not using the NetMaster SAF security exit (As specified by the NetMaster JCL parm SEC=NMSAF).

System Action:

The Dataset Services request fails unconditionally.

User Action:

Ensure that the correct security exit is in use.

NSXB84**INVALID ACEE****Reason:**

This message is produced by the NMSECDSS exit during processing of a Dataset Services request when invalid parameters are detected. The most likely explanation for this is the use of the NMSECDSS exit when not using the NetMaster SAF security exit (As specified by the NetMaster JCL parm SEC=NMSAF).

System Action:

The Dataset Services request fails unconditionally.

User Action:

Ensure that the correct security exit is in use.

NSXB85**HFS USERID MISMATCH. HFS: aaaaa SAF: bbbbb****Reason:**

This message is produced by the NMSECDSS exit during processing of a Dataset Services request. The current user's SAF user ID and the pre-registered HFS user ID do not match.

This can only occur for NetMaster background user IDs when the security exit has nominated a different SAF user ID, and the SYSPARM HFSUSEC=YES is in effect. (SYSPARMS HFSUSEC=YES causes NetMaster to internally register the NetMaster user ID as the HFS user ID).

System Action:

The Dataset Services request fails unconditionally.

User Action:

Do not use SYSPARMS HFSUSEC=YES with the NMSECDSS and SEC=NMSAF exits.

NSXB86

BPX1SEC FAILURE. RC: *aaaa* REASON: *bbbb*

Reason:

This message is produced by the NMSECDSS exit during processing of a Dataset Services request. An attempt to perform HFS security initialization failed. The BPX1SEC system call return and reason codes are displayed.

These codes can be found in the *Unix System Services Messages and Codes* manual.

System Action:

The Dataset Services request fails unconditionally.

User Action:

Examine the return and reason codes to determine the cause of the failure.

NTx to Px Messages

NT0310

ATF LOAD FOR TABLE: *tttt* COMPLETE

Reason:

You issued the ATF LOAD command and the requested translation table has been loaded successfully.

System Action:

None.

User Action:

None.

NT0311**ATF LOAD FOR TABLE: *tttt* FAILED****Reason:**

You issued the ATF LOAD command but the requested translation table could not be loaded.

The preceding error messages describe the problem.

System Action:

The requested table is not loaded.

User Action:

Review the preceding error messages and correct the problem. Then reissue the ATF LOAD command.

NT0320**ATF UNLOAD FOR TABLE: *tttt* COMPLETE****Reason:**

You issued the ATF UNLOAD command and the requested translation table has been unloaded successfully.

System Action:

None.

User Action:

None.

NT0321

ATF UNLOAD FOR TABLE: *tttt* FAILED

Reason:

You issued the ATF UNLOAD command and the requested translation table could not be unloaded.

The preceding error messages describe the problem.

System Action:

The requested table is not unloaded.

User Action:

Review the preceding error messages and correct the problem. Then reissue the ATF UNLOAD command.

NT0330

ATF DEFINE FOR TABLE: *tttt* COMPLETE. ENCODING: *eeee*

Reason:

You issued the ATF DEFINE command and the named translation table has been defined.

System Action:

None.

User Action:

The named table can now be used when requesting ATF translation services.

NT0380

ATF *ffff* FOR TABLE: *tttt* FAILED, ENCODING: *eee* IS ALGORITHMIC

Reason:

You issued an ATF command but the named table has an encoding type that is algorithmic. Only translation names defined as table-based can be manipulated by the ATF command.

System Action:

The command is ignored.

User Action:

Correct the table name and, if relevant, reissue the command.

NT0381**ATF LOAD FOR TABLE: *tttt* NOT DONE, TABLE ALREADY LOADED****Reason:**

You issued the ATF LOAD command but the named table is already loaded.

System Action:

The command is ignored.

User Action:

If you wish to reload the table after changing the related load modules, first issue an ATF UNLOAD command, then reissue the ATF LOAD command.

NT0382**ATF UNLOAD FOR TABLE: *tttt* NOT DONE, TABLE NOT LOADED****Reason:**

You issued the ATF UNLOAD command but the named table is not loaded.

System Action:

The command is ignored.

User Action:

Probably none. The table does not need to be unloaded.

NT0390**INVALID TABLE NAME: *tttt*****Reason:**

You issued the ATF command but the supplied table name is invalid.

System Action:

The command is ignored.

User Action:

Check that the correct table name has been supplied. If you are issuing an ATF DEFINE command, these conditions apply:

- The table name is from 1 to 16 characters long,
- The first character is alphabetic or national (@#\$),
- The remaining characters are alphanumeric, national, or the underscore.

NT0391

TABLE NAME: tttt NOT FOUND

Reason:

You issued an ATF command but the named table does not exist.

System Action:

The command is ignored.

User Action:

Correct the table name and reissue the command. To obtain a list of known table names, use the SHOW ATF command.

NT0392

NO FREE TABLE NAME SLOTS

Reason:

You issued an ATF DEFINE command but there are no slots left for defining new tables.

System Action:

The command is ignored.

User Action:

If you need to define additional ATF translation tables, contact Technical Support for assistance.

To determine the number of available free slots, issue a SHOW ATF command. The last line indicates how many free slots are still available. (The distributed product has four.)

NT0393

TABLE NAME: tttt ALREADY EXISTS

Reason:

You issued an ATF DEFINE command but the named table already exists.

System Action:

The command is ignored.

User Action:

Choose a new unique table name and reissue the command.

NT0395**INVALID ENCODING NAME: tttt****Reason:**

You issued an ATF DEFINE command but the supplied encoding name is invalid.

System Action:

The command is ignored.

User Action:

Supply a valid encoding name.

To determine encoding names, issue a SHOW ATF ENCODING command. Only 'TABLE' type encoding names can be used with ATF DEFINE.

NT0396**ENCODING NAME: tttt NOT FOUND****Reason:**

You issued the ATF DEFINE command but the supplied encoding name is not recognised.

System Action:

The command is ignored.

User Action:

Supply a valid known encoding name.

To determine encoding names, issue a SHOW ATF ENCODING command. Only 'TABLE' type encoding names can be used with ATF DEFINE.

NT0410**TABLE NAME ENCODING NAME TYP LOAD PRI-LM SEC-LM OFST INDX****Reason:**

This is the heading message for a SHOW ATF command. The column headings are:

TABLE NAME This column contains the name of the translation table (that is, the name that can be used in NCL verbs, and so on).

ENCODING NAME This column shows the name of the encoding technique used by this table.

TYP This column will contain either 'ALG', or 'TAB'. ALG means that this is an algorithmic encoding type (that is, conversion to/from Unicode uses an algorithm). 'TAB' means that this is a table-driven encoding type (that is, conversion to/from Unicode uses a table).

LOAD For 'TAB' types, this indicates whether the tables have been loaded into storage.

PRI-LM For 'TAB' types, this indicates the primary conversion tables load module name.

SEC-LM For 'TAB' types, this indicates the secondary conversion tables load module name.

OFST The allocated Unicode table entry offset (hex)

INDX The allocated slot index for this table

System Action:

None.

User Action:

None.

NT0415**table-name encoding-name typ load pri-lm sec-lm ofst indx****Reason:**

This is the detail message for a SHOW ATF command. Refer to message NT0410 for an explanation of column headings.

System Action:

None.

User Action:

None.

NT0419

***END* FREE ENTRIES: nnn**

Reason:

This is the final message for a SHOW ATF command. The number of free table entries is displayed.

System Action:

None.

User Action:

None.

NT0420

INFORMATION FOR ATF TRANSLATION TABLE: tttt

Reason:

This is the first message for a SHOW ATF TABLE=tttt command. It is the start of information for this display.

System Action:

None.

User Action:

None.

NT0421

ENCODING: eeeeeee CODE: ccc (type)

Reason:

This is an information message for a SHOW ATF TABLE=tttt command. The encoding name, internal code, and general type (TABLE or ALGORITHMIC) are shown.

System Action:

None.

User Action:

None.

NT0422

PRIMARY MODULE: mmmmmmmm

Reason:

This is an information message for a SHOW ATF TABLE=tttt command. The primary table load module name is displayed.

System Action:

None.

User Action:

None.

NT0423

SECONDARY MODULE: ssssssss

Reason:

This is an information message for a SHOW ATF TABLE=tttt command. The secondary table load module name is displayed.

System Action:

None.

User Action:

None.

NT0424

TABLE ENTRY OFFSET: oooo

Reason:

This is an information message for a SHOW ATF TABLE=tttt command. The UNICODE table entry offset for this table is displayed.

System Action:

None.

User Action:

None.

NT0425**SLOT INDEX: ssss****Reason:**

This is an information message for a SHOW ATF TABLE=tttt command. The internal table slot index for this table is displayed.

System Action:

None.

User Action:

None.

NT0426**LOAD STATUS: ssss****Reason:**

This is an information message for a SHOW ATF TABLE=tttt command. The current table load status is shown. Values are: NOT LOADED - The table has not been loaded. LOADED - The table has been successfully loaded. LOAD FAILED - The table load failed.

System Action:

None.

User Action:

None.

NT0427**LOAD DATE/TIME: dddddddd tttttttt****Reason:**

This is an information message for a SHOW ATF TABLE=tttt command. The date and time that the table was loaded into storage are shown.

System Action:

None.

User Action:

None.

NT0428

SUBS CHARS (HEX): ss dddd

Reason:

This is an information message for a SHOW ATF TABLE=tttt command. The substitution character values for single-byte and double-byte replacement are shown (in hex). These values are used during conversion to this character set when the source character has no equivalent in this character set.

System Action:

None.

User Action:

None.

NT0429

MOD GEN DATE/TIME: dddddddd tttttttt (type)

Reason:

This is an information message for a SHOW ATF TABLE=tttt command. The date and time that a table module was compiled (by the NMBL DXLT program) are displayed. The TYPE field will be (PRIMARY) or (SECONDARY), indicating which module date/time is displayed.

System Action:

None.

User Action:

None.

NT0430**TABLE STORAGE: nnnK****Reason:**

This is an information message for a SHOW ATF TABLE=tttt command. The amount of additional storage for double-byte translation lookup tables is shown (in Kbytes). Note that tables that only contain single-byte conversions will have 0K for this value.

System Action:

None.

User Action:

None.

NT0431**tttttt TABLES DEF: 1: a 2: b 3: c 4: d****Reason:**

This is an information message for a SHOW ATF TABLE=tttt command. This message indicates which of the four tables of a specific type (SINGLE or DOUBLE) is defined for this translation table. Each indicator is Y or N.

System Action:

None.

User Action:

None.

NT0450**ENCODING NAME CODE TYPE SB1 SB2 SB3 SB4 DB1 DB2 DB3 DB4****Reason:**

This is the heading message for a SHOW ATF ENCODING command. The column headings are:

ENCODING NAME The encoding name that this line describes.

CODE The internal code assigned to this encoding name.

TYPE The encoding type, either 'ALG' or 'TAB'. 'ALG' means that this is an algorithmic encoding type (that is, conversion to/from Unicode uses an algorithm) 'TAB' means that this is a table-driven encoding type (that is, conversion to/from Unicode uses a table).

SB1 Indicates (for 'TAB' types) whether the single-byte conversion table 1 is required or optional.

SB2 As for SB1, for single byte table 2

SB3 As for SB1, for single byte table 3

SB4 As for SB1, for single byte table 4

DB1 Indicates (for 'TAB' types) whether the double-byte conversion table 1 is required or optional.

DB2 As for DB1, for double byte table 2

DB3 As for DB1, for double byte table 3

DB4 As for DB1, for double byte table 4

System Action:

None.

User Action:

None.

NT0455**encoding-name code type sb1 sb2 sb3 sb4 db1 db2 db3 db4****Reason:**

This is the detail message for a SHOW ATF ENCODING command. Refer to message NT0450 for an explanation of column meanings.

System Action:

None.

User Action:

None.

NT0490**INVALID OR UNKNOWN TABLE NAME: tttt****Reason:**

This message is issued in response to a SHOW ATF command when the supplied table name is invalid.

System Action:

The command is ignored.

User Action:

Correct the table name and reissue the command.

NT0501**TRANSLATION INPUT STRING OVERFLOW****Reason:**

This message is issued by the OML CSCONV function if an output string area overflow occurred during execution of the translation.

System Action:

An OML ERROR is raised.

User Action:

Reduce the length of the input string. CSCONV supports a maximum output size of 64K. Some input strings and conversion types can result in an output string that is much longer than the input string.

NT0502

INPUT STRING SYNTAX ERROR # eee OFFSET: oooo

Reason:

This message is issued by the OML CSCONV function if a syntax error was detected in the input string to be converted.

The offset in the input where the error was detected is also shown. This offset may precede the actual error point.

The syntax errors are:

2 - A double-byte string (or substring) was not an even length.

3 - Invalid input character for current mode or character set (that is, the definition of the character set prohibits the value)

4 - Input exhausted unexpectedly, for example, in the middle of a shift sequence.

5 - UNICODE surrogate pair error (First or second of pair is missing. Only detected if output is UTF8)

6 - Invalid shift sequence

7 - Truncated shift sequence

System Action:

An OML ERROR is raised.

User Action:

Examine the input data and determine why the error occurred.

NT0503

iiiiii UNKNOWN TRANSLATION TABLE: tttttt

Reason:

This message is issued by the OML CSCONV function if an invalid or unknown translation table name is supplied.

iiiiii is the table type (INPUT or OUTPUT). tttttt is the supplied table name.

System Action:

An OML ERROR is raised.

User Action:

Check the names of the tables used. (The SHOW ATF command shows the valid names.)

NT0504**iiiiii TRANSLATION TABLE: tttttt FAILED TO LOAD, REFER TO LOG****Reason:**

This message is issued by the OML CSCONV function if a requested translation table failed to load.

iiiiii is the table type (INPUT or OUTPUT). tttttt is the supplied table name. There will be messages on the SOLVE log describing the load failure problem.

System Action:

An OML ERROR is raised.

User Action:

Check the SOLVE log for load failure messages (NT11?? messages). Take corrective action as required.

NT1101**tttttt BASIC TABLE ERROR: rrrrrrrr****Reason:**

This message is issued by the ATF table loader when a basic error in the translation table load process occurs.

The table name is shown.

The errors are:

PRIMARY LOAD MODULE LOAD FAILED The primary load module - as defined in the table definition \use SHOW ATF TABLE=tttttt) - could not be loaded.

SECONDARY LOAD MODULE LOAD FAILED The secondary load module - as defined in the table definition (use SHOW ATF TABLE=tttttt) - could not be loaded.

MISSING SINGLE/DOUBLE TABLES The required conversion tables, as required by the encoding name for this table, were not all present in the primary and secondary load modules.

STORAGE SHORTAGE Insufficient storage was available.

System Action:

The ATF translation table load fails. This may cause an NCL conversion request to fail.

User Action:

Correct the problem based on the error description.

NT1110**tttttt MOD: mmmmm rrrrrrr****Reason:**

This message is issued by the ATF table loader when an error in the translation table load process occurs.

The table name is shown. The name of the load module being processed is shown.

The errors are described below.

TABLE HEADER ERROR: eeeeeeeee An error in the load module table header was detected. Errors indicate a problem with the table header. The errors are: HEADER VALIDATION ERROR 1 HEADER VALIDATION ERROR 2 HEADER VALIDATION ERROR 3 HEADER VALIDATION ERROR 4

ENCODING NAME MISMATCH The encoding name in the table does not match the encoding name in the load module.

SINGLE TABLE n ERROR: eeeeeeeee An error in a single-byte table (n indicates the number, 1 to 4), was detected. The errors are:

EYECATCHER INVALID The internal eyecatcher was invalid.

INTERNAL TABLE CODE WRONG The internal table code was not the expected code.

NO ENTRIES There are no entries in the table.

TOO MANY ENTRIES There are too many entries in the table (> 256).

DOUBLE TABLE n ERROR: eeeeeeeee An error in a double-byte table (n indicates the number, 1 to 4) was detected. The errors are:

EYECATCHER INVALID The internal eyecatcher was invalid.

INTERNAL TABLE CODE WRONG The internal table code was not the expected code.

NO ENTRIES

TOO MANY ENTRIES There are too many entries in the table (> 256).

System Action:

The ATF translation table load fails. This may cause an NCL conversion request to fail.

User Action:

Correct the problem based on the error description.

NT1120

ttttt MOD: mmmmm UNICODE: uuuu HAS 2 DIFFERENT SB MAPPINGS: xx/yy

Reason:

This message is issued by the ATF table loader when it detects that two single-byte translation tables map the same Unicode to two different single-byte codes.

For example, single byte table 1 may map input character X'45' to Unicode entry X'0045', but single byte table 2 may map input character X'C1' to Unicode entry X'0045'.

This cannot be handled by the present ATF design.

Note: Different translation tables can of course map different characters to the same Unicode (to facilitate conversion). However, for character sets with multiple modes (for example, EUC, or JIS7) where escape sequences switch between modes, ATF presently disallows different single-bytes mapping to the same Unicode.

System Action:

The ATF translation table load fails. This may cause an NCL conversion request to fail.

User Action:

Correct the translation tables to remove the overlap.

NT1125

ttttt MOD: mmmmm UNICODE: uuuu HAS 2 DIFFERENT DB MAPPINGS: xxxx/yyyy

Reason:

This message is issued by the ATF table loader when it detects that two double-byte translation tables map the same Unicode to two different double-byte codes.

For example, double byte table 1 may map input character X'4545' to Unicode entry X'6578', but double byte table 2 may map input character X'A2C1' to unicode entry X'6578'.

This cannot be handled by the present ATF design.

Note: Different translation tables can of course map different characters to the same Unicode (to facilitate conversion). However, for character sets with multiple modes (for example, EUC, or JIS7) where escape sequences switch between modes, ATF presently disallows different double-bytes mapping to the same Unicode.

System Action:

The ATF translation table load fails. This may cause an NCL conversion request to fail.

User Action:

Correct the translation tables to remove the overlap.

NT3001

I STARTING TRANSLATION TABLE COMPILE...

Reason:

This message is issued by the ATF translation table compiler to indicate that it is starting a compilation.

System Action:

Compilation commences.

User Action:

None.

NT3002

>>> nnnnn: source-line-text

Reason:

This message is issued by the ATF translation table compiler to display an input line when an error is detected.
The error message will follow.

System Action:

Error messages related to this line follow.

User Action:

Examine the error message(s).

NT3003

I EOF ON INPUT FILE

Reason:

This message is issued by the ATF translation table compiler to indicate that end-of-file was detected on the input file.

System Action:

Compilation proceeds.

User Action:

None.

NT3004

I GENERATING TABLE: tttt MODULE: mmmm

Reason:

This message is issued by the ATF translation table compiler to indicate that it is proceeding to generate the named translation table, and the load module name.

System Action:

Compilation proceeds.

User Action:

None.

NT3009

I TABLE GENERATION COMPLETE

Reason:

This message is issued by the ATF translation table compiler to indicate that it has completed table generation.

System Action:

Compilation finishes.

User Action:

None.

NT3010

E STATEMENTS FOUND AFTER 'END TABLE' STATEMENT

Reason:

This message is issued by the ATF translation table compiler to indicate that it found statements in the source after the 'END TABLE' statement.

System Action:

Compilation terminates.

User Action:

Correct the error and recompile the table.

NT3011

E UNRECOGNISED STATEMENT

Reason:

This message is issued by the ATF translation table compiler to indicate that the displayed statement (previous print line, MSG NT3002), is not a valid statement.

System Action:

Compilation proceeds for error checking purposes only.

User Action:

Correct the error and recompile the table.

NT3012**E STATEMENT INVALID INSIDE START ... END GROUP****Reason:**

This message is issued by the ATF translation table compiler to indicate that the displayed statement (previous print line, MSG NT3002), is not valid between a START and END sequence.

System Action:

Compilation proceeds for error checking purposes only.

User Action:

Correct the error and recompile the table.

NT3013**E DUPLICATED STATEMENT****Reason:**

This message is issued by the ATF translation table compiler to indicate that the displayed statement (previous print line, MSG NT3002), is duplicated. (For example, two MODULE statements were found.)

System Action:

Compilation proceeds for error checking purposes only.

User Action:

Correct the error and recompile the table.

NT3014**E INVALID DATA AFTER STATEMENT OPERAND(S)****Reason:**

This message is issued by the ATF translation table compiler to indicate that the displayed statement (previous print line, MSG NT3002), has invalid data after the valid operand(s).

System Action:

Compilation proceeds for error checking purposes only.

User Action:

Correct the error and recompile the table.

NT3020

E UNRECOGNISED 'START' OPERAND

Reason:

This message is issued by the ATF translation table compiler to indicate that the displayed statement (previous print line, MSG NT3002), a 'START' statement, has an unrecognised operand. The operand must be 'SINGLE' or 'DOUBLE' and a number from 1 to 4.

System Action:

Compilation proceeds for error checking purposes only.

User Action:

Correct the error and recompile the table.

NT3021

E NO 'ENCODING' STATEMENT BEFORE 'START' (FATAL)

Reason:

This message is issued by the ATF translation table compiler to indicate that the displayed statement (previous print line, MSG NT3002), a 'START' statement, was not preceded by an 'ENCODING' statement. This is a fatal error.

System Action:

Compilation terminates.

User Action:

Correct the error and recompile the table.

NT3022**E UNRECOGNISED 'END' OPERAND****Reason:**

This message is issued by the ATF translation table compiler to indicate that the displayed statement (previous print line, MSG NT3002), an 'END' statement, has an unrecognised operand. The operand must be 'SINGLE', 'DOUBLE', or 'TABLE'.

System Action:

Compilation proceeds for error checking purposes only.

User Action:

Correct the error and recompile the table.

NT3030**E INVALID 'NAME' STATEMENT****Reason:**

This message is issued by the ATF translation table compiler to indicate that the displayed statement (previous print line, MSG NT3002), a 'NAME' statement, is not valid.

The reasons it can be invalid are:

- No table name was supplied.
- The table name is too long (more than 16 characters).
- The table name is invalid. (First character must be alpha or national, the remainder must be alphanumeric, national, or underscore.)

System Action:

Compilation proceeds for error checking purposes only.

User Action:

Correct the error and recompile the table.

NT3031

E INVALID 'ENCODING' STATEMENT

Reason:

This message is issued by the ATF translation table compiler to indicate that the displayed statement (previous print line, MSG NT3002), an 'ENCODING' statement, is not valid.

The reasons it can be invalid are:

- No encoding name was supplied.
- The encoding name is too long (more than 16 characters).
- The encoding name is invalid. (First character must be alpha or national, the remainder must be alphanumeric, national, or underscore.)

System Action:

Compilation proceeds for error checking purposes only.

User Action:

Correct the error and recompile the table.

NT3032

E INVALID 'MODULE' STATEMENT

Reason:

This message is issued by the ATF translation table compiler to indicate that the displayed statement (previous print line, MSG NT3002), an 'MODULE' statement, is not valid.

The reasons it can be invalid are:

- No module name was supplied.
- The module name is too long (more than 8 characters).
- The module name is invalid. (First character must be alpha or national, the remainder must be alphanumeric or national.)

System Action:

Compilation proceeds for error checking purposes only.

User Action:

Correct the error and recompile the table.

NT3034**E INVALID 'SINGLE_SUB' STATEMENT****Reason:**

This message is issued by the ATF translation table compiler to indicate that the displayed statement (previous print line, MSG NT3002), a 'SINGLE_SUB' statement, is not valid.

The reasons it can be invalid are:

- No value was supplied.
- The value was not two characters long, or the characters were not valid hexadecimal digits (0-9 or A-F).

System Action:

Compilation proceeds for error checking purposes only.

User Action:

Correct the error and recompile the table.

NT3035**E INVALID 'DOUBLE_SUB' STATEMENT****Reason:**

This message is issued by the ATF translation table compiler to indicate that the displayed statement (previous print line, MSG NT3002), a 'DOUBLE_SUB' statement, is not valid.

The reasons it can be invalid are:

- No value was supplied.
- The value was not four characters long, or the characters were not valid hexadecimal digits (0-9 or A-F).

System Action:

Compilation proceeds for error checking purposes only.

User Action:

Correct the error and recompile the table.

NT3036

E ENCODING NAME INVALID OR UNRECOGNISED

Reason:

This message is issued by the ATF translation table compiler to indicate that the displayed statement (previous print line, MSG NT3002), an 'ENCODING' statement, is not valid.

The reasons it can be invalid are:

- The encoding name was not found in the table of valid encoding names.
- The encoding name was found, but the encoding type is 'algorithmic' (Only 'table' encoding types are valid.)

System Action:

Compilation proceeds for error checking purposes only.

User Action:

Correct the error and recompile the table.

NT3050

E INVALID SINGLE TABLE NUMBER (NOT 1 TO 4)

Reason:

This message is issued by the ATF translation table compiler to indicate that the displayed statement (previous print line, MSG NT3002), a 'START SINGLE' statement, has an invalid table number after it. The value must be 1 to 4.

System Action:

Compilation proceeds for error checking purposes only.

User Action:

Correct the error and recompile the table.

NT3051**E THIS SINGLE TABLE ALREADY PROCESSED****Reason:**

This message is issued by the ATF translation table compiler to indicate that the displayed statement (previous print line, MSG NT3002), a 'START SINGLE' statement, has a table number that has already been seen.

System Action:

Compilation proceeds for error checking purposes only.

User Action:

Correct the error and recompile the table.

NT3052**E INVALID OPTION AFTER TABLE NUMBER****Reason:**

This message is issued by the ATF translation table compiler to indicate that the displayed statement (previous print line, MSG NT3002), a 'START SINGLE' statement, has an invalid option after the table number. The only valid option is 'REPLACE'.

System Action:

Compilation proceeds for error checking purposes only.

User Action:

Correct the error and recompile the table.

NT3053

E THIS TABLE NUMBER NOT ALLOWED FOR THIS ENCODING

Reason:

This message is issued by the ATF translation table compiler to indicate that the displayed statement (previous print line, MSG NT3002), a 'START SINGLE' statement, has a table number that is not allowed for the encoding name specified.

System Action:

Compilation proceeds for error checking purposes only.

User Action:

Correct the error and recompile the table.

NT3054

E DUPLICATED SOURCE VALUE FOR THIS TABLE

Reason:

This message is issued by the ATF translation table compiler to indicate that the displayed statement (previous print line, MSG NT3002), a code/Unicode map statement (for a single table), has a duplicate source value. This source value has already appeared on an earlier statement.

System Action:

Compilation proceeds for error checking purposes only.

User Action:

Correct the error and recompile the table.

NT3055**E NOT PROCESSING A 'SINGLE' TABLE****Reason:**

This message is issued by the ATF translation table compiler to indicate that the displayed statement (previous print line, MSG NT3002), an 'END SINGLE' statement, is not valid, as no single table is presently being processed.

System Action:

Compilation proceeds for error checking purposes only.

User Action:

Correct the error and recompile the table.

NT3056**E NO ENTRIES DEFINED IN THIS SINGLE TABLE****Reason:**

This message is issued by the ATF translation table compiler to indicate that the displayed statement (previous print line, MSG NT3002), an 'END SINGLE' statement, terminates a single table, but there were no mapping statements after the 'START SINGLE' statement.

System Action:

Compilation proceeds for error checking purposes only.

User Action:

Correct the error and recompile the table.

NT3060**E INVALID DOUBLE TABLE NUMBER (NOT 1 TO 4)****Reason:**

This message is issued by the ATF translation table compiler to indicate that the displayed statement (previous print line, MSG NT3002), a 'START DOUBLE' statement, has an invalid table number after it. The value must be 1 to 4.

System Action:

Compilation proceeds for error checking purposes only.

User Action:

Correct the error and recompile the table.

NT3061

E THIS DOUBLE TABLE ALREADY PROCESSED

Reason:

This message is issued by the ATF translation table compiler to indicate that the displayed statement (previous print line, MSG NT3002), a 'START DOUBLE' statement, has a table number that has already been seen.

System Action:

Compilation proceeds for error checking purposes only.

User Action:

Correct the error and recompile the table.

NT3062

E INVALID OPTION AFTER TABLE NUMBER

Reason:

This message is issued by the ATF translation table compiler to indicate that the displayed statement (previous print line, MSG NT3002), a 'START DOUBLE' statement, has an invalid option after the table number. The only valid option is 'REPLACE'.

System Action:

Compilation proceeds for error checking purposes only.

User Action:

Correct the error and recompile the table.

NT3063**E THIS TABLE NUMBER NOT ALLOWED FOR THIS ENCODING****Reason:**

This message is issued by the ATF translation table compiler to indicate that the displayed statement (previous print line, MSG NT3002), a 'START DOUBLE' statement, has a table number that is not allowed for the encoding name specified.

System Action:

Compilation proceeds for error checking purposes only.

User Action:

Correct the error and recompile the table.

NT3064**E DUPLICATED SOURCE VALUE FOR THIS TABLE****Reason:**

This message is issued by the ATF translation table compiler to indicate that the displayed statement (previous print line, MSG NT3002), a code/Unicode map statement (for a double table), has a duplicate source value. This source value has already appeared on an earlier statement.

System Action:

Compilation proceeds for error checking purposes only.

User Action:

Correct the error and recompile the table.

NT3065

E NOT PROCESSING A 'DOUBLE' TABLE

Reason:

This message is issued by the ATF translation table compiler to indicate that the displayed statement (previous print line, MSG NT3002), an 'END DOUBLE' statement, is not valid, as no double table is presently being processed.

System Action:

Compilation proceeds for error checking purposes only.

User Action:

Correct the error and recompile the table.

NT3066

E NO ENTRIES DEFINED IN THIS DOUBLE TABLE

Reason:

This message is issued by the ATF translation table compiler to indicate that the displayed statement (previous print line, MSG NT3002), an 'END DOUBLE' statement, terminates a double table, but there were no mapping statements after the 'START DOUBLE' statement.

System Action:

Compilation proceeds for error checking purposes only.

User Action:

Correct the error and recompile the table.

NT3070**C INVALID PARM STARTING AT: dddddd****Reason:**

This message is issued by the ATF translation table compiler to indicate that the JCL PARM value is invalid.

The position where invalid data was detected is displayed.

System Action:

The compiler immediately terminates.

Note that this message will be WTO'd, as no files are open yet.

User Action:

Correct the parameter error.

NT3071**C UNRECOGNISED PARM: dddd****Reason:**

This message is issued by the ATF translation table compiler to indicate that an unrecognised JCL PARM option was found.

The invalid parm is displayed.

System Action:

The compiler immediately terminates.

Note that this message will be WTO'd, as no files are open yet.

User Action:

Correct the parameter error.

NT3072

C DUPLICATED PARM: dddd

Reason:

This message is issued by the ATF translation table compiler to indicate that a duplicated JCL PARM option was found.
The invalid parm is displayed.

System Action:

The compiler immediately terminates.
Note that this message will be WTO'd, as no files are open yet.

User Action:

Correct the parameter error.

NT3075

C INVALID 'IN' DDNAME:

Reason:

This message is issued by the ATF translation table compiler to indicate that the JCL PARM 'IN' option had an invalid ddname value.
The invalid value is displayed.

System Action:

The compiler immediately terminates.
Note that this message will be WTO'd, as no files are open yet.

User Action:

Correct the parameter error.

NT3076**C INVALID 'OUT' DDNAME:****Reason:**

This message is issued by the ATF translation table compiler to indicate that the JCL PARM 'OUT' option had an invalid ddname value.
The invalid value is displayed.

System Action:

The compiler immediately terminates.
Note that this message will be WTO'd, as no files are open yet.

User Action:

Correct the parameter error.

NT3077**C INVALID 'PRINT' DDNAME:****Reason:**

This message is issued by the ATF translation table compiler to indicate that the JCL PARM 'PRINT' option had an invalid ddname value.
The invalid value is displayed.

System Action:

The compiler immediately terminates.
Note that this message will be WTO'd, as no files are open yet.

User Action:

Correct the parameter error.

NT3079

S OPEN FAILED FOR ddname

Reason:

This message is issued by the ATF translation table compiler to indicate that it was unable to open the indicated file.

System Action:

The compiler immediately terminates.

Note that this message may be WTO'd, depending on which file cannot be opened.

User Action:

Refer to the job log for other error messages (for example, missing ddname). Correct the error and rerun the compiler.

NT3080

E NO 'NAME' STATEMENT FOUND

Reason:

This message is issued by the ATF translation table compiler to indicate that after processing all input, no 'NAME' statement was found.

System Action:

Compilation terminates.

User Action:

Add a NAME statement and recompile the table.

NT3081

E NO 'ENCODING' STATEMENT FOUND

Reason:

This message is issued by the ATF translation table compiler to indicate that after processing all input, no 'ENCODING' statement was found.

System Action:

Compilation terminates.

User Action:

Add an ENCODING statement and recompile the table.

NT3082**E NO 'MODULE' STATEMENT FOUND****Reason:**

This message is issued by the ATF translation table compiler to indicate that after processing all input, no 'MODULE' statement was found.

System Action:

Compilation terminates.

User Action:

Add a MODULE statement and recompile the table.

NT3090**S UNABLE TO LOAD NM072002****Reason:**

This message is issued by the ATF translation table compiler to indicate that it was unable to load module NM072002, which contains the encoding names table.

System Action:

Compilation terminates.

User Action:

Ensure that the SOLVE load library is available to the compiler job.

NT3091**S VALIDATION OF NM072002 FAILED, REASON: n****Reason:**

This message is issued by the ATF translation table compiler to indicate that the validation of the NM072002 module failed. An error code is displayed.

System Action:

Compilation terminates.

User Action:

Contact Technical Support.

NT3099

E TABLE GENERATION SUPPRESSED DUE TO ERRORS

Reason:

This message is issued by the ATF translation table compiler to indicate that, due to previous errors, generation of the assembler source for the translation table has been suppressed.

System Action:

Compilation terminates.

User Action:

Correct the previous errors.

NT5001

NETSPY INTERFACE INITIALIZED

Reason:

The interface that enables communication with CA NetSpy has been initialized.

System Action:

None

User Action:

None

NT5090

NETSPY INTERFACE INITIALIZATION FAILED - VTAM ACCESS METHOD NOT AVAILABLE

Reason:

This message is produced during NetMaster initialization, if the NETSPY interface cannot be initialized.

If the VTAM access method has been omitted (via the AM=... JCL PARM), then the NETSPY interface has no way of communicating.

System Action:

The NETSPY interface is not initialized.

User Action:

Normally, none. It is not normal to omit VTAM as an access method.

NT5401**SHOW NETSPY oooo COMMAND COMPLETED****Reason:**

This message indicates that a SHOW NETSPY command was successfully processed. The command option is shown.

System Action:

None

User Action:

None

NT5410**LIST OF NETSPY CONNECTIONS FOLLOWS...****Reason:**

This message commences the output of a SHOW NETSPY CONN command.

System Action:

None

User Action:

None

NT5411

CONN-NAME APPL STATUS PEND-STATUS ACT-TIME ACT-DATE

Reason:

This message is the first heading of a SHOW NETSPY CONN command. It contains the column headings for the NT5413 message, as follows:

CONN-NAME - Shows the value of the NSYXNAME parameter in the INITPRM member of each NetSpy linked to this region.

APPL - Shows the VTAM application name for each NetSpy.

STATUS - Shows the current status of each NetSpy link.

PEND-STATUS - Shows the pending (desired) status of each NetSpy link.

ACT-DATE - Shows the date when each NetSpy link was activated.

ACT-TIME - Shows the time when each NetSpy link was activated.

System Action:

None.

User Action:

None.

NT5412**INFORMATION: PRI-ACB VERSION SYSNAME INTERVAL SYNC
ALTBITVL RETRY****Reason:**

This message is the second heading of a SHOW NETSPY CONN command. It contains the column headings for the NT5414 message, as follows:

INFORMATION - Shows the internally generated link name for each NetSpy linked to your *region*.

PRI-ACB - Shows the ACB name of each NetSpy.

VERSION - Shows the version of each NetSpy.

SYSNAME - Shows the local identifier of the region, as set at system initialization.

INTERVAL - Shows the time between retries when connecting NetSpys.

SYNC - Shows the NetSpy SYNC initialization value.

ALTBITVL - Shows the NetSpy ALTBITVL initialization value.

RETRY - Shows the current retry number and maximum number of retries for a given link.

System Action:

None.

User Action:

None.

NT5413**conn-name appl status pend-status act-time act-date****Reason:**

This message is the first detail line of a SHOW NETSPY CONN command. It contains information about a NETSPY connection. Refer to message NT5411 for column headings.

System Action:

None

User Action:

None

NT5414

pri-acb version sysname interval sync altbitvl retry

Reason:

This message is the second detail line of a SHOW NETSPY CONN command. It contains additional information about a NETSPY connection. Refer to message NT5412 for column headings.

System Action:

None

User Action:

NT5420

LIST OF NETSPY (NCL/OML) USERS FOLLOWS...

Reason:

This message commences the output of a SHOW NETSPY USERS command.

System Action:

None

User Action:

None

NT5421

USERID NCLID BASEPROC LAST-ID

Reason:

This message is the first heading of a SHOW NETSPY USERS command. It contains the column headings for the NT5423 message, as follows:

USERID - Shows the user ID using NetSpy.

NCLID - Shows the NCL is of the procedure using NetSpy.

BASEPROC - Shows the name of the current procedure using NetSpy.

LAST-ID - Shows the NetSpy link identifier last used.

System Action:

None.

User Action:

None.

NT5422**REQ-ID ID-NAME TGT-NETSPY****Reason:**

This message is the second heading of a SHOW NETSPY USERS command. It contains the column headings for the NT5424 message, as follows:

REQ-ID - Shows the value of the correlator

ID-NAME - Shows the value of unique request identifier

TGT-NETSPY - Shows the name of the target NetSpy

System Action:

None.

User Action:

None.

NT5423**userid nclid baseproc last-id****Reason:**

This message is the first detail line of a SHOW NETSPY USERS command. It contains information about a NETSPY connection user (process). Refer to message NT5421 for column headings.

System Action:

None

User Action:

None

NT5424

req-id id-name tgt-netspy

Reason:

This message is the second detail line of a SHOW NETSPY USERS command. It contains information about defined commands for the user. Refer to message NT5422 for column headings.

System Action:

None

User Action:

NT5431**DEF-ID TERMNAME USERID REQ-ID NCLID SSEQ# RSEQ# TGT- NETSPY****Reason:**

This message is the first heading of a SHOW NETSPY DEFS command. It contains the column headings for the NT5433 message, as follows:

DEF-ID - Shows the correlator for this command request definition.

TERMNAME - Shows logical terminal name for this command request.

USERID - Shows the ID of the user that defined the request.

REQ-ID - Shows unique request identifier.

NCLID - Shows NCL ID of the procedure that defined the request.

SSEQ# - Shows the the number of send request since last reset.

RSEQ# - Shows the number of reset request.

TGT-NETSPY - Shows the identifier of the target NetSpy or * if the request is not targetting any specific NetSpy.

System Action:

None.

User Action:

None.

NT5432**COMMAND...****Reason:**

This message is the second heading of a SHOW NETSPY DEFS command. It contains the column headings for the NT5434 message, as follows:

COMMAND... - Shows the command represented by this request.

System Action:

None

User Action:

None

NT5433

def-id termname userid req-id nclid sseq# rseq# tgt-netspy

Reason:

This message is the first detail line of a SHOW NETSPY DEFS command. It contains details of a command definition. Refer to message NT5431 for column headings.

System Action:

None

User Action:

None

NT5434

cccccccc

Reason:

This message is the second detail line of a SHOW NETSPY DEFS command. It contains the defined command text.

System Action:

None

User Action:

NT5501

NSPCONN option COMMAND PROCESSED

Reason:

This message indicates that an NSPCONN command was successfully processed. The command option is shown.

System Action:

None

User Action:

None

NT5510**NSPCONN option FAILED - DEFINITION: defname ALREADY DEFINED****Reason:**

An NSPCONN DEFINE command was not processed. The definition name for the NETSPY connection was already defined.

System Action:

The command is ignored.

User Action:

Choose a unique definition name and re-enter the command.

NT5511**NSPCONN option FAILED - APPL: applname IN USE BY DEFINITION: defname****Reason:**

An NSPCONN DEFINE command was not processed. The APPL name specified (or defaulted as the first 8 characters of the definition name) was already in use by another NETSPY connection definition.

System Action:

The command is ignored.

User Action:

Correct the application name and re-enter the command.

NT5512**NSPCONN option FAILED - APPL: applname IN USE ELSEWHERE****Reason:**

An NSPCONN DEFINE command was not processed. The specified APPL name (or defaulted as the first eight characters of the definition name) was already used in this region (for example, a terminal name or another link application name).

System Action:

The command is ignored.

User Action:

Correct the application name, and reenter the command.

NT5513

NSPCONN option FAILED - DEFINITION: def-name IN STATE: state

Reason:

An NSPCONN command was not processed. The option requested is shown. The targeted definition could not be altered, as its current state is not compatible with the request. For example, NSPCONN START for an already-running definition.

System Action:

The command is ignored.

User Action:

Check the state of the definition and correct and re-enter the command if necessary.

NT5514

NSPCONN option FAILED - DEFINITION: def-name NOT FOUND

Reason:

An NSPCONN command was not processed. The option requested is shown. The targeted definition could not be found.

System Action:

The command is ignored.

User Action:

Check the name of the definition and correct and re-enter the command if necessary.

NT6201

RCV ERROR ON NETSPY CONNECTION: conn-name APPL: appl- name: info

Reason:

This message is issued when an error occurs while receiving data on a NETSPY connection.

The name of the NETSPY connection is shown, as well as the VTAM application name.

The information in the message will be in one of two formats:

RC=xx,FBK2=xx,SENSE=xxxxxxx

- which indicates a VTAM error occurred whilst receiving data. The VTAM return code, feedback code, and sense code are shown.

INVALID DATA RECEIVED, CODE: nn

- which indicates that invalid or incorrectly formatted data was received. The codes are:

04 - invalid length buffer received

System Action:

The VTAM session with NETSPY will be terminated

User Action:

Examine the reason for failure. Use the NSPCTL command to restart the connection.

If the error persists, contact your local support representative.

NT6801

APPARENT NETSPY CONNECTION REQUEST RECEIVED. APPL: *appl-name*

Reason:

A connection request was received from a CA NetSpy region. The sourcing application name is shown.

NetMaster does not accept inbound connection requests from CA NetSpy. To connect this region and CA NetSpy, this region must initiate the connection (using the NSPREQ command).

Note: This message is produced only if the CA NetSpy region making the request is Version 5.4 or later.

System Action:

The connection request is refused.

User Action:

Alter the CA NetSpy region to stop it from attempting to connect to NetMaster.

NT6990**INVALID BIND UDATA RCVD FROM NETSPY: *appl-name* REASON: *nnn* - SEE LOG****Reason:**

Invalid or unrecognized user data was supplied on the BIND request from CA NetSpy, resulting in one of the following reason codes:

1 indicates that the user data does not start with NTNLOGON.

2 indicates that no information vectors were supplied. (This error can occur if an attempt is made to connect to a CA NetSpy region that is not at least Version 5.4.)

3 indicates that information vectors were incorrectly formatted.

1xx indicates that vector number xx was missing or formatted incorrectly.

The activity log contains further information, in the form of an NT6991 message and NT6992 messages containing a dump of the BIND user data.

System Action:

The BIND request is rejected.

User Action:

Check that the APPL name identifies a CA NetSpy region. If not, stop the software using that application name from attempting to connect to NetMaster.

If the application *is* CA NetSpy, ensure that it is at least Version 5.4.

NT6991**NETSPY: *appl-name* BIND UDATA FOLLOWS (LEN=*ll*)****Reason:**

This message follows message NT6990. It indicates that a dump of the BIND user data follows.

System Action:

None

User Action:

See message NT6990.

NT6992

+000 xxxxxxxx xxxxxxxx xxxxxxxx xxxxxxxx cccccccccccccccc

Reason:

This message follows message NT6991. It displays a dump of the BIND user data.

System Action:

None

User Action:

See message NT6990.

NT6A01

COMMAND REJECTED. YOU CANNOT USE cmdname COMMAND FOR A NETSPY SYSTEM

Reason:

This message is issued if you attempt to perform some operations on an application name (APPLname) that is presently related to a NETSPY connection. The command name is shown in the message.

System Action:

The command is ignored.

User Action:

Check that the correct application name was specified on the command.

NT7001

NETSPY CONNECTION: cccc TO APPL: aaaa ACTIVE

Reason:

This message indicates that a connection to the indicated NETSPY has completed successfully.

System Action:

None

User Action:

None

NT7002**NETSPY CONNECTION: cccc TO APPL: aaaa INACTIVE****Reason:**

This message indicates that a connection to the indicated NETSPY has terminated.

System Action:

None

User Action:

If the termination was not as a result of an NSPCONN STOP command, check the log for messages relating to the connection.

NT7003**NETSPY CONNECTION: cccc TO APPL: aaaa STOPPING...****Reason:**

This message indicates that a connection to the indicated NETSPY is being terminated.

System Action:

None

User Action:

None

NT7010**NETSPY CONNECTION: cccc TO APPL: aaaa STARTING...****Reason:**

This message indicates that a connection to the indicated NETSPY is being attempted.

System Action:

None

User Action:

None

NT7080

NETSPY CONNECTION: cccc TO APPL: aaaa FAILED, reason

Reason:

This message indicates that a connection to the indicated NETSPY was unsuccessful.
The connection failure reason is displayed. This will typically be a VTAM reason. The various return, reason, and sense codes can be looked up using the /CODES shortcut.

System Action:

None

User Action:

Check the log for error messages relating to the connection failure.

NT7081

UNBIND/LOSTERM RECEIVED FOR NETSPY CONNECTION: cccc TO APPL: aaaa

Reason:

This message indicates that a VTAM UNBIND or LOSTERM was received for the indicated NETSPY connection.

System Action:

The connection is terminated.

User Action:

Determine why NETSPY disconnected.

NT7082

NETSPY CONNECTION: cccc TO APPL: aaaa EXCEEDED RETRY LIMIT=P1

Reason:

This message indicates that a limit of start retries of the link to NETSPY was reached. P1 is the number of unsuccessful link starts limit reached. See preceeding message NT7080 for last start failure details.

System Action:

Link restarts will be discontinued. Link will enter FAILED state.

User Action:

Start/redefine the link after addressing the reasons for failure.

NT7180

ENABLE-INPUT FAILED FOR NETSPY: cccc APPL: aaaa

Reason:

This message indicates that a VTAM ENABLE-INPUT failed on the indicated NETSPY connection.

System Action:

The connection is terminated.

User Action:

None

NT7380

INVALID BUFFER RCVD FROM NETSPY. CONN: cccc APPL: aaaa CODE: cccc DATA FOLLOWS (L=IIII)

Reason:

This message indicates that an invalid buffer was received from NETSPY.

System Action:

The buffer is ignored.

User Action:

Contact your support representative. The information in this and subsequent messages will aid problem determination.

NT7381

**UNMATCHED BUFFER RCVD FROM NETSPY. CONN: cccc APPL: aaaa
LUNAME: IIII DATA FOLLOWS (L=IIII)**

Reason:

This message indicates that incoming data from NETSPY was unable to be matched with an outstanding request. The LUNAME is an internal name used to separate out individual requests.

System Action:

The data is ignored.

User Action:

Contact your support representative. The information in this and subsequent messages will aid problem determination.

NT7382

**WRONG LEN REPLY RCVD FROM NETSPY. CONN: cccc APPL: aaaa
LUNAME: IIII DATA FOLLOWS (L=IIII)**

Reason:

This message indicates that incoming data from NETSPY had an incorrect length.

System Action:

The data is ignored.

User Action:

Contact your support representative. The information in this and subsequent messages will aid problem determination.

NT7389

+off xxxxxxxx xxxxxxxx xxxxxxxx xxxxxxxx cccccccccccccccc

Reason:

This message follows other NT738x messages and displays a hex and character dump of the invalid buffer.

System Action:

None

User Action:

See messages NT7380-NT7382.

NT7490

**NETSPY SESSION SEND FAILURE. NAME: nnnn APPL: aaaa R15: rr
RC/FB rr-ff SS/US ss-us**

Reason:

This message indicates that a VTAM SEND to the indicated NETSPY failed with the indicated error.

System Action:

The connection is terminated.

User Action:

Contact your support representative. The information in this and subsequent messages will aid problem determination.

NT8090**STORAGE SHORTAGE****Reason:**

This message is returned from the NETSPY assembler API when a DEFINE request fails due to a storage shortage.

System Action:

The internal DEFINE request fails.

User Action:

Increase available storage.

NT8151

SYNTAX ERROR IN THRESHOLD LIST

Reason:

This message is returned from the NETSPY assembler API when a DEFINE request fails due to a syntax error in the TH=(...) operand of the NETSPY command.

There was a basic problem with this operand, such as:

- Unbalanced parenthesis.
- List too long.
- Null parameters.

System Action:

The internal DEFINE request fails.

User Action:

Correct the TH operand.

NT8152

THRESHOLD LIST MUST HAVE A MULTIPLE OF 3 ENTRIES

Reason:

This message is returned from the NETSPY assembler API when a DEFINE request fails due to a syntax error in the TH=(...) operand of the NETSPY command.

The list must have a multiple of 3 entries (3, 6, 9, ...).

System Action:

The internal DEFINE request fails.

User Action:

Correct the TH operand.

NT8153**INVALID OR NULL NAME IN THRESHOLD LIST: <name>****Reason:**

This message is returned from the NETSPY assembler API when a DEFINE request fails due to a syntax error in the TH=(...) operand of the NETSPY command.

The indicated field name is invalid or null.

System Action:

The internal DEFINE request fails.

User Action:

Correct the TH operand.

NT8154**UNKNOWN NAME IN THRESHOLD LIST: name****Reason:**

This message is returned from the NETSPY assembler API when a DEFINE request fails due to a syntax error in the TH=(...) operand of the NETSPY command.

The indicated field name is not known.

System Action:

The internal DEFINE request fails.

User Action:

Correct the TH operand.

NT8155

INVALID OR NULL RELOP IN THRESHOLD LIST: value

Reason:

This message is returned from the NETSPY assembler API when a DEFINE request fails due to a syntax error in the TH=(...) operand of the NETSPY command.

The indicated relation operator value is invalid or omitted.

System Action:

The internal DEFINE request fails.

User Action:

Correct the TH operand.

NT8156

INVALID RELOP FOR NAME (nnnnnnnn): value

Reason:

This message is returned from the NETSPY assembler API when a DEFINE request fails due to a syntax error in the TH=(...) operand of the NETSPY command.

The indicated relational operator value is not allowed for this field.

System Action:

The internal DEFINE request fails.

User Action:

Correct the TH operand.

NT8157**INVALID NUMBER IN THRESHOLD LIST: vvvvvvvv****Reason:**

This message is returned from the NETSPY assembler API when a DEFINE request fails due to a syntax error in the TH=(...) operand of the NETSPY command.

The indicated value is not a valid number.

System Action:

The internal DEFINE request fails.

User Action:

Correct the TH operand.

NT8158**DUPLICATE NAME+RELOP ENTRY IN THRESHOLD LIST****Reason:**

This message is returned from the NETSPY assembler API when a DEFINE request fails due to a syntax error in the TH=(...) operand of the NETSPY command.

The indicated field name and relational operator are duplicated.

System Action:

The internal DEFINE request fails.

User Action:

Correct the TH operand.

NT8159

TOO MANY THRESHOLDS IN LIST

Reason:

This message is returned from the NETSPY assembler API when a DEFINE request fails due to a syntax error in the TH=(...) operand of the NETSPY command.

The list contains too many thresholds for the current NETSPY command.

System Action:

The internal DEFINE request fails.

User Action:

Correct the TH operand.

NT8180

THIS COMMAND REQUIRES AN EXACT NETSPY TARGET

Reason:

This message is returned from the NETSPY assembler API when a DEFINE request fails for a command that must be specifically targeted to a single NETSPY.

The supplied NETSPY mask was not an exact name.

System Action:

The internal DEFINE request fails.

User Action:

Correct the supplied NETSPY name mask to be an exact name. Note that even if the mask would only match one NETSPY, this is not acceptable. A non-wildcard value must be supplied.

NT8181**MONITOR NAME IS NOT GLOBALLY UNIQUE****Reason:**

This message is returned from the CA NetSpy assembler API when a DEFINE request fails for a MONITOR command because the assigned MONITOR name is not globally unique in this region.

System Action:

The internal DEFINE request fails.

User Action:

Correct the MONITOR name. It must be unique in this region.

NT9181**DUPLICATE ID: iiiiiiiiii****Reason:**

This message is returned from an NSPREQ OML verb that detects a duplicate path name definition.

System Action:

The NSPREQ Define fails with return code 8, feedback code 81. &SYSMSG is set to this message.

User Action:

Correct the procedure.

NT9183**UNKNOWN ID: iiiiiiiiii****Reason:**

This message is returned from an NSPREQ OML verb that detects an unknown path name.

System Action:

The NSPREQ request fails with return code 8, feedback code 83. &SYSMSG is set to this message.

User Action:

Correct the procedure.

NT9184

ID: iiiiiiiiii HAS AN OUTSTANDING ASYNCH REQUEST

Reason:

This message is returned from an NSPREQ SEND OML verb when the path that the send was requested on has an outstanding asynchronous request.

System Action:

The NSPREQ SEND fails with return code 8, feedback code 84. &SYSMSG is set to this message.

User Action:

Correct the procedure.

NT9187

NSPREQ SEND FOR ID: iiiiiiiiii FAILED. R15: rr

Reason:

This message is returned from an NSPREQ SEND OML verb when the send fails. The return code from the inner API is shown.

Possible return code values are:

04 - Unknown RCORR value (should not happen with OML)

08 - Previous send not completed (Should not happen with OML)

12 - No suitable target NETSPYs. (should not happen with OML)

System Action:

The NSPREQ SEND fails with return code 8, feedback code 87. &SYSMSG is set to this message.

User Action:

Correct the procedure.

NX0001**SYSPLEX NOT SUPPORTED - SYSPLEX SERVICES UNAVAILABLE****Reason:**

This message is issued if the SYSPLEX feature is licenced in a SOLVE system that is executed on an operating system that is not at least MVS/ESA 5.1. It indicates that the SYSPLEX feature is not useable in this environment

System Action:

SOLVE processing continues, however the SYSPLEX feature is not activated.

User Action:

Use the EXC JCL parameter to omit the SYSPLEX feature.

NX1001**SYSPLEX/ARM NOT AVAILABLE - NOT APF AUTHORIZED****Reason:**

This message is issued during SOLVE initialization if the ARM facility is activated and the SOLVE region is not APF-authorized. (ARM is the Automatic Restart Manager).

System Action:

Processing continues; however, the ARM facility is not available.

User Action:

Ensure that the region is set up to run APF-authorized.

NX1002**SYSPLEX/ARM NOT AVAILABLE - NOT AT LEAST MVS/ESA 5.2****Reason:**

This message is issued during SOLVE initialization if the ARM facility is activated and the MVS/ESA level is not at least 5.2. This is because the ARM (Automatic Restart Manager) component of MVS/ESA first appeared in MVS/ESA 5.2.

System Action:

Processing continues, however, the ARM facility is not available.

User Action:

Upgrade MVS/ESA to at least version 5.2.

NX1101

ARM REGISTRATION SUCCESSFUL, ELEMENT NAME IS *elementname*

Reason:

This message is issued during SOLVE initialization if the ARM facility is activated. It indicates that a successful registration with ARM (Automatic Restart Manager) has occurred. The ARM element name is also displayed. The default name is *SVM_acbname* unless changed using JCL initialization parameters.

System Action:

Processing continues, with possible restarts under ARM control.

User Action:

None.

NX1102

ARM WAITPRED SUCCESSFUL

Reason:

This message is issued during SOLVE initialization if the ARM facility is activated. It indicates that a successful WAITPRED request to ARM (Automatic Restart Manager) occurred.

System Action:

Processing continues, with possible restarts under ARM control.

User Action:

None.

NX1103**ARM READY SUCCESSFUL****Reason:**

This message is issued during SOLVE initialization if the ARM facility is activated. It indicates that a successful READY request to ARM (Automatic Restart Manager) occurred.

System Action:

Processing continues, with possible restarts under ARM control.

User Action:

None.

NX1104**ARM DEREGISTER SUCCESSFUL****Reason:**

This message is issued during SOLVE termination if the ARM facility is activated. It indicates that a SOLVE has deregistered from ARM (Automatic Restart Manager).

System Action:

SOLVE continues termination. ARM will not restart SOLVE.

User Action:

None.

NX1190

ARM FAILURE, FUNCTION=func, RC=rc (DEC), R0=r0 (HEX)

Reason:

This message is issued during SOLVE processing if the ARM facility is requested. It indicates that an error occurred during processing of an ARM (Automatic Restart Manager) request. The return code and reason code (R0) are displayed.

System Action:

Processing continues. However, ARM services will not be used.

User Action:

Examine the return and reason codes and determine the appropriate action. Explanations for the return and reason codes are in the MVS/ESA Version 5 Sysplex Services References manual, in the section on the IXCARM macro.

NX1201

ARM STATUS IS status (restarted), ELEMNAME=elemname, ELEMTYPE=elemtype

Reason:

This message is issued by the STATUS command if the ARM facility was requested in the SOLVE JCL parameters. It indicates the current status of the ARM connection and shows the element name and element type that SOLVE is known to ARM by.

System Action:

None.

User Action:

None.

NX1202

**ARM REQUEST=request FAILED, RC=rc (D), R0=r0 (X),
ELEMNAME=elemname**

Reason:

This message is issued by the STATUS command if the ARM facility is requested. It indicates that an error occurred during processing of an ARM (Automatic Restart Manager) request. The request in error and the return code and reason code (R0) are displayed, as well as the element name that was used.

System Action:

None.

User Action:

Examine the return and reason codes and determine the appropriate action. Explanations for the return and reason codes are in the MVS/ESA Version 5 Sysplex Services References manual, in the section on the IXCARM macro.

NXS001**SYSPLEX NOT SUPPORTED - SYSPLEX SERVICES UNAVAILABLE****Reason:**

This message is issued if the SYSPLEX feature is licenced in an NMSSI region that is executed on an operating system that is not at least MVS/ESA 5.1. It indicates that the SYSPLEX feature cannot be used in this environment.

System Action:

NMSSI processing continues; however, the SYSPLEX feature is not activated.

User Action:

Use the EXC initialization parameter to omit the SYSPLEX feature.

NXSA01

SYSPLEX/XCF NOT AVAILABLE - NOT AT LEAST MVS/ESA 5.1

Reason:

This message is issued during NMSSI initialization if the XCF facility is activated and the MVS/ESA level is not at least 5.1. The XCF facility requires at least MVS/ESA 5.1

System Action:

NMSSI processing continues; however, the XCF facility is not available.

User Action:

Upgrade MVS/ESA to at least version 5.1.

NXSB01

XCF ACTIVE, G=gggggggg M=mmmmmmmm T=ttttttt

Reason:

This message is issued by the SSI STATUS command if the XCF facility was requested in the NMSSI JCL parameters. It indicates that the XCF facility is active, and provides the XCF member name, group name, and XCF token

System Action:

None.

User Action:

None.

NXSB10

ERROR OBTAINING STORAGE FOR XCF INTERFACE

Reason:

This message is issued during NMSSI initialization if an error occurs while initializing the XCF interface. NMSSI was unable to obtain storage needed to initialize the XCF interface.

System Action:

NMSSI terminates.

User Action:

Check the amount of storage available to the NMSSI region and increase it if possible.

NXSB11**IXCJOIN FAILURE RC=rrrr R0=xxxxxxxx****Reason:**

This message is issued during NMSSI initialization if an error occurs while attempting to connect to XCF (using the IXCJOIN macro). The return code and reason code (R0) are displayed.

System Action:

NMSSI terminates.

User Action:

Check the return and reason codes in the *MVS/ESA Sysplex Services Reference* guide (the IXCJOIN macro) and correct the problem if possible. If not, contact Technical Support.

NXSB20**XCF STATISTICS FOLLOW...****Reason:**

This message is issued by the SHOW SSISTATS command if the XCF facility was requested in the NMSSI JCL parameters. It indicates that XCF statistical information follows.

System Action:

None.

User Action:

None.

NXSB21**MEMBER NAME BUF-SENT BYT-SENT BUF-RCVD BYT-RCVD****Reason:**

This message is issued by the SHOW SSISTATS command if the XCF facility was requested in the NMSSI JCL parameters. It provides column headings for the following NXSB22 messages.

Columns are:

MEMBER NAME The XCF member name of a member in the group

BUF-SENT The number of data buffers sent to the member

BYT-SENT The total number of bytes sent to the member

BUF-RCVD The number of data buffers received from the member

BYT- RCVD the total number of bytes received from the member

System Action:

None.

User Action:

None.

NXSB22**MEMBER-NAME BUF-SENT BYT-SENT BUF-RCVD BYT-RCVD****Reason:**

This message is issued by the SHOW SSISTATS command if the XCF facility was requested in the NMSSI JCL parameters. It provides information about an XCF member in the same group as this NMSSI region.

Refer to message NXSB21 for column meanings.

System Action:

None.

User Action:

None.

NXSB23**POOLTYPE ELT-SIZE FRM-POOL GETMAIN****Reason:**

This message is issued by the SHOW SSISTATS command if the XCF facility was requested in the NMSSI JCL parameters. It provides column headings for the following NXSB23 messages.

Columns are:

POOLTYPE The type of storage pool being described

ELT-SIZE The size of elements in the pool

FRM-POOL The number of satisfied requests for elements from the pool

GETMAIN The number of requests for elements that had to be getmained as the pool was empty

System Action:

None.

User Action:

None.

NXSB24**POOLTYPE ELT-SIZE FROM-POOL GETMAIN****Reason:**

This message is issued by the SHOW SSISTATS command if the XCF facility was requested in the NMSSI JCL parameters. It provides information about XCF-related storage pools.

Refer to message NXSB23 for column headings.

System Action:

None.

User Action:

None.

NXSB25

#-EVENTS #-EV-LST #-MS-RCV #-MS-LST #-MS-SNT

Reason:

This message is issued by the SHOW SSISTATS command if the XCF facility was requested in the NMSSI JCL parameters. It provides column headings for the following NXSB26 message.

Columns are:

#-EVENTS The number of XCF events that were seen
#-EV-LST The number of XCF events lost due to storage shortages
#-MS-RCV The number of incoming messages that were seen
#-MS-LST The number of messages lost due to storage shortages
#-MS-SNT The number of outgoing messages sent

System Action:

None.

User Action:

None.

NXSB26

#-EVENTS #-EV-LST #-MS-RCV #-MS-LST #-MS-SNT

Reason:

This message is issued by the SHOW SSISTATS command if the XCF facility was requested in the NMSSI JCL parameters. It provides statistics about various XCF events and messages.

Refer to message NXSB25 for column meanings.

System Action:

None.

User Action:

None.

NXSD01**XCF ACTIVE, G=ggggggggg M=mmmmmmmm T=ttttttt****Reason:**

This message is issued by the SHOW SSIEPS command if the XCF facility was requested in the NMSSI JCL parameters. It indicates that the XCF facility is active, and provides the XCF member name, group name, and token.

System Action:

None.

User Action:

None.

NXSD10**MEMBER-NAME MEMBER-TOKEN ID SYSNAME F1 F2****Reason:**

This message is issued by the SHOW SSIEPS command if the XCF facility was requested in the NMSSI JCL parameters. It provides column headings for the following NXSD11 message(s).

The headings are:

MEMBER-NAME The XCF member name of a member of the same XCF group as this NMSSI region. (Normally the XCF member name is <sysname||ssid>.)

MEMBER-TOKEN The XCF member token of the member

ID The NMSSI-assigned internal id of this member

SYSNAME The system name this member is on

F1 Flags: 80 - if on, this is 'this' XCF member (ie us)

02 - if on, this member is 'dead'

01 - if on, this member has a different version of the NMSSI XCF code, and is not supported.

F2 Flags: 08 - if on, this member is of indeterminate status

System Action:

None.

User Action:

None.

NXSD11

MEMBER-NAME MEMBER-TOKEN ID SYSNAME F1 F2

Reason:

This message is issued by the SHOW SSIEPS command if the XCF facility was requested in the NMSSI JCL parameters. It provides details about each XCF member in the same XCF group.

Refer to message NXSD10 for column headings and descriptions.

System Action:

None.

User Action:

None.

NXSI01

SYSPLEX/ARM NOT AVAILABLE - NOT AT LEAST MVS/ESA 5.2

Reason:

This message is issued during NMSSI initialization if the ARM facility is activated and the MVS/ESA level is not at least 5.2. This is because the ARM (Automatic Restart Manager) component of MVS/ESA first appeared in MVS/ESA 5.2.

System Action:

NMSSI processing continues; however, the ARM facility is not available.

User Action:

Upgrade MVS/ESA to at least version 5.2.

NXSJ01**ARM REGISTRATION SUCCESSFUL, ELEMENT NAME IS *elementname*****Reason:**

This message is issued during NMSSI initialization if the ARM facility is activated. It indicates that a successful registration with ARM (Automatic Restart Manager) has occurred. The ARM element name is also displayed. (The default name if not changed in the JCL parms is SVS_*sysnamessid*.)

System Action:

NMSSI processing continues, with possible restarts under ARM control.

User Action:

None.

NXSJ02**ARM WAITPRED SUCCESSFUL****Reason:**

This message is issued during NMSSI initialization if the ARM facility is activated. It indicates that a successful WAITPRED request to ARM (Automatic Restart Manager) occurred.

System Action:

NMSSI processing continues, with possible restarts under ARM control.

User Action:

None.

NXSJ03**ARM READY SUCCESSFUL****Reason:**

This message is issued during NMSSI initialization if the ARM facility is activated. It indicates that a successful READY request to ARM (Automatic Restart Manager) occurred.

System Action:

NMSSI processing continues, with possible restarts under ARM control.

User Action:

None.

NXSJ04

ARM DEREGISTER SUCCESSFUL

Reason:

This message is issued during NMSSI termination if the ARM facility is activated. It indicates that a NMSSI has deregistered from ARM (Automatic Restart Manager).

System Action:

NMSSI continues termination. ARM will not restart NMSSI.

User Action:

None.

NXSJ90

ARM FAILURE, FUNCTION=func, RC=rc (DEC), R0=r0 (HEX)

Reason:

This message is issued during NMSSI processing if the ARM facility is requested. It indicates that an error occurred during processing of an ARM (Automatic Restart Manager) request. The return code and reason code (R0) are displayed.

System Action:

Processing continues. However, ARM services will not be used.

User Action:

Examine the return and reason codes and determine the appropriate action. Explanations for the return and reason codes are in the MVS/ESA Version 5 Sysplex Services References manual in the section on the IXCARM macro.

NXSK01

**ARM STATUS IS status (restarted), ELEMNAME=elemname,
ELEMTYPE=elemtype**

Reason:

This message is issued by the SSI STATUS command if the ARM facility was requested in the NMSSI JCL parameters. It indicates the current status of the ARM connection and shows the element name and element type that NMSSI is known to ARM by.

System Action:

None.

User Action:

None.

NXSK02

**ARM REQUEST=request FAILED, RC=rc (D), R0=r0 (X),
ELEMNAME=elemname**

Reason:

This message is issued by the SSI STATUS command if the ARM facility is requested. It indicates that an error occurred during processing of an ARM (Automatic Restart Manager) request. The request in error, the return code, and reason code (R0) are displayed, as well as the element name that was used.

System Action:

None.

User Action:

Examine the return and reason codes and determine the appropriate action. Explanations for the return and reason codes are in the MVS/ESA Version 5 Sysplex Services References manual in the section on the IXCARM macro.

NY1101

Connection to local router refused - terminating

Reason:

An attempt to connect to the local router was refused.

System Action:

The XAPI one-shot backend exit terminates, since this is a system error.

User Action:

Investigate any previous messages from the local router.

NY1102

Short on storage - terminating

Reason:

An attempt to acquire storage by the one-shot XAPI backend exit failed.

System Action:

The XAPI one-shot backend exit terminates, since this is a system error.

User Action:

Increase the size of the region running SSI.

NY1103

EPS connect to local router failed with RC=XX - terminating

Reason:

An attempt to connect to the local router failed.

System Action:

The XAPI one-shot backend exit terminates, since this is a system error.

User Action:

Investigate the return code in the message.

NY1104**EPS send to lcoal router failed with RC=XX - terminating****Reason:**

An attempt to send data to the local router failed.

System Action:

The XAPI one-shot backend exit terminates, since this is a system error.

User Action:

Investigate the return code in the message.

NY1105**Structure of supplied vectors invalid****Reason:**

The structure of the MDO supplied to the XAPI one-shot interface is invalid.

System Action:

The message is ignored.

User Action:

This is an error in the user exit issuing the XAPI call. Verify the MDO structure being sent.

NY3001**SMF Exits registered successfully****Reason:**

SOLVESSI SMF Exit registration was successful.

System Action:

SOLVESSI initialization continues.

User Action:

None.

NY3002

SMF Exits registered already

Reason:

The current execution of SOLVESSI SMF Exit registration detected that SMF Exits are already registered. A previous run of SOLVESSI registered the exits.

System Action:

SOLVESSI initialization continues.

User Action:

None.

NY3003

Required SAB not found

Reason:

The expected System Anchor Block was not found. This should not happen, because the SAB should have been created in an earlier stages of the SOLVESSI processing.

System Action:

SOLVESSI initialization terminates.

User Action:

Check whether the SOLVESSI log contains any previous messages related to SAB creation or any other abnormal situations. If the problem persists, contact Technical Support.

NY3004**GETMAIN Failed, CTLBLK= P1****Reason:**

Obtaining storage for SMF control block *P1* failed. Normally, this should not happen unless the system has a serious storage constrain.

P1 describes the control block for which GETMAIN failed:

SMFQ - Reply area for CAISMFQ function.

SMCT - SMF Master Control Table.

SMCU - 512 bytes for the SMCT migration.

System Action:

SOLVESSI initialization continues and depending on *P1* , the following occurs:
SMFQ (SP0) - SMF registration terminates. SMCT (CSA) - SMF registration terminates. SMCU (CSA) - SMCT upgrade terminates; SMF registration continues.

User Action:

Ensure there is a memory shortage. If so, resolve the shortage and restart SOLVESSI. CSA storage shortage is normally accompanied by relevant messages issued to the system console. If the problem persists, contact Technical Support.

NY3005**Required SMF support not found****Reason:**

At least one of the NetMaster modules corresponding to SMF IEF83, IEF84, IEF85, or common code was not found in the searched link libraries. This may indicate incomplete installation and/or customization of NetMaster SMF support.

System Action:

SOLVESSI initialization continues.

User Action:

Check whether the library containing Y7FU83, Y7FU84, Y7FU85, and SOLVESSI SMF modules is available for the SOLVESSI task. If it is not available, correct the situation.

NY3006

#SMFI Failed, RC= P1, EXIT= P2

Reason:

An attempt to register SMF exit *P2* failed with return code *P1* . This situation may indicate that exits are already registered and enabled (RC=4), or there is a more serious reason, for example, CSA shortage, load errors, or incomplete installation of CA Common Services.

RC=4 can be considered normal, although it may indicate incomplete SMF control block creation. It may happen during consecutive SOLVE SSI starts after a system IPL.

System Action:

SOLVESSI initialization continues.

User Action:

If *P1* is higher than 4, ensure CA Common Services is installed and active, using the following return codes as guidelines:

08 - Unable to load requested module, product not installed: Check if CA Common Services is installed correctly and it is the required level, minimum 0300. Check for other CA Common Services related messages in the SSI or system log. Contact your System Programmer for assistance.

12 - Environmental error (no CSA, LOAD error, and so on): Check for the case of the system resources shortage, load library errors. This situation may be accompanied by CA Common Services induced messages and dumps. Check system log. Contact your System Programmer for assistance.

16 - Invalid parameter list: Internal coding error, contact Technical Support. If the problem persists, contact Technical Support.

NY3007

SMF exit(s) registration failed

Reason:

One or more SMF exit registrations failed.

System Action:

SOLVESSI initialization continues.

User Action:

Check for the occurrence of NY3006 for more details.

NY3008**CA Common Services not available****Reason:**

The required CA Common Services environment (CAS9) was not established. This indicates either that TNGFW was not properly installed/customized and/or that CAS9 was not started.

System Action:

SOLVESSI initialization continues.

User Action:

Check for the reasons why CA Common Services was not started, fix the problem, and restart SOLVESSI.

NY3009**CA Common Services module(s) missing****Reason:**

An attempt to use one of dynamic CA Common Services SMF functions failed due to one or more load modules missing. This normally indicates problems with accessing the CA Common Services library.

System Action:

SOLVESSI initialization continues.

User Action:

Check the availability to SOLVESSI (link list/STEPLIB) of the library containing TNG Framework SMF functions. Fix the problem and restart SOLVESSI.

NY3010

SMF processing disabled; registration aborted

Reason:

SOLVESSI SMF exit registration function detected that SMF processing was disabled.

System Action:

SOLVESSI initialization continues.

User Action:

Check the reasons for SMF processing disablement. Enable and restart SMF processing, if necessary.

NY3011

#SMFQ failed; registration aborted

Reason:

The TNG Framework #SMFQ function returned unexpected results. This may indicate incomplete installation of TNG Framework.

System Action:

SOLVESSI initialization continues.

User Action:

Check for previous problems with TNG Framework. Fix them and then restart SOLVESSI. If the problem persists, contact Technical Support.

NY3012

CA Common Services requires OS390 2.5 or above

Reason:

An attempt was made to activate CA Common Services for dynamic SMF Exit code registration, but the operating system is not IBM OS/390 V2R5 or above.

System Action:

SOLVESSI initialization continues; SMF exit registration is terminated.

User Action:

Make sure to run dynamic SMF registration on IBM OS/390 V2R5 or above.

NY3013**SMF record=119 requires ZOS 1.2 or above****Reason:**

An attempt was made to activate NetMaster collection of IBM TCP/IP SMF record 119 (x'77), but the operating system is not IBM z/OS V1R2 or above.

System Action:

SOLVESSI initialization continues, but no SMF records will be collected.

User Action:

Change to collecting SMF record 118 (x'76') or upgrade to z/OS V1R2 or above.

NY3014**Unable to release common code storage****Reason:**

SSI reload of SMF exits common code detected that it was not able to remove a previous copy of the code from memory. This indicates that common code is still in use by another exit code. Common code storage release will be attempted on the return from the last active copy of this code.

System Action:

SOLVESSI initialization continues, and the next copy of the common code is loaded into memory.

User Action:

None.

NY3015**SMF exits registration failed****Reason:**

SSI SMF exits registration failed.

System Action:

SOLVESSI initialization continues.

User Action:

Check the SSI log for a more detailed explanation and proceed according to the messages logged there.

NY3016

CA Common Services level lower than expected, *P1*

Reason:

The SSI detected that the level of CA Common Services *P1* is lower than required to ensure the correct registration of SMF exits. It may indicate that some exits, typically Y7FU85, may not function correctly. If *P1* is 000000, it indicates that the CAS9GLVL module holding the release information does not conform to the expected format. It may indicate that the CA Common Services used is not current. It may indicate that an old version of the CA Common Services library is specified in LNKLST or JOBLIB, or STEPLIB before the most current version.

System Action:

SOLVESSI initialization continues.

User Action:

Use the command SSI STATUS to see the CA Common Services level (look for message NY3116 CA COMMON SERVICES LEVEL DETECTED=*nnnnnn*).

Install the latest service pack of CA Common Services for z/OS.

Ask your systems programmer to verify LNKLST specifications.

Review the SSI JCL to check for JOBLIB/STEPLIB-specified CA Common Services library.

NY3017

NetMaster SMF exits may not function properly

Reason:

This is the continuation of message NY3016, see its explanation for more details.

System Action:

SOLVESSI initialization continues.

User Action:

See message NY3016.

NY3018**#SMFQ function unavailable****Reason:**

SSI start detected that the CA Common Services CAISMFQ function was not available.

System Action:

SOLVESSI initialization continues.

User Action:

See message NY3016.

NY3019**SMF errors detected, exit=*P1*****Reason:**

The SSI detected that the SMF exit code cannot proceed with SMF data processing because it has detected an incomplete control block environment. *P1* is the name of the exit that detected the error.

System Action:

SOLVESSI initialization continues.

No SMF data is processed by SMF exits until the situation is rectified.

User Action:

Check the SSI log for error messages. Generally, it indicates that the SMF exit code was started before the environment was created by the SSI. The actual starting of the SSI may have rectified the situation.

For information about how to get diagnostics on SMF exit configuration, contact Technical Support.

NY3020

SMCT errors detected, exit=*P1*

Reason:

The SSI detected that SMF exit code cannot proceed with SMF data processing as a result of detecting an incomplete control block environment. *P1* is the name of the exit that detected the error.

System Action:

SOLVESSI initialization continues.

No SMF data is processed by SMF exits until the situation is rectified.

User Action:

Check the SSI log for error messages. Generally, it indicates that the SMF exits code was started before the environment was created by the SSI. It may also indicate that SSI detected an incomplete version (lack of CAISMFQ) of CA Common Services. The actual starting of the SSI may have rectified the situation.

For information about how to get diagnostics on SMF exit configuration, contact Technical Support.

NY3021

Common Code errors detected, EXIT=*P1*

Reason:

The SSI detected that SMF exit code cannot proceed with SMF data processing because it has detected an incomplete environment. *P1* is the name of the exit that detected the error.

System Action:

SOLVESSI initialization continues.

No SMF data is processed by SMF exits until the situation is rectified.

User Action:

Check the SSI log for error messages. Generally, it indicates that the SMF exit code was started before the environment was created by the SSI. It indicates that the SMF exits common code module (SOLVESSISMF) was not loaded. The actual starting of the SSI may rectify the situation.

For information about how to get diagnostics on SMF exit configuration, contact Technical Support.

NY3022**SA Getmain failed, EXIT= P1****Reason:**

The *P1* exit cannot obtain dynamic storage for the save area. The message reports incidents that happened before the SSI was started. They may still be happening. The private storage shortage in the SMF exit caller (IBM stack normally) may prevent SMF record processing.

System Action:

None.

User Action:

Investigate, and correct possible private storage shortage in the running IBM stacks.

NY3023**Older version of SMF Exits detected****Reason:**

The SSI SMF Management detected that the SMF Exits Common Code version is too low for this version of SSI.

System Action:

SOLVESSI initialization terminates. No SMF-related function, including SMF support of SSI commands, will be performed by this instance of the SSI.

User Action:

Review the contents of the SSI load library.

NY3104

Getmain failed, reason= P1

Reason:

Obtaining storage for SMF control blocks failed with reason code *P1* . This should not normally happen unless the system has a serious memory shortage.

System Action:

SOLVESSI initialization continues.

User Action:

Check whether there is a memory shortage. If so, resolve the shortage and restart SOLVESSI. If the problem persists, contact Technical Support.

NY3109

CA Common Services module(a) missing

Reason:

An attempt to use one of dynamic CA Common Services functions failed due to one or more missing load modules. This normally indicates problems with accessing the CA Common Services library.

System Action:

SOLVESSI initialization continues.

User Action:

Check the availability to SOLVESSI (link list/STEPLIB) of the library containing CA Common Services SMF functions. Fix the problem and restart SOLVESSI.

NY3116

CA Common Services level detected= P1

Reason:

SSI reports the level of CA Common Services used as *P1* .

System Action:

None.

User Action:

None.

NY3117**NetMaster SMF Exits may not function properly****Reason:**

This is the continuation of message NY3016, see its explanation for details.

System Action:

SOLVESSI initialization continues.

User Action:

See message NY3016.

NY3120**SMF Information****Reason:**

This is the first message issued as a reply to the *SSI STATUS* command.

System Action:

None.

User Action:

None.

NY3121**SMF Processing P1****Reason:**

This message indicates the current status of SMF processing. P1 can be ENABLED or DISABLED .

System Action:

None.

User Action:

None.

NY3123**SMF Exit Information****Reason:**

This message indicates that SMF exit information follows. *P1* is the number of entries received. *P2* is the number of entries requested.

System Action:

None.

User Action:

None.

NY3124**P1 P2 P3 P4 P5 P6 P7 P8****Reason:**

This message, repeated for each NetMaster SMF exit found, provides the following information:

P1 is the Load Module Name.

P2 is the name of the Job/Started Task which registered the Exit.

P3 is the date of the registration in yyyyymmdd format.

P4 is the time of the registration in hhmmsshh format.

P5 is the Attributes1 byte: 1... This entry is enabled. .1.. This entry has abended. ..1. Call test program on first call. ...1 Disable entry onabend. 1... Take SVC dump onabend.1.. (unused)1. (unused)1 (unused) Note: A normal situation is indicated by: 98 - for SMF processing enabled 18 - for SMF processing disabled

P6 is the entry point address of the Exit code stub.

P7 is the number of processed SMF records received by the Exit.

P8 is the number of processed SMF records for which the Exit sent the write request to SMF. Note: These are indicative fields only, in hexadecimal format for brevity. They help in verifying if any SMF records are actually flowing through the interface.

System Action:

None.

User Action:

None.

NY3125**P1 P2 P3 P4 P5 P6****Reason:**

This message, repeated for each NetMaster SMF Exit found, and issued when #SMFQ failed, provides the following information:

P1 is the Load Module Name.

P2 is the name of the Job/Started Task which registered the Exit.

P3 is the date of the registration in yyyyymmdd format.

P4 is the time of the registration in hhmmsshh format.

P5 is the number of processed SMF records received by the Exit.

P6 is the number of processed SMF records for which the Exit sent the write request to SMF. Note: These are indicative fields only, in hexadecimal format for brevity. They help in verifying if any SMF records are actually flowing through the interface.

System Action:

None.

User Action:

None.

NY3126**P1 P2 P3 P4****Reason:**

This message, repeated for each NetMaster SMF Exit found, and issued when the SAB chain walk fails, provides the following information:

P1 is the Load Module Name.

P2 is the product version number.

P3 is the Attributes1 byte (see message NY3124 for details).

P4 is the entry point address of the Exit code stub.

System Action:

None.

User Action:

None.

NY3127

**EXIT_NME REG_JOB REG_DATE REG_TIME AT EP RECV_REC
WRTN_REC**

Reason:

This is a header message, followed by either NY3124 or NY3125, which provides information about the following messages (in tabulated form):

EXIT_NME - Load module name of the SMF exit

REG_JOB - Name of the Job/STC that registered the exit last

REG_DATE - Registration date in the format : YYYYMMDD

REG_TIME - Registration time in the format : HHMM

AT - CA Common Services attributes in hexadecimal

EP - SMF Exit entry point address in hexadecimal

RECV-REC - Number of received SMF records in hexadecimal

WRTN-REC - Number of SMF records returned to SMF (in hexadecimal) with write request

System Action:

None.

User Action:

None.

NY3128

CSVER VERSION PTF_LVL CMP_DATE CMP_TIME REJT_REC

Reason:

This second header message provides information about consecutive NY3137 messages in the tabulated form of the SMF Exit modules information.

CSVER - CA Common Services Exit version in the format :

PPVV VERSION - Delivery level in the format : VVRR

PTF_LVL - PTF level of the module in the format : Z99999

CMP_DATE - Compilation time date in the format : YYYYMMDD

CMP_TIME - Compilation time in the format : HHMM

REJT_REC - Number of SMF records rejected (failed validity check) by the SMF exit

System Action:

None.

User Action:

None.

NY3129**End of SMF Information, listed exits *P1* out of *P2* required****Reason:**

This is the last message issued as a reply to the SSI STATUS command. It summarizes the query results, providing the number of entries returned by query (*P1*) and the number of required entries (*P2*).

A discrepancy between *P1* and *P2* indicates that there may be older versions of SMF exits registered or remaining in the exit lists. It is normal when migration from older versions is performed without an IPL of the operating system. All old and new SMF exits registered and deregistered are listed in this situation.

System Action:

None.

User Action:

No action is required unless *P1* and *P2* provide different values.

List this region's configuration details (/IPTEST), and investigate any errors.

For information about how to get diagnostics on SMF exit configuration, contact Technical Support.

NY3130**SAB not found****Reason:**

This message indicates that the System Anchor Block has not been found.

System Action:

None.

User Action:

None.

NY3131

SMFS not formatted

Reason:

This message indicates that the SMF Slot (Slot 2 in SAB) has not been found or that its formatting has not been finished.

System Action:

None.

User Action:

None.

NY3132

SMCT not found

Reason:

This message indicates that the SMF Control Table has not been found.

System Action:

None.

User Action:

None.

NY3133

SMCT not formatted

Reason:

This message indicates that the SMF Control Table formatting has not been finished.

System Action:

None.

User Action:

None.

NY3134**TNGFW not enabled****Reason:**

This message indicates that TNG FrameWork (CAS9) has not been run.

System Action:

None.

User Action:

None.

NY3135**#SMFQ failed, RC= P1****Reason:**

This message indicates that the TNGFW SMF Query function returned an error. *P1* is the error code.

System Action:

None.

User Action:

None.

NY3136

#SMFQ Function unavailable

Reason:

This message indicates that the CA Common Services (TNGFW) SMF Query Query function (CAISMFQ) is not available to SSI. Generally, it indicates that the installed version of CA Common Services is not at the minimum required level of SP3.

System Action:

None.

User Action:

Contact your system programmer to check the installation of the CA Common Services software.

Use the command SSI STATUS to determine the CA Common Services level (look for message NY3116 CA COMMON SERVICES LEVEL DETECTED=*nnnnnn*).

Install the latest service pack of CA Common Services for z/OS.

Ask your systems programmer to verify LNKLST specifications.

Review the SSI JCL to check for JOBLIB/STEPLIB-specified CA Common Services library.

NY3137

P1 P2 P3 P4 P5 P6

Reason:

This message, repeated for each SMF exit found, provides the following information:

P1 is the CA Common Services registered SMF exit version string.

P2 is the delivery level.

P3 is the PTF level.

P4 is the compilation date.

P5 is the compilation time.

P6 is the rejected record count.

System Action:

None.

User Action:

None.

NY3138

**Common Code EP= P1 VER= P2 PTF_LVL= P3 CMP_DATE= P4
CMP_TIME= P5**

Reason:

This message, issued for the SMF exits common code, provides the location and currency of the load module:

P1 is the load module entry point.

P2 is the delivery level in the format of : VVRR

P3 is the PTF level of the module in the format of : Z99999

P4 is the compilation time date in the format of : YYYYMMDD

P5 is the compilation time in the format of : HHMM

System Action:

None.

User Action:

None.

NY3201

CA Common Services query service active, name= P1

Reason:

In response to the *ssi status* command, this message indicates that the CA Common Services Query service EPS receiver is active. *P1* is the receiver name.

System Action:

None.

User Action:

None.

NY3202

CA Common Services query EPS registration failed, RC= P1

Reason:

Registration of the CA Common Services query service EPS receiver failed with return code *P1* .

System Action:

SOLVESSI initialization continues.

User Action:

Restart SOLVESSI. If the problem persists, contact Technical Support.

NY3501

SMF command function missing

Reason:

The SOLVESSI SMF command processor detected that the mandatory function code describing the function to perform is missing.

System Action:

SOLVESSI SMF command processing terminates.

User Action:

Check valid SOLVESSI SMF function codes and re-enter the command.

NY3502

SMF command function invalid

Reason:

The SOLVESSI SMF command processor detected that the function code describing the function to perform is invalid.

System Action:

SOLVESSI SMF command processing terminates.

User Action:

Check valid SOLVESSI SMF function codes and re-enter the command.

NY3503**SMF command function argument invalid: P1****Reason:**

SOLVESSI SMF command processor detected that the function code argument *P1* for the function to perform is invalid. This may indicate that the argument type is not compatible with the function (not a valid hexadecimal number) or that it is of the wrong length.

System Action:

SOLVESSI SMF command processing terminates.

User Action:

Check valid arguments for the function of the SOLVESSI SMF command and re-enter correct command.

NY3510**Required SAB not found****Reason:**

The expected System Anchor Block cannot be found. This should not happen because the SAB should be created in earlier stages of SOLVESSI processing.

System Action:

SOLVESSI processing continues.

User Action:

Check if the SOLVESSI log contains any previous messages related to SAB creation or any other abnormal situations. If you are unable to resolve the problem, contact Technical Support.

NY3511

Required SMCT not found

Reason:

The expected SMF Control Table cannot be found. This should not happen because the SMCT should be created in earlier stages of SOLVESSI processing.

System Action:

SOLVESSI processing continues.

User Action:

Check if the SOLVESSI log contains any previous messages related to SMCT creation or any other abnormal situations. If you are unable to resolve the problem, contact Technical Support.

NY3520

SMF exits deregistered successfully

Reason:

The SOLVESSI SMF Deregister command completed without errors. All previously registered SMF exits were deregistered.

System Action:

None.

User Action:

None.

NY3521

SMF Exit deregistration failed, RC= *P1*, EXIT= *P2*

Reason:

An attempt to deregister SMF exit *P2* failed with return code *P1*. This may indicate an internal CA NetMaster or CA Common Services error.

System Action:

SOLVESSI processing continues.

User Action:

If *P1* is higher than 4, ensure CA Common Services is installed and active, and then check for such things as a shortage of system resources. If the problem persists, contact Technical Support.

NY3522**SMF exits deregistered already****Reason:**

The current execution of SOLVESSI SMF exit deregistration detected that SMF exits are already deregistered.

System Action:

None.

User Action:

None.

NY3530**SMF debugging flags set****Reason:**

The SOLVESSI SMF DEBUG command has completed setting debug flags.

System Action:

None.

User Action:

None.

NY3702**Required SMF support not found****Reason:**

At least one of the modules corresponding to SMF IEF83, IEF84, IEF85, or common code cannot be found in the searched link libraries. This may indicate in complete installation and customization of SMF support.

System Action:

SOLVESSI initialization continues.

User Action:

Check whether the library containing Y7FU83, Y7FU84, Y7FU85, and SOLVESSI SMF modules is available for the SOLVESSI task. If it is not available, correct the situation.

NY3703

Required SAB not found

Reason:

The expected System Anchor Block cannot be found. This should not happen because the SAB should be created in earlier stages of SOLVESSI processing.

System Action:

SOLVESSI processing continues.

User Action:

Check if the SOLVESSI log contains any previous messages related to SAB creation or any other abnormal situations. If you are unable to resolve the problem, contact Technical Support.

NY3704

Required SMCT not found

Reason:

The expected SMF Control Table cannot be found. This should not happen because the SMCT should be created in earlier stages of SOLVESSI processing.

System Action:

SOLVESSI processing continues.

User Action:

Check if the SOLVESSI log contains any previous messages related to SMCT creation or any other abnormal situations. If you are unable to resolve the problem, contact Technical Support.

NY3706**GETMAIN Failed, CTLBLK= P1****Reason:**

Obtaining storage for SMF control block *P1* failed. Normally, this should not happen unless the system has a serious storage constrain.

P1 describes the control block for which GETMAIN failed: SMFQ - Reply area for CAISMFQ function. SMCT - SMF Master Control Table. SMCU - 512 bytes for the SMCT migration.

System Action:

SOLVESSI initialization continues; depending on *P1* , the following occurs: SMFQ (SP0) - SMF registration terminates. SMCT (CSA) - SMF registration terminates. SMCU (CSA) - SMCT upgrade terminate; SMF registration continues.

User Action:

Check whether there is a memory shortage. If so, resolve the shortage and restart SOLVESSI. CSA storage shortage is normally accompanied by relevant messages issued to the system console. If the problem persists, contact Technical Support.

NY3707**#SMFI Failed, RC= P1, EXIT= P2****Reason:**

An attempt to register SMF exit *P2* failed with return code *P1*. This may indicate that exits are already registered and enabled (RC=4), or there may be more serious reasons, such as CSA shortage, load errors, or incomplete installation of CA Common Services.

RC=4 can be considered normal, although it may indicate incomplete SMF control block creation. It may happen during consecutive SOLVESSI starts after a system IPL.

System Action:

SOLVESSI initialization continues.

User Action:

If *P1* is higher than 4, ensure CA Common Services is installed and active, using the following return codes as the guidelines:

08 - Unable to load requested module, product not installed:

- Check that the load library is not PDSE.
- Check that CA Common Services is installed properly and that it is at the latest level.
- Check for other CA Common Services related messages in the SSI or system log.
- Contact your System Programmer for assistance.

12 - Environmental error (no CSA, LOAD error, and so on):

- Check for the case of the system resources shortage, load library errors. This situation may be accompanied by CA Common Services induced messages and dumps.
- Check system log.
- Contact your System Programmer for assistance.

16 - Invalid parameter list:

Internal coding error, contact Technical Support.

If the problem persists, contact Technical Support.

NY3708**#SMFQ failed, RC= P1****Reason:**

This message indicates that the CA Common Services SMF query function returned an error. *P1* is the error code.

System Action:

None.

User Action:

None.

NY3709**CA Common Services module(s) missing****Reason:**

An attempt to use one of dynamic CA Common Services SMF functions failed due to one or more load modules missing. This normally indicates problems with accessing the CA Common Services library.

System Action:

SOLVESSI initialization continues.

User Action:

Check the availability to SOLVESSI (link list/STEPLIB) of the library containing CA Common Services SMF functions. Fix the problem and restart the SOLVESSI.

NY3712

Unable to release common code storage

Reason:

SSI reload of SMF exits common code detected that it was not able to remove a previous copy of the code from memory. This indicates that common code is in use by another exit code. Common code storage release is attempted on the return from the last active copy of this code.

System Action:

SOLVESSI initialization continues and the next copy of the common code is loaded into memory.

User Action:

None.

NY3713

SMF exits registration failed

Reason:

One or more SMF exit registrations failed.

System Action:

SOLVESSI initialization continues.

User Action:

Check for the occurrence of NY3006 for more details.

NY3714

NetMaster SMF exits may not function properly

Reason:

This is the continuation of message NY3016; see its explanation for more information.

System Action:

SOLVESSI initialization continues.

User Action:

See message NY3016.

NY3720**SMF Exits registered successfully****Reason:**

SOLVESSI SMF exit registration was successful.

System Action:

SOLVESSI initialization continues.

User Action:

None.

NY3730**SMF Exits deregistered successfully****Reason:**

The SOLVESSI SMF Deregister command completed without errors. All previously registered SMF exits were deregistered.

System Action:

None.

User Action:

None.

NY3731**SMF Exit deregistration failed, RC= *P1*, EXIT= *P2*****Reason:**

An attempt to deregister SMF exit *P2* failed with return code *P1*. This may indicate an internal CA NetMaster or CA Common Services error.

System Action:

SOLVESSI processing continues.

User Action:

If *P1* is higher than 4, ensure CA Common Services is installed and active, and then check for such things as a shortage of system resources. If the problem persists, contact Technical Support.

NY3732

SMF exits deregistered already

Reason:

The current execution of SOLVESSI SMF exit deregistration detected that SMF exits are already deregistered.

System Action:

None.

User Action:

None.

NY3901

SMF facility initialization failed - P1**Reason:**

The SMF facility front runner module terminated the SSI initialization due to the lack of one of the following prerequisites described by *P1*:

NOT SUPPORTED ON THIS OPERATING SYSTEM The operating system level detected is lower than the minimum required, which is OS/390 2.10.

SMF RECORD=119 REQUIRES ZOS ABOVE 1.2 Processing of SMF record number 119 is supported on z/OSlevel 1.2 and above only.

CA COMMON SERVICES NOT ACTIVE SSI detected that the Common Services code is not started.

This normally indicates problems with accessing the latest level of the CA Common Services library.

CA COMMON SERVICES INCOMPLETE OR REL LOW SSI detected that the CA Common Services library is incomplete or at a release lower than required.

REQUIRED SMF MODULES NOT FOUND SSI detected that required SMF support modules are not available. All of the following modules are required:

NMSSISMF - SMF Common Code Y7FU83 - SMF IEFU83 Exit Y7FU84 - SMF IEFU84 Exit Y7FU85 - SMF IEFU85 Exit

SMF MANAGEMENT ALREADY ACTIVE SSI SMF Management detected that another copy is already active. Only one copy is allowed to run at the same time.

System Action:

SOLVESSI initialization terminates.

User Action:

NOT SUPPORTED ON THIS OPERATING SYSTEM: Ensure that the operating system used is at a minimum level of S/390 V2R10.

SMF RECORD=119 REQUIRES ZOS ABOVE 1.2: Ensure that the operating system used is at a minimum level of z/OS v1 rel 2. SMF record 119 does not exist below this level. Change IPSMF specification to 118 or move to the required minimum level of the operating system.

CA COMMON SERVICES NOT ACTIVE: Check that the CAS9 job executed prior to SSI start.

CA COMMON SERVICES INCOMPLETE OR REL LOW Ensure that the CA Common Services library available to NMSSI using link list or STEPLIB contains the following modules:

CAISMFQ CAS9GLVL

REQUIRED SMF MODULES NOT FOUND: Ensure that the NMSSI STEPLIB definition lists the libraries that contain the required modules.

The expected SAB (System Anchor Block) was not found. This should not happen because SAB should be created in earlier stages of NMSSI processing.

SMF MANAGEMENT ALREADY ACTIVE: Ensure that only one copy of SSI controls SMF activities.

NY3902

SMF facility not initialized - P1

Reason:

SMF facility front runner module terminated due to the following reason described by *P1*:

IPSMF=NO User specified NO in SSI startup parameter IPSMF.

System Action:

SMF processing is not initialized for this SSI instance.

User Action:

IPSMF=NO Ensure that SMF support is not needed for this SSI instance.

NY3903**Unable to check CA Common Services level - P1****Reason:**

The SMF facility front runner module is unable to access CA Common Services level information. This message is related to the processing of the CACS version modules definition table, either standard or modified. This message is issued when no modules in the table match table-specified criteria only.

P1 is the reason:

NO CACS MODULES DEFINED The table does not define any CACS modules.

NO CACS VERSION TARGET The table contains errors.

TABLE SKIPPED Empty tables encountered.

VERSION OFFSET Version offset=0.

OFFSET GT MODLEN Version offset exceeds loaded version load module length.

EYECATCHER Specified module fails eyecatcher check.

LOAD FAILED Unable to load the module specified by the table.

BLDL FAILED Unable to locate the module specified by the table.

System Action:

None.

User Action:

Contact Technical Support if you encounter the following:

NO CACS MODULES DEFINED

NO CACS VERSION TARGET

TABLE SKIPPED

VERSION OFFSET

OFFSET GT MODLEN

EYECATCHER

If you encounter LOAD FAILED or BLDL FAILED, verify the completeness and version of CA Common Services. If the current version is installed and available through LPALIB or LNKLST, contact Technical Support.

NY3904

Invalid format of CA Common Services table

Reason:

The SMF facility front runner module is unable to process the CA Common Services version definition table. This message relates to the processing of the CACS version modules definition table, either standard or modified.

System Action:

None.

User Action:

Contact Technical Support.

NY3905

Abend processing CA Common Services table

Reason:

The SMF facility front runner module failed processing the CA Common Services version definition table. This message relates to the processing of the CACS version modules definition table, either standard or modified.

System Action:

None.

User Action:

Contact Technical Support.

NY4001

SMF API is active - Records processed: P1

Reason:

This is part of the output resulting from an SSI STATUS command.

System Action:

Processing continues.

User Action:

None.

NY4002**Thread START failed - RC = P1****Reason:**

A THREAD START command failed with return code *P1*

System Action:

SSI STARTUP fails.

User Action:

Contact Technical Support.

NY4003**EPS Register failed - RC = P1****Reason:**

A call to register an EPS service failed with return code *P1*

System Action:

SSI STARTUP fails.

User Action:

Contact Technical Support.

NY4004**SMF API is active in another region****Reason:**

An instance of the SMF API is active in another region on an LPAR. Only one instance of the SMF API is allowed to run on each LPAR.

System Action:

SSI STARTUP fails.

User Action:

Locate and terminate the other SMF API SSI region and retry.

NY4005

Packet Analyzer is not allowed in the same region as SMF API

Reason:

Both PKTANALYZER=YES and IPSMFAPIREC=YES have been specified in the SSI startup parameters.

System Action:

SSI STARTUP fails.

User Action:

Remove one of the parameters from the SSI startup and retry.

NY4C01

UNIX call failure - Stack Name: *P1*, Call: *P2*, Errno: *P3*, Errnojr: *P4*

Reason:

A UNIX call *P2* to stack *P1* failed with errno *P3* and errnojr *P4*.

System Action:

The operation is retried every 30 seconds.

User Action:

For more information about the error, see IBM's *UNIX System Services Messages and Codes*.

NY4C02

Server terminated connection - Stack Name: *P1*, Term code: *P2*

Reason:

A UNIX server in stack *P1* terminated the connection with termination code *P2*.

System Action:

The operation is retried every 30 seconds.

User Action:

For more information about this error, see IBM's *UNIX System Services Messages and Codes*.

NY4C03**SMF records overwritten****Reason:**

The NMI server was unable to retrieve SMF records from the server before they were overwritten.

System Action:

Processing continues - SMF records are lost.

User Action:

Consider increasing the priority of the NMI SSI region.

NY4C05**Call to EZBTMIC1 failed - Stack Name: *P1*, Return Value=*P2*****Reason:**

A call to retrieve records from server *P1* failed with return value *P2*.

System Action:

Processing continues—the records are lost.

User Action:

For more information about this error, see IBM's *Communications Server IP Programmer's Guide and Reference*.

NY4C06**Service *P1* not enabled on stack *P2*, Errno: *P3*, Errnojr: *P4*****Reason:**

The *P1* service is not enabled on the *P2* stack. Because more than one ErrnoJr may cause this message, the errno and ErrnoJr are included in the message.

System Action:

The operation is retried every 30 seconds.

User Action:

Add the NETMONITOR configuration statement to the stack's PROFILE.

NY4C07

Region not permitted to connect to *P1* service on stack *P2*

Reason:

The user ID associated with the region is not authorized to connect to the *P1* service on the *P2* stack.

System Action:

The operation is retried every 30 seconds.

User Action:

Ask your security administrator to provide the necessary authorization for the user ID associated with the region to access the Network Management API.

NY4C08

CREATE SOCKET call failure - Stack Name: *P1*, Errno: *P2*, Errnojr: *P3*

Reason:

A CREATE SOCKET call made to stack *P1* failed with errno *P2* and errnojr *P3*.

System Action:

The region terminates with the following message:

NS9501 NMSSI ABEND N-Y4S-03...

User Action:

For more information about this error, see IBM's *UNIX System Services Messages and Codes*.

NY4K01

\$NMXEVT failed - R15: *P1*, R0: *P2*

Reason:

A call to \$NMXEVT failed with R15= *P1* and R0= *P2*

System Action:

Processing continues.

User Action:

Contact Technical Support.

NY7101**FXTB present****Reason:**

FTP Exit Control Table was created or was already present.

System Action:

None.

User Action:

None.

NY7109**FXTB Creation failed, Reason=*P1*****Reason:**

NMSSI initialization encountered errors during FTP Exit Control Table (FXTB) creation.

P1 is the reason code returned by the creation module:

08-FXTB is being created by another task.

12-SAB does not exist.

16-SAB location error.

20-Bad control blocks.

24-Private storage shortage.

System Action:

None.

User Action:

Depends on the reason provided:

08-There is another task in the same LPAR creating FXTB. Rerun your program, if needed.

12-SAB was not created. Ensure that at least one NMSSI is started and repeat the task.

16-Internal error; contact Technical Support.

20-Internal error; contact Technical Support.

24-Private storage shortage; increase the region size. Contact Technical Support if the problem persists.

NY7201

FTPX command function missing

Reason:

The SOLVESSI FTPX command processor detected that the mandatory function code describing the function to perform is missing.

System Action:

SOLVESSI FTPX command processing terminates.

User Action:

Check valid SOLVESSI FTPX function codes and reenter the command.

NY7202

FTPX command function invalid

Reason:

The SOLVESSI FTPX command processor detected that the function code describing the function to perform is invalid.

System Action:

SOLVESSI FTPX command processing terminates.

User Action:

Check valid SOLVESSI FTPX function codes and reenter the command.

NY7203

FTPX command function argument invalid: *P1*

Reason:

The SOLVESSI FTPX command processor detected that the function code argument *P1* for the function to perform is invalid. This may indicate that the argument type is not compatible with the function (not a valid hexadecimal number) or that it is of the wrong length.

System Action:

SOLVESSI FTPX command processing terminates.

User Action:

Check valid arguments for the function of the SOLVESSI FTPX command and reenter the correct command.

NY7209**FTPX debugging flags set****Reason:**

The SOLVESSI FTPX DEBUG command has completed setting debug flags.

System Action:

None.

User Action:

None.

NY7210**Required SAB not found****Reason:**

The expected System Anchor Block cannot be found. This should not happen because the SAB should be created in earlier stages of SOLVESSI processing.

System Action:

SOLVESSI processing continues.

User Action:

Check if the SOLVESSI log contains any previous messages related to SAB creation or any other abnormal situations. If you are unable to resolve the problem, contact Technical Support.

NY7211**Required FXTB not found****Reason:**

The expected FTP Exit Control Table cannot be found. This should not happen because the FXTB should be created in earlier stages of SOLVESSI processing.

System Action:

SOLVESSI processing continues.

User Action:

Check if the SOLVESSI log contains any previous messages related to FXTB creation or any other abnormal situations. If you are unable to resolve the problem, contact Technical Support.

NY8001

Simple event service active, name=aaaa, listeners=bb, senders=cc

Reason:

This message is issued as a response to an SSI STATUS command and indicates that the simple event service is active. The EPS service name is displayed, as well as the current numbers of registered listeners and senders.

System Action:

None.

User Action:

None.

NY8010

Simple event service has aa listeners, bb events received, cc senders

Reason:

This message is issued as a response to a SHOW SSISTATS command and indicates that the simple event service is active. The number of listeners, events received, and senders is displayed.

System Action:

None.

User Action:

None.

NY8011**SYSNAME JOBNAME EVT-NAME MODE #-EV DESC....****Reason:**

This message is issued as a response to a SHOW SSISTATS command and provides column headings for the following NY8012 messages. The columns are:

SYSNAME The system name that the sender or receiver resides on JOBNAME The jobname for the sender or receiver EVT-NAME The event name that the sender or receiver has registered for MODE The mode: SEND or RECV #-EV The number of events sent to a receiver, or received from a sender DESC... The description supplied by the sender or receiver when connecting

System Action:

None.

User Action:

None.

NY8012**sysname jobname evt-name mode #-ev desc....****Reason:**

This message is issued as a response to a SHOW SSISTATS command and provides information about a simple event sender or receiver. Refer to message NY8011 for column descriptions.

System Action:

None.

User Action:

None.

NY8013

MASK

Reason:

This message is issued as a response to a SHOW SSISTATS command and provide a column heading for the following NY8014 messages. The column is: MASK The mask value that was passed on registration. The value is displayed in hex.

System Action:

None.

User Action:

None.

NY8014

mask

Reason:

This message is issued as a response to a SHOW SSISTATS command and provides information about a simple event sender or receiver. Refer to message NY8013 for column descriptions.

System Action:

None.

User Action:

None.

NY8090**XMS=NO OR XMS/ESAXMS NOT SUPPORTED, XEVNT UNAVAILABLE****Reason:**

This message is issued during NMSSI startup if the XEVNT=YES operand was specified, but either the XMS=NO operand was specified, or the current operating system does not support (ESA-style) cross-memory services.

System Action:

The SOLVESSI startup fails.

User Action:

Change any XMS=NO parameter in the startup parms to XMS=YES. If the operating system does not support MVS/ESA-style Cross-memory services, the XEVNT facility cannot be used.

NY8091**XAPI=NO, XEVNT unavailable****Reason:**

This message is issued during SOLVESSI startup if the XEVNT=YES operand was specified, but the XAPI=NO operand was specified.

System Action:

The SOLVESSI startup fails.

User Action:

Change any XAPI=NO operand in the startup parms to XAPI=YES.

NY8092

XEVNT ENQ FAILED

Reason:

This message is issued during SOLVESSI startup if the XEVNT=YES operand was specified, but the system ENQ for this failed. This means that another executing NMSSI region has XEVNT=YES specified.

System Action:

The SOLVESSI startup fails.

User Action:

Ensure that only one SOLVESSI region that executes concurrently has the XEVNT=YES operand specified.

NY8201

CONN TP=aaa SN=bbb JN=ccc NM=ddd MS=eee DE=fff

Reason:

This message is logged to the SOLVESSI log when a new connection to the Simple Event Sender occurs. The message shows information about the connector:

TP L (listener) or S (sender) SN The SYSNAME of the connector JN The JOBNAME of the connector NM The EVENT NAME supplied by the connector MS The first 4 bytes of the MASK supplied by the connector DE The description supplied by the connector

System Action:

None.

User Action:

None.

NY8202

DISC TP=aaa SN=bbb JN=ccc NM=ddd MS=eee DE=fff gggg

Reason:

This message is logged to the SOLVESSI log when a disconnection from the Simple Event Sender occurs. The message shows information about the connector:

TP L (listener) or S (sender) SN The SYSNAME of the connector JN The JOBNAME of the connector NM The EVENT NAME supplied by the connector MS The first 4 bytes of the MASK supplied by the connector DE The description supplied by the connector

If the disconnection of a sender occurs due to excessive errors, this is indicated by a suffix on the message.

System Action:

None.

User Action:

None.

NY8220**Invalid CONNTYPE value****Reason:**

This message is returned as the response to an EPS CONNECT request to the simple event router, when the connection MDO (mapped by \$NMSEVSM) CONNTYPE field has an invalid value.

System Action:

The EPS CONNECT is rejected.

User Action:

Correct the signon request MDO and retry.

NY8250

MDO FLD kkkk (nnnn) DUPLICATE, OFFSET oooo

Reason:

This message is returned as the response to an EPS CONNECT request to the simple event router, when the connection MDO (mapped by \$NMSEVSM) contains a duplicate field. The field key and name is shown, as well as the (hex) offset into the MDO of the length/key/data.

System Action:

The EPS CONNECT is REJECTed.

User Action:

Correct the signon request MDO and retry.

NY8251

MDO FLD kkkk (nnnn) TOO LONG, OFFSET oooo

Reason:

This message is returned as the response to an EPS CONNECT request to the simple event router, when the connection MDO (mapped by \$NMSEVSM) contains a field value that is too long. The field key and name is shown, as well as the (hex) offset into the MDO of the length/key/data.

System Action:

The EPS CONNECT is REJECTed.

User Action:

Correct the signon request MDO and retry.

NY8252**MDO STRUCTURE ERROR AT OFFSET 0000****Reason:**

This message is returned as the response to an EPS CONNECT request to the simple event router, when the connection MDO (mapped by \$NMSEVSM) has an internal structure error. The (hex) offset into the MDO where the problem was detected is shown.

System Action:

The EPS CONNECT is REJECTed.

User Action:

Correct the signon request MDO and retry.

NY8253**RQD MDO FLD kkkk (nnnn) NOT FOUND****Reason:**

This message is returned as the response to an EPS CONNECT request to the simple event router, when the connection MDO (mapped by \$NMSEVSM) is missing a required field. The field key and name is shown.

System Action:

The EPS CONNECT is REJECTed.

User Action:

Correct the signon request MDO and retry.

NY8254**MDO FLD kkkk (nnnn) invalid length (lll) offset 000****Reason:**

This message is returned as the response to an EPS CONNECT request to the simple event router, when the connection MDO (mapped by \$NMSEVSM) has a field with an invalid length. The field key and name is shown.

System Action:

The EPS CONNECT is rejected.

User Action:

Correct the signon request MDO and retry.

NZ8601

NMSSI ABEND ccc JN=jjjjjjj DT=yyyyddd TM=hhmmssth

Reason:

This message is written to the system console when a subtask engine instance ABENDs. The message contains the abend code, jobname, date and time of the abend.

System Action:

A formatted dump and system dump are taken. This message is followed by the NZ8602 and NZ8603 messages with additional information.

User Action:

Contact your support office with the details of the ABEND.

NZ8602

SRC=sss PRD=pp1 VRS=vvv PUT=pp2 ABC=ccc

Reason:

This message is written to the system console when a subtask engine instance ABENDs. It follows the NZ8601 message and contains information about the ABEND. The fields are:

SRC=sss - The source of the abend information. sss is either:

AB - meaning that the information in this and the NS9503 message was derived from the PSW and registers at the time of the abend, or SE - meaning that the information was derived from the registers and PSW from the region's primary RB

PRD=pp1 - The product name

VRS=vvv - The product version (for example, V4.1)

PUT=pp2 - The product PUT level

ABC=ccc - The ABEND code: S-xxx for a SYSTEM abend U-nnn for a user abend N-aaa-bb for an internal abend

System Action:

See message NZ8601.

User Action:

See message NZ8601.

NZ8603

ALM=aaa ALO=bbb ACS=ccc ACO=ddd LLM=eee LCS=fff

Reason:

This message is written to the system console when a subtask engine instance ABENDs. It follows the NZ8602 message and contains information about the ABEND. The fields are:

ALM=aaa - The ABEND load module

ALO=bbb - The offset within the ABEND load module

ACS=ccc - The ABEND CSECT, if it could be identified

ACO=ddd - The offset within the ABEND CSECT, if the CSECT could be identified

LLM=eee - The last apparent active load module

LCS=fff - The last apparent CSECT

System Action:

See message NZ8601.

User Action:

See message NZ8601.

OC0004**THE SPECIFIED COMMAND IS UNRECOGNIZED****Reason:**

The OCS command help system did not recognize the command you requested help for. This could be because the specified command does not exist or the command prefix you specified is not unique.

System Action:

None.

User Action:

Correct the command and retry. For a list of all valid commands, specify HELP as the command you wish to get help for.

OC0501

NETM NOT SUPPORTED ON THIS OPERATING SYSTEM

Reason:

An attempt has been made to start the NETM unsolicited messages receiver procedure, but the current operating system does not support NETM. NETM is supported only on the VOS3 operating system.

System Action:

The NETM message receiver procedure terminates.

User Action:

None.

OC0502

COLOR= PARAMETER IS INVALID

Reason:

The NETM unsolicited messages receiver procedure has been started with the COLOR= parameter specified. The value of the COLOR= parameter is invalid.

System Action:

The NETM message receiver procedure terminates.

User Action:

Correct the value of the COLOR= parameter and retry. The valid values are WHITE, RED, BLUE, GREEN, TURQUOISE, PINK or YELLOW

OC0504**EDS PROFILE NOT INITIALIZED - NO NETM MESSAGES CAN BE RECEIVED****Reason:**

The NETM unsolicited messages receiver procedure has been started but the attempt to establish the Event Distribution Services (EDS) profile required to receive NETM messages has failed.

System Action:

The NETM message receiver procedure terminates.

User Action:

The EDS profile is established using the PROFILE EDS command. The message returned in response to the PROFILE EDS command will be displayed immediately following message OC0504. Investigate the reason for the failure of the PROFILE EDS command.

PN0002**USERID P1 NOT AUTHORIZED FOR ADMINISTRATION FUNCTIONS****Reason:**

You attempted to access Administration functions, but you are not authorized.

System Action:

The request is rejected.

User Action:

Request authorization from your installation and retry the request.

PN0003

MENU/FUNCTION NOT SUPPORTED, MENU= P1 OPT= P2

Reason:

The MODS Panel Library Definition menu service procedure \$PNLM00M failed because it received a menu number (\$MHMENUNUM= P1) and/or function (\$MHOPT= P2) that it does not support.

System Action:

Procedure \$PNLM00M terminates.

User Action:

Contact your systems administrator. Ensure the installation has been performed as stated in the installation instructions, as the cause of the error may be due to incorrect installation.

PN0004

~P1 IS NOT ACTIVE ON THIS PANEL

Reason:

Function key P1 was pressed and it has no action assigned to it.

System Action:

None.

User Action:

None.

PN0005

PLEASE ENTER A SELECTION

Reason:

The ENTER key was pressed, but no option was selected.

System Action:

None.

User Action:

Select an option or press a function key to proceed.

PN0006**INVALID OPTION****Reason:**

An invalid selection was entered in the Select Option field.

System Action:

The cursor is placed in the field in error and the field is highlighted.

User Action:

Correct the option and retry.

PN0007**REQUIRED PARAMETER OMITTED****Reason:**

A field which is required for the option selected was omitted.

System Action:

The cursor is placed in the field in error and the field is highlighted.

User Action:

Enter a value in the required field and retry.

PN0008**LIBRARY IS NOT DEFINED****Reason:**

The library name entered on the panel copy menu is not defined to the system.

System Action:

The request is rejected.

User Action:

Enter a valid library name and retry.

PN0010

PANEL NAME INVALID

Reason:

An invalid name was entered where a panel name was required.

System Action:

The cursor is placed in the field in error and the field is highlighted.

User Action:

Correct and retry.

PN0013

OPTION MUST BE YES OR NO

Reason:

The only values allowed for the field are 'YES' and 'NO'.

System Action:

The cursor is placed in the field in error and the field is highlighted.

User Action:

Correct the field value and retry.

PN0014

'From' AND 'To' LIBRARIES MUST NOT BE THE SAME

Reason:

Panels may be copied from one library to another, but not into the same library.

System Action:

The cursor is placed in the field in error and the field is highlighted.

User Action:

Correct the library names and retry.

PN0015**'To' LIBRARY MUST HAVE WRITE ACCESS****Reason:**

Target library should be opened with write access.

System Action:

The cursor is placed in the field in error and the field is highlighted.

User Action:

Correct the target library access and retry.

PN0101**LIBRARY IS NOT DEFINED****Reason:**

The Library Name specified has not been defined previously.

System Action:

The request is rejected.

User Action:

Enter a valid Library Name and retry.

PN0102**LIBRARY NAME OMITTED OR INVALID****Reason:**

A request to define a Library failed because the Library Name, as specified by the LIB= operand, was either omitted or the value was invalid. Library names must be 1-8 characters starting with an alphabetic character.

System Action:

The request is rejected.

User Action:

Specify a valid Library Name and retry.

PN0103

DD NAME INVALID

Reason:

The DD Name value was invalid.

System Action:

The request fails.

User Action:

Correct the DD Name and retry.

PN0104

PATH NAME OMITTED OR INVALID

Reason:

A request to define a Library Path failed because the Path Name, as specified by the ID= operand, was either omitted or was invalid. Library path names must be 1-8 characters starting with an alphabetic character.

System Action:

The request fails.

User Action:

Correct the Path Name and retry.

PN0105**LIBRARY NAME(S) INVALID OR OMITTED****Reason:**

A request to define a Library Path failed because a (list of) library names was invalid. This may be due to one of the following reasons:

* The LIB= operand specifies the list of libraries which make up the path. This operand was either omitted or was invalid. The operand value should be either: - a single library, e.g. LIB=libname - a sublist of libraries, e.g. LIB=(libname1,libname2,...,libnamen)

* The EDIT= operand specifies the list of libraries on the path which can be edited. The operand should be one of the following:

- the operand may be omitted in which case EDIT=ALL is assumed
- EDIT=ALL is specified which means that all libraries in the path may be edited
- EDIT=NONE is specified which means that no libraries in the path may be edited
- a single library, e.g. EDIT=libname
- a sublist of libraries, e.g. EDIT=(libname1,libname2,...,libnamen)

System Action:

The request is rejected.

User Action:

Correct the operand(s) and retry.

PN0106**KEYWORD P1 HAS AN INVALID VALUE P2****Reason:**

The MODS Panel Library Definition Utility was called with a parameter of the form *P1=P2* and this was invalid.

System Action:

The request is rejected.

User Action:

Contact your systems administrator.

PN0107

DATASET NAME OMITTED

Reason:

The Dataset Name was required but was omitted.

System Action:

The request is rejected.

User Action:

Enter a value for the Dataset Name and retry.

PN0108

MEMBER NOT PERMITTED IN DATASET NAME

Reason:

A dataset to be allocated as a panel library must be a VSAM dataset, therefore a member name may not be specified.

System Action:

The request is rejected.

User Action:

Correct the dataset name and retry.

PN0109

INVALID DATASET NAME

Reason:

The dataset name specified is not valid.

System Action:

The request is rejected.

User Action:

Enter the name of a VSAM dataset without quotes and retry.

PN0110**INVALID FILE ID****Reason:**

An invalid File ID was entered.

System Action:

The request fails.

User Action:

Correct the File ID and retry.

PN0111**ACTION COMPLETE****Reason:**

The requested action has completed successfully.

System Action:

None.

User Action:

None.

PN0113**EDIT OPTION MUST BE YES OR NO****Reason:**

The Edit option must contain a value of 'YES' or 'NO'.

System Action:

The request is rejected.

User Action:

Correct the field value and retry.

PN0114

~p1

Reason:

An error occurred performing a dynamic allocation of a dataset.

System Action:

The cursor is placed in the field in error and the field is highlighted.

User Action:

Correct the field value and retry.

PN1001

LIBRARY IS NOT DEFINED

Reason:

The library name entered on the panel copy menu is not defined to the system.

System Action:

The cursor is placed in the field in error and the field is highlighted.

User Action:

Enter a valid library name and retry.

PN1002

UNABLE TO OPEN LIBRARY - FILERC=~P1

Reason:

The library name entered on the Panel Copy menu cannot be opened. The return code from the &FILE OPEN statement is shown.

System Action:

The requested selection list is not displayed.

User Action:

Check that the library is open and accessible using the SHOW LIB and SHOW UDB commands, then retry.

PN1003**TOO MANY SORT FIELDS****Reason:**

The SORT command on the Panel Copy selection list has been issued. The command supports two sort fields but more than two were entered.

System Action:

None.

User Action:

Enter a correct SORT command.

PN1004**INVALID SORT FIELD****Reason:**

The SORT command on the Panel Copy selection list has been issued. The command supports two sort fields but more than two were entered.

System Action:

None.

User Action:

Enter a valid SORT command. The valid sort fields are: NAME, CREATED, MODIFIED, SIZE, MLEV and ID, corresponding to the column headings on the selection list.

PN1005**~P1 RECORDS SORTED****Reason:**

The SORT command has completed, and the displayed number of records was sorted.

System Action:

None.

User Action:

None.

PN1006

UNABLE TO RETRIEVE USER INFORMATION

Reason:

The &SECCALL statement was used to check user authorisation for the requested operation. This request was unsuccessful.

System Action:

The request is rejected.

User Action:

Determine the cause of the failure in the security system, and retry.

PN1007

USER NOT AUTHORIZED FOR SYSTEM SUPPORT UTILITIES

Reason:

You attempted to access system support utilities, but you are not authorized.

System Action:

The request is rejected.

User Action:

Contact the System Administrator if authorization is required.

PN1009

~P1 PANELS COPIED, ~P2 REPLACED

Reason:

P1 panels were copied to the 'TO' library. P2 of the copied panels already existed in the 'TO' library and were replaced.

System Action:

None.

User Action:

None.

PN1010**~P1 PANELS COPIED/REPLACED****Reason:**

P1 panels were copied to the 'TO' library. If any already existed in the 'TO' library, they were replaced.

System Action:

None.

User Action:

None.

PS0001**INVALID KEYWORD VALUE SPECIFIED, KEYWORD=~P1 VALUE=~P2****Reason:**

The Print Services Manager external interface procedure \$PSCALL failed during request processing because it was passed an invalid keyword value. The keyword was P1 and the invalid value was P2 .

System Action:

The request is rejected and procedure \$PSCALL terminates. Control is returned to the NCL procedure which executed \$PSCALL. If \$PSCALL was executed from OCS, control is returned to OCS.

User Action:

Correct the NCL procedure which executed \$PSCALL. If executed from OCS, check the command entered on the command line and retry.

PS0002

UNSUPPORTED RETURN CODE RECEIVED FROM PROCEDURE P1, RC= P2

Reason:

The Print Services Manager external interface procedure \$PSCALL failed during request processing because it received an unknown return code from a procedure. The name of the procedure was P1 and the unknown return code was P2 .

System Action:

The request is rejected and procedure \$PSCALL terminates. Control is returned to the NCL procedure which executed \$PSCALL.

User Action:

Contact the system administrator.

PS0003

USER P1 NOT AUTHORIZED TO P2 REQUEST P3

Reason:

A request to release, hold or delete a print request failed because the user was not authorized for the request. The userid of the user was *P1* the request was *P2* and the print request number was *P3* .

System Action:

The request is rejected.

User Action:

None.

PS0004**REQUEST ~P1 ~P2****Reason:**

A print request was successfully opened, cancelled, released or held. The print request number was P1 and the action successfully performed was P2 .

System Action:

None.

User Action:

None.

PS0005**LOCK ERROR, RC= P1 FDBK= P2 PNAME= P3 MNAME= P4****Reason:**

The Print Services Manager external interface procedure \$PSCALL failed processing a request because it was unable to obtain a lock. The primary name of the lock was P3 , the minor name was P4 , the return code was P1 and the feedback code was P2 .

System Action:

The request is rejected and procedure \$PSCALL terminates.

User Action:

Interpret the feedback code using the NCL Reference. The SHOW LOCKS command can be issued from an OCS window to determine the procedure and userid that is holding the lock.

PS0006

DEFAULT PRINTER NOT DEFINED FOR USERID ~P1

Reason:

A request to get the default printer for a user or send output to a user's default printer failed because a default printer was not defined for the user. The userid of the user was P1 .

System Action:

The request is rejected.

User Action:

Correct the userid or add a default printer assignment for the user to the Control File using the PSM maintenance facilities and retry.

PS0007

PRINTER ~P1 NOT DEFINED

Reason:

A request to get information about a printer or send output to a printer failed because the printer was not defined. The name of the printer was P1 .

System Action:

The request is rejected.

User Action:

Correct the printer name or add a printer definition for the printer to the Control File using the PSM maintenance facilities and retry.

PS0008**FORM ~P1 NOT DEFINED****Reason:**

A request to get information about a form or open a print request with a form name specified on the open call failed because the form was not defined. The name of the form was P1 .

System Action:

The request is rejected.

User Action:

Correct the form name or add a form definition for the form to the Control File using the PSM maintenance facilities and retry.

PS0009**SETUP ~P1 NOT DEFINED****Reason:**

A request to get information about a setup or open a print request with a setup name specified on the open call failed because the setup was not defined. The name of the setup was P1 .

System Action:

The request is rejected.

User Action:

Correct the setup name or add a setup definition for the setup to the Control File using the PSM maintenance facilities and retry.

PS0010

VARIABLE P1 ERROR, FDBK= P2 ID= P3 KEY= P4

Reason:

The Print Services Manager external interface procedure \$PSCALL failed during request processing because it encountered an error accessing a variable table. The request was *P1* , the identifier of the variable table was *P3* , the feedback code was *P2* and the value of the key was *P4* .

System Action:

The request is rejected and procedure \$PSCALL terminates.

User Action:

Interpret the feedback code using the NCL Reference.

PS0011

REQUEST ~P1 NOT ~P2

Reason:

A request to add output to a print request or close, cancel, release or hold a print request failed because the request was not open or found. The print request number was *P1* and the requested action was *P2* .

System Action:

The request is rejected.

User Action:

Correct and retry.

PS0012**RELEASE REQUEST REJECTED, STATUS MUST NOT BE '~P1'****Reason:**

A request to release a print request was rejected because the request had a status of P1 .

System Action:

The request is rejected.

User Action:

None. Print requests must have a status of HELD, HELD-ERROR or BUILD-HELD when requested to be released.

PS0013**HOLD REQUEST REJECTED, STATUS MUST BE 'BUILD' OR 'QUEUED'****Reason:**

A request to hold a print request was rejected because the request did not have a status of BUILD or QUEUED.

System Action:

The request is rejected.

User Action:

None. Print requests must have a status of BUILD or QUEUED when requested to be held.

PS0014**JES PRINTING NOT SUPPORTED ON ~P1 OPERATING SYSTEM, PRINTER=~P2****Reason:**

A request to send output to a JES printer failed because JES printing is not supported on the particular operating system. The printer name or JES remote destination name was P2 and the operating system was P1 .

System Action:

The request is rejected.

User Action:

Specify a non JES printer and retry.

PS0015

MAXIMUM DATA LINES EXCEEDED FOR REQUEST P1, REQUEST CLOSED

Reason:

A request to add output to a print request failed because the maximum number of lines of output for the print request was exceeded. The print request number was P1 .

System Action:

The request is rejected. The print request is closed and the status is set to HELD-ERROR or DIRECT-ERR.

User Action:

The maximum number of lines of output that may be added to a print request is 999999.

PS0016

MAXIMUM HEADER LINES EXCEEDED FOR REQUEST ~P1

Reason:

A request to add header lines to a print request failed because the maximum number of lines for a header was exceeded. The print request number was P1 .

System Action:

The request is rejected.

User Action:

The maximum number of lines that may be added to a header is 30. Correct and retry.

PS0017**REQUEST ~P1 CANNOT BE DELETED, IN USE BY ~P2****Reason:**

A request to delete a print request failed because the request was being accessed by the system or another user. The print request number was P1 and the userid of the user accessing the request was P2 .

System Action:

The delete request is rejected.

User Action:

Retry when there is no user accessing the print request.

PS0018**DELETE REQUEST REJECTED, STATUS MUST NOT BE 'BUILD- PRT'****Reason:**

A request to delete a print request was rejected because the request had a status of BUILD-PRT.

System Action:

The delete request is rejected.

User Action:

None. Print requests must not have a status of BUILD-PRT when requested to be deleted.

PS0019

PRINT REQUEST P1 FAILED, DRIVER PROCEDURE TERMINATED

Reason:

Printing of a print request at a JES printer or to a printer exit failed because the printer driver procedure \$PSDR72H terminated processing. The print request was opened with the HOLD and KEEP keywords set to 'NO'. The print request number was *P1* .

System Action:

Error messages are written to the SOLVE activity log by the printer driver procedure \$PSDR72H and processing is terminated.

User Action:

Determine the cause of the error from the messages written to the activity log and retry.

PS0020

PRINT REQUEST ~P1 SENT TO PRINTER ~P2

Reason:

A print request has been queued to a printer. The number of the print request was P1 and the printer name, JES remote destination name or VTAM defined network name was P2 .

System Action:

None.

User Action:

None.

PS0021**PRINT REQUEST ~P1 HELD ON THE SPOOL FOR PRINTER ~P2****Reason:**

A print request has been held on the spool. The number of the print request was P1 and the printer name, JES remote destination name or VTAM defined network name for which the request was held was P2 .

System Action:

None.

User Action:

None.

PS0022**VTAM PRINTING NOT SUPPORTED ON THIS SOLVE SYSTEM, PRINTER= P1****Reason:**

A request to send output to a VTAM printer failed because the SOLVE system was not using access method VTAM. The printer name or VTAM defined network name was P1 .

System Action:

The request is rejected.

User Action:

Specify a non VTAM printer and retry.

PS0101**INVALID KEYWORD VALUE SPECIFIED, KEYWORD= P1 VALUE= P2****Reason:**

The service procedure \$PSPM01M for the PSM Primary Menu failed because it received an invalid keyword value. The keyword was *P1* and the invalid value was *P2* .

System Action:

Procedure \$PSPM01M terminates.

User Action:

Contact the system administrator.

PS0102

USER P1 NOT AUTHORIZED TO ACCESS THE PSM PRIMARY MENU

Reason:

A request to access the PSM Primary Menu failed because the user was not authorized for the request. The userid of the user was P1 .

System Action:

The request is rejected.

User Action:

None.

PS0103

UNSUPPORTED RETURN CODE RECEIVED FROM PROCEDURE \$CAUA000, RC= P1

Reason:

A request to access the PSM Primary Menu failed because the service procedure \$PSPM01M for the menu received an unknown return code from procedure \$CAUA000. The unknown return code was **P1** .

System Action:

The request is rejected and procedure \$PSPM01M terminates.

User Action:

Contact the system administrator.

PS0104

UNSUPPORTED RETURN CODE RECEIVED FROM MENU ACTION, RC= P1

Reason:

The service procedure \$PSPM01M for the PSM Primary Menu received an unknown return code from a procedure that was executed as the action for an option on the menu. The unknown return code was P1 .

System Action:

Procedure \$PSPM01M terminates and the PSM Primary Menu is presented.

User Action:

Contact the system administrator.

PS0105**INVALID ~P1, MUST BE ALPHANUMERIC AND/OR NATIONAL CHARACTERS****Reason:**

The Q option was selected from the PSM Primary Menu and an invalid value was entered in the Userid or Printer field. The value entered was not alphanumeric and/or national characters. The field into which the invalid value was entered was P1 .

System Action:

The selection of the Q option is rejected and the P1 field is set in error.

User Action:

Correct the value in the P1 field and retry.

PS5002**USER P1 NOT AUTHORIZED TO ACCESS ADMINISTRATION FACILITIES****Reason:**

A request to access the Administration Menu failed because the user was not authorized for the request. The userid of the user was P1 .

System Action:

The request is rejected.

User Action:

None.

PS5003

UNSUPPORTED RETURN CODE RECEIVED FROM PROCEDURE \$CAUA000, RC= P1

Reason:

A request to access the Administration Menu failed because the service procedure \$PSAD50M for the menu, received an unknown return code from procedure \$CAUA000. The unknown return code was **P1** .

System Action:

The request is rejected and procedure \$PSAD50M terminates.

User Action:

Contact the system administrator.

PS5004

UNSUPPORTED RETURN CODE RECEIVED FROM MENU ACTION, RC= P1

Reason:

The service procedure \$PSAD50M for the Administration Menu received an unknown return code from a procedure that was executed as the action for an option on the menu. The unknown return code was P1 .

System Action:

Procedure \$PSAD50M terminates and the Administration Menu is presented.

User Action:

Contact the system administrator.

PS5401

UNSUPPORTED FIELD NAME RECEIVED FROM \$CAGP000, FIELD=~P1

Reason:

The validation exit \$PSCS54X for the Clear Spool panel received an unknown field name from procedure \$CAGP000. The name of the field was P1 .

System Action:

Procedure \$PSCS54X terminates.

User Action:

Contact the system administrator.

PS5402**~P1 MUST BE LESS THAN OR EQUAL TO CURRENT DATE****Reason:**

A date was entered in the P1 field on the Clear Spool panel that was greater than the current date.

System Action:

The Clear Spool panel is displayed with the P1 field set in error.

User Action:

Enter a date in the P1 field that is less than or equal to the current date and retry.

PS5501**INVALID KEYWORD VALUE SPECIFIED, KEYWORD= P1 VALUE= P2****Reason:**

A request to clear the spool failed because procedure \$PSCS55P received an invalid keyword value. The keyword was *P1* and the invalid value was *P2* .

System Action:

The request is rejected and procedure \$PSCS55P terminates.

User Action:

Contact the system administrator.

PS5502**USER P1 NOT AUTHORIZED TO CLEAR SPOOL****Reason:**

A request to clear the spool failed because the user was not authorized for the request. The userid of the user was *P1* .

System Action:

The request is rejected.

User Action:

None.

PS5503

UNSUPPORTED RETURN CODE RECEIVED FROM PROCEDURE \$CAUA000, RC= P1

Reason:

A request to clear the spool failed because procedure \$PSCS55P received an unknown return code from procedure \$CAUA000. The unknown return code was **P1** .

System Action:

The request is rejected and procedure \$PSCS55P terminates.

User Action:

Contact the system administrator.

PS5504

INVALID COMMAND

Reason:

An invalid command was entered in the Command field on the Clear Spool panel.

System Action:

The command is rejected.

User Action:

Correct the command and retry.

PS5505**CLEAR SPOOL EXECUTED, DELETE= P1 CREATE DATE= P2 USERID= P3****Reason:**

A clear spool request was executed resulting in print requests created on or before the date specified being deleted from the Print Spool File. The number of requests deleted was P1 and the creation date used to determine which to delete was P2 and the userid of the *user* who requested the clear spool request was P3 .

System Action:

This message is written to the activity log when a clear spool request completes.

User Action:

None.

PS5506**~P1 REQUESTS DELETED****Reason:**

P1 print requests were successfully deleted from the Print Spool File.

System Action:

None.

User Action:

None.

PS5507

CLEAR SPOOL REQUEST IN PROGRESS

Reason:

Print requests created on or before the date entered in the Date field on the Clear Spool panel were requested to be deleted. This message is displayed on the Clear Spool panel while the print requests are being deleted by the system.

System Action:

The print requests created on or before the date entered are being deleted from the Print Spool File.

User Action:

None.

PS5508

COMMAND ASSIGNED TO FUNCTION KEY ~P1 IS INVALID

Reason:

Function key P1 was pressed on the Clear Spool panel and the command assigned to it was invalid.

System Action:

The command is rejected.

User Action:

Correct the setting of the function key and retry.

PS5601

INVALID KEYWORD VALUE SPECIFIED, KEYWORD= P1 VALUE= P2

Reason:

A request to confirm printer details failed because procedure \$PSCP56P received an invalid keyword value. The keyword was *P1* and the invalid value was *P2*.

System Action:

The request is rejected and procedure \$PSCP56P terminates.

User Action:

Contact the system administrator.

PS5602**UNSUPPORTED RETURN CODE RECEIVED FROM PROCEDURE
\$CAUA000, RC= P1****Reason:**

A request to confirm printer details failed because procedure \$PSCP56P received an unknown return code from procedure \$CAUA000. The unknown return code was **P1** .

System Action:

The request is rejected and procedure \$PSCP56P terminates.

User Action:

Contact the system administrator.

PS5603**INVALID COMMAND****Reason:**

An invalid command was entered in the Command field on the Confirm Printer panel.

System Action:

The command is rejected.

User Action:

Correct the command and retry.

PS5604**REQUEST CANCELLED****Reason:**

A confirm printer details request was cancelled.

System Action:

None.

User Action:

None.

PS5605

COMMAND ASSIGNED TO FUNCTION KEY ~P1 IS INVALID

Reason:

Function key P1 was pressed on the Confirm Printer panel and the command assigned to it was invalid.

System Action:

The command is rejected.

User Action:

Correct the setting of the function key and retry.

PS5607

EMAIL ADDRESS IS NOT VALID

Reason:

The email address entered is not in the form user@host.

System Action:

The field in error is highlighted.

User Action:

Correct the email address. Check that an @ character is used to separate the user and host segments of the address.

PS5608

CONTACT NUMBER IS NOT AN 8 DIGIT NUMBER

Reason:

The Contact Number field contains non-numeric characters or is not eight digits.

System Action:

The field in error is highlighted.

User Action:

Correct the Contact Number field.

PS5609**ISSUE NUMBER IS NOT A 2 DIGIT NUMBER****Reason:**

The Issue Number field contains non-numeric characters or is not two digits.

System Action:

The field in error is highlighted.

User Action:

Correct the Issue Number field.

PS5610**Attachment name not valid****Reason:**

The attachment name cannot contain the characters \:*?<>|"

System Action:

The field in error is highlighted.

User Action:

Correct the value.

PS5702**Printer P1 not defined****Reason:**

A printer name was entered in the Printer Name field on the Confirm Printer panel that was not previously defined. The printer name entered was *P1* .

System Action:

None.

User Action:

Enter a defined printer name or enter ? to display a prompt list of defined printers.

PS6101

INVALID KEYWORD VALUE SPECIFIED, KEYWORD= P1 VALUE= P2

Reason:

A request to modify a print request failed because procedure \$PSPR61P received an invalid keyword value. The keyword was *P1* and the invalid value was *P2* .

System Action:

The request is rejected and procedure \$PSPR61P terminates.

User Action:

Contact the system administrator.

PS6102

USER P1 NOT AUTHORIZED TO P2 PRINT REQUEST

Reason:

A request to modify a print request failed because the user was not authorized for the request. The function requested was *P2* and the userid of the user was *P1* .

System Action:

The request is rejected.

User Action:

None.

PS6103

UNSUPPORTED RETURN CODE RECEIVED FROM PROCEDURE \$CAUA000, RC= P1

Reason:

A request to modify a print request failed because procedure \$PSPR61P received an unknown return code from procedure \$CAUA000. The unknown return code was **P1** .

System Action:

The request is rejected and procedure \$PSPR61P terminates.

User Action:

Contact the system administrator.

PS6104**INVALID COMMAND****Reason:**

An invalid command was entered in the Command field on the Print Request panel.

System Action:

The command is rejected.

User Action:

Correct the command and retry.

PS6105**REQUEST ~P1 NOT FOUND****Reason:**

A request to modify a print request failed because the print request was not found on the spool. The number of the request was P1 .

System Action:

The request is rejected.

User Action:

Specify a print request number previously added to the spool and retry.

PS6106**MODIFY CANCELLED****Reason:**

A request to modify a print request was cancelled.

System Action:

None.

User Action:

None.

PS6107

REQUEST ~P1 MODIFIED

Reason:

A print request was successfully modified. The number of the print request modified was P1 .

System Action:

None.

User Action:

None.

PS6108

MODIFY REQUEST REJECTED, STATUS MUST NOT BE '~P1'

Reason:

A request to modify a print request was rejected because the request had a status of P1 .

System Action:

The request is rejected.

User Action:

Retry when the status of the print request is not P1 . Print requests must not have a status of PRINTING, BUILD-PRT or DIRECT-ERR when requested to be modified.

PS6109

COMMAND ASSIGNED TO FUNCTION KEY ~P1 IS INVALID

Reason:

Function key P1 was pressed on the Print Request panel and the command assigned to it was invalid.

System Action:

The command is rejected.

User Action:

Correct the setting of the function key and retry.

PS6202**Printer P1 not defined****Reason:**

A printer name was entered in the Printer Name field on the Confirm Printer panel that was not previously defined. The printer name entered was *P1* .

System Action:

None.

User Action:

Enter a defined printer name or enter ? to display a prompt list of defined printers.

PS6203**P1 must be one alphanumeric character****Reason:**

A value was entered in the *P1* field on the Print Request panel that was more than one character long.

System Action:

The Print Request panel is displayed with the *P1* field set in error.

User Action:

Enter one alphanumeric character in the *P1* field and retry.

PS6204

Destination invalid, destid must be 1 to 8 alphanumerics and nationals

Reason:

The value entered as the destid (JES remote destination name) in the Destination field on the Print Request panel was invalid. The value entered was not alphanumeric and/or national characters. The format of the Destination field is destid.userid, where destid and userid must be 1 to 8 alphanumeric and/or national characters. The userid is optional and if entered must be separated from the destid by a period.

System Action:

The Print Request panel is displayed with the Destination field set in error.

User Action:

Correct the value entered in the Destination field and retry.

PS6205

Destination invalid, userid must be 1 to 8 alphanumerics and nationals

Reason:

The value entered as the userid (JES remote userid) in the Destination field on the Print Request panel was invalid. The value entered was not alphanumeric and/or national characters. The format of the Destination field is destid.userid, where destid and userid must be 1 to 8 alphanumeric and/or national characters. The userid is optional and if entered must be separated from the destid by a period.

System Action:

The Print Request panel is displayed with the Destination field set in error.

User Action:

Correct the value entered in the Destination field and retry.

PS6206**Destination invalid, destid must be entered when userid is entered****Reason:**

A userid (JES remote userid) was entered in the Destination field on the on the Print Request panel and a destid (JES remote destination name) was not entered. The format of the Destination field is destid.userid, where destid and userid must be 1 to 8 alphanumeric and/or national characters. The userid is optional and if entered must be separated from the destid by a period. A destid must be entered when a userid is entered.

System Action:

The Print Request panel is displayed with the Destination field set in error.

User Action:

Correct the value entered in the Destination field and retry.

PS6207**destination must not end with the character '.'****Reason:**

A destid (JES remote destination name) was entered in the Destination field on the Print Request panel that ended with a period. The format of the Destination field is destid.userid, where destid and userid must be 1 to 8 alphanumeric and/or national characters. The userid is optional and if entered must be separated from the destid by a period. If a userid is not entered, the full stop must be omitted.

System Action:

The Print Request panel is displayed with the Destination field set in error.

User Action:

Correct the Destination field by deleting the period from the end of the destid or adding a userid after the period and retry.

PS6301

UNSUPPORTED CALL TYPE RECEIVED FROM \$CASL000, CALLTYPE= P1

Reason:

The service procedure \$PSOQ63L for the Output Queue failed because it received an unknown call type in variable &\$SLCALLTYPE from procedure \$CASL000. The unknown call type was P1 .

System Action:

Procedure \$PSOQ63L terminates.

User Action:

Contact the system administrator.

PS6302

USER P1 NOT AUTHORIZED TO ACCESS REQUESTS

Reason:

A request to access the Output Queue failed because the user was not authorized for the request. The userid of the user was *P1* .

System Action:

The request is rejected.

User Action:

None.

PS6303

UNSUPPORTED RETURN CODE RECEIVED FROM PROCEDURE \$CAUA000, RC= P1

Reason:

A request to present the Output Queue failed because the service procedure \$PSOQ63L for the Output Queue received an unknown return code from procedure \$CAUA000. The unknown return code was **P1** .

System Action:

The request is rejected and procedure \$PSOQ63L terminates.

User Action:

Contact the system administrator.

PS6304**REQUEST ~P1 DELETED****Reason:**

A print request was successfully deleted. The number of the print request successfully deleted was P1 .

System Action:

None.

User Action:

None.

PS6305**REQUEST ~P1 DELETED BY THE SYSTEM OR ANOTHER USER****Reason:**

The selection of a print request from the Output Queue failed because the request was deleted by the system or another user since the Output Queue was presented. The number of the print request selected was P1 .

System Action:

The selection of the print request is rejected.

User Action:

None.

PS6306**COMMAND PARAMETER INVALID****Reason:**

A command was entered in the Command field that was a valid command, however, the command parameter was invalid.

System Action:

The command is rejected.

User Action:

Correct the command parameter and retry.

PS6401

UNSUPPORTED CALL TYPE RECEIVED FROM \$CABU000, CALLTYPE= P1

Reason:

The service procedure \$PSPR64L for the Output Queue failed because it received an unknown call type in variable &\$SLCALLTYPE from procedure \$CABU000. The unknown call type was P1 .

System Action:

Procedure \$PSPR64L terminates.

User Action:

Contact the system administrator.

PS6402

USER P1 NOT AUTHORIZED TO BROWSE REQUEST P2

Reason:

A request to browse the output for a print request failed because the user was not authorized for the request. The userid of the user was *P1* and the number of the print request was *P2* .

System Action:

The request is rejected.

User Action:

None.

PS6403**UNSUPPORTED RETURN CODE RECEIVED FROM PROCEDURE
\$CAUA000, RC= P1****Reason:**

A request to browse the output for a print request failed because the service procedure \$PSPR64L for the Browse Output panel received an unknown return code from procedure \$CAUA000. The unknown return code was **P1** .

System Action:

The request is rejected and procedure \$PSPR64L terminates.

User Action:

Contact the system administrator.

PS6404**NO OUTPUT FOR REQUEST ~P1****Reason:**

A request to browse the output for a print request failed because there was no output found on the spool for the request. The number of the request was P1 .

System Action:

The request is rejected.

User Action:

None.

PS6405**REQUEST ~P1 NOT FOUND****Reason:**

A request to browse the output for a print request failed because the the print request was not found on the spool. The number of the request was P1 .

System Action:

The request is rejected.

User Action:

Specify a print request number previously added to the spool and retry.

PS6406

BROWSE REQUEST REJECTED, STATUS MUST NOT BE '~P1'

Reason:

A request to browse the output for a print request was rejected because the request had a status of P1 .

System Action:

The request is rejected.

User Action:

None. Print requests must not have a status of BUILD-PRT or DIRECT-ERR when the output is requested to be browsed.

PS6407

REQUEST ~P1 DELETED BY THE SYSTEM OR ANOTHER USER

Reason:

A request to scroll or refresh the output presented on the Browse Output panel failed because the print request was deleted by the system or another user since the Browse Output panel was presented. The number of the print request of which the output was being browsed was P1 .

System Action:

The request is rejected and the panel presented prior to the Browse Output panel is presented.

User Action:

None.

PS7001**INVALID KEYWORD VALUE SPECIFIED, KEYWORD= P1 VALUE= P2****Reason:**

The request waiter procedure \$PSRW70Z failed because it received an invalid keyword value. The keyword was *P1* and the invalid value was *P2* .

System Action:

Procedure \$PSRW70Z terminates.

User Action:

Contact the system administrator.

PS7002**LOCK ERROR, RC= P1 FDBK= P2 PNAME= P3 MNAME= P4****Reason:**

The request waiter procedure \$PSRW70Z failed because it was unable to obtain a lock. The primary name of the lock was *P3* , the minor name was *P4* , the return code was *P1* and the feedback code was *P2* .

System Action:

Procedure \$PSRW70Z terminates.

User Action:

Interpret the feedback code using the NCL Reference. The SHOW LOCKS command can be issued from an OCSwindow to determine the procedure and userid that is holding the lock.

PS7003

STATUS CHANGED FROM ~P1 TO HELD-ERROR BY THE SYSTEM DUE TO ERROR

Reason:

The status of a print request was changed from P1 to HELD-ERROR by the system due to the process creating the request terminating abnormally.

System Action:

None.

User Action:

Determine the cause of the error from the messages written to the activity log.

PS7101

INVALID KEYWORD VALUE SPECIFIED, KEYWORD= P1 VALUE= P2

Reason:

The queue manager procedure \$PSQM71Z failed because it received an invalid keyword value. The keyword was *P1* and the invalid value was *P2* .

System Action:

Procedure \$PSQM71Z terminates.

User Action:

Contact the system administrator.

PS7102

VARIABLE ALLOC ERROR, FDBK= P1 ID= P2

Reason:

The queue manager procedure \$PSQM71Z failed because it encountered an error allocating a variable table. The identifier of the variable table was *P2* and the feedback code was *P1* .

System Action:

Procedure \$PSQM71Z terminates.

User Action:

Interpret the feedback code using the NCL Reference.

PS7103**VARTABLE P1 ERROR, FDBK= P2 ID= P3 KEY= P4****Reason:**

The queue manager procedure \$PSQM71Z failed because it encountered an error accessing a variable table. The request was *P1* , the identifier of the variable table was *P3* , the feedback code was *P2* and the value of the key was *P4* .

System Action:

Procedure \$PSQM71Z terminates.

User Action:

Interpret the feedback code using the NCL Reference.

PS7201**INVALID KEYWORD VALUE SPECIFIED, KEYWORD= P1 VALUE= P2****Reason:**

The printer driver procedure \$PSDR72H failed because it received an invalid keyword value. The keyword was *P1* and the invalid value was *P2* .

System Action:

Procedure \$PSDR72H terminates.

User Action:

Contact the system administrator.

PS7202**VARTABLE ALLOC ERROR, FDBK= P1 ID= P2****Reason:**

The printer driver procedure \$PSDR72H failed because it encountered an error allocating a variable table. The identifier of the variable table was *P2* and the feedback code was *P1* .

System Action:

Procedure \$PSDR72H terminates.

User Action:

Interpret the feedback code using the NCL Reference.

PS7203

VARIABLE P1 ERROR, FDBK= P2 ID= P3 KEY= P4

Reason:

The printer driver procedure \$PSDR72H failed because it encountered an error accessing a variable table. The request was *P1* , the identifier of the variable table was *P3* , the feedback code was *P2* and the value of the key was *P4* .

System Action:

Procedure \$PSDR72H terminates.

User Action:

Interpret the feedback code using the NCL Reference.

PS7204

P1 P2 NOT DEFINED

Reason:

The printer driver procedure was unable to print the output for a request because a printer, form or setup definition was not defined on the Control File. The definition not defined was a *P1* and the name of it was *P2* .

System Action:

This message and message PS7205 are written to the activity log and the status of the print request is set to HELD-ERROR.

User Action:

Refer to message PS7205 on the activity log for more information. Add a *P1* definition for the *P2* resource to the Control File using the PSM maintenance facilities, and retry printing the output by releasing the print request from the Output Queue.

PS7205**PRINTING OF REQUEST ~P1 ~P2, REFER TO MESSAGE ~P3 ON THE LOG****Reason:**

The printing of output for a print request failed or was incomplete because the printer driver procedure encountered an error. The number of the print request was P1 , P2 indicates whether it failed or was incomplete and the ID of the message describing the error was P3 .

System Action:

This message and message P3 are written to the activity log and the status of the print request is set to HELD-ERROR or DIRECT-ERR.

User Action:

Refer to message P3 on the activity log for more information.

PS7206**PRINTER ERROR, RC= P1 LUNAME= P2****Reason:**

The printing of output for a print request on a VTAM printer was not completed because the printer driver procedure received an error from the printer when sending output to it using an &WRITE statement. The return code from the &WRITE statement was P1 and the LU Name of the printer was P2 .

System Action:

This message and message PS7205 are written to the SOLVE activity log and the status of the print request is set to HELD-ERROR.

User Action:

Refer to message PS7205 on the activity log for more information. Interpret the return code using the NCL Reference.

PS7207

SYSOUT UNAVAILABLE, RC= P1 FILE= P2

Reason:

The printing of output for a print request to a JES printer failed because the printer driver procedure was unable to open the SYSOUT file. The return code from the &FILEID statement was *P1* and the file identifier for SYSOUT was *P2* .

System Action:

This message and message PS7205 are written to the SOLVE activity log and the status of the print request is set to HELD-ERROR.

User Action:

Refer to message PS7205 on the activity log for more information. Interpret the message using the NCL Reference.

PS7208

SYSOUT ERROR, FDBK= P1 FILE= P2

Reason:

The printing of output for a print request to a JES printer was not completed because the printer driver procedure received an error writing to the SYSOUT file using an &FILEADD statement. The feedback code was *P1* and the file identifier for SYSOUT was *P2* .

System Action:

This message and message PS7205 are written to the activity log and the status of the print request is set to HELD-ERROR.

User Action:

Refer to message PS7205 on the activity log for more information. Interpret the feedback code using the VSAM Programmer's Guide or the VSAM Administration: Macro Instruction Reference for installations with DFP.

PS7209**BANNER EXIT ~P1 NOT FOUND****Reason:**

The printer driver procedure was unable to print the banner page for a print request because the banner exit procedure that was to be executed for the request was not found in the procedure library. The name of the banner exit procedure was P1 .

System Action:

This message is printed on the banner page of the output for the print request.

User Action:

Define a banner exit procedure with a name of P1 . The banner exit procedure is defined in the form definition or may be over ridden on the open call to procedure \$PSCALL for a print request.

PS7210**INVALID BANNER EXIT VARIABLE SPECIFIED, PROC= P1 VAR= P2
VALUE= P3****Reason:**

The printer driver procedure was unable to print the banner page for a print request because the banner exit procedure returned an invalid variable. The name of the banner exit procedure was P1 , the variable name was P2 and the invalid value was P3 .

System Action:

This message is printed on the banner page of the output for the print request.

User Action:

Correct the setting of the variable by the banner exit procedure. Refer to the NCL Reference for further details on the banner exit procedure. The banner exit procedure is defined in the form definition or may be over ridden on the open call to procedure \$PSCALL for a print request.

PS7211

PRINTING OF REQUEST P1 INCOMPLETE, LINE LIMIT EXCEEDED

Reason:

The printing of output for a print request was not completed because the line limit for the printer was exceeded. The number of the print request was *P1* .

System Action:

This message is written to the activity log and is printed at the printer. The status of the print request is set to HELD-ERROR.

User Action:

Redirect the print request to another printer that will not cause the line limit to be exceeded, by first modifying the request then releasing the request from the Output Queue. The line limit for a printer is defined in the printer definition, or if the DEST keyword specified on the open call to procedure \$PSCALL is set to JES, it is defined in the defaults definition.

PS7212

JES PRINTING NOT SUPPORTED ON ~P1 OPERATING SYSTEM, PRINTER=~P2 REQ=~P3

Reason:

The printer driver procedure \$PSDR72H failed to print the output for a print request at a JES printer because JES printing is not supported on operating system *P1* . The printer name or JES remote destination name was *P2* and the print request number was *P3* .

System Action:

The status of the print request is set to HELD-ERROR or DIRECT-ERR and the printer driver procedure \$PSDR72H terminates.

User Action:

Redirect the print request to a non JES printer, by first modifying the request then releasing the request from the Output Queue.

PS7213

LOCK ERROR, RC= P1 FDBK= P2 PNAME= P3 MNAME= P4

Reason:

The printer driver procedure \$PSDR72H failed because it was unable to obtain a lock. The primary name of the lock was *P3* , the minor name was *P4* , the return code was *P1* and the feedback code was *P2* .

System Action:

Procedure \$PSDR72H terminates.

User Action:

Interpret the feedback code using the NCL Reference. The SHOW LOCKS command can be issued from an OCS window to determine the procedure and userid that is holding the lock.

PS7214

UNABLE TO ESTABLISH SESSION WITH VTAM PRINTER, LU= P1 MSG= P2 REQ= P3 DE LAY= P4

Reason:

The printer driver procedure \$PSDR72H was unable to establish a session with a VTAM printer and would retry the OPNDST command after delaying processing for a period of time. The LU name of the printer was **P1** , the number of the message received from the OPNDST command was **P2** . The number of the print request to be printed was **P3** and the time in seconds which processing would be delayed was **P4** . If no response was received from the OPNDST command after 60 seconds **P2** will be null.

System Action:

This message is written to the activity log and the OPNDST command is reissued after processing is delayed for *P4* seconds.

User Action:

None.

PS7215

PRINTER EXIT P1 NOT FOUND

Reason:

The printer driver procedure was unable to print the output for a print request because the printer exit procedure that was to be executed was not found in the procedure library. The name of the printer exit procedure was *P1* .

System Action:

This message is written to the activity log and the printer driver procedure terminates.

User Action:

Define a printer exit procedure with a name of *P1* . The printer exit procedure is defined in a printer definition.

PS7216

INVALID RETURN CODE RECEIVED FROM PRINTER EXIT, PROC= P1 RC= P2

Reason:

The printer driver procedure was unable to print the output for a print request because the printer exit procedure returned an invalid return code. The name of the printer exit procedure was *P1* and the invalid return code was *P2* .

System Action:

This message is written to the activity log and the printer driver procedure terminates.

User Action:

Correct the setting of the return code by the printer exit procedure. See the NCL Reference for details on the printer exit procedure. The printer exit procedure is defined in the printer definition.

PS7217**VTAM PRINTING NOT SUPPORTED ON THIS SOLVE SYSTEM, PRINTER= P1 REQ= P2****Reason:**

The printer driver procedure \$PSDR72H failed to print the output for a print request at a VTAM printer because the SOLVE system was not using access method VTAM. The printer name or VTAM defined network name was **P1** and the print request number was **P2** .

System Action:

The status of the print request is set to HELD-ERROR and the printer driver procedure \$PSDR72H terminates.

User Action:

Redirect the print request to a non VTAM printer, by first modifying the request then releasing the request from the Output Queue.

PS7301**INVALID KEYWORD VALUE SPECIFIED, KEYWORD= P1 VALUE= P2****Reason:**

The printer driver waiter procedure \$PSDW73Z failed because it received an invalid keyword value. The keyword was *P1* and the invalid value was *P2* .

System Action:

Procedure \$PSDW73Z terminates.

User Action:

Contact the system administrator.

PS7302

LOCK ERROR, RC= P1 FDBK= P2 PNAME= P3 MNAME= P4

Reason:

The printer driver waiter procedure \$PSDW73Z failed because it was unable to obtain a lock. The primary name of the lock was *P3* , the minor name was *P4* , the return code was *P1* and the feedback code was *P2* .

System Action:

Procedure \$PSDW73Z terminates.

User Action:

Interpret the feedback code using the NCL Reference. The SHOW LOCKS command can be issued from an OCS window to determine the procedure and userid that is holding the lock.

PS7303

VARIABLE P1 ERROR, FDBK= P2 ID= P3 KEY= P4

Reason:

The printer driver waiter procedure \$PSDW73Z failed because it encountered an error accessing a variable table. The request was *P1* , the identifier of the variable table was *P3* , the feedback code was *P2* and the value of the key was *P4* .

System Action:

Procedure \$PSDW73Z terminates.

User Action:

Interpret the feedback code using the NCL Reference.

PS7304**STATUS CHANGED FROM ~P1 TO ~P2 BY THE SYSTEM DUE TO ERROR****Reason:**

The status of a print request was changed from P1 to P2 by the system due to the printer driver procedure terminating abnormally.

System Action:

None.

User Action:

Determine the cause of the error from the messages written to the activity log.

PS7501**\$PSPOOL UNAVAILABLE, FILERC= P1****Reason:**

A request to access output for a print request failed because procedure \$PSZZ75D was unable to open the Print Spool File. The file identifier of the Print Spool File is \$PSPOOL and the return code from the &FILEID statement was *P1* .

System Action:

The request is rejected and procedure \$PSZZ75D terminates.

User Action:

Interpret the return code using the NCL Reference.

PS7502

VSAM ERROR, FILE=\$PSPOOL REQ= P1 RC= P2 FDBK= P3 KEY= P4

Reason:

A request to access output for a print request failed because procedure \$PSZZ75D was unable to access the Print Spool File. The file identifier of the Print Spool File is \$PSPOOL. The file request that failed was P1 , the file return code was P2 , the VSAM feedback code was P3 and the key of the record was P4 .

System Action:

The request is rejected and procedure \$PSZZ75D terminates.

User Action:

Interpret the file return code using the NCL Reference and the feedback code using the VSAM Programmer's Guide or the VSAM Administration: Macro Instruction Reference *for installations with DFP*.

PS7503

VARIABLE P1 ERROR, FDBK= P2 ID= P3 KEY= P4

Reason:

A request to access output for a print request failed because procedure \$PSZZ75D failed during request processing because it encountered an error accessing a variable table. The request was P1 , the identifier of the variable table was P3 , the feedback code was P2 and the value of the key was P4 .

System Action:

The request is rejected and procedure \$PSZZ75D terminates.

User Action:

Interpret the feedback code using the NCL Reference.

PS7504**OPT= P1 NOT SUPPORTED FOR DIRECT JES PRINTING****Reason:**

A request to delete output for a print request failed because the OPT keyword passed to procedure \$PSZZ75D was set to a value that is not supported for print requests that are sent directly to the JES spool or a printer exit. The print request for which the output was to be deleted was opened with the HOLD and KEEP keywords set to 'NO' and was sent to a JES printer or a printer exit, meaning the output was added directly to the JES spool or sent directly to the printer exit and not added to the PSM spool. The value of the OPT keyword was *P1* .

System Action:

The request is rejected and procedure \$PSZZ75D terminates.

User Action:

Contact the system administrator.

PS7505**LOCK ERROR, RC= P1 FDBK= P2 PNAME= P3 MNAME= P4****Reason:**

A request to access output for a print request failed because procedure \$PSZZ75D failed processing because it was unable to obtain a lock. The primary name of the lock was *P3* , the minor name was *P4* , the return code was *P1* and the feedback code was *P2* .

System Action:

The request is rejected and procedure \$PSZZ75D terminates.

User Action:

Interpret the feedback code using the NCL Reference. The SHOW LOCKS command can be issued from an OCS window to determine the procedure and userid that is holding the lock.

PS7601**REQUEST *P1* - STATUS CHANGED FROM *P2* TO *P3*****Reason:**

The PSM clean-up utility detected a print request with a status that did not reflect its real state, and it updated the request's status to the correct status. The number of the print request updated was *P1*, the old status was *P2* and the new status was *P3*. A print request can have an incorrect status due to the system terminating abnormally while PSM is processing the request. The PSM clean-up utility is executed during initialization processing.

System Action:

None.

User Action:

If the new status of the request is HELD-ERROR or DIRECT-ERR, the process that created the print request did not complete successfully and should be rerun; otherwise, no action is required.

PS7602**STATUS CHANGED FROM *P1* TO *P2* BY THE SYSTEM DUE TO ERROR****Reason:**

The PSM clean-up utility detected a print request with a status that did not reflect its real state, and it updated the request's status to the correct status. The old status was *P1* and the new status was *P2*. A print request can have an incorrect status due to the system terminating abnormally while PSM is processing the request. The PSM clean-up utility is executed during initialization processing.

System Action:

None.

User Action:

The process that created the print request did not complete successfully and should be rerun.

PS7801**INVALID EXIT DATA SPECIFIED, REFER TO MESSAGE ~P1 ON THE LOG****Reason:**

The PSM Net/Mail (V2.1) Interface which runs as a Print Services Manager printer exit has been invoked with invalid exit data. Message number P1 further describes the nature of the error.

System Action:

Delivery of the print to Net/Mail is aborted and the print request is marked in error.

User Action:

Refer to message P1 on the activity log for more information. Determine whether the invalid exit data was specified in the PSM printer definition or passed to PSM with the print request.

PS7802**INVALID KEYWORD VALUE SPECIFIED, KEYWORD=~P1 VALUE=~P2****Reason:**

The Print Services Manager Net/Mail (V2.1) Interface printer exit failed during request processing because it was passed an invalid keyword value in the exit data. The keyword was P1 and the invalid value was P2.

System Action:

Delivery of the print to Net/Mail is aborted and the print request is marked in error.

User Action:

Correct the exit data defined in the PSM printer definition. If the invalid value is passed to PSM with the print request, correct the requesting procedure.

PS7803

~P1 ACCESS ERROR FOR ~P2, REFER TO MESSAGE ~P3 ON THE LOG

Reason:

The PSM Net/Mail (V2.1) Interface which runs as a Print Services Manager printer exit has failed due to an access error. P1 indicates the type of access failure and P2 indicates the Net/Mail ID or the APPC profile on whose behalf the access was attempted. Message number P3 further describes the nature of the problem.

System Action:

Delivery of the print to Net/Mail is aborted and the print request is marked in error.

User Action:

Refer to message P3 on the activity log for more information on the cause of the access failure.

PS7804

VARIABLE ERROR, ID= P1 FUNC= P2 FDBK= P3 KEY= P4

Reason:

The PSM Net/Mail (V2.1) Interface which runs as a Print Services Manager printer exit has failed because it encountered an error accessing a variable table. The table identifier was *P1* , the request was *P2* , the feedback code was *P3* and the value of the key was *P4* .

System Action:

Delivery of the print to Net/Mail is aborted and the print request is marked in error.

User Action:

Interpret the feedback code using the NCL Reference.

PS7901**INVALID EXIT DATA SPECIFIED, REFER TO MESSAGE ~P1 ON THE LOG****Reason:**

The PSM Net/Mail (V2.2) Interface which runs as a Print Services Manager printer exit has been invoked with invalid exit data. Message number P1 further describes the nature of the error.

System Action:

Delivery of the print to Net/Mail is aborted and the print request is marked in error.

User Action:

Refer to message P1 on the activity log for more information. Determine whether the invalid exit data was specified in the PSM printer definition or passed to PSM with the print request.

PS7902**INVALID KEYWORD VALUE SPECIFIED, KEYWORD=~P1 VALUE=~P2****Reason:**

The Print Services Manager Net/Mail (V2.2) Interface printer exit failed during request processing because it was passed an invalid keyword value in the exit data. The keyword was P1 and the invalid value was P2.

System Action:

Delivery of the print to Net/Mail is aborted and the print request is marked in error.

User Action:

Correct the exit data defined in the PSM printer definition. If the invalid value is passed to PSM with the print request, correct the requesting procedure.

PS7903

~P1 ACCESS ERROR FOR ~P2, REFER TO MESSAGE ~P3 ON THE LOG

Reason:

The PSM Net/Mail (V2.2) Interface which runs as a Print Services Manager printer exit has failed due to an access error. P1 indicates the type of access failure and P2 indicates the Net/Mail ID or the APPC profile on whose behalf the access was attempted. Message number P3 further describes the nature of the problem.

System Action:

Delivery of the print to Net/Mail is aborted and the print request is marked in error.

User Action:

Refer to message P3 on the activity log for more information on the cause of the access failure.

PS7904

VARIABLE ERROR, ID= P1 FUNC= P2 FDBK= P3 KEY= P4

Reason:

The PSM Net/Mail (V2.2) Interface which runs as a Print Services Manager printer exit has failed because it encountered an error accessing a variable table. The table identifier was *P1* , the request was *P2* , the feedback code was *P3* and the value of the key was *P4* .

System Action:

Delivery of the print to Net/Mail is aborted and the print request is marked in error.

User Action:

Interpret the feedback code using the NCL Reference.

PS8101**INVALID KEYWORD VALUE SPECIFIED, KEYWORD=~P1 VALUE=~P2****Reason:**

The PSM dataset printer exit procedure failed during request processing because it was passed an invalid keyword value in the exit data. The keyword was P1 and the invalid value was P2.

System Action:

The print request aborts and is marked in error.

User Action:

Correct the exit data defined in the PSM printer definition. If the invalid value is passed to PSM with the print request, correct the requesting procedure.

PS8102**IDCAMS ~P1 FAILED, RC=~P2****Reason:**

The PSM dataset printer exit procedure failed when using IDCAMS to manipulate a VSAM file. P1 is the type of processing which was being performed and P2 is the return code from IDCAMS.

System Action:

The print request aborts and is marked in error.

User Action:

Determine the cause of the error from the return code. Additional information may be obtained by passing the LIST=YES parameter to the PSM dataset printer exit procedure. This causes all IDCAMS request statements and output to be written to the activity log.

PS8103

PRINTER EXIT PROC (\$PSDS81X) NOT SUPPORTED UNDER VM OPERATING SYSTEM

Reason:

The PSM dataset printer exit procedure \$PSDS81X does not work in the VM operating system.

System Action:

The print request fails.

User Action:

Select another printer or change the PSM printer definition so that it does not use the printer exit procedure \$PSDS81X.

PS8104

FILE P1 ERROR, ID= P2 RC= P3 FDBK= P4

Reason:

The PSM dataset printer exit procedure failed during request processing because it encountered an error accessing the staging file. The file request that failed was *P1* , the file ID was *P2* , the file return code was *P3* and the VSAM feedback code was *P4* .

System Action:

The print request aborts and is marked in error.

User Action:

Interpret the file return code using the NCL Reference and the feedback code using the VSAM Programmer's Guide or the VSAM Administration: Macro Instruction Reference for installations with DFP.

PS8105**PSM REQUEST ~P1 EXPORTED SUCCESSFULLY, ~P2 RECORDS EXPORTED****Reason:**

A print request using the PSM dataset printer exit procedure completed successfully. P1 was the PSM request number and P2 was the number of records that were output.

System Action:

None.

User Action:

None.

PS8106**IDCAMS ~P1 STATEMENTS FOLLOW FOR PSM PRINT REQUEST # ~P2****Reason:**

This message is written to the activity log when the LIST=YES parameter is passed to the PSM dataset printer exit procedure. It indicates that statements generated from IDCAMS processing follow in the log. P1 is the type of IDCAMS processing that was requested and may be set to DELETE, DEFINE or REPRO. P2 is the PSM request number.

System Action:

None.

User Action:

Refer to the messages following this message in the activity log with message ID PS8107.

PS8107

~P1

Reason:

This message contains the output from an IDCAMS operation and is written to the activity log when the LIST=YES parameter is passed to the PSM dataset printer exit procedure.

System Action:

None.

User Action:

None.

PS8108

P1 FILE IS ALLOCATED, DDNAME= P2, DSNAME= P3

Reason:

A file required by the PSM data set printer exit procedure was successfully allocated. *P1* is the type of file that was allocated, and is either STAGE or OUTPUT. *P2* is the ddname that was used. *P3* is the name of the allocated data set.

System Action:

None.

User Action:

None.

PS8801

PSM print data emailed to P1

Reason:

A PSM print request has been forwarded in email format to recipient *P1* .

System Action:

None.

User Action:

None.

PS8802***p1* PSM Print *P2* at *p3*****Reason:**

This message text is used as the subject line for PSM printing using email.

P1 is the system ID.

P2 is the PSM print request number.

P3 is the date and time of the print request.

System Action:

The message text, minus the message identifier, is formatted as the email subject line.

User Action:

Modify the message text if you want to change the format of the email subject text.

PS8803**Data attached for *P1*****Reason:**

A PSM print request has been forwarded in email format as an attachment. *P1* is the email subject as generated by the application. The default is *SystemId* PSM Print *nnnn* at *date time*, where *SystemId* is the system identifier and *nnnn* is the PSM print request number.

System Action:

PSM print data is sent as an attachment and this message is sent as the message body.

User Action:

None.

PS8804

Yours,

Reason:

A PSM print request has been forwarded in email format as an attachment. This message is used as the signature in the message body.

System Action:

PSM print data is sent as an attachment and this message is sent as the signature in the message body.

User Action:

None.

PS8805

PSM print data emailed to *P1* for issue *P2*

Reason:

A PSM print request is emailed to Technical Support for issue *P2*.

System Action:

The generated email is queued to the SMTP task.

User Action:

None.

PSDB1012

VSAM error on file get: FileID *P1*, FileRC= *P2* FDBK= *P3* KEY= *P4*

Reason:

An error occurred attempting to read a PSM definition. In the message:

P1 is the file ID.

P3 is the file return code (&FILERC).

P4 is the file feedback code (&VSAMFDBK).

P4 is the file key.

System Action:

The procedure terminates.

User Action:

For return code and feedback values, see the &FILE GET verb description in the NCL Reference.

PSDB1013

VSAM error on file put: FileID *P1*, FileRC= *P2* FDBK= *P3* KEY= *P4*

Reason:

An error occurred attempting to write a PSM definition. In the message:

P1 is the file ID

P3 is the file return code (&FILERC)

P4 is the file feedback code (&VSAMFDBK)

P4 is the file key

System Action:

The procedure terminates.

User Action:

For return code and feedback values, see the &FILE GET verb description in the NCL Reference.

PSDB1014

VSAM error on file delete: FileID *P1*, FileRC= *P2* FDBK= *P3* KEY= *P4*

Reason:

An error occurred attempting to delete a PSM definition. In the message:

P1 is the file ID.

P3 is the file return code (&FILERC).

P4 is the file feedback code (&VSAMFDBK).

P4 is the file key.

System Action:

The procedure terminates.

User Action:

For return code and feedback values, see the &FILE GET verb description in the NCL Reference.

PSDB1201

P1 P2 already defined

Reason:

A request to add a PSM definition failed because a PSM definition of the same name and type already exists.

P1 is the definition type: - Printer Name - Form Name - Setup Name

P2 is the value provided.

System Action:

The request is ignored.

User Action:

Enter a unique definition name and retry.

PSDB1202**P1 P2 is not defined****Reason:**

The requested PSM definition does not exist.

P1 is the definition type: - Printer Name - Form Name - Setup Name

P2 is the value provided.

System Action:

The request is ignored.

User Action:

Enter a correct definition name or use the field prompt (?), and then retry.

PSDB1301**P1 not selected from list****Reason:**

A PSM definition not was selected from the prompt list.

P1 is the definition type: - Printer Name - Form Name - Setup Name

System Action:

The request is ignored.

User Action:

Enter a unique definition name or select an item from the list.

PSINW01**Form Name P1 is not defined****Reason:**

The requested PSM form definition (*P1*) does not exist.

System Action:

The request is ignored.

User Action:

Enter a correct form name or use the field prompt (?), and then retry.

PSPKG01

User P1 not authorized to P2 PSM definitions

Reason:

A request to access or delete a PSM definition failed because the user is not authorized for the request. The function requested was *P2* and the user ID of the requestor was *P1* .

System Action:

The request is rejected.

User Action:

None.

PSPKG02

Unsupported return code received from procedure \$CAUA000, RC= P1

Reason:

A request to access or delete a PSM definition failed because the definition list service procedure received an unknown return code (*P1*) from procedure \$CAUA000.

System Action:

The request is rejected.

User Action:

Contact your system administrator.

PV0001

INVALID KEYWORD VALUE SPECIFIED, KEYWORD=~P1 VALUE=~P2

Reason:

Procedure \$CAPV000 failed during request processing because it was passed an invalid keyword value. The keyword was *P1* and the invalid value was *P2* .

System Action:

Procedure \$CAPV000 ends.

User Action:

Check the request. Contact the systems administrator.

PV0002**NO ~P1 PANEL DOMAINS DEFINED FOR APPL=~P2****Reason:**

Procedure \$CAPV000 failed during prompt processing because no panel domains are defined for the TYPE and APPL specified. P1 is the Domain Type and P2 is the Application ID.

System Action:

Procedure \$CAPV000 ends.

User Action:

Check the TYPE and APPL values specified and retry.

PV0003**DOMAIN ~P1 IS NOT LOADED****Reason:**

A Panel Domain is not currently loaded in the Panel Navigator domain table. P1 is the ID of the Panel Domain that was tested.

System Action:

None.

User Action:

RELOAD the the Panel Domain if required.

PV0004**APPLICATION ID IS REQUIRED FOR ~P1****Reason:**

Procedure \$CAPV000 failed during request processing because it requires an Application ID to perform the request action. P1 is the action that could not be performed.

System Action:

Procedure \$CAPV000 ends.

User Action:

Specify an Application ID for the action and retry.

PV0030

~P1 OF ~P2 DOMAIN(S) LOADED FOR APPL=~P3, ~P4 ERROR(S)

Reason:

Domain Definitions were loaded into the domain table. P1 is the number of domains successfully loaded, P2 is the total number of domains selected to be loaded, P3 is the Application ID used to select domains to be loaded and P4 is the number of errors encountered loading the domains.

System Action:

None.

User Action:

If any errors were encountered then review the associated error messages contained in the activity log and process accordingly.

PV1001

INVALID KEYWORD VALUE SPECIFIED, KEYWORD=~P1 VALUE=~P2

Reason:

Procedure \$CAPV10M failed during request processing because it received an invalid keyword value. The keyword was P1 and the invalid value was P2 .

System Action:

Procedure \$CAPV10M ends.

User Action:

Contact the system administrator.

PV1002**Domain Type MUST BE PUBLIC OR PRIVATE****Reason:**

An option was selected from the Panel Navigator Primary Menu and an invalid value was entered in the Domain Type field. The value of this field must be either PUBLIC or PRIVATE.

System Action:

The selection of the option is rejected and the Domain Type field is set in error.

User Action:

Enter PUBLIC or PRIVATE in the Domain Type field and retry. Only the first two characters need to be entered.

PV1003**Userid CAN NOT BE SPECIFIED FOR PUBLIC DOMAINS****Reason:**

A request to process a Domain Definition failed because the Domain Type was specified as PUBLIC but a Userid was specified. A value for the Userid field can only be specified if the Domain Type is PUBLIC.

System Action:

The request is rejected.

User Action:

Do not specify a Userid value for PUBLIC domains.

PV2001

INVALID KEYWORD VALUE SPECIFIED, KEYWORD=~P1 VALUE=~P2

Reason:

The Panel Navigator Presentation Procedure \$CAPV20P failed because it received an invalid keyword value. The keyword was P1 and the invalid value was P2 .

System Action:

Procedure \$CAPV20P terminates.

User Action:

Contact the system administrator.

PV2002

USERID P1 NOT AUTHORIZED FOR MAINTENANCE OF PANEL DOMAINS

Reason:

A request to modify Panel Domains was denied because the user was not authorized. P1 is the unauthorized userid.

System Action:

The request is rejected.

User Action:

Contact the systems administrator if access to panel domain maintenance is required.

PV2004

INVALID COMMAND

Reason:

An invalid command was entered in the Command field.

System Action:

The command is rejected.

User Action:

Correct the command and retry.

PV2006**~P1 CANCELLED****Reason:**

A request to perform a function on a Panel Navigator database record definition was cancelled at the users request. P1 is the function that was being performed.

System Action:

None.

User Action:

None.

PV2009**PRESS ENTER KEY TO CONFIRM DELETE OR CANCEL KEY TO CANCEL REQUEST****Reason:**

The Domain Definition panel was displayed requesting the user to confirm the deletion of the domain definition presented.

System Action:

None.

User Action:

Press the ENTER key to allow the domain definition to be deleted, or press the CANCEL key to cancel the delete request.

PV2010**DOMAIN ~P1 ADDED : ~P2 ELEMENT(S), ~P3 PATH(S)****Reason:**

A Domain Definition and its associated elements/paths was successfully added. P1 is the domain ID, P2 is the number of elements in the domain and P3 is the number of paths in the domain.

System Action:

None.

User Action:

None.

PV2011

DOMAIN ~P1 DELETED : ~P2 ELEMENT(S), ~P3 PATH(S)

Reason:

A Domain Definition and its associated elements/paths was successfully deleted. P1 is the domain ID, P2 is the number of elements that were deleted and P3 is the number of paths that were deleted.

System Action:

None.

User Action:

None.

PV2012

DOMAIN DEFINITION ALREADY EXISTS

Reason:

A Domain definition of the same ID already exist on the database.

System Action:

The Add request is rejected.

User Action:

Specify a unique Domain ID. Note that the Domain ID consists of the Domain APPL, TYPE, USERID and NAME.

PV2501

INVALID KEYWORD VALUE SPECIFIED, KEYWORD=~P1 VALUE=~P2

Reason:

Procedure \$CAPV25L failed during request processing because it was passed an invalid keyword value. The keyword was P1 and the invalid value was P2 .

System Action:

Procedure \$CAPV25L ends.

User Action:

Contact the system administrator.

PV3003**FUNCTION KEY ~P1 IS NOT ACTIVE IN THIS WINDOW****Reason:**

Function key P1 was pressed and it has no action assigned to it.

System Action:

None.

User Action:

None.

PV3004**INVALID COMMAND****Reason:**

An invalid command was entered in the Command field.

System Action:

The command is rejected.

User Action:

Correct the command and retry.

PV5001**INVALID KEYWORD VALUE SPECIFIED, KEYWORD=~P1 VALUE=~P2****Reason:**

The CAS Panel Navigator utilities procedure \$CAPV50U failed during request processing because it was passed an invalid keyword value. The keyword was P1 and the invalid value was P2 .

System Action:

The request is rejected and procedure \$CAPV50U terminates.

User Action:

Contact the system administrator.

PV5005

DOMAIN ~P1 IS NOT DEFINED

Reason:

A request to perform a function on a Panel Domain database definition failed because the definition was not defined. P1 is the ID of the Panel Domain in error.

System Action:

The request is rejected.

User Action:

Specify a Domain ID previously defined and retry.

PV5006

ELEMENT ~P1 IS NOT DEFINED

Reason:

A request to perform a function on a Panel Element definition failed because the element was not defined. P1 is the name if the element in error.

System Action:

The request is rejected.

User Action:

Specify an Element previously defined and retry.

PV5007

PATH ~P1 IS NOT DEFINED

Reason:

A request to perform a function on a Path definition failed because the path was not defined. P1 is the name of the path in error.

System Action:

The request is rejected.

User Action:

Specify a Path name previously defined and retry.

PV5008**DOMAIN ~P1 ~P2****Reason:**

An action for a Domain definition was successfully performed. P1 is the ID of the Domain and P2 is the action performed.

System Action:

None.

User Action:

None.

PV5009**ELEMENT ~P1 ~P2****Reason:**

An action for an Element definition was successfully performed. P1 is the name of the element and P2 is the action performed.

System Action:

None.

User Action:

None.

PV5010**PATH ~P1 ~P2****Reason:**

An action for a Path definition was successfully performed. P1 is the Path name and P2 is the action performed.

System Action:

None.

User Action:

None.

PV5011

DOMAIN ~P1 IS ALREADY DEFINED

Reason:

A request to add a Domain Definition failed because a domain of the same ID was already defined. P1 is the ID of the domain.

System Action:

The request is rejected.

User Action:

Specify a Domain ID not previously defined and retry. Note that the domain ID consists of the domain APPL, TYPE, USER and NAME.

PV5012

ELEMENT ~P1 IS ALREADY DEFINED

Reason:

A request to add an Element definition failed because an element of the same name was already defined. P1 is the name of the element.

System Action:

The request is rejected.

User Action:

Specify an Element name not previously defined and retry.

PV5014

PATH ~P1 IS ALREADY DEFINED

Reason:

A request to add a Path definition failed because a path of the same ID was already defined. P1 is the ID of the path.

System Action:

The request is rejected.

User Action:

Specify a Path ID not previously defined and retry. Note that a path ID consists of the FROM and TO element names.

PV5015**UNABLE TO ~P1, NO PANEL NAME DEFINED****Reason:**

A request to View or Edit the panel associated with an element failed because the element does not specify a panel name. P1 is the action that was requested (View or Edit). This error normally occurs when the selected element is not of TYPE= PANEL.

System Action:

The request is rejected.

User Action:

Do not invoke the View or Edit actions against elements that do not specify a panel name.

PV5017**UNABLE TO OBTAIN LOCK HELD BY ~P1****Reason:**

The CAS Panel Navigator procedure \$CAPV50U failed during processing because it was unable to obtain an NCL procedure lock. P1 is the userid of the current holder of the lock.

System Action:

Procedure \$CAPV50U ends.

User Action:

Wait and then retry the request. Contact the system administrator.

PV5020

CAN NOT DELETE DOMAIN, ELEMENTS EXIST

Reason:

A request to delete a Domain Definition failed because Elements are defined within the domain.

System Action:

The request is rejected.

User Action:

Delete all elements defined within the domain before attempting to delete the domain.

PV5021

CAN NOT DELETE DOMAIN, PATHS EXIST

Reason:

A request to delete a Domain Definition failed because Paths are defined within the domain.

System Action:

The request is rejected.

User Action:

Delete all paths defined within the domain before attempting to delete the domain.

PV5022

CAN NOT DELETE ELEMENT, FROM PATHS EXIST

Reason:

A request to delete an Element definition failed because Paths are defined FROM this element.

System Action:

The request is rejected.

User Action:

Delete all paths defined FROM this element before attempting to delete the element.

PV5023**CAN NOT DELETE ELEMENT, TO PATHS EXIST****Reason:**

A request to delete an Element Definition failed because Paths are defined TO this element.

System Action:

The request is rejected.

User Action:

Delete all paths defined TO an element before attempting to delete the element.

PV5030**DOMAIN ~P1 LOADED : ~P2 ELEMENT(S), ~P3 PATH(S)****Reason:**

A Domain Definition was successfully loaded into the domain table. P1 is the domain ID, P2 is the number of elements and P3 is the number of paths between elements.

System Action:

None.

User Action:

None.

PV5031**LOAD FAILED, DOMAIN ~P1 HAS NO ACTIVE ELEMENTS****Reason:**

A Domain Definition could not be loaded into the domain table since there were no ACTIVE elements defined for it. P1 is the domain ID.

System Action:

The request to load the domain is rejected.

User Action:

Define at least 1 ACTIVE element for the domain before attempting to load it.

PV5032

LOAD FAILED, DOMAIN ~P1 DOES NOT EXIST

Reason:

A Domain Definition could not be loaded into the domain table since there were no corresponding database record. P1 is the domain ID.

System Action:

The request to load the domain is rejected.

User Action:

Check the domain ID. Note that the domain ID consists of the domain APPL, TYPE, USER and NAME.

PV5050

VARIABLE ERROR : TABLE=~P1 ACTION=~P2 FEEDBACK=~P3

Reason:

An error occurred performing an action on a VARIABLE. P1 is the name of the VARIABLE, P2 is the action that was being performed and P3 is the feedback code returned from the VARIABLE action.

System Action:

The request is rejected.

User Action:

Contact the systems administrator.

PV6003

INVALID Domain Type, MUST BE PUBLIC OR PRIVATE

Reason:

An invalid value was entered in the Domain Type field. The value of this field must be either PUBLIC or PRIVATE.

System Action:

The Domain Type field is set in error.

User Action:

Enter PUBLIC or PRIVATE in the Domain Type field. Only the first two characters need to be entered.

PV6004**INVALID Criteria Type, MUST BE PUBLIC OR PRIVATE****Reason:**

An invalid value was entered in the Criteria Type field. The value of this field must be either PUBLIC or PRIVATE.

System Action:

The Criteria Type field is set in error.

User Action:

Enter PUBLIC or PRIVATE in the Criteria Type field. Only the first two characters need to be entered.

PV6005**INVALID Status, MUST BE ACTIVE OR INACTIVE****Reason:**

An invalid value was entered in the Status field. The value of this field must be either ACTIVE or INACTIVE.

System Action:

The Status field is set in error.

User Action:

Enter ACTIVE or INACTIVE in the Status field. Only the first character needs to be entered.

PV6006**INVALID PATH STATUS, MUST BE ACTIVE OR INACTIVE****Reason:**

An invalid value was entered in the Status field. The value of this field must be either ACTIVE or INACTIVE.

System Action:

The Status field is set in error.

User Action:

Enter ACTIVE or INACTIVE in the Status field. Only the first character needs to be entered.

PV6007

INVALID VALUE, From Element ~P1 IS NOT DEFINED

Reason:

A request to define a Path Definition failed because an Element Definition for the 'From Element' value has not been defined. P1 is the 'From Element' value.

System Action:

The request is rejected.

User Action:

Specify a 'From Element' value that is the name of an existing element.

PV6008

INVALID VALUE, To Element ~P1 IS NOT DEFINED

Reason:

A request to define a Path Definition failed because an Element Definition for the 'To Element' value has not been defined. P1 is the value of the 'To Element' field.

System Action:

The request is rejected.

User Action:

Specify a 'To Element' value that is the name of an existing element.

PV6009

INVALID VALUE, Userid MUST BE SPECIFIED FOR PRIVATE DOMAINS

Reason:

A request to define a Domain Definition failed because the Domain Type was specified as PRIVATE but a Userid was not specified.

System Action:

The request is rejected.

User Action:

Specify a Userid value for PRIVATE domains.

PV6010**INVALID VALUE, Userid CAN NOT BE SPECIFIED FOR PUBLIC DOMAINS****Reason:**

A request to define a Domain Definition failed because the Domain Type was specified as PUBLIC but a Userid was specified.

System Action:

The request is rejected.

User Action:

Do not specify a Userid value for PUBLIC domains.

PV6011**INVALID Element Type, MUST BE PANEL OR TEXT****Reason:**

An invalid value was entered in the Element Type. The value of this field must be either PANEL or TEXT.

System Action:

The Element Type field is set in error.

User Action:

Enter PANEL or TEXT in the Element Type field.

PV6012**INVALID Text Style, MUST BE LOG OR NORMAL****Reason:**

An invalid value was entered in the Text Style. The value of this field must be either LOG or NORMAL.

System Action:

The Text Style field is set in error.

User Action:

Enter LOG or NORMAL in the Text Style field.

PV6013

Panel Name IS REQUIRED FOR Type PANEL

Reason:

A value for Panel Name must be specified if the Element Type is PANEL.

System Action:

The Panel Name field is set in error.

User Action:

Enter a value for the Panel Name.

PV6014

Text Name IS REQUIRED FOR Type TEXT

Reason:

A value for Text Name must be specified if the Element Type IS TEXT.

System Action:

The Text Name field is set in error.

User Action:

Enter a value for the Text Name.

PV6015

Text Title IS REQUIRED FOR Type TEXT

Reason:

A value for Text Title must be specified if the Element Type is TEXT.

System Action:

The Text Title field is set in error.

User Action:

Enter a value for the Text Title.

PV6016**Help Name IS REQUIRED FOR Type PANEL****Reason:**

A value for Help Name must be specified if the Element Type is PANEL.

System Action:

The Help Name field is set in error.

User Action:

Enter a value for the Help Name.

PV6017**Criteria Name IS REQUIRED****Reason:**

A value for Criteria Name must be specified.

System Action:

The Criteria Name field is set in error.

User Action:

Enter a value for the Criteria Name.

PV6018**Criteria Appl ID IS REQUIRED****Reason:**

A value for Criteria Appl ID must be specified

System Action:

The Criteria Appl field is set in error.

User Action:

Enter a value for the Criteria Appl.

PV6020

Panel Name CAN NOT BE SPECIFIED FOR Type TEXT

Reason:

A value for Panel Name can not be specified if the Element Type is TEXT.

System Action:

The Panel Name field is set in error.

User Action:

Do not enter a value for the Panel Name unless the Element type is PANEL

PV6021

Text Name CAN NOT BE SPECIFIED FOR Type PANEL

Reason:

A value for Text Name can not be specified if the Element Type is PANEL.

System Action:

The Text Name field is set in error.

User Action:

Do not enter a value for the Text Name unless the Element type is TEXT

PV6022

Text Title CAN NOT BE SPECIFIED FOR Type PANEL

Reason:

A value for Text Title can not be specified if the Element Type is PANEL

System Action:

The Text Title field is set in error.

User Action:

Do not enter a value for the Text Title unless the Element type is TEXT

PV6023**Domain ~P1 ALREADY EXISTS****Reason:**

A Domain of the same name already exist on the database. P1 is the ID of the domain.

System Action:

Add request rejected

User Action:

Change the domain definition elements

PV6024**Element ~P1 ALREADY EXISTS****Reason:**

An Element of the same name already exists on the database. P1 is the element name.

System Action:

The Add request is rejected

User Action:

Change the Element Name to be unique within the Domain

PV6025**Path ~P1 ALREADY EXISTS****Reason:**

A Path of the same name already exists on the database. P1 is the path name.

System Action:

The Add request is rejected

User Action:

Change the Path Name to be unique within the Domain

PV6026

Path ~P1 IS REDUNDANT

Reason:

The specified path is redundant. P1 is the path name. This error normally occurs when a path has been defined directly for ##TOP## to ##END##.

System Action:

The Add request is rejected

User Action:

Correct the Path Name

PV7001

INVALID KEYWORD VALUE SPECIFIED, KEYWORD=~P1 VALUE=~P2

Reason:

Procedure \$CAPV70U failed during request processing because it was passed an invalid keyword value. The keyword was P1 and the invalid value was P2 .

System Action:

Procedure \$CAPV70U ends.

User Action:

Contact the systems administrator.

PV7004

NO PANELS ARE ~P1

Reason:

A request to display a list of panels failed because no panels no panels are currently eligible or defined. P1 is the reason the request could not be processed (DEFINED or ELIGIBLE).

System Action:

The request is rejected.

User Action:

None.

PV7005**PANEL ~P1 IS NOT ELIGIBLE****Reason:**

A request to navigate to a panel failed because the requested panel is not currently eligible. P1 is the name of the panel that was requested.

System Action:

The request is rejected.

User Action:

Check the spelling of the requested panel.

PV7007**UNABLE TO OBTAIN LOCK HELD BY ~P1****Reason:**

Procedure \$CAPV70U failed during processing because it was unable to obtain an NCL procedure lock. P1 is the userid of the current holder of the lock.

System Action:

Procedure \$CAPV70U ends.

User Action:

Wait and then retry the request. Contact the system administrator.

PV7008**PANEL ~P1 IS NOT DEFINED****Reason:**

A request to navigate to a panel failed because the panel is not defined in the panel domain. P1 is the name of the requested panel.

System Action:

The request is rejected.

User Action:

Check the name of the requested panel.

PV7010

PANEL ~P1 ELIGIBILITY TEST IN ERROR : SEE LOG MESSAGE ~P2

Reason:

A test of the eligibility of a panel failed because the defined test is invalid. P1 is the name of the panel that was being tested and P2 is the error message number of the returned syntax error (see the log for the full text of this message).

System Action:

The request is rejected.

User Action:

Contact the systems administrator.

PV7011

INVALID PANEL SKIP AMOUNT

Reason:

A request to skip through 'n' panels failed because the specified skip amount is invalid. Note that only numeric values (1 - 9999) or M/MAX can be specified as a skip amount.

System Action:

The request is rejected.

User Action:

Check the specified skip amount.

PV7012

DOMAIN ID MUST BE SPECIFIED

Reason:

Procedure \$CAPV70U failed during request processing because it was invoked without a valid Domain ID being passed to it.

System Action:

Procedure \$CAPV70U ends.

User Action:

Contact the systems administrator. Note that the Domain ID is the concatenation of APPL, TYPE, USER and NAME

PV7013**~P1 AND ~P2 CAN NOT BOTH BE SPECIFIED****Reason:**

Procedure \$CAPV70U failed during request processing because it was passed two mutually exclusive keywords. P1 and P2 are the keywords that can not be specified together.

System Action:

Procedure \$CAPV70U ends.

User Action:

Check the request. Note that only one of the keywords can be specified for the current request.

PV7014**NO ~P1 PANELS ARE ~P2****Reason:**

A request to navigate to a panel failed because no panels in the requested direction were DEFINED or ELIGIBLE. P1 is the direction requested (FORWARD, BACKWARD or PREVIOUS) and P2 is the reason the request could not be processed (DEFINED or ELIGIBLE)

System Action:

The request is rejected.

User Action:

None.

PV7015

APPLICATION ID MUST BE SPECIFIED

Reason:

Procedure \$CAPV70U failed during request processing because it was invoked without a valid Application ID being passed to it. Note that the Application ID is part of the Domain ID.

System Action:

Procedure \$CAPV70U ends.

User Action:

Contact the systems administrator.

PV7016

DOMAIN NAME MUST BE SPECIFIED

Reason:

Procedure \$CAPV70U failed during request processing because it was invoked without a valid Domain Name being passed to it. Note that the Domain Name is part of the Domain ID.

System Action:

Procedure \$CAPV70U ends.

User Action:

Contact the systems administrator.

PV7017

INVALID DOMAIN TYPE, MUST BE PUBLIC OR PRIVATE

Reason:

Procedure \$CAPV70U failed during request processing because it was invoked without a valid Domain Type being passed to it. The value of the Domain Type must be either PUBLIC or PRIVATE. Note that the Domain Type forms part of the Domain ID.

System Action:

Procedure \$CAPV70U ends.

User Action:

Contact the systems administrator.

PV7018**A USER ID CAN NOT BE SPECIFIED FOR ~P1 DOMAINS****Reason:**

Procedure \$CAPV70U failed during request processing because it was invoked with a User ID being specified for a Domain Type that does not support a User ID. P1 is the Domain Type. Note that the User ID forms part of the Domain ID.

System Action:

Procedure \$CAPV70U ends.

User Action:

Contact the systems administrator.

PV7019**DOMAIN ~P1 DOES NOT EXIST****Reason:**

Procedure \$CAPV70U failed during request processing because no domain of the specified ID exists. P1 is the Domain ID. Note that the Domain ID is formed using the values specified (or defaulted) for the APPL, TYPE, USER and NAME keywords.

System Action:

Procedure \$CAPV70U terminates.

User Action:

Contact the systems administrator.

PV7050

VARIABLE ERROR : TABLE=~P1 ACTION=~P2 FEEDBACK=~P3

Reason:

An error occurred performing an action on a VARIABLE. P1 is the name of the VARIABLE, P2 is the action that was being performed and P3 is the feedback code returned from the VARIABLE action.

System Action:

The request is rejected.

User Action:

Contact the systems administrator.

PV8001

INVALID KEYWORD VALUE SPECIFIED, KEYWORD=~P1 VALUE=~P2

Reason:

The CAS Panel Navigator procedure \$CAPV80L failed during request processing because it was passed an invalid keyword value. The keyword was P1 and the invalid value was P2 .

System Action:

The request is rejected and procedure \$CAPV80L terminates.

User Action:

Contact the Systems Administrator.

REx to RMAx Messages

RE0101

INCORRECT PARAMETER SPECIFIED *P1*=*P2*

Reason:

An incorrect keyword parameter was supplied to an internal procedure.

System Action:

The action is rejected.

User Action:

Contact your systems support representative.

RE0102

RULESET *P1* LOADED

Reason:

The ruleset *P1* has been successfully loaded.

System Action:

Eventview processes the rules in the ruleset.

User Action:

None.

RE0103

RULESET *P1* ALREADY INCLUDED IN *P2* - IGNORED

Reason:

The ruleset *P2* was being loaded by EventView. During the processing of included rulesets, it was found that the ruleset *P1* was already included. The additional include of the ruleset is ignored.

System Action:

The included ruleset is ignored this time and ruleset loading continues.

User Action:

None.

RE0104

RULESET P1 NOT ACTIVE

Reason:

An attempt was made to load a ruleset which had a ruleset status of INACTIVE.

System Action:

The named ruleset is not loaded. If the load was attempted because the ruleset was included in another ruleset, the load of the other ruleset continues.

User Action:

If you want the ruleset loaded, update the ruleset and change status to ACTIVE.

RE0105

RULESET HANDLER ALREADY RUNNING

Reason:

An attempt was made to start a ruleset handler for EventView, however the ruleset handler was already running.

System Action:

The new ruleset handler process ends.

User Action:

None.

RE0106

REGISTRATION FOR RULESET P1 FAILED, VARIABLE P2 ZFDBK= P3

Reason:

An attempt was made to load or unload the ruleset P1 and error on the registration variable occurred during a P2 action. The feedback code P3 indicates the nature of the error.

System Action:

Processing continues.

User Action:

Determine the cause of the error by examining the ZFDBK code, correct and retry.

RE0107**UNLOAD FAILED, GDB ZFDBK P1 ON P2****Reason:**

An attempt was made to unload a ruleset *P1* and a GDB error occurred during a *P2* action. The feedback code *P1* indicates the nature of the error.

System Action:

The load fails.

User Action:

Determine the cause of the error by examining the ZFDBK code, correct and retry.

RE0108**RULESET P1 INCLUDED****Reason:**

The ruleset *P1* has been successfully loaded as a result of being included in another ruleset.

System Action:

EventView processes the rules in the ruleset.

User Action:

None.

RE0109**RULESET P1 UNLOADED****Reason:**

The ruleset *P1* has been unloaded from the running system. This could be caused by the update of ruleset definitions.

System Action:

EventView no longer processes the rules in the ruleset.

User Action:

None.

RE0110

RULESET P1 IS NOT LOADED

Reason:

This message is issued in response to a query on EventView for the ruleset *P1* which is not currently loaded.

System Action:

None.

User Action:

None.

RE0111

RULESET P1 DOES NOT EXIST

Reason:

An attempt was made to load a ruleset which is not defined.

System Action:

The named ruleset is not loaded. If the load was attempted because the ruleset was included in another ruleset, the load of the other ruleset continues.

User Action:

Correct the ruleset name.

RE0112

RULESET P1 ALREADY LOADED

Reason:

This message is issued when a ruleset is included in another ruleset, but the ruleset has already been loaded by another ruleset. For example, ruleset1 is being loaded, which includes ruleset2, which in turn includes ruleset1 again.

System Action:

The included ruleset is ignored this time and ruleset loading continues.

User Action:

Correct the include ruleset definition.

RE0113**RULESET ACTIVITY LOGGING STARTED****Reason:**

The ruleset control options for the primary loaded ruleset indicate that activity logging should take place. Activity logging has started.

System Action:

The actions performed by EventView are logged.

User Action:

Activity logging increases the cost of running EventView. It is intended for use as a ruleset debugging facility. When the ruleset is running correctly you should turn off activity logging by updating the ruleset control options.

RE0114**RULESET ACTIVITY LOGGING STOPPED****Reason:**

The ruleset control options for the primary loaded ruleset have been changed to indicate that activity logging should stop.

System Action:

The actions performed by EventView are no longer logged.

User Action:

None.

RE0115**EVENTVIEW IS NOT ACTIVE****Reason:**

There is no EventView ruleset active. This is probably because the current system image does not name a ruleset to load.

System Action:

None.

User Action:

None.

RE0120**P1 RULE FOR P2 RESULTED IN P3****Reason:**

This message indicates that a rule resulted in the action *P3*. The rule is indicated by *P2* as follows: IACTION-name The named initial action GROUP-name The named message group rule TIMER-name The named timer rule msgid A message with this MSGID If *P1* is (TEST) the action was not actually done because the ruleset control option 'Perform Action?' was set to no, or the 'Perform Action in Manual Mode?' field in the AUTOIDS parameter group was set to NO.

This message is part of eventview ruleset activity logging. Ruleset activity logging is controlled by a ruleset control option.

System Action:

None.

User Action:

None.

RE0121**P1 RULE FOR P2 SET EVENTVIEW VARIABLE: P3****Reason:**

This message indicates that a rule resulted in an EventView variable being set to the value shown in *P3*. The rule is indicated by *P2* as follows:

IACTION-name The named initial action

GROUP-name The named message group rule

TIMER-name The named timer rule

msgid A message with this MSGID

If *P1* is (TEST) the action was not actually done because the ruleset control option 'Perform Action?' was set to no, or the 'Perform Action in Manual Mode?' field in the AUTOIDS parameter group was set to NO.

This message is part of eventview ruleset activity logging. Ruleset activity logging is controlled by a ruleset control option.

System Action:

None.

User Action:

None.

RE0122**P1 RULE FOR P2 ISSUED COMMAND: P3****Reason:**

This message indicates that a rule resulted in the system command *P3* being issued. The rule is indicated by *P2* as follows:

IACTION-*name*

The named initial action

GROUP-*name*

The named message group rule

TIMER-*name*

The named timer rule

msgid

A message with this MSGID

If *P1* is (TEST), the action was not actually done because the ruleset control option 'Perform Action?' was set to NO or the 'Perform Action in Manual Mode?' field in the AUTOIDS parameter group was set to NO.

This message is part of EventView ruleset activity logging. Ruleset activity logging is controlled by a ruleset control option.

System Action:

None.

User Action:

None.

RE0123

P1 RULE FOR P2 REPLIED: P3

Reason:

This message indicates that a rule resulted in the reply command *P3* being issued. The rule is indicated by *P2* as follows:

IACTION-name The named initial action

GROUP-name The named message group rule

TIMER-name The named timer rule

msgid A message with this MSGID

If *P1* is (TEST) the action was not actually done because the ruleset control option 'Perform Action?' was set to no, or the 'Perform Action in Manual Mode?' field in the AUTOIDS parameter group was set to NO.

This message is part of eventview ruleset activity logging. Ruleset activity logging is controlled by a ruleset control option.

System Action:

None.

User Action:

None.

RE0124

P1 RULE FOR P2 ISSUED AUTOMATION COMMAND: P3

Reason:

This message indicates that a rule resulted in the automation command *P3* being issued. The rule is indicated by *P2* as follows:

IACTION-name The named initial action

GROUP- name The named message group rule

TIMER-name The named timer rule

msgid A message with this MSGID

If *P1* is (TEST) the action was not actually done because the ruleset control option 'Perform Action?' was set to no, or the 'Perform Action in Manual Mode?' field in the AUTOIDS parameter group was set to NO.

This message is part of eventview ruleset activity logging. Ruleset activity logging is controlled by a ruleset control option.

System Action:

None.

User Action:

None.

RE0125**P1 RULE FOR P2 ISSUED MESSAGE: P3****Reason:**

This message indicates that a rule resulted in the message *P3* being issued as a WTO. The rule is indicated by *P2* as follows:

IACTION-name The named initial action

GROUP- name The named message group rule

TIMER-name The named timer rule

msgid A message with this MSGID

If *P1* is (TEST) the action was not actually done because the ruleset control option 'Perform Action?' was set to no, or the 'Perform Action in Manual Mode?' field in the AUTOIDS parameter group was set to NO.

This message is part of eventview ruleset activity logging. Ruleset activity logging is controlled by a ruleset control option.

System Action:

None.

User Action:

None.

RE0126**P1 RULE FOR P2 STARTED AUTOMATION PROCESS: P3****Reason:**

This message indicates that a rule resulted in the automation process *P3* being started. The rule is indicated by *P2* as follows:

IACTION-name The named initial action

GROUP- name The named message group rule

TIMER-name The named timer rule

msgid A message with this MSGID

If *P1* is (TEST) the action was not actually done because the ruleset control option 'Perform Action?' was set to no, or the 'Perform Action in Manual Mode?' field in the AUTOIDS parameter group was set to NO.

This message is part of eventview ruleset activity logging. Ruleset activity logging is controlled by a ruleset control option.

System Action:

None.

User Action:

None.

RE0127

P1 RULE FOR P2 ISSUED OCS COMMAND: P3

Reason:

This message indicates that a rule resulted in the *P3* command being issued.

The rule is indicated by *P2* as follows:

IACTION-name The named initial action

GROUP-name The named message group rule

TIMER-name The named timer rule

msgid A message with this MSGID

If *P1* is (TEST), the action was not actually done because the ruleset control option 'Perform Action?' was set to no, or the 'Perform Action in Manual Mode?' field in the AUTOIDS parameter group was set to NO.

This message is part of EventView ruleset activity logging. Ruleset activity logging is controlled by a ruleset control option.

System Action:

None.

User Action:

None.

RE0130

P1 RULE FOR P2 SET ATTRIBUTES: P3

Reason:

This message indicates that a rule resulted in the message attributes being altered to *P3*. The rule is indicated by *P2* as follows:

IACTION-name The named initial action

GROUP- name The named message group rule

TIMER-name The named timer rule

msgid A message with this MSGID

If *P1* is (TEST) the attributes were not actually altered because the ruleset control option 'Perform Message Modification?' was set to no, or the 'Perform Action in Manual Mode?' field in the AUTOIDS parameter group was set to NO.

This message is part of eventview ruleset activity logging. Ruleset activity logging is controlled by a ruleset control option.

System Action:

None.

User Action:

None.

RE0131**P1 RULE FOR P2 MODIFIED TEXT TO: P3****Reason:**

This message indicates that a rule resulted in the message text being altered to *P3*. The rule is indicated by *P2* as follows:

IACTION-name The named initial action

GROUP-name The named message group rule

TIMER-name The named timer rule

msgid A message with this MSGID

If *P1* is (TEST) the message was not actually altered because the ruleset control option 'Perform Message Modification?' was set to no, or the 'Perform Action in Manual Mode?' field in the AUTOIDS parameter group was set to NO. This message is part of eventview ruleset activity logging. Ruleset activity logging is controlled by a ruleset control option.

System Action:

None.

User Action:

None.

RE0132**P1 RULE FOR P2 SET ROUTE CODE TO: P3****Reason:**

This message indicates that a rule resulted in the message route code being altered to *P3*. The rule is indicated by *P2* as follows:

IACTION-name The named initial action

GROUP-name The named message group rule

TIMER-name The named timer rule

msgid A message with this MSGID

If *P1* is (TEST) the route code was not actually altered because the ruleset control option 'Perform Message Modification?' was set to no, or the 'Perform Action in Manual Mode?' field in the AUTOIDS parameter group was set to NO. This message is part of eventview ruleset activity logging. Ruleset activity logging is controlled by a ruleset control option.

System Action:

None.

User Action:

None.

RE0133

P1 RULE FOR P2 SET DESCRIPTOR CODE TO: P3

Reason:

This message indicates that a rule resulted in the message descriptor code being altered to *P3*. The rule is indicated by *P2* as follows:

IACTION-name The named initial action

GROUP-name The named message group rule

TIMER-name The named timer rule

msgid A message with this MSGID

If *P1* is (TEST) the descriptor code was not actually altered because the ruleset control option 'Perform Message Modification?' was set to no or the 'Perform Action in Manual Mode?' field in the AUTOIDS parameter group was set to NO. This message is part of eventview ruleset activity logging. Ruleset activity logging is controlled by a ruleset control option.

System Action:

None.

User Action:

None.

RE0134

RULESET CONTROL OPTIONS FOR MESSAGE MODIFICATION & ACTIONS DISABLED

Reason:

The Perform Message Modification? and the Perform Action? EventView ruleset control options were disabled by the following:

- The global operation mode is MANUAL.

- The value in the Perform Action in Manual Mode? field of the AUTOIDS parameter group is NO.

System Action:

None.

User Action:

None.

RE3001**INCORRECT PARAMETER SPECIFIED P1= P2****Reason:**

An incorrect keyword parameter was supplied to an internal procedure.

System Action:

The action is rejected.

User Action:

Contact your systems support representative.

RE3002**GDB ERROR, ZFDBK P1 ON P2 KEY= P3****Reason:**

An attempt was made to load a rule and a GDB error occurred during a *P2* action. The feedback code *P1* indicates the nature of the error. The key value *P3* indicates which record was being actioned.

System Action:

The load fails.

User Action:

Determine the cause of the error by examining the ZFDBK code, correct and retry.

RE3003**WARNING, IGNORING EXTENDED VALIDATION FOR RULEID= P1
BECAUSE P2= P3****Reason:**

Some extended validation characteristics of a rule with id *P1* were ignored because they are not supported. The value *P3* is not supported for the field *P2*.

System Action:

Not all validation for the rule is done.

User Action:

Correct the rule definition.

RE3004

VARIABLE ERROR: ID= P1 ACTION= P2 ZFDBK= P3

Reason:

An unexpected error occurred while a message rule was being loaded. The ID of the variable is *P1* The action which failed is *P2* The ZFDBK code is *P3*

System Action:

The load of this rule fails.

User Action:

Determine the cause of the error by examining the ZFDBK code, correct and retry.

RE3005

GROUP RULE P1, RULESET P2, DROPPED - MORE THAN P3 MEMBERS

Reason:

The Group rule P1 in ruleset P2 was found to have too many members. The load process ignores the message group rule. The maximum number of members allowed in a group rule is *P3*.

System Action:

The group rule will not be processed.

User Action:

Correct the rule definitions.

RE3006

NO RULESETS LOADED

Reason:

An ACTION=DUMP display was requested for a message, but there are no EventView rulesets active.

System Action:

None.

User Action:

None.

RE3007**SEARCHING LOADED RULESETS FOR MESSAGE: P1****Reason:**

An ACTION=DUMP display was requested for the message *P1* and EventView is searching for rules which might be executed for that message.

System Action:

None.

User Action:

None.

RE3008**RULES WITH TEST TEXT: P1****Reason:**

An ACTION=DUMP display was requested for a message and EventView has found rules with the test text *P1* which match it. Rules with the test text *P1* follow. Note: the test text has been truncated at the first wildcard character.

System Action:

None.

User Action:

None.

RE3009****END** P1 RULE(S) FOUND****Reason:**

An ACTION=DUMP display was requested for a message and EventView has found *P1* rules which match the message.

System Action:

None.

User Action:

None.

RE3010

RULE ID P1, RANK P2

Reason:

An ACTION=DUMP display was requested for a message and EventView has found the rule with ID *P1* which matches the message. The rule ID is an internal name for the rule. The rank value of the rule id *P2*, when comparing rules, the lowest rank value is the best.

System Action:

None.

User Action:

None.

RE3011

RULE VALIDATION: P1

Reason:

The rule named in the previous RE3010 message has the validation operations *P1* Validation operations tell EventView how to check that a rule is valid for a message.

System Action:

None.

User Action:

None.

RE3012

RULE EXECUTED EVEN IF NOT BEST FIT

Reason:

The rule named in the previous RE3010 message will have its actions performed, even if it is not the best ranked rule.

System Action:

None.

User Action:

None.

RE3013**MESSAGE MODIFICATIONS:****Reason:**

The rule named in the previous RE3010 message will cause the following modifications to the message.

System Action:

None.

User Action:

None.

RE3014**MESSAGE REPLACEMENT: P1****Reason:**

The rule named in the previous RE3010 message will cause the message replacement: *P1*

P1 is a string of text operations which tell EventView how to generate the replacement text.

System Action:

None.

User Action:

None.

RE3015**MESSAGE THRESHOLD: P1****Reason:**

The rule named in the previous RE3010 message has a threshold specified. This message details the threshold.

System Action:

None.

User Action:

None.

RE3016

ROUTE CODE SET TO P1, DESCRIPTOR CODE SET TO P2

Reason:

The rule named in the previous RE3010 message specifies a change in route or descriptor codes.

P1 is the route code to be set (blank if unchanged)

P2 is the descriptor code to be set (blank if unchanged)

System Action:

None.

User Action:

None.

RE3017

ATTRIBUTE KEY P1, SETS ATTRIBUTES P2

Reason:

The rule named in the previous RE3010 message specifies a change in message attributes.

P1 is the key to the attribute table

P2 is the list of attributes set

System Action:

None.

User Action:

None.

RE3018

RULE ACTIONS:

Reason:

The rule named in the previous RE3010 message will cause the following actions to be performed.

System Action:

None.

User Action:

None.

RE3019**RULE IS IN GROUP P1, CORRELATOR (P2), INTERVAL P3, OTHER MEMBERS:****Reason:**

The rule named in the previous RE3010 message is a member of a message group rule P1 The group correlator is P2 . The lifetime of a group is P3. Messages showing other members of the group follow.

System Action:

None.

User Action:

None.

RE3020**P1 RULE ID P2****Reason:**

The group rule named in the previous RE3019 message contains the rule with test text *P1* and an ID of *P2*.

System Action:

None.

User Action:

None.

RE3021**GROUP RULE ACTIONS:****Reason:**

The group rule named in the previous RE3019 message will cause the following actions to be performed.

System Action:

None.

User Action:

None.

RE3022

MESSAGE REPLY: P1

Reason:

The rule being displayed results in a reply command being issued, as described by *P1*

System Action:

None.

User Action:

None.

RE3023

COMMAND: P1

Reason:

The rule being displayed results in a command being issued, as described by *P1*

System Action:

None.

User Action:

None.

RE3024

BEFORE OTHER ACTIONS SET VAR ZREV P1 TO P2

Reason:

The rule being displayed results in an EventView variable *P1* being set to the value described by *P2* The variable is set before other actions for the rule are performed.

System Action:

None.

User Action:

None.

RE3025**AFTER OTHER ACTIONS SET VAR ZREV P1 TO P2****Reason:**

The rule being displayed results in an EventView variable *P1* being set to the value *P2*. The variable is set after other actions for the rule are performed.

System Action:

None.

User Action:

None.

RE3026**OCS COMMAND: P1****Reason:**

The rule being displayed results in the *P1* command being issued.

System Action:

None.

User Action:

None.

RE3027**AUTOMATION PROCESS TO START: P1****Reason:**

The rule being displayed results in the automation process *P1* being started.

System Action:

None.

User Action:

None.

RE3028

AUTOMATION COMMAND: P1

Reason:

The rule being displayed results in the automation command *P1* being executed.

System Action:

None.

User Action:

None.

RE3029

MESSAGE ISSUED: P1 WITH ROUTE CODE= P1 DESCRIPTOR CODE= P2

Reason:

The rule being displayed results in the WTO message P1 being issued with route code P1 descriptor code P2

System Action:

None.

User Action:

None.

RE3030

MESSAGE REPLY CMD: P1

Reason:

A rule results in the *P1* reply command being issued. The command will be issued from the region rather than from the subsystem interface.

System Action:

None.

User Action:

None.

RE3031**SYSTEM COMMAND: P1****Reason:**

A rule results in the *P1* command being issued. The command will be issued from the region rather than from the subsystem interface.

System Action:

None.

User Action:

None.

RE6001**INCORRECT PARAMETER SPECIFIED P1= P2****Reason:**

An incorrect keyword parameter was supplied to an internal procedure.

System Action:

The action is rejected.

User Action:

Contact your systems support representative.

READ5102**UNKNOWN CLASS(P1)****Reason:**

Class specified in the calling parameter is unknown to the system.

System Action:

The request is rejected.

User Action:

Contact System Administrator.

READ5103

INVALID KEYWORD VALUE SPECIFIED - KEYWORD(P1) VALUE(P2)

Reason:

An invalid keyword was passed to the procedure.

System Action:

The request is rejected.

User Action:

Contact System Administrator.

READ5104

P1 DOES NOT EXIST

Reason:

P1 specified is not known to the system.

System Action:

None.

User Action:

Create Ruleset Control Option before creating rules.

READ5105

P1 COMPLETED

Reason:

P1 process specified has been completed.

System Action:

None.

User Action:

None.

READ5106**INVALID COMMAND****Reason:**

Command specified is not recognized by the system.

System Action:

The request is rejected.

User Action:

Specify a valid command.

READ5201**INVALID KEYWORD VALUE SPECIFIED - KEYWORD(P1) VALUE(P2)****Reason:**

An invalid keyword was passed to the service procedure.

System Action:

The request is rejected.

User Action:

Contact System Administrator.

READ5202**REQUIRED FIELD/S NOT ENTERED****Reason:**

Validation found no entry specified on mandatory field/s.

System Action:

The request is rejected.

User Action:

Specify entry on field/s in error.

READ5203

NO P1 SPECIFIED

Reason:

Nothing to be done because *P1* was not specified.

System Action:

The request is rejected.

User Action:

Specify *P1* name before requesting an action for *P1* .

READ5204

CANNOT CREATE OBJECT ID

Reason:

Object ID required for processing cannot be created because of missing Ruleset name, class or ruleid in the calling parameters.

System Action:

The request is rejected.

User Action:

Contact System Administrator.

READ5205

WARNING, THERE ARE P1 CORRELATED MESSAGE RULES TO THIS MESSAGE GROUP

Reason:

Only the first 10 correlated message rules can be displayed.

System Action:

None.

User Action:

None.

READ5206**MESSAGE GROUP RULE(P1) DOES NOT EXIST FOR RULESET(P2)****Reason:**

The Related Message Group P1 defined for this Message Rule does not exist under ruleset P2.

System Action:

The request is rejected.

User Action:

Create the required Message Group Rule *P1* and save/file the Message Rule

READ5207**VARIABLE(P1) WAS NOT ALLOCATED FOR THIS EVENTVIEW REGION****Reason:**

The vartable identified by P1 has not been allocated.

System Action:

The current process continues.

User Action:

Contact your local support representative.

READ5208**P1 DOES NOT EXIST****Reason:**

P1 specified is not known to the system.

System Action:

None.

User Action:

Use '?' to select *P1*

READ5209

REQUEST DENIED - USER P1 P2 THE MESSAGE LEARNING DATABASE

Reason:

The update request is rejected because userid P1 was previously P2 the Message Learning database. P2 will indicate whether the user was deleting or resetting the database.

System Action:

The request is rejected.

User Action:

Try again later.

READ5210

UPDATE IN PROGRESS BY P1

Reason:

Update is in progress on this definition by other user.

System Action:

The request is rejected.

User Action:

Try again later.

READ5301

INVALID KEYWORD VALUE SPECIFIED - KEYWORD(P1) VALUE(P2)

Reason:

An invalid keyword was passed to the procedure.

System Action:

The request is rejected.

User Action:

Contact System Administrator.

READ5302**REQUIRED FIELD/S NOT ENTERED****Reason:**

Validation found no entry specified on mandatory field/s.

System Action:

The request is rejected.

User Action:

Specify entry on field/s in error.

READ5401**INVALID KEYWORD VALUE SPECIFIED - KEYWORD(P1) VALUE(P2)****Reason:**

An invalid keyword was passed to the procedure.

System Action:

The request is rejected.

User Action:

Contact System Administrator.

READ5402**VALUE NOT SELECTED FROM LIST****Reason:**

No value selected from the selection list displayed.

System Action:

None.

User Action:

None.

READ5403

MESSAGE TEXT MUST BE SUPPLIED

Reason:

Message Text is required and no value was entered in that field.

System Action:

The panel is redisplayed with the field(s) in error highlighted.

User Action:

Enter a valid value in the highlighted field(s).

READ5404

INVALID P1 SPECIFIED

Reason:

Validation routine rejected the value of *P1* specified.

System Action:

The panel is redisplayed with the field in error highlighted.

User Action:

Enter a valid value for *P1* in the highlighted field.

READ5405

VARIABLE NAME MUST BE SPECIFIED

Reason:

Validation routine rejected the value because no variable name specified

System Action:

The panel is redisplayed with the field in error highlighted.

User Action:

Enter a valid variable name for the value specified.

READ5406**VALUE NOT SELECTED FROM LIST****Reason:**

No value selected from the selection list displayed.

System Action:

None.

User Action:

None.

READ5407**P1 DOES NOT EXIST****Reason:**

P1 specified is not known to the system.

System Action:

None.

User Action:

Use '?' to select *P1*.

READ5408**SPECIFY P1 IF PARAMETER SPECIFIED****Reason:**

There is no use specifying parameter without *P1* name to process.

System Action:

None.

User Action:

Specify *P1* name or use '?' to select *P1*.

READ5409

P1 USED IN THE EXPRESSION

Reason:

If condition specified then it has to be referenced in the expression and vice versa.

System Action:

Validation failed.

User Action:

Specify condition if referenced in the expression or refer the condition in the expression.

READ5410

P1 MUST BE SPECIFIED

Reason:

P1 must be specified for a valid test condition.

System Action:

None.

User Action:

Enter a valid *P1* to create a valid test condition.

READ5411

END TIME MUST BE GREATER THAN START TIME

Reason:

When a time range specified, the end time must be greater than the start time for a valid duration.

System Action:

None.

User Action:

Enter a valid time duration.

READ5412**RULESET(P1) ALREADY EXISTS****Reason:**

The ruleset *P1* already defined for EventView.

System Action:

The request is rejected.

User Action:

Specify another valid ruleset name.

READ5413**FIRST WORD OF MESSAGE TEXT MAY NOT BE MODIFIED****Reason:**

The first word of the Message Text value is used as the key of the message in the Learnt Message database. Therefore, the first word may not be changed.

System Action:

The panel is redisplayed with the field(s) in error highlighted.

User Action:

Ensure the first word of the Message Text is the same as it was before the field was modified.

READ5414**INVALID CHARACTERS ENCOUNTERED****Reason:**

DBCS data was encountered during validation. DBCS data is not valid in this field.

System Action:

The panel is redisplayed with the field in error highlighted.

User Action:

Enter a non-DBCS value in the highlighted field.

READ5415

WILDCARD MESSAGE RULES ARE NOT ALLOWED

Reason:

This region does not allow you to define a message rule with only a wildcard character.

System Action:

The panel is redisplayed with the field(s) in error highlighted.

User Action:

Define a more specific message rule, or contact your Systems Administrator.
Refer to Global Variable \$RE\$WIRU = NO

READ5501

INVALID KEYWORD VALUE SPECIFIED - KEYWORD(P1) VALUE(P2)

Reason:

An invalid keyword was passed to the service procedure.

System Action:

The request is rejected.

User Action:

Correct the calling procedure to the service procedure and rerun exec.

READ5502

NO RULE FOUND

Reason:

No rule found to be displayed in the selection list.

System Action:

None.

User Action:

None.

READ5503**RULESET NOT SELECTED FOR ADDING A MESSAGE RULE****Reason:**

Process cancelled because no ruleset was selected.

System Action:

The request is rejected.

User Action:

Ruleset must be selected to add a message rule.

READ5504**RULESET HAS P1 RULES****Reason:**

The ruleset cannot be deleted because there are rules under this ruleset.

System Action:

The request is rejected.

User Action:

Ruleset must not have any rules for a successful deletion.

READ5505**THIS RULESET IS INCLUDED BY RULESET(P1)****Reason:**

The ruleset cannot be deleted because it is included by other ruleset/s.

System Action:

The request is rejected.

User Action:

Use Delete Entire to delete this ruleset.

READ5506

THIS RULE IS CORRELATED TO P1 MESSAGE RULE/S

Reason:

The rule cannot be deleted because it is correlated to message rule/s.

System Action:

The request is rejected.

User Action:

Remove all correlation to this rule by updating the message rule/s and retry the delete process.

READ5507

REQUEST DENIED - USER P1 P2 THE MESSAGE LEARNING DATABASE

Reason:

The requested action is rejected because userid P1 was previously P2 the Message Learning database. P2 will indicate whether the *user* was deleting or resetting the database.

System Action:

The request is rejected.

User Action:

Try again later.

READ5508

NO MESSAGES FOUND IN MESSAGE LEARNING DATABASE

Reason:

There are no learnt messages available for display.

System Action:

None.

User Action:

None.

READ5509**GENERATE REJECTED. MESSAGE STARTS WITH A DBCS CHARACTER.****Reason:**

The message you have selected by using the GR action code starts with a DBCS character. Message rules cannot be defined for such messages.

System Action:

The action is rejected.

User Action:

None.

READ5510***P1 is now P2*****Reason:**

This message confirms that a request to activate or inactivate an object completed successfully.

System Action:

None.

User Action:

None.

READ5511***P1 is already P2*****Reason:**

A request to activate or inactivate an object failed because the object is already in the state requested. *P1* is the object class and *P2* is the current state of the object.

System Action:

The request is rejected.

User Action:

Select another object or another action.

READ5601

INVALID KEYWORD VALUE SPECIFIED - KEYWORD(P1) VALUE(P2)

Reason:

An invalid keyword was passed to the procedure.

System Action:

The request is rejected.

User Action:

Contact System Administrator.

READ5602

NCL PROCEDURE P1 DOES NOT EXIST IN LIBRARY P2

Reason:

The procedure *P1* specified on the EXEC, START or FSPROC command does not exist in the procedure library *P2*.

System Action:

The command is rejected.

User Action:

Correct the procedure name. If the procedure name is correct ensure that it exists in the procedure library specified for use by this userid. This can be determined by the SHOW EXEC command or alternatively the LIST command could be used to display the procedure without execution.

READ5701

INVALID KEYWORD VALUE SPECIFIED - KEYWORD(P1) VALUE(P2)

Reason:

An invalid keyword was passed to the procedure.

System Action:

The request is rejected.

User Action:

Contact System Administrator.

READ5801**INVALID KEYWORD VALUE SPECIFIED - KEYWORD(P1) VALUE(P2)****Reason:**

An invalid keyword was passed to the service procedure.

System Action:

The request is rejected.

User Action:

Correct the calling procedure to the service procedure and rerun exec.

READ5802**P1 DOES NOT EXIST****Reason:**

P1 specified is not known to the system.

System Action:

None.

User Action:

Use '?' to select *P1*.

READ5803**INVALID NAME SPECIFIED****Reason:**

An invalid name was passed to the service procedure.

System Action:

The request is rejected.

User Action:

Correct the name required and rerun exec.

READ5804

RULESET NOT SELECTED FROM LIST

Reason:

No value was selected from the displayed list.

System Action:

None.

User Action:

Select a ruleset from the list.

READ5901

INVALID KEYWORD VALUE SPECIFIED - KEYWORD(P1) VALUE(P2)

Reason:

An invalid keyword was passed to the service procedure.

System Action:

The request is rejected.

User Action:

Correct the calling procedure to the service procedure and rerun exec.

READ6202

Statistics processing not started - SMF not enabled

Reason:

Statistics processing cannot be started because SMF has not been enabled due to one or both of the following:

- To write SMF records, the SMF Record Identification must have a non-zero value. This value is specified in the Customizer *SMF* parameter group.
- To collect EventView SMF records, specify *YES* in the Customizer *SMFDATA* parameter group.

System Action:

The procedure terminates with a RC of 8 and writes an error message to the system log.

User Action:

Contact your system administrator.

READ6203**Unable to reset VARIABLE (P1)****Reason:**

The variable identified by *P1* does not exist in the current region.

System Action:

The procedure terminates with a RC of 8 and writes an error message to the system log.

User Action:

Contact your Systems Administrator.

READ6204**Unable to allocate VARIABLE (P1)****Reason:**

The variable identified by *P1* cannot be allocated in the current region.

System Action:

The procedure terminates with a RC of 8 and writes an error message to the system log.

User Action:

Contact your Systems Administrator.

RECALL01**INVALID KEYWORD VALUE SPECIFIED - KEYWORD(P1) VALUE(P2)****Reason:**

An invalid keyword was passed to the procedure.

System Action:

The request is rejected.

User Action:

Contact System Administrator.

RECALL02

UNABLE TO CREATE INCLUDE RECORD

Reason:

Target ruleset name is not specified in the calling parameter.

System Action:

The request is rejected.

User Action:

Contact System Administrator.

RECALL03

ENTER TARGET RULESET

Reason:

Target ruleset name must be specified for copy process.

System Action:

The request is rejected.

User Action:

Specify the target ruleset name in the highlighted field.

RECALL04

TARGET RULESET(P1) ALREADY EXISTS

Reason:

Target ruleset name specified already exists in the system.

System Action:

The request is rejected.

User Action:

Specify a new target ruleset name in the highlighted field.

RECALL05**INVALID COMMAND****Reason:**

Command specified is not recognized by the system.

System Action:

The request is rejected.

User Action:

Specify a valid command.

RECALL06**P1 P2 CANCELLED****Reason:**

The function *P1* being performed on *P2* was cancelled at the user's request.

System Action:

None.

User Action:

None.

RECALL07**CANNOT CREATE OBJECT ID****Reason:**

Object ID required for procesing cannot be created because of missing Ruleset name, class or ruleid in the calling parameters.

System Action:

The request is rejected.

User Action:

Contact System Administrator.

RECALL08

UNKNOWN CLASS(P1)

Reason:

Class specified in the calling parameter is unknown to the system.

System Action:

The request is rejected.

User Action:

Contact System Administrator.

RECALL09

UPDATE IN PROGRESS BY P1

Reason:

Update is in progress on this definition by other user.

System Action:

The request is rejected.

User Action:

Try again later.

RECALL10

EventView API called with invalid data

Reason:

The \$RECALL EventView API was called with invalid operands. This could be caused by invalid data (for example, special characters in a ruleset name).

System Action:

The request is rejected.

User Action:

Correct the input data, and retry.

REDBAPI01**SYNTAX ERROR: P1****Reason:**

A call Syntax Error has been detected while processing a RAMDB Maintenance Request. *P1* contains the details of the error.

System Action:

The request is rejected.

User Action:

Correct the API Call request and re-submit.

REDBAPI02**P1 EXCEEDS MAXIMUM LENGTH P2****Reason:**

The value presented in *P1* exceeds the maximum length allowable for that variable.

System Action:

The request is rejected.

User Action:

Reduce the length of the value to less than or equal to the value indicated by *P2*.

REDBAPI03**INVALID CLASS(P1) SPECIFIED****Reason:**

An invalid class has been specified in the request. The valid classes are 93 (Rulesets), 94 (Message Rules), 95 (Message Group Rules) and 98 (Timer Rules).

System Action:

The request is rejected.

User Action:

Specify a valid class value or remove and retry.

REDBAPI04

' P1' IS AN INVALID VALUE FOR P2

Reason:

The value *P1* is an invalid value for the field *P2*.

System Action:

The request is rejected.

User Action:

Correct the value for the field and retry.

REDBAPI05

P1(P2) ALREADY EXISTS

Reason:

On a CREATE call a record of type *P1* with the name *P2* was found on the database and therefore cannot be added.

System Action:

The call is rejected.

User Action:

Choose a different name or delete the existing record.

REDBAPI06

FOR CLASS 93 "NAME" MUST BE THE SAME AS "RULESET"

Reason:

For calls dealing with class 93 (RULESETS) the value for NAME, if supplied, must be the same as the value for RULESET.

System Action:

The call is rejected.

User Action:

Change either the value of the NAME or RULESET keyword and retry.

REDBAPI07**P1 SERVICE COMPLETED SUCCESSFULLY****Reason:**

The service *P1* was performed successfully.

System Action:

None.

User Action:

None.

REDBAPI08**RULESET(P1) DOES NOT EXIST****Reason:**

The RULESET *P1* specified in the request does not exist on the database.

System Action:

The call is rejected.

User Action:

Choose a different name or create the required ruleset.

REDBAPI09**' P1' IS A REQUIRED FIELD WHEN CREATING A P2****Reason:**

The field *P1* is required when performing a CREATE for *P2* type records.

System Action:

The request is rejected.

User Action:

Supply a value for the field and retry.

REDBAPI10

LENGTH OF ' P1' EXCEEDS THE MAXIMUM OF P2

Reason:

The length of field *P1* exceeds the maximum allowable length, *P2*, for this field.

System Action:

The request is rejected.

User Action:

Either supply a shorter value for the field or invoke \$REDBAPI with TRUNCATE=YES to automatically truncate fields which exceed the maximum length.

REDBAPI11

NO P1 RECORDS LISTED

Reason:

Issued in response to a SERVICE=LIST request, if no records of class *P1* have been listed as a result of the request.

System Action:

None.

User Action:

None.

REM00201

P1 does not exist

Reason:

Event Rule Ruleset *P1* is not known to the system.

System Action:

None.

User Action:

Use '?' to display and select an existing ruleset.

REM00202**Invalid Ruleset Name specified****Reason:**

An invalid ruleset name was entered.

System Action:

The request is rejected.

User Action:

Correct the ruleset name and retry the operation.

REM00203**Ruleset not selected from list****Reason:**

No ruleset was selected from the displayed list.

System Action:

None.

User Action:

Select a ruleset from the list.

REM00301**Database scan terminated - System Parameter Record Limit Exceeded****Reason:**

The database scan required to display the selected Message Learning list was terminated because the number of records returned by the scan would have exceeded the maximum allowed by the system parameters NDB Default Record Limit and/or NDB Maximum Record Limit.

System Action:

The requested database scan terminates and processing returns to the Message Learning menu.

User Action:

Contact your system administrator about increasing the values of the NDB record limits in the system's Initialization Parameters.

REML2001

P1 IS AN INVALID VALUE FOR KEYWORD PARAMETER P2

Reason:

The Message Learning API procedure was called with keyword *P2* set to a value (*P1*) which the API does not support.

System Action:

The procedure sets a return code of '16' and returns processing to the caller.

User Action:

Check the defined allowed values for the keyword *P2* and retry.

REML2002

MESSAGE LEARNING DATABASE P1 SUCCESSFULLY

Reason:

The requested Message Learning database *P1* function completed successfully.

System Action:

None.

User Action:

None.

REML2101

P1 FAILED FOR VARIABLE P2 - ZFDBK= P3, MSGID= P4

Reason:

The Message Learning secondary AOMProc's attempted *P1* for variable *P2* failed. *P3* contains the feedback code returned and *P4* contains the Message ID of the record which was being actioned. This message implies that something extraordinary occurred whilst processing the variable.

System Action:

The message is not processed.

User Action:

Contact Systems Administrator.

REML2102**P1 FAILED - MSGID P2 NOT FOUND IN VARTABLE P3****Reason:**

The Message Learning secondary AOMProc received a message with message ID *P2* from the primary AOMProc but there was no corresponding record in variable *P3*.

System Action:

The message is not processed.

User Action:

Contact Systems Administrator.

REML2103**P1 FAILED FOR GDB RECORD MSGID= P2 - ZFDBK= P3****Reason:**

The Message Learning secondary AOMProc's attempted *P1* failed for the GDB record whose message ID is *P2*. *P3* contains the feedback code returned. This message implies that something extraordinary occurred whilst processing the GDB.

System Action:

The message is not processed.

User Action:

Contact Systems Administrator.

REML2104**P1 FAILED FOR GDB RECORD MSGID P1 - NO ENTRY FOUND****Reason:**

The Message Learning secondary AOMProc received a message with message ID *P1* from the primary AOMProc but there was no corresponding record in the GDB.

System Action:

The message is not processed.

User Action:

Contact Systems Administrator.

REML2105

**** MESSAGE LEARNING STOPPED - GDB AREA FOUND TO BE CORRUPT

Reason:

The Message Learning secondary AOMProc attempted to process a GDB record but failed because the GDB was found to be corrupted. This is a serious situation and no further messages will be learned which require any GDB processing.

System Action:

Message Learning is stopped - no new messages will be learned but the user interface functions are still available.

User Action:

Contact Systems Administrator.

REML2106

ALLOC FAILED FOR VARIABLE P1 - ZFDBK= P2

Reason:

The Message Learning secondary AOMProc's attempted allocation of process variable *P1* failed. *P2* contains the feedback code returned.

System Action:

The procedure sets a return code of '8' and ends.

User Action:

Contact Systems Administrator.

REML2107**ADD FAILED FOR VARIABLE P1 - KEY P2 ALREADY EXISTS****Reason:**

The Message Learning secondary AOMProc attempted to add a record to the scope=process variable *P1* but failed because a record with that key value ('*P2* ') was already in the vartable. This implies that the secondary AOMProc has received a duplicate event, that is, an event for a message which has previously been processed.

System Action:

The message is not processed.

User Action:

Contact Systems Administrator.

REML2108**RECORD NOT ADDED - MESSAGE LEARNING DATABASE BEING P1****Reason:**

The Message Learning secondary AOMProc was unable to gain a shared lock on the Message Learning database because a P1 action was in progress which modifies the whole database. Message Learning discarded the message it was attempting to add. The secondary AOMProc will wait for up to 2 minutes before discarding a new message.

System Action:

The new message is discarded. The secondary AOMProc issues this message to monitor class users and the log and then continues processing.

User Action:

If this message occurs repeatedly, check for any processes which are holding an exclusive lock against the Message Learning database.

REML2109

**** MESSAGE LEARNING STOPPED - MESSAGE LEARNING AOM TABLE NOT FOUND ****

Reason:

The Message Learning secondary AOMProc attempted to add a message but was unable to do so because the Message Learning AOM vartable was not found. This message implies that the Message Learning AOM vartable has been deleted or that &AOMGFLAG 33 has been set 'ON' by something external to Message Learning whilst Message Learning was inactive.

System Action:

Message Learning is stopped - no new messages will be learned but the user interface functions are still available.

User Action:

To restart the learning function, set to 'NO' the value of the 'Learn New Messages?...' field in the active EventView ruleset and save the change. Then reset the same field to 'YES' and again save the change. Message Learning will restart with a larger vartable capacity.

REML2110

Reason:

This message is used only to highlight message REML2112 - see the description for message REML2112 for explanation of the relevant error.

System Action:

None.

User Action:

None.

REML2111

**** ****

Reason:

This message is used only to highlight message REML2112 - see the description for message REML2112 for explanation of the relevant error.

System Action:

None.

User Action:

None.

REML2112**** MESSAGE LEARNING STOPPED - MESSAGE LEARNING AOM TABLE AT ITS LIMIT ******Reason:**

The Message Learning secondary AOMProc attempted to add a message but was unable to do so because the Message Learning AOM vartable was at its limit.

System Action:

Message Learning is stopped - no new messages will be learned but the user interface functions are still available.

User Action:

To restart the learning function, set to 'NO' the value of the 'Learn New Messages?...' field in the active EventView ruleset and save the change. Then reset the same field to 'YES' and again save the change. Message Learning will restart with a larger vartable capacity.

REML2201

DATABASE SCAN TERMINATED - SYSTEM PARAMETER RECORD LIMIT EXCEEDED

Reason:

The database scan required to display the selected Message Learning list was terminated because the number of records returned by the scan would have exceeded the maximum allowed by the system parameters NDB Default Record Limit and/or NDB Maximum Record Limit.

System Action:

The requested database scan terminates and processing returns to the Message Learning menu.

User Action:

Contact your system administrator about increasing the values of the NDB record limits in the system's Initialization Parameters.

REML2301

P1 IS AN INVALID VALUE FOR KEYWORD PARAMETER P2

Reason:

The Message Learning confirmation display utility procedure was called with keyword *P2* set to a value (*P1*) which the procedure does not support.

System Action:

The procedure sets a return code of '8' and returns processing to the caller.

User Action:

Check the defined allowed values for the keyword *P2* and retry.

REML2302**P1 IS A REQUIRED KEYWORD PARAMETER****Reason:**

When the Message Learning confirmation display utility procedure was called the required keyword *P2* was not set.

System Action:

The procedure sets a return code of '16' and returns processing to the caller.

User Action:

Check the defined allowed values for the keyword *P1* and retry.

REML2303**MESSAGE LEARNING DATABASE P1 IN PROGRESS (AT P2) BY P3****Reason:**

The requested action is rejected because a database *P1* is already in progress. The *P1* was requested at *P2* by user *P3*.

System Action:

The request is rejected.

User Action:

Try again later.

REML2304**COMMAND IS INVALID FOR THIS WINDOW****Reason:**

You entered a command at the command line whilst in the Message Learning database Reset/Delete confirmation window.

System Action:

The request is rejected. The confirmation window is redisplayed with the error message.

User Action:

None.

REML2305

P1 OF MESSAGE LEARNING DATABASE CANCELLED

Reason:

The function *P1* being performed on the Message Learning database was cancelled at the user's request.

System Action:

None.

User Action:

None.

REML2401

UNEXPECTED MESSAGE RECEIVED ON INTERNAL EVENT READ QUEUE

Reason:

The Message Learning table loader procedure received a message other than an expected EDS event on its internal queue. This message serves only as a warning. This message is followed by the message received. Subsequent errors will not result in a warning being written to the log.

System Action:

The procedure writes the message to the activity log and continues.

User Action:

Contact Systems Administrator.

REML2402

P1 FAILED FOR VARIABLE P2 - ZFDBK= P3

Reason:

The Message Learning table loader procedure tried to perform a *P1* action on AOM vartable *P2* but the action failed. *P3* contains the feedback code returned.

System Action:

The procedure writes the message to the activity log and continues.

User Action:

Contact Systems Administrator.

REML2403**ALLOCATE FAILED FOR VARTABLE P1 - 16 TABLES ALREADY EXIST****Reason:**

The Message Learning table loader procedure tried to allocate AOM vartable P1 but the allocation failed - there are already the maximum allowed number of SCOPE=AOM tables allocated.

System Action:

The procedure writes the message to the activity log and continues.

User Action:

Contact Systems Administrator.

REML2404**ALLOCATE FAILED FOR VARTABLE P1 - STORAGE WOULD BE EXCEEDED****Reason:**

The Message Learning table loader procedure tried to allocate AOM vartable P1 but the allocation failed - its allocation would have caused total storage allocated for vartable mirroring to exceed the maximum defined by SYSPARMS AOMMAXTS.

System Action:

The procedure writes the message to the activity log and continues.

User Action:

Contact Systems Administrator.

REML2405**P1 FAILED FOR P2 - ZFDBK= P3, MSGID= P4****Reason:**

The Message Learning table loader procedure tried to perform a *P1* action on *P2* but the action failed. *P3* contains the feedback code returned and *P4* contains the Message ID of the record which was being actioned.

System Action:

The procedure writes the message to the activity log and continues.

User Action:

Contact Systems Administrator.

REML2406

P1 FAILED FOR VARIABLE P2 - KEY P3 IS TOO LONG

Reason:

The Message Learning table loader procedure tried to perform a *P1* action on variable *P2* but the key value supplied, *P3*, was too long for the variable key definition.

System Action:

The procedure writes the message to the activity log and continues.

User Action:

Contact Systems Administrator.

REML2407

P1 FAILED - VARIABLE P2 DOES NOT EXIST

Reason:

The Message Learning table loader procedure tried to perform a *P1* action on variable *P2* but the table was not found in the AOM region.

System Action:

The procedure writes the message to the activity log and continues.

User Action:

Contact Systems Administrator.

REML2408

P1 FAILED - VARIABLE P2 IS AT ITS LIMIT

Reason:

The Message Learning table loader procedure tried to perform a *P1* action on variable *P2* but the table has already reached its limit for number of records stored.

System Action:

The procedure writes the message to the activity log and continues.

User Action:

Contact Systems Administrator.

REML2409**P1 FAILED - VARIABLE P2 DISABLED DUE TO STORAGE ERROR****Reason:**

The Message Learning table loader procedure tried to perform a *P1* action on variable *P2* but the variable has been disabled due to a previous storage error.

System Action:

The procedure writes the message to the activity log and continues.

User Action:

Contact Systems Administrator.

REML2410**PUT FAILED - GDB IS AT ITS LIMIT****Reason:**

The Message Learning table loader procedure tried to perform a PUT action on the GDB but the GDB has reached its maximum storage limit.

System Action:

The procedure writes the message to the activity log and continues.

User Action:

Contact Systems Administrator.

REML2411**PUT FAILED - GDB IS CORRUPTED****Reason:**

The Message Learning table loader procedure tried to perform a PUT action on the GDB but the GDB has been corrupted.

System Action:

The procedure writes the message to the activity log and continues.

User Action:

Contact Systems Administrator.

REML2412

DELETE FAILED - RECORD DOES NOT EXIST FOR MSGID P1 ON THE GDB

Reason:

The Message Learning table loader procedure tried to perform a DELETE action on the GDB but no record was found in the GDB for the specified message ID P1.

System Action:

The procedure writes the message to the activity log and continues.

User Action:

Contact Systems Administrator.

REML2413

WARNING: EVENTVIEW MESSAGE LEARNING PROCESSING ERROR

Reason:

An error or unexpected result occurred whilst the Message Learning table loader procedure was processing. This message is written to the activity log and precedes a message which will describe the particular error.

System Action:

The procedure writes the message to the activity log and continues.

User Action:

Contact Systems Administrator.

REML2414

NO MESSAGE RECEIVED IN RESPONSE TO PROFILE P1 COMMAND

Reason:

The Message Learning table loader procedure did not receive a response to a PROFILE P1 command, which was issued internally.

System Action:

The procedure writes the message to the activity log and continues.

User Action:

Contact Systems Administrator.

REML2415**P1 FAILED FOR VARIABLE P2 - KEY P3 NOT FOUND****Reason:**

The Message Learning table loader procedure tried to perform a *P1* action on variable *P2* but a table entry was not found for the key value, *P3*, supplied.

System Action:

The procedure writes the message to the activity log and continues.

User Action:

Contact Systems Administrator.

REML2416**MESSAGE LEARNING STOPPED BY EVENTVIEW REQUEST****Reason:**

The Message Learning table loader procedure ended processing because it received a SHUTDOWN request message on its internal message stack from another part of EventView. This may be because a new ruleset has been activated which requires Message Learning to be turned off.

System Action:

The procedure writes the message to the activity log and terminates.

User Action:

None.

REML2417**MESSAGE LEARNING PROCESSING ENDED - REASON CODE P1****Reason:**

The Message Learning table loader procedure has ended processing. *P1* contains the value of the return code at the time the procedure ended.

System Action:

The procedure writes the message to the activity log and terminates.

User Action:

None.

RETM1001

INVALID KEYWORD VALUE SPECIFIED - KEYWORD(P1) VALUE(P2)

Reason:

An invalid keyword was passed to the service procedure.

System Action:

The request is rejected.

User Action:

Correct the calling procedure to the service procedure and rerun exec.

RETM1002

VARIABLE(P1) IS NOT ALLOCATED IN THIS EVENTVIEW REGION

Reason:

The vartable identified by *P1* has not been allocated.

System Action:

The current process terminates.

User Action:

Contact your local support representative.

RETM1003

UNABLE TO OPEN CATCHUP DB FILE(P1) FILERC(P2)

Reason:

An *OPEN* request for the file identified by *P1* failed with FILERC *P2*.

System Action:

Processing continues but CATCHUP processing will not be available.

User Action:

Contact you local support representative.

RETM1004**FUNCTION(P1) FAILED WITH DBRC(P2) AND MSG(P3)****Reason:**

The database function *P1* failed with RC *P2* and message *P3*.

System Action:

The current process terminates.

User Action:

Contact your local support representative.

RETM1005**NO RECORDS FOUND IN VARIABLE(P1) FOR KEY(P2) FDBK(P3)****Reason:**

No records for the record key *P2* were found in variable *P1*.

System Action:

The Current process is terminated

User Action:

Check to see whether any valid timer rules have been defined for the ruleset and retry the function.

RETM1006**RECORD WITH KEY(P1) NOT DELETED FROM VARIABLE(P2) FDBK(P3)****Reason:**

The record with key identified by *P1* was not deleted from variable *P2*.

System Action:

The Current process is terminated

User Action:

Check to see whether any valid timer rules have been defined for the ruleset and retry the function.

RETM1007

FUNCTION(P1) FAILED FOR VARIABLE(P2) FDBK(P3)

Reason:

The function identified by *P1* failed for record key *P2* on variable *P3*.

System Action:

The Current process is terminated.

User Action:

Check to see whether any valid timer rules have been defined for the ruleset and retry the function.

RETM1008

FUNCTION(P1) FAILED FOR KEY(P2) FOR FILE(P3) FILERC(P4)

Reason:

The function identified by *P1* failed for record key *P2* on file *P3*.

System Action:

The Current process is terminated.

User Action:

Check to see whether any valid timer rules have been defined for the ruleset and retry the function.

RETM1009

EVENTVIEW TIMER(P1) WAS NOT PURGED

Reason:

The timer associated with EventView was not purged.

System Action:

The timer driver procedure may not execute at the correct time for the next timer rule to be actioned.

User Action:

View the log to determine the reason for the timer not being purged. Contact your local support representative.

RETM1010**NO RECORDS FOUND IN VARTABLE(P1) FDBK(P2)****Reason:**

No records were found in the vartable identified by *P1*. The feedback value is *P2*.

System Action:

The current process terminates.

User Action:

Check to see whether any valid timer rules have been defined for the ruleset and retry the function.

RETM1011**FUNCTION(P1) FOR RULESET(P2) RULEID(P3) FAILED****Reason:**

The function identified by *P1* failed for ruleset *P2* ruleid *P3*.

System Action:

The current process terminates.

User Action:

View the log to determine the reason for the timer not being set. Contact your local support representative.

RETM1012**GET REQUEST FAILED BECAUSE A REQUIRED PARAMETER WAS OMITTED****Reason:**

A get request from the active timer vartables failed because one of the required parameters was omitted from the request.

System Action:

The current process terminates.

User Action:

Correct the request and retry.

RETM1013

Eventview timer adjustment failed - *P1*

Reason:

An attempt to reevaluate EventView timer rules after a time change failed. *P1* is the failure reason.

System Action:

Processing continues. Some timers may not be issued when expected.

User Action:

This is an internal error. Contact Technical Support.

RETM1014**Execution of timer rule *P1* in ruleset *P2* adjusted for time change****Reason:**

The EventView timer rule *P1* has been impacted by a time change such as a Daylight Saving change, and its execution time has been adjusted.

System Action:

The timer rule is adjusted as follows.

For a forward time change:

- If the timer was scheduled to execute in the skipped period and it is not an EVERY timer, it is executed immediately.
- If an EVERY timer is active and its interval is less than or equal to the time change amount, the timer continues at the defined interval for the defined number of times.
- If an EVERY timer is active and its interval is greater than the time change amount, and it was due to execute in the skipped period, it executes immediately. The next execution will be at the next scheduled time, in the new local time.

For a backward time change:

- If an EVERY timer is active and the interval is less than or equal to the time change amount, the timer continues at the defined interval for the defined number of times.
- If an EVERY timer is active and the interval is greater than the time change amount, the next execution will be at the next scheduled time, in the new local time.

User Action:

None.

RETM1601**INVALID KEYWORD VALUE SPECIFIED - KEYWORD(*P1*) VALUE(*P2*)****Reason:**

An invalid keyword was passed to the service procedure.

System Action:

The request is rejected.

User Action:

Correct the calling procedure to the service procedure and rerun exec.

RETM1602

SCROLLIST CANCELLED AT USER REQUEST - UPDATES NOT SAVED

Reason:

The user has requested a cancel of the SCROLLIST function. All updates made while in SCROLLIST mode will be lost.

System Action:

Control is returned to the calling procedure. Updates made while in *SCROLLIST* mode will not be saved.

User Action:

None.

RETM1603

MAXIMUM NUMBER OF SCHEDULE ITEM ENTRIES ALREADY EXIST

Reason:

A Repeat of a schedule item entry has been attempted which would cause the maximum number of entries to be exceeded.

System Action:

Action disallowed.

User Action:

None.

RETM1604

VARIABLE(P1) IS NOT ALLOCATED, FEEDBACK (P1)

Reason:

The vartable identified by *P1* has not been allocated. Vartable feedback information is *P2*.

System Action:

The current process terminates.

User Action:

Contact your local support representative.

RETM1701**FUNCTION (P1) NOT CURRENTLY SUPPORTED****Reason:**

The function identified by *P1* is not supported by the procedure.

System Action:

A message is issued to the user. Processing continues.

User Action:

None.

RETM1702**PUT OF VARIABLE RECORD (P1) FAILED - FEEDBACK (P2)****Reason:**

The vartable PUT function failed for the record identified by *P1* with vartable feedback *P2*.

System Action:

A message is issued to the user. Processing continues.

User Action:

Contact you local support representative.

RETM1703**GET OF VARIABLE RECORD (P1) FAILED - FEEDBACK (P2)****Reason:**

The vartable GET function failed for the record identified by *P1* with vartable feedback *P2*.

System Action:

A message is issued to the user. Processing continues.

User Action:

Contact you local support representative.

RETM1801

INVALID KEYWORD VALUE SPECIFIED - KEYWORD(P1) VALUE(P2)

Reason:

An invalid keyword was passed to the service procedure.

System Action:

The request is rejected.

User Action:

Correct the calling procedure to the service procedure and rerun exec.

RETM1802

EITHER (P1) OR (P2) MUST BE SPECIFIED

Reason:

One of the fields identified by *P1* and *P2*, must be specified on this screen.

System Action:

Field(s) highlighted in error.

User Action:

Enter a valid value for one of the specified fields.

RETM1803

(P1) IS A REQUIRED FIELD

Reason:

While defining a resource availability map the field identified by *P1* was not entered and is a required field.

System Action:

Field highlighted in error.

User Action:

Enter a value for the specified field.

RETM1804**UNABLE TO EXPAND SCHEDULE ITEM - NOT ENOUGH LINES
AVAILABLE ON PANEL****Reason:**

A generic value of '*' , 'W/D' or 'W/E' was specified, which would cause the maximum number of timers on the panel to be exceeded if it were expanded out.

System Action:

Field(s) highlighted in error.

User Action:

Clear the fields for the entry and press PF10 to invoke the scrollable list.
Retype the entry in the scrollable list and press ENTER to resolve the entry.

RETM1805**UNABLE TO EXPAND SCHEDULE ITEM. ITEM LIMIT OF (P1) WILL BE
EXCEEDED****Reason:**

A generic value of '*' , 'W/D' or 'W/E' was specified which would cause the maximum number of timers (P1) to be exceeded if it were expanded out to one timer entry for each day covered.

System Action:

Field(s) highlighted in error.

User Action:

Correct the number of timer entries to remain below the limit.

RETM1806

(P1) IS NOT A VALID VALUE FOR (P2)

Reason:

The value identified by *P1* is not valid for the field identified by *P2*.
This message may also have a list of valid values for the field appended to the end of it.

System Action:

Field highlighted in error.

User Action:

Enter a valid value for the specified field.

RETM1807

DAY AND DATE VALUES CANNOT BOTH BE SPECIFIED

Reason:

Both 'day' and 'date' values have been specified. Only one of these values may be specified, as calculation of the next execution date for a generic date will result in a different day value each time.

System Action:

Both Fields highlighted in error.

User Action:

Specify a value for only one of either 'day' or 'date'.

RETM1808

DAY MUST BE BETWEEN 1 AND P1

Reason:

The DAY portion of a date must be a value between 1 and *P1*.

System Action:

Field(s) highlighted in error.

User Action:

Change day to conform with message.

RETM1809**DATE VALUE (P1) IS A PAST DATE****Reason:**

The 'date' value identified by *P1* is a date in the past.

System Action:

The 'date' field is highlighted in error.

User Action:

Specify a date value for a date in the future.

RETM1810**DUPLICATE SCHEDULE ITEM DEFINITION****Reason:**

A combination of DAY, DATE and TIME may only appear once within a timer rule.

System Action:

Fields highlighted in error.

User Action:

Change the DAY, DATE or TIME to make the schedule item unique.

RETM1811**DATE (P1) OCCURS IN THE PAST****Reason:**

The date and time identified by *P1* has already passed.

System Action:

The 'date' and 'time' fields are highlighted and an error message is displayed to the user.

User Action:

Reenter new date and/or timer values.

RETM1812

'Delete on Expiry?' is YES but there are no expiring timers

Reason:

This rule does not contain a timer that activates on a specific date. The timers specified currently never expire.

Delete on Expiry? is effective only for timers that activate on specific dates. Other types of timers (for example, timers that activate on a particular day of the week) do not expire.

System Action:

The Delete on Expiry? field is highlighted.

User Action:

If you plan to include a timer that activates on a specific date, add the timer; otherwise, change the value of the Delete on Expiry? field to *NO*.

RETM1901

INVALID KEYWORD VALUE SPECIFIED - KEYWORD(P1) VALUE(P2)

Reason:

An invalid keyword was passed to the service procedure.

System Action:

The request is rejected.

User Action:

Correct the calling procedure to the service procedure and rerun exec.

RETM1902**TIME VALUE OMITTED - UNABLE TO PERFORM CALCULATION FOR SCHEDULE ITEM****Reason:**

The time value for the schedule item does not exist so the calculation routine is unable to perform calculation for the schedule item.

System Action:

The system stops processing for the timer rule.

User Action:

Check the Timer Rule definition in the DB to ensure that valid schedule items exist for the timer rule.

RETM1903**DAY AND DATE VALUES OMITTED - UNABLE TO PERFORM CALCULATION FOR ITEM****Reason:**

Both the day and date values for the schedule item are null. The date calculation routine is unable to perform calculation for the schedule item.

System Action:

The system stops processing for the timer rule.

User Action:

Check the Timer Rule definition in the DB to ensure that valid schedule items exist for the timer rule.

RF240101**P1 - P2****Reason:**

The file transfer schedule *P1* is inactive, and the next scheduled start is described by *P2* .

System Action:

None.

User Action:

None.

RF240102

CHECKPOINT DATASET DOES NOT CONTAIN ENTRIES

Reason:

The file transfer schedule is inactive and its checkpoint dataset does not contain any entries.

System Action:

None.

User Action:

None.

RF240103

P1 OF RFTSCHD FILE FAILED RC - P2, VSAM REASON CODE - P3

Reason:

An attempt to access the Schedule Checkpoint dataset failed. The above Retcode and VSAM error code were generated.

System Action:

The request is rejected.

User Action:

Interpret the error code using the *VSAM Programmer Manual*.

RF240201

LONGEST TRANSFER DURATION CANNOT EXCEED PROCESSING PERIOD

Reason:

The time interval in the Longest Transfer field cannot be greater than that in the Processing Period field.

System Action:

The Longest Transfer field is highlighted.

User Action:

Either decrease the value in the Longest Transfer field or increase the value in the Processing Period field.

RF240203**UPDATE OF FILE TRANSFER SCHEDULE ENTRIES LIST CANCELLED****Reason:**

You cancelled the updates you made to the file transfer schedule entries on the Schedule Entries List panel.

System Action:

The updates are not retained.

User Action:

None

RF240204**MAXIMUM NUMBER OF SCHEDULE ENTRIES ALREADY EXIST****Reason:**

The Repeat action tries to add a file transfer schedule entry. However, the definition already contains the maximum number of entries and cannot accept another entry.

System Action:

The action is disallowed.

User Action:

None

RF240205

' P1' IS NOT A VALID DAY, DATE OR CRITERIA NAME

Reason:

The value, *P1* , in the Day/Date or Criteria Name field is not valid.

The valid day values are:

MON TUE WED THU FRI SAT SUN

The valid date formats are:

- *dd-MMM-yyyy* (for example, 31-JAN-1998)

- *dd-MMM* , indicating a date for any year

- *dd* , indicating a date for any month and year

To display the list of valid criteria names, enter ? in the field.

System Action:

The field is highlighted.

User Action:

Enter a value in one of the valid forms.

RF240206

DUPLICATE ENTRY

Reason:

The highlighted file transfer schedule entry is the same as another entry.

System Action:

The duplicate is highlighted.

User Action:

Either delete the duplicate, or change the value in its *Day/Date or Criteria Name* field or in its *Start Time* field such that it is no longer a duplicate.

RF240207**' P1' IS NOT A VALID TIME****Reason:**

The time value, *P1* , is not valid. A time value must be of the form *hh.mm* , where hh is from 0 through 23 and mm is from 0 through 59.

System Action:

The field in error is highlighted.

User Action:

Enter a valid time value.

RF240301**MAXIMUM FILE SIZE MUST NOT BE LESS THAN MINIMUM FILE SIZE****Reason:**

The Maximum File Size specified must be greater than or equal to the Minimum File size previously specified.

System Action:

The Maximum File Size field is highlighted.

User Action:

Either increase the value in the Maximum File Size field or decrease the value in the Minimum File Size field.

RF240302**FILE TYPE MUST BE 'ID', 'SRC', 'TGT' OR 'CTL'****Reason:**

Valid values for this field are ID (Transfer Id), SRC (Source), TGT (Target) or CTL (Control). I, S, T, or C are also acceptable.

System Action:

The field in error is highlighted.

User Action:

Enter one of the valid type values.

RF240303

UPDATE OF FILE TRANSFER FILE FILTERS LIST CANCELLED

Reason:

You cancelled the updates you made to the file filter entries on the File Filters List panel.

System Action:

The updates are not retained.

User Action:

None

RF240304

MAXIMUM NUMBER OF FILE FILTERS ALREADY EXIST

Reason:

The Repeat action tries to add a file filter entry. However, the definition already contains the maximum number of entries and cannot accept another entry.

System Action:

The action is disallowed.

User Action:

None

RF240305

INVALID DATASET NAME SPECIFIED

Reason:

A CTL filter entry must use a valid dataset name or a DDNAME with no embedded wildcard characters. If DDNAMEs are used it must be in the format DD(ddname) or DDNAME(ddname).

System Action:

Request rejected.

User Action:

Provide a valid dataset name. The dataset name should be in uppercase.

RF240306**DUPLICATE CTL ENTRY****Reason:**

Duplicate dataset names not allowed for CTL entries.

System Action:

The action is disallowed.

User Action:

Review the list of filters or check the spelling of the dataset name for this CTL entry.

RF240307**QUOTES ARE NOT ALLOWED IN THE INPUT FIELDS****Reason:**

Quotes are not allowed in any of the file filter attribute fields.

System Action:

None.

User Action:

Correct the entry.

RF240308**INVALID DDNAME SPECIFIED: P1****Reason:**

A CTL filter entry must use a valid dataset name or a DDNAME with no embedded wildcard characters. If DDNAMEs are used it must be in the format DD(ddname) or DDNAME(ddname).

System Action:

Request rejected.

User Action:

Correct the entry.

RF240309

INVALID MEMBER NAME: P1

Reason:

A CTL filter entry must use a valid dataset name or a DDNAME with no embedded wildcard characters. If DDNAMEs are used it must be in the format DD(ddname(member- name)) or DDNAME(ddname(member-name)).

System Action:

Request rejected.

User Action:

Correct the entry.

RF240310

Incomplete filter specification

Reason:

The filter specification is incomplete. The source data, target data, transfer ID, or CTL file must be identified.

System Action:

The field in error is highlighted.

User Action:

Specify a value in the Source Data or Target Data or Transfer ID field.

To remove a filter entry, you must clear all its fields.

RF240401

REQUIRED PARAMETER P1 NOT AVAILABLE.

Reason:

A required parameter was not available when this procedure was invoked.

System Action:

Procedure is terminated.

User Action:

Check the parameters used to invoke this procedure.

RF240402**INVALID OPTION P1****Reason:**

An invalid option was used to invoke this procedure.

System Action:

Procedure is terminated.

User Action:

Check the parameters used to invoke this procedure.

RF240403**Error in line *P1* : FILENAME exceeds 75 characters****Reason:**

The specified file name is too large.

System Action:

None.

User Action:

Correct the FILENAME entry in the CTL file. You can use the wildcard characters % to specify a larger file name.

RF240404**SELECTED CTL FILE HAS NO ENTRIES****Reason:**

The select CTL file has no entries.

System Action:

None.

User Action:

Verify the contents of the file selected.

RF240405

ERROR IN LINE P1 : FILENAME/PROCESS ID IS REQUIRED

Reason:

A file filter requires either a filename or a process ID.

System Action:

None.

User Action:

Correct the FILTER entry in the CTL file.

RF240406

ERROR IN LINE P1 : CTL TYPE NOT ALLOWED IN A CTL FILE

Reason:

A CTL file cannot contain CTL entires.

System Action:

None.

User Action:

Correct the FILTER entry in the CTL file.

RF240407

ERROR IN LINE P1 : INVALID TYPE SUPPLIED

Reason:

A file filter TYPE was not supplied or is invalid. Valid values for TYPE are 'TGT', 'SRC' and 'ID'.

System Action:

None.

User Action:

Correct the FILTER entry in the CTL file.

RF240408**ERROR IN LINE P1 : NON-NUMERIC VALUE IN MINSIZE/MAXSIZE
KEYWORD****Reason:**

A non-numeric value was supplied for MINSIZE/MAXSIZE.

System Action:

None.

User Action:

Correct the FILTER entry in the CTL file.

RF240409**ERROR IN LINE P1 : MINSIZE MUST BE LESS THAN MAXSIZE****Reason:**

The MAXSIZE value was less than the MINSIZE value.

System Action:

None.

User Action:

Correct the FILTER entry in the CTL file.

RF240410**ERROR IN LINE P1 : NEGATIVE VALUE IN MINSIZE/MAXSIZE/NUMBER
KEYWORD****Reason:**

A negative numeric value was specified in keywords MINSIZE, MAXSIZE, or NUMBER.

System Action:

None.

User Action:

Correct the FILTER entry in the CTL file.

RF240411

NO ERRORS FOUND DURING CHECK OF CTL ENTRY

Reason:

A check of the CTL entry was successful.

System Action:

None.

User Action:

None.

RF240412

UNABLE TO EXPAND LIST DUE TO ERROR IN P1

Reason:

An error was detected while evaluating a CTL entry.

System Action:

The action is disallowed.

User Action:

Select 'V' or 'CHK' on the CTL entry in error to determine the cause.

RF240413

UNABLE TO EXPAND LIST MAXIMUM NUMBER OF FILE FILTERS ALREADY EXIST

Reason:

The expansion of the file filter list exceeds the maximum number of 99 entries.

System Action:

The action is disallowed.

User Action:

Review all file filters and reduce the number of entries to 99.

RF240414**ERROR IN LINE P1 : P2 SHOULD NOT BE GREATER THAN P3****Reason:**

The upper limit for parameter *P2* has been exceeded.

System Action:

None.

User Action:

Correct the FILTER entry in the CTL file.

RF240415**ERROR IN LINE P1 : QUOTES NOT ALLOWED****Reason:**

Quotes are not allowed in any of the CTL keywords.

System Action:

None.

User Action:

Correct the FILTER entry in the CTL file.

RF240416**SELECTED CTL FILE HAS NO FILTER ENTRIES****Reason:**

The select CTL file has no FILTER entries.

System Action:

None.

User Action:

Verify the contents of the file selected and ensure that at least 1 FILTER statement exists.

RF380001

P1 is a required field

Reason:

A value must be entered in field *P1* .

System Action:

The field in error is highlighted.

User Action:

Enter a value for the field.

RF380002

P1 contains an invalid value - P2

Reason:

The value *P2* is not permitted in the *P1* field.

System Action:

The *P1* field is highlighted.

User Action:

Enter a valid value for the field.

RF380003

Ruleset P1 does not exist

Reason:

The ruleset with the name *P1* is not in the database.

System Action:

The field in error is highlighted.

User Action:

Enter ? (question mark) in the highlighted field to list the rulesets in the database and select one.

RF380004**File name contains invalid characters****Reason:**

The value in the File Name field contains the * or ? character. These characters are invalid in that field.

System Action:

The field in error is highlighted.

User Action:

Use the following wildcard characters to match file names that contain disallowed characters:

% (percent) matches any string of characters

_ (underscore) matches a single character

RF380005**Userid is invalid (P1)****Reason:**

The value *P1* is invalid in the User List field. The field value must be a userid or list of userids separated by commas. Each userid may consist of alphabetic, numeric and national (\$, @, #) characters only. Spaces are permitted between values, but are not required.

System Action:

The field in error is highlighted.

User Action:

With the cursor in the field, press F1 to display the Help. Correct the value that is in error.

RF380006

Log 'FAIL' not valid when Allow Request is 'NO'

Reason:

When the Allow Request field is set to NO the Log field cannot be set to FAIL. The 'FAIL' only occurs when Allow Request is set to YES and a request is disallowed by the external security facility.

System Action:

The field in error is highlighted.

User Action:

Correct the value.

RF380007

Invalid IP address range

Reason:

The low and high remote IP addresses are incorrectly ordered.

System Action:

The field in error is highlighted.

User Action:

Ensure that the value in the Remote IP Address [low] field is less than the value in the Remote IP Address [High] field.

RF380008

Ruleset P1 already exists

Reason:

The *P1* ruleset already exists in the database.

System Action:

The error is highlighted.

User Action:

Specify a name that has not been used for an FTP policy ruleset.

RF380009**Ruleset P1 already in use by P2****Reason:**

The user *P2* is currently maintaining the *P1* FTP policy ruleset. Only one user can maintain the a ruleset at a time.

System Action:

Your request is rejected.

User Action:

Wait until the other user has finished with the ruleset, then retry.

RF380010**Ruleset P1 loaded successfully****Reason:**

The *P1* FTP policy ruleset was successfully loaded in the SSI.

System Action:

None.

User Action:

None.

RF380011**Ruleset P1 load failed - See log for details****Reason:**

The *P1* FTP policy ruleset failed to load.

System Action:

The ruleset is not loaded in the SSI.

User Action:

See the activity log for detailed messages on why the ruleset failed to load. To access the log, enter the \$LOG command from any panel.

RF380012

Ruleset P1 load failed - SSI is full

Reason:

The *P1* FTP policy ruleset failed to load because there was not enough space in the configuration area in the SSI.

System Action:

The ruleset is not loaded. Any previously loaded ruleset remains in effect.

User Action:

Reduce the number of rules in the *P1* ruleset, and retry. If the problem persists contact Technical Support.

RF380013

Ruleset P1 load failed - No records

Reason:

The *P1* FTP policy ruleset failed to load because there are no rules in the ruleset.

System Action:

The request is denied.

User Action:

Load a policy ruleset that contains rules.

RF380014**SAF Security Check: P1 P2 access was denied****Reason:**

A SAF call to your external security subsystem (RACF, ACF2, or Top Secret) was made for READ, UPDATE, or ALTER access to the FTP policy ruleset and rule definitions.

The SAF resource that is checked to determine access to the definitions is a FACILITY class rule named *\$SOLVE.FTP.CONTROL* .

Your user ID was denied the level of access requested. The levels are as follows:

- *READ* access is required to browse definitions
 - *UPDATE* access is required to update definitions
 - *ALTER* access is required to add, delete and load definitions
- SAF security must be defined before you can use the FTP policy functions.

System Action:

The request is denied.

User Action:

Check the activity log for any additional details about this failure. Provide this information to your security administrator.

To set up SAF security for the FTP policy functions, add a FACILITY class rule called *\$SOLVE.FTP.CONTROL* , then provide permissions to the users of the FTP policy functions.

RF380015**SAF Qualifier not permitted when Allow Request is 'NO'****Reason:**

If the value of the Allow Request? field is NO, matched FTP requests are disallowed and the SAF Qualifier field serves no purpose.

System Action:

The field in error is highlighted.

User Action:

If FTP requests are to be disallowed based on the matching criteria alone, remove the value in the SAF Qualifier field.

RF380016

Request rejected, SSI is not active

Reason:

The request cannot be processed when the SSI is inactive.

System Action:

None.

User Action:

To perform this action, start the data space manager task first (for example, S SOLVESSI).

RF380017

Ruleset not yet created

Reason:

While creating an FTP policy ruleset, you pressed F6 (Rules) before saving the ruleset definition. Your ruleset has not been created yet.

System Action:

None.

User Action:

Press F4 (Save), then press F6 (Rules).

RF380018

Ruleset name missing

Reason:

While creating an FTP policy ruleset, you pressed F6 (Rules) before you complete the Name field.

System Action:

None.

User Action:

Create your ruleset, then press F6 (Rules).

RF380019**Ruleset P1 load failed - load in progress by P2 on P3****Reason:**

The *P1* FTP policy ruleset failed to load because another load is in progress by the user ID specified in *P2* on the region specified in *P3* .

System Action:

The request is denied.

User Action:

Contact the specified user or wait and retry to load this ruleset.

RF38SEC000**FUNCTION COMPLETED****Reason:**

A SAF call to verify access to the \$SOLVE.FTP.CONTROL resource definition has completed. The requested access level was permitted.

System Action:

Processing continues.

User Action:

None.

RF38SEC001

Security Check failed: P1 RC=P2 SFRC=P3 SFREAS=P4 ENV=P5 P6

Reason:

A SAF call to verify access to the \$SOLVE.FTP.CONTROL resource definition has failed.

RC displays the return code from the SAF interface (UTIL0039).

SFRC displays the sub-function return code.

SFREAS displays the sub-function reason code.

ENV displays environmental information.

The most common RC and SFRC combinations are:

04 PROGRAM ACTIVATION FAILURE

04 Program not APF-authorized

08 Invalid parameter

0C Missing parameter

10 Parameters inconsistent

08 SAF INTERFACE FAILURE

SAF/RACROUTE RETURN CODES:

04 Requested function was not processed

08 Requested function was processed, but failed

12 ACCESS VERIFICATION FAILURE

RACROUTE REQUEST=VERIFY CODES:

04 No security profile defined

08 Password invalid

0C Password expired

10 New password invalid

14 Group definition is missing

18 Security exit denied access

1C User temporarily revoked

20 Security system not active

24 Access to group is closed

?? others as per specific security system

16 ACCESS AUTHORIZATION FAILURE

RACROUTE REQUEST=AUTH CODES:

04 Resource is not security protected

08 Resource access not allowed

99 NO ENTRY PARAMETERS

System Action:

The user access request is denied.

User Action:

Contact your system administrator. Use the displayed codes and messages to investigate the cause of the error.

You also need the following documentation:

- The SAF RACROUTE macro documentation
- The messages and codes documentation for your external security system (CA ACF2, CA Top Secret, or RACF)

Ensure that:

- Your product is running in an authorized load library.
- Your external SAF security system is active.
- Your security administrator has set up SAF protection of \$SOLVE.FTP.CONTROL correctly. For information about these tasks, see the *CA NetMaster File Transfer Management Administration Guide*.

RF38SEC002

Authorization failure: resource not security protected

Reason:

A user has attempted to access the \$SOLVE.FTP.CONTROL resource definition. A SAF call was done to check the user's authority level, but failed because the necessary resource is not defined to SAF.

System Action:

All requests, by all users, for any level of access (including READ) to the \$SOLVE.FTP.CONTROL resource will be rejected. Requests will only be allowed when the necessary resources and access permissions are defined to SAF.

User Action:

Ask your Security Administrator to define the \$SOLVE.FTP.CONTROL resource profile to SAF. Until this is completed, all access requests (even read-only ones) are denied.

RF38SEC003

SAF Authorization: access request denied.

Reason:

A user has attempted to access the \$SOLVE.FTP.CONTROL resource definitions. A SAF call was done to check the user's authority level. This user does not have the level of access required to perform the function they requested. This message is followed by RF38SEC004, which lists the user ID and requested access.

System Action:

The request is rejected.

User Action:

Ask your security administrator to give this user ID the required level of access to the \$SOLVE.FTP.CONTROL FACILITY class rule.

For information about defining \$SOLVE.FTP.CONTROL to your external SAF security system (CA ACF2, CA Top Secret, or RACF), see the *CA NetMaster File Transfer Management Administration Guide*.

- READ is required to list or browse a definition.
- UPDATE is required to update a definition.
- ALTER is required to add or delete a definition.

RF38SEC004**P1****Reason:**

This message is written to the Activity Log following any SAF check failure messages. It contains the parameters used by the failing SAF RACROUTE REQUEST=VERIFY macro call. These parameters may include:
USRID - the user ID requesting access to \$SOLVE.FTP.CONTROL
GRPID - the user ID's SAF default group
CHKENV - the SAF checking environment (APPL|USER|FULL)
ACCTYP - the access type requested (READ|UPDATE|ALTER)
RSNAME - the SAF resource name
RSCLSS - the SAF class

System Action:

None.

User Action:

Use this information, combined with the information in the previous error message, to determine the cause of the error. For more specific information, see the User Action in the previous error message.

RFAC01L01**No queued Auto Connects found matching the search criteria****Reason:**

There are no queued Auto Connects which match the List Names defined in the monitor definition.

System Action:

None.

User Action:

None.

RFAC01L02

List Name P1 deleted successfully by user P2

Reason:

The List Name specified by *P1* has been successfully deleted by the user specified by *P2* .

System Action:

The List Name is deleted from the Auto Connect queue.

User Action:

None.

RFACB01

COMMAND NOT SUPPORTED ON C:D for P1

Reason:

The command is not supported by CONNECT:Direct for *P1* .

System Action:

The command is rejected.

User Action:

None

RFACMON03

AUTO CONNECT QUEUE CHECK TIMED OUT

Reason:

The Auto Connect Queue Monitor has issued a heartbeat to the CONNECT:Mailbox STC and has not received a response.

System Action:

None.

User Action:

None.

RFACMON04**AUTO CONNECT QUEUE CNT(P1) ALL OK AT P2****Reason:**

The Auto Connect Queue Monitor has found that the number of queued Auto Connects does not exceed the threshold defined in the monitor definition. *P1* is the current count of the Auto Connect Queue. *P2* is the time the monitor performed the heartbeat.

System Action:

None.

User Action:

None.

RFACMON05**AUTO CONNECT QUEUE CNT(P1) AT P2****Reason:**

The Auto Connect Queue Monitor has found that the number of queued Auto Connects exceeds the threshold defined in the monitor definition. *P1* is the current count of the Auto Connect Queue. *P2* is the time the monitor performed the heartbeat.

System Action:

The Monitor is set to a degraded state under ResourceView and an alert is sent to the Alert Monitor.

User Action:

Issue the display command to check the Auto Connect Queue.

RFAD3801**No records found****Reason:**

No records were found for this list.

System Action:

None.

User Action:

None.

RFAD3802

Command conflict

Reason:

You performed an action that is in conflict with another action.

System Action:

The action that caused the conflict is highlighted.

User Action:

Review your actions, and correct the error.

RFBS01L01

No BSC Lines found matching the search criteria

Reason:

There are no BSC Lines which match the BSC Lines defined in the monitor definition.

System Action:

None.

User Action:

None.

RFBS01L02

BSC Line P1 stopped successfully by user P2

Reason:

The BSC Line specified by *P1* has been successfully stopped by the user specified by *P2*.

System Action:

The BSC Line is closed.

User Action:

None.

RFBS01L03**BSC Line P1 started successfully by user P2****Reason:**

The BSC Line specified by *P1* has been successfully started by the user specified by *P2*.

System Action:

The BSC Line is started.

User Action:

None.

RFBS01L05**P1 stop failed as it is already inactive****Reason:**

The BSC Line specified by *P1* has failed to stop as it was not running at the time the command was issued.

System Action:

None.

User Action:

None.

RFBSMON01**RESTART OF P1 COMPLETED SUCCESSFULLY****Reason:**

The BSC Line Monitor has automatically restarted line *P1* as the monitor field Automatic Restart? is set to YES. The restart has completed successfully.

System Action:

None.

User Action:

None.

RFBSMON02

RESTART OF P1 FAILED WITH THE ERROR P2

Reason:

The BSC Line Monitor has attempted to automatically restart line *P1* as the monitor field Automatic Restart? is set to YES. The restart has failed with the error *P2*.

System Action:

None.

User Action:

Investigate the cause of the failure. Enter CMMMSG at the command prompt for additional message help for the error *P2*.

RFBSMON03

BSC LINE CHECK TIMED OUT

Reason:

The BSC Line Monitor has issued a heartbeat to the CONNECT:Mailbox STC and has not received a response.

System Action:

None.

User Action:

None.

RFBSMON04

BSC LINE CNT(P1) ALL OK AT P2

Reason:

The BSC Line Monitor has found there are no BSC lines in a status of CLOSED. *P1* is the current number of BSC Lines. *P2* is the time the monitor performed the heartbeat.

System Action:

None.

User Action:

None.

RFBSMON05**BSC LINE CNT(P1) AND P2 CLOSED AT P3****Reason:**

The BSC Line Monitor has found *P1* BSC Lines and *P2* have a status of CLOSED. *P3* is the time the monitor performed the heartbeat.

System Action:

The monitor is set to a degraded state under ResourceView and an alert is sent to the Alert Monitor.

User Action:

Issue the display command to check which BSC Lines are in a closed status.

RFBSMON06**NO BSC LINES FOUND AT P1****Reason:**

The BSC Line Monitor has not found BSC lines that match the BSC lines defined in the monitor. *P1* is the time the monitor performed the heartbeat.

System Action:

None.

User Action:

Check the monitor definition as it may be incorrect.

RFCALL01**INTERFACE INVOKED WITHOUT REQUIRED KEYWORD(S) P1****Reason:**

THE CONNECT:Direct API procedure was invoked without the required keyword(s) identified by *P1*.

System Action:

The request is rejected. The interface procedure ends with return code 16.

User Action:

Supply the required keyword parameter(s).

RFCALL02

INTERFACE INVOKED WITH INVALID VALUE(P1) FOR KEYWORD(P2)

Reason:

THE CONNECT:Direct API procedure was invoked with an invalid value, identified by P1 for the keyword parameter identified by P2

System Action:

The request is rejected. The interface procedure ends with return code 16.

User Action:

Correct the invalid keyword parameter.

RFCALL03

COMMAND NOT SUPPORTED FOR CONNECT:Direct TYPE(P1)

Reason:

A command was issued for a CDMGR resource of type *P1* , but the command is not supported by a resource of that type.

System Action:

The request is rejected.

User Action:

None

RFCD01

REQUEST REJECTED, SUBSYSTEM INACTIVE

Reason:

The SOLVE-CONNECT:Direct interface was called, but the subsystem which enables the interface is not active.

System Action:

The request is rejected with a return code of 8.

User Action:

Enable the interface using SUBSYS START as per the installation instructions.

RFCD0101**SERVICE PROCEDURE P1 INVOKED WITH INVALID KEYWORD P2(P3)****Reason:**

Service procedure P1 was invoked with an invalid value for the keyword, P2 , of P3 .

System Action:

The request is rejected.

User Action:

Contact your local support representative.

RFCD0102**SIGNON REQUEST CANCELLED****Reason:**

A signon attempt to CONNECT:Direct was cancelled at the user's request.

System Action:

Signon is terminated.

User Action:

None.

RFCD02

REQUEST FAILED BY DMCHLAPI: RETURNED R15= P1 EXPECTED R15= P2

Reason:

The CONNECT:Direct interface was called, but the R15 response from DMCHLAPI (P1) was not the expected value. The returned and expected values are both shown in hexadecimal format. The expected value (P2) is:

- X'00000014' (decimal 20) for SIGNOFF
- X'00000000' (decimal 0) for all other commands

System Action:

The request is rejected with a return code of 12.

User Action:

This message may be issued when the CONNECT:Direct region is inactive or not functioning normally. Check to see if there are such problems, and resolve them.

If the CONNECT:Direct region is functioning as expected, this message may indicate a problem in the CONNECT:Direct definitions in the this region. Review the \$RF CDAPI parameter group, and check that the specified values are correct.

The use of the CONNECT:Direct programming interface, DMCHLAPI, is described in the CONNECT:Direct for MVS Installation and Administration Guide, in the chapter, Using the Programming Interface. Associated return codes are listed in the section, DMCHLAPI Return Codes.

See the above reference for a technical explanation of the return code. If the cause of the problem is not apparent, contact Technical Support.

RFCD04

NULL COMMAND RECEIVED

Reason:

The SOLVE-CONNECT:Direct interface was called with a command (variable), but the command is null (that is, zero length).

System Action:

The request is rejected with a return code of 8.

User Action:

Contact your local support representative.

RFCD05**INVALID OUTSPECS PASSED****Reason:**

The SOLVE-CONNECT:Direct interface is called with CONNECT:Direct output specifications (OUTSPECS), which default to NNNNNNN. These specifications may be overridden by specifying a 7-character string as the second parameter when the SOLVE- CONNECT:Direct interface is called. A second parameter was specified, but it was neither null nor 7-characters long.

System Action:

The request is rejected with a return code of 8.

User Action:

Contact your local support representative.

RFCD06

LOAD FOR CONNECT:DIRECT API FAILED: MODULE NAME= P1 R0= P2 R15= P3

Reason:

The CONNECT:Direct interface was called. The subsystem which enables the interface is active, but the CONNECT:Direct API failed to load when the SOLVE region initializes. The load module name is P1 , and R0 and R15 from the LOAD instruction are P2 and P3 respectively.

System Action:

The request is rejected with a return code of 8.

User Action:

Ensure that the module name is correct (DMCHLAPI).

If it is correct, use the R0 and R15 return codes to determine the cause of the error.

A common error is 806, which indicates that the module could not be found in the load library list (that is, the list of libraries in the STEPLIB). Ensure that the CONNECT:Direct load library (for example, \$CD.V2101.LINKLIB) is included in either the STEPLIB or the system link list.

Notes: - All libraries included in the STEPLIB must be APF authorized.

- If the STEPLIB is changed, you must restart this region.

- The CONNECT:Direct API program, DMCHLAPI, may require other load modules which are usually present in the same CONNECT:Direct load library.

- The API program is loaded as a result of the SUBSYS DEFINE command when this region initializes. To reload the program, the region must be terminated and restarted.

RFCD00

P1

Reason:

This message displays the result of a CONNECT:Direct command issued through the CONNECT:Direct API

P1 is the trace text.

System Action:

None.

User Action:

Contact Technical Support.

RFCDCMD01**COMMAND INTERFACE INVOKED WITHOUT REQUIRED KEYWORD(S)
P1****Reason:**

THE CONNECT:Direct Command Interface procedure was invoked without the required keyword(s) identified by P1.

System Action:

The request is rejected. The interface procedure ends with return code 16.

User Action:

Supply the required keyword parameter(s). If the missing keyword is either USERID or PASSWORD go to option A.C.P and check the CDAPI parameter group. Ensure that the USERID and PASSWORD are specified and action (F6) the group to cause these values to be set.

RFCD CMD02

REQUIRED FILE NAMES(P1) FOR CDMGR(P2) WERE UNAVAILABLE

Reason:

The CONNECT:Direct command interface procedure was invoked for a CDMGR but was unable to ascertain the values for the NETMAP and MSGFIL datasets. The file names which could not be derived are identified by P1 , while P2 identifies the CONNECT:Direct manager.

The reason for the failure could be because the INQUIRE INITPARMS command issued to CONNECT:Direct was unsuccessful or because the \$RFXPRMS exit was not modified to provide the required file names.

Including the file names of the managed CONNECT:Direct region in the \$RFXPRMS exit will bypass the need for the command API to issue the INQUIRE INITPARMS command to obtain these file names.

Note: For CONNECT:Direct Version 1.8, the \$RFZPRMS exit *must* be customized because this version of CONNECT:Direct does not support the INQUIRE INITPARMS command.

System Action:

The request is rejected. The interface procedure ends with return code 16.

User Action:

Update the \$RFXPRMS exit to include the file names of the NETMAP and MSGFIL datasets for the managed CONNNECT:Direct region.

If the version of CONNECT:Direct is later than V1.8, the file names can be dynamically extracted by the INQUIRE INITPARMS command. In this case, check that the user ID specified in the CDAPI parameter group is defined to CONNECT:Direct and has the necessary authority. Also check that the CMD clist is available in the CONNECT:Direct OPLIST dataset.

RFDCMD03**REQUEST IS QUEUED - PLEASE WAIT ID= P1****Reason:**

The CONNECT:Direct Command Interface procedure has not got exclusive control of the CONNECT:Direct API and is waiting for a previous request to complete. *P1* is the NCLID of the command interface.

System Action:

The procedure will wait for 30 seconds at a time to get exclusive control of the CONNECT:Direct API, issuing this message each time until successful.

User Action:

Wait for exclusive control to be gained or flush the procedure.

RFDCMD04**ATTEMPT TO P1 SUBSYS P2 RETURNED ' P3'****Reason:**

The CONNECT:Direct Command Interface procedure has attempted to perform function *P1* against the subsystem *P2* and received the unexpected result *P3*.

System Action:

The procedure will terminate, the request is rejected.

User Action:

Investigate the cause of the error and rectify.

RFDCMD05**SUBSYS P1 ABENDED - RESTART WAS UNSUCCESSFUL****Reason:**

The CONNECT:Direct Command Interface procedure has attempted to use the SUBSYS identified by *P1* and received an error indicating that the SUBSYS had abended. A restart of the SUBSYS also abended.

System Action:

The procedure will terminate, the request is rejected.

User Action:

Investigate the cause of the error and rectify.

RFCD CMD06

P1 OF DMPRINT FAILED. RC(P2) FDBK(P3)

Reason:

The CONNECT:Direct Command Interface procedure has attempted to perform the function identified by *P1* against the DMPRINT dataset and received return code *P2* and feedback *P3*

System Action:

The procedure terminates.

User Action:

Investigate the cause of the error and rectify.

RFCD CMD07

COMMAND PROCESSING COMPLETED

Reason:

This message indicates that the The CONNECT:Direct Command Interface has successfully terminated and returned all responses received from CONNECT:Direct.

System Action:

The procedure terminates.

User Action:

None

RFCD CMD08

P1 RC(P2) FDBK(P3) MSG(P4)

Reason:

The CONNECT:Direct Command Interface procedure has attempted to allocate/unallocate the dataset identified by *P1* and received return code *P2* and feedback *P3* with error message *P4* .

System Action:

The procedure terminates.

User Action:

Investigate the cause of the error and rectify.

RFCD CMD09**RC= P1 MSG= P2****Reason:**

The CONNECT:Direct Command Interface procedure issued a command and received a non-zero return code *P1* (greater than 4) and message *P2* from the CONNECT:Direct API.

System Action:

Any contents of DMPRINT are returned along with this message.

User Action:

None.

RFCD CMD10**P1****Reason:**

The CONNECT:Direct Command Interface procedure issued a command and received return code 4 from CONNECT:Direct. The returned message text is in *P1*.

System Action:

Any contents of DMPRINT are returned along with this message.

User Action:

None.

RFDCMD11

REQUIRED DDNAME(P1) IS NOT ALLOCATED

Reason:

The CONNECT:Direct Command Interface procedure was invoked and found that one of the required DDNAMES, DMPRINT or DMPUBLIB as identified by *P1* has not been allocated.

System Action:

The request is rejected. The interface procedure ends with return code 16.

User Action:

Go to option A.C.P and check the CDAPI parameter group. Ensure that the appropriate file(s) are specified and action (F6) the group to cause the files to be allocated.

RFDCMD12

CONNECT:Direct signon for USERID P1 failed P2

Reason:

The CONNECT:Direct Command Interface procedure attempted a signon and failed. *P1* is the user ID. If available, *P2* is the return code from the CONNECT:Direct Command Interface.

Any additional messages returned by CONNECT:Direct are written to the activity log. These messages are prefixed with the message ID RFDCMD22.

System Action:

The request fails. Any related error messages are written to the activity log.

User Action:

Determine the cause of the failure. Correct it, and retry.

Following are some possible causes:

- User ID is not defined to CONNECT:Direct.
- Password is incorrect.
- User ID was defined as being case sensitive, and the wrong case was used in the signon.
- If you are using the Auto Populate Facility for CONNECT:Direct manager resources, the CDMGR Name field must specify the name of a CONNECT:Direct region that is currently active.

RFDCMD20**DMPRINT file has been allocated as a temporary file****Reason:**

The CONNECT:Direct Command API work file DDNAME: *DMPRINT* has been allocated to a temporary file.

System Action:

Processing continues.

User Action:

None.

RFDCMD21**DMPRINT file cannot be allocated; reason: P1****Reason:**

An internal error has occurred.

The CONNECT:Direct Command API work file DDNAME: *DMPRINT* cannot be allocated. *P1* is the error text.

System Action:

The request is rejected. The interface procedure ends with return code 16.
The CONNECT:Direct Command API responses is disabled.

User Action:

Contact Technical Support with the full text of this message.

RFCD CMD22

(P1) P2

Reason:

A signon or signoff request to the CONNECT:Direct Command Interface has failed. *P2* is a message returned by the interface. *P1* is the name of the CDMGR resource. A companion message (RFCD CMD12) is written to the related CDMON transient log.

System Action:

The request fails.

User Action:

Determine the cause of the failure. Correct it, and retry.

Following are some possible causes:

- User ID is not defined to CONNECT:Direct.
- Password is incorrect.
- User ID was defined as being case sensitive, and the wrong case was used in the request.
- If you are using the Auto Populate Facility for CONNECT:Direct manager resources, the CDMGR Name field must specify the name of a CONNECT:Direct region that is currently active.

RFCDEV01**PROCESS P1 SUBMITTED****Reason:**

A notification has been received from CONNECT:Direct, indicating that a CONNECT:Direct process was successfully submitted.

The process is identified by the process name and number, *P1* , and is usually shown as *name(number)* . If neither of these is supplied in the CONNECT:Direct event, the process is identified as *UNKNOWN* . However, if part of the information is not supplied, then:

If the... P1 is shown as... name is missing #number# number is missing
name(0)

This message may be followed by RFCDEV03, which provides additional identification details.

System Action:

None

User Action:

None

RFCDEV02

PROCESS P1 SUBMISSION FAILED: CC= P2 MSG= P3

Reason:

A notification has been received from CONNECT:Direct, indicating that a CONNECT:Direct process was submitted but has failed. The completion code, *P2* , and the CONNECT:Direct message ID, *P3* , are shown.

The process is identified by the process name and number, *P1* , and is usually shown as *name(number)* . If neither of these is supplied in the CONNECT:Direct event, the process is identified as *UNKNOWN* . However, if only part of the information is not supplied, then:

If the... P1 is shown as... name is missing #number# number is missing
name(0)

This message may be followed by RFCDEV03, which provides additional identification details.

System Action:

None

User Action:

This message may indicate that a CONNECT:Direct transmission has failed and that manual intervention is required to restart or resubmit the process. The following may be useful in problem diagnosis:

- CONNECT:Direct completion code and message ID - CONNECT:Direct job output - System log

RFCDEV03

PROCESS P1 WAS SUBMITTED BY P2 ON P3 PNODE= P4 SNODE= P5**Reason:**

This message provides additional information about a CONNECT:Direct process that was identified by a previous message that indicates the success or failure of the process.

The process is identified by the process name and number, P1 , and is usually shown as name(number) . If neither of these is supplied in the CONNECT:Direct event, the process is identified as *UNKNOWN* . However, if only part of the information is not supplied, then:

If the... P1 is shown as... name is missing #number# number is missing name(0)

The message also includes the following:

- CONNECT:Direct user ID, P2 , that submitted the process
- CONNECT:Direct node, P3 , from where the process is submitted
- CONNECT:Direct sending node, P4
- CONNECT:Direct receiving node, P5

RFCDEV04

PROCESS P1 STARTED

Reason:

A notification has been received from CONNECT:Direct, indicating that a CONNECT:Direct process has started.

Note: This message is generated only if the CONNECT:Direct region is version 2.2 or higher.

The process is identified by the process name and number, *P1* , and is usually shown as *name(number)* . If neither of these is supplied in the CONNECT:Direct event, the process is identified as *UNKNOWN* . However, if only part of the information is not supplied, then:

If the... P1 is shown as...

name is missing #number#

number is missing name(0)

This message may be followed by RFCDEV03, which provides additional identification details.

RFCDEV40

WARNING: MISMATCHED START DETAILS - KEY: P1**Reason:**

NetMaster for File Transfer received a CONNECT:Direct "CT" Copy Termination statistic record for which no corresponding START EVENT had been processed. However, there was a START EVENT for the same transfer with a swapped PNODE/SNODE (known CONNECT:Direct problem). Transfer details are rebuilt. *P1* is the transfer key of the START EVENT:

Primary Node - (16 Characters)

Process Number - (08 Characters)

Process Name - (08 Characters)

Secondary Node - (16 Characters)

Step Name - (08 Characters)

The rebuilt START EVENT will have its PNODE/SNODE swapped to match the Copy Termination transfer key.

System Action:

The error is corrected, processing continues.

User Action:

None.

RFCDEV41

**WARNING: NO MATCHING START EVENT ISSUED FOR PNODE: P1
SNODE: P2 TRANSFER ID: P3 STEP: P4****Reason:**

NetMaster for File Transfer received a CONNECT:Direct "CT" Copy Termination statistic record for which no corresponding START EVENT had been processed. Transfer details are built from the Copy Termination statistic record.

System Action:

Processing continues.

User Action:

None.

Note: No START EVENT would have been raised for this transfer. The transfer start date and time are not available, and are set as the current system time.

RFCDEV42

EXPECTED CONNECT:DIRECT STATS RECORD LATE OR MISSING - P1

Reason:

NetMaster for File Transfer received a CONNECT:Direct "CT" Copy Termination statistic record and was waiting on other related statistic records to complete the END/FAILURE event. These expected CONNECT:Direct statistic records were not received within the expected time. The END/FAILURE event is raised with the available data. P1 is the transfer key of the END/FAILURE event:

Primary Node - (16 Characters)

Process Number - (08 Characters)

Process Name - (08 Characters)

Secondary Node - (16 Characters)

Step Name - (08 Characters)

System Action:

The END/FAILURE event is raised. Some of the CONNECT:Direct WO message records may not have been captured. However, the END/FAILURE event key fields are complete.

User Action:

None.

RFCDEV43

WARNING: DUPLICATE START EVENT IGNORED. PNODE: P1 SNODE: P2 PROC. #: P3 PROC. NAME: P4 - PROC. STEP: P5

Reason:

NetMaster for File Transfer received a CONNECT:Direct Statistic Exit "ALLOC" record for a process step which is currently active. P1 is the PNODE P2 is the SNODE P3 is the PROCESS NUMBER P4 is the PROCESS NAME P5 is the PROCESS STEP NAME

System Action:

The duplicate record is ignored and processing continues.

User Action:

Contact Technical Support and provide the following diagnostic information:
- Full text of this message - CONNECT:DIRECT message log

RFCDEV70**CONNECT:Direct Statistic Exit for *P1* is not yet active****Reason:**

The CA Netmaster FTM statistics exit NMCDSTEX for CDMGR *P1* is not active.

System Action:

CONNECT:Direct File Transfer Manager *P1* is waiting for CONNECT:Direct statistic exit message *RFCX01* indicating that the exit has started.

User Action:

Check the Resource Monitor *P1* CDMGR Extended Display. If the message *RFCDEV70 NM STATS EXIT START PENDING* is not reset in a short period, one of the following problems may exist:

- The CONNECT:Direct statistics exit (NMCDSTEX) failed to start.
Check the CONNECT:Direct job log for related errors.
- The CONNECT:Direct initialization parameter *STATISTICS.EXIT* does not specify the correct exit name (NMCDSTEX).

RFCDEV71

CONNECT:Direct Statistic Exit for *P1* is active, initial notification pending

Reason:

The CA NetMaster FTM statistics exit NMCDSTEX for CDMGR *P1* is active but has not sent any events.

System Action:

CONNECT:Direct File Transfer Manager *P1* is waiting for a notification event from the exit.

User Action:

Check the Resource Monitor *P1* CDMGR Extended Display. If the message RFCDEV71 NM STATS EXIT NOTIFICATION PENDING is not reset in a short period, issue a CHK line command against the *P1* CDMGR. If the Extended Display message persists, one of the following problems may exist:

- The CONNECT:Direct statistics exit (NMCDSTEX) Event Receiver ID does not match the Event Receiver ID specified by the Customizer Parameter Group: CDAPI - CONNECT:Direct Interface.
- The Sub-System Interface (SSI) is not operational. Issue the following command to verify the SSI status:

SSI STATUS

If the problem cannot be resolved, contact Technical Support.

RFCDEV72**A response from the CONNECT:Direct Statistic Exit for *P1* is pending****Reason:**

A health check request response from the CA NetMaster FTM statistics exit NMCDSTEX for CDMGR *P1* has not been received.

System Action:

CONNECT:Direct File Transfer Manager *P1* is waiting for a response from the exit.

User Action:

Check the Resource Monitor *P1* CDMGR Extended Display. If the message RFCDEV72 NM STATS EXIT RESPONSE PENDING is not reset in a short period, issue a CHK line command against the *P1* CDMGR. If the Extended Display message persists, one of the following problems may exist:

- The CONNECT:Direct statistics exit (NMCDSTEX) Event Receiver ID does not match the Event Receiver ID specified by the Customizer Parameter Group: CDAPI - CONNECT:Direct Interface.
- The Sub-System Interface (SSI) is not operational. Issue the following command to verify the SSI status:

SSI STATUS

If the problem cannot be resolved, contact Technical Support.

RFCDEV73***P1* is active with event receiver disabled****Reason:**

The CA NetMaster FTM CDMGR *P1* is active with CONNECT:Direct Event Receiver disabled.

System Action:

None.

User Action:

This is an informational message only. It informs you that CDMGR *P1* is active and that the CONNECT:Direct Event Receiver is disabled.

This is not an issue when CONNECT:Direct transfer events are not required. If this is not the case, you must update Enable CONNECT:Direct Event Receiver in Customizer Parameter Group: CDAPI. Set the CONNECT:Direct Interface to **YES** and press F6 (Action) to apply the change.

RFCDEV80

Health Check response received from CONNECT:Direct Statistic Exit

Reason:

CA NetMaster FTM received a CONNECT:Direct Statistic Exit "HEALTH CHECK" response. This is the expected response to a HEALTH CHECK request.

System Action:

None.

User Action:

None.

RFCDEV81

CONNECT:Direct Statistic Exit trace is now inactive

Reason:

CA NetMaster FTM CONNECT:Direct Statistic Exit trace has been stopped.

System Action:

CONNECT:Direct Statistic Exit trace terminates.

User Action:

None.

RFCDEV82

CONNECT:Direct Statistic Exit trace is now active

Reason:

CA NetMaster FTM CONNECT:Direct Statistic Exit trace has been started.

System Action:

CONNECT:Direct Statistic Exit trace is active. Trace messages RFCX93 are written to the System Log.

User Action:

None.

RFCDEV83**CONNECT:Direct Statistic Exit event flow is now operational****Reason:**

A pending notification or an event record from the CA NetMaster FTM CONNECT:Direct Statistic Exit was received.

System Action:

The processing of CONNECT:Direct file transfer events starts or resumes.

User Action:

This message may be issued during the CONNECT:Direct region startup indicating that the CONNECT:Direct Statistic Exit event flow started.

If this message was issued after recovering from a loss of communication with the CA NetMaster FTM statistics exit NMCDSTEX, some file transfer events may have been lost.

RFCDEV11**OPERAND P1 OMITTED OR IS NULL****Reason:**

The NetMaster for File Transfer CONNECT:Direct event message format procedure has failed because a mandatory operand either was omitted or has a null value. The operand in error, *P1*, is identified.

System Action:

The procedure terminates.

User Action:

Contact Technical Support.

RFCDEVI10

XFERID= P1 TASKNAME= P2 BYTES(P3)

Reason:

The message displays the bytes SENT/RECEIVED and READ/WRITTEN for a C:D Transfer. The information presented is used to derive the compression percentage value but incomplete or invalid data was detected.

System Action:

Processing continues with the compression percentage set to 'INC.'

User Action:

Contact your local support representative.

RFCDEVI2

**MDO ASSIGN FAILED: RC= P1 FDBK= P2 MAP= P3 COMPONENT= P4
TAG= P5 TYPE= P 6**

Reason:

The NetMaster for File Transfer CONNECT:Direct event message format procedure has failed due to an MDO error. The failure is identified by the following:

- Statement type, ASSIGN
- MDO return code, **P1** =&ZMDORC
- MDO feedback code, **P2** =&ZDMOFDBK
- Map name, **P3** =&ZMDOMAP
- Full map component name, **P4** =&ZMDONAME
- Map component tag value, **P5** =&ZMDOTAG
- ASN.1 type of the component, **P6** =&ZMDOTYPE

System Action:

This message is written to the activity log and is followed by a series of messages (DD9003, DD9004, DD9006, and DD9007), which display the event in dump format. The event is ignored.

User Action:

Contact Technical Support, making available the following diagnostic information:

- Full text of this message
- Record dump

It is suggested that the information be obtained immediately as follows:

1. Locate the message and dump in the activity log.
2. Use the PRINT START and PRINT END commands to mark the lines. Refer to the activity log help if you do not know how to do this. Ensure that the marked text contains this error message and the entire record dump (that is, up to and including the DD9007 message).
3. Use the PRINT command to print the marked section of the log.

Note: If you use a 3270 terminal emulator and choose to print the diagnostics by using the "cut and paste" procedure, ensure that you include an image where you scroll right to capture the end of this message.

RFCDEVI3

RECORD TYPE P1 (X' P2') IS NOT SUPPORTED

Reason:

The NetMaster for File Transfer CONNECT:Direct event message format procedure has failed because a CONNECT:Direct event record was received but the procedure does not support it. The record type is shown in character, *P1* , and hexadecimal, *P2* .

System Action:

The procedure terminates.

User Action:

Contact Technical Support.

RFCDEVI4

**DATA ERROR AT LINE P1 IN PROC P2. RTN= P3 COND= P4 KWD= P5
EVENT= P6. STATEMENT= P7**

Reason:

The NetMaster for File Transfer CONNECT:Direct event message format procedure has failed due to a data error in the event received from CONNECT:Direct. The error is identified by the following:

- Line number, *P1* , and procedure name, *P2* , where the error occurred
- Subroutine name, *P3* , if applicable
- Error condition raised, *P4*
- Verb operand that has detected the error, *P5* , if applicable
- CONNECT:Direct statistics record type, *P6*
- Statement text where the error occurred, *P7*

System Action:

This message is written to the activity log and is followed by a series of messages (DD9003, DD9004, DD9006, and DD9007), which display the event in dump format. The event is then ignored.

If file transfer logging is active, it is also written to the file transfer log.

User Action:

Contact Technical Support, making available the following diagnostic information:

- Full text of this message
- Record dump

It is suggested that the information be obtained immediately as follows:

1. Locate the message and dump in the activity log.
2. Use the PRINT START and PRINT END commands to mark the lines. Refer to the activity log help if you do not know how to do this. Ensure that the marked text contains this error message and the entire record dump (that is, up to and including the DD9007 message).
3. Use the PRINT command to print the marked section of the log.

Note: If you use a 3270 terminal emulator and choose to print the diagnostics by using the "cut and paste" procedure, ensure that you include an image where you scroll right to capture the end of this message.

RFCDEVI5

CONNECT:DIRECT EVENT MESSAGE FORMAT PROCEDURE HAS FAILED - REASON: P1

Reason:

The NetMaster for File Transfer CONNECT:Direct event message format procedure has failed because of an internal system error. **P1** is the reason for the failure.

System Action:

The procedure terminates.

User Action:

Contact Technical Support.

RFCDEVI6

CONNECT:DIRECT EVENT MESSAGE FORMAT PROCEDURE IS ATTEMPTING TO START P1

Reason:

The NetMaster for File Transfer CONNECT:Direct event message format procedure has detected that there is currently no active event receiver procedure. The event procedure, **P1**, will be started.

System Action:

The required event receiver procedure is started.

User Action:

None.

RFCDEV17**CONNECT:DIRECT ALLOCATION EVENT INCOMPLETE - PNODE P1
SNODE P2 PROCESS NUMBER P3 - REASON: P4****Reason:**

The NetMaster for File Transfer CONNECT:Direct statistics exit could not process an ALLOCATION event. This may result in the lost of a file transfer START event.

The reason code, *P4* , is set as follows:

- 90 indicates that the required TCQE pointer was null.
- 91 indicates that the TCQE could not be validated.
- 92 indicates that the source file information could not be obtained.
- 93 indicates that the target file information could not be obtained.
- 94 indicates that the required TCA pointer was null.
- 95 indicates that the TCA could not be validated.

System Action:

The event is discarded.

User Action:

Contact Technical Support, making available the following diagnostic information:

- Full text of this message - CONNECT:DIRECT message log

RFCDEV18**ID= P1 - P2****Reason:**

The message displays a file transfer event trace record. *P1* is the trace ID, and *P2* is the trace text.

System Action:

None

User Action:

Contact your local support representative.

RFCDEVI9

CONNECT:DIRECT EVENT MESSAGE FORMAT PROCEDURE HAS ENCOUNTERED A RECOVERABLE ERROR.

Reason:

The NetMaster for File Transfer CONNECT:Direct event message format procedure has encountered a recoverable error. Check previous messages for the cause of the error.

System Action:

Event processing continues. However, some events may have been lost.

User Action:

Contact Technical Support, making available the following diagnostic information:

- Full text of this message
- Relevant activity log messages
- CONNECT:DIRECT message log

RFCDEV00

FILE TRANSFER EVENTS RECEIVER INVOKED WITHOUT REQUIRED KEYWORD(S) P1

Reason:

The file transfer event receiver procedure was invoked without the required keyword, **P1**.

System Action:

The request is rejected. The interface procedure ends with return code 8.

User Action:

Supply the required keywords. If the missing keyword is ID, enter the /PARMS shortcut and select the file transfer product API parameter group (for example, CDAPI or CMAPI). Check that the Event Receiver ID is specified, then press F6 (Action) to reset the value.

Note: The ID must be the same as the ID specified in the related product exit (for example, NMCDSTEX for CONNECT:Direct or NMCMLGEX for CONNECT:Mailbox).

If the missing keyword is PRD, contact Technical Support.

RFCDEV01**FILE TRANSFER EVENTS RECEIVER - P1 - EPS REQUEST REJECTED
(RETCODE= P2 ERRORNO= P3) REASON: P4****Reason:**

The events receiver failed when it issued an EPS request. The failure is identified by the following:

- Type of EPS request, *P1* (for example, CONNECT)
- Return code, *P2* (&RETCODE)
- ERROR NUMBER, *P3* (&ERRNO)
- Reason, *P4* (for example, EPS UNAVAILABLE)

If possible, recovery is attempted as indicated by the next message (see also RFCDEV08, RFCDEV09, or RFCDEV10).

System Action:

The file transfer events receiver attempts recovery.

User Action:

If the message is not followed by a recovery message, it is likely that the error is related to data corruption. In this instance, the event is discarded and processing continues.

If the problem cannot be resolved, contact Technical Support.

RFCDEV02**UNKNOWN FILE TRANSFER EVENT TYPE x' P1' - IGNORED****Reason:**

The file transfer event receiver received an event which it does not recognize, and the event is ignored. The record received has a hexadecimal value of *P1* at offset 2.

System Action:

The file transfer event is ignored.

User Action:

Contact Technical Support.

RFCDEV03

**MDO ASSIGN FAILED: RC= P1 FDBK= P2 MAP= P3 COMPONENT= P4
TAG= P5 TYPE= P 6**

Reason:

The NetMaster for File Transfer event receiver failed due to an MDO error. The failure is identified by the following:

- The statement type, ASSIGN
- The MDO return code, **P1** (&ZMDORC)
- The MDO feedback code, **P2** (&ZDMOFDBK)
- The map name, **P3** (&ZMDOMAP)
- The full map component name, **P4** (&ZMDONAME)
- The map component tag value, **P5** (&ZMDOTAG)
- The ASN.1 type of the component, **P6** (&ZMDOTYPE)

This failure indicates one of the following causes:

- An invalid record has been received.
- There is a mismatch between the ASN.1 map and the record.

System Action:

The procedure terminates.

User Action:

Contact Technical Support.

RFCDEV04**MDO ASSIGN FAILED: RC= P1 FDBK= P2 NAME COUNT= P3****Reason:**

The NetMaster for File Transfer event receiver failed due to an MDO error. It indicates that an invalid record has been received. The failure is identified by the following:

- The statement type, ASSIGN OPT=NAMES PRESENT_IN
- The MDO return code, *P1* (&ZMDORC)
- The MDO feedback code, *P2* (&ZDMOFDBK)
- The number of component names returned, *P3* (&SYS.VARCNT)

The failure occurs because of one of the following causes:

- The return code is non-zero.
- The number of component names is less than 4.

System Action:

The record is ignored.

User Action:

Contact Technical Support.

RFCDEV05**UNKNOWN FILE TRANSFER EVENT COMPONENT P1. EVENT IGNORED.****Reason:**

The file transfer event receiver received an event which it identifies as a valid event type. The specific event type (*P1*), however, is not supported. This failure indicates one of the following causes:

- An invalid record has been received.
- There is a mismatch between the ASN.1 map and the data.

System Action:

The file transfer event is ignored.

User Action:

Contact Technical Support.

RFCDEVR06

FILE TRANSFER EVENTS EPS RECEIVER ACTIVE, EPS RECEIVER ID: P1

Reason:

The file transfer event receiver procedure is now ready to receive file transfer events via the EPS Services. The associated EPS receiver ID is P1 .

System Action:

The region is ready for file transfer events processing. If required the product specific events handler will be started when the first event is received (message RFCDEVR07).

User Action:

None.

RFCDEVR07

P1 EVENTS HANDLER PROCEDURE: P2 IS STARTING - EPS RECEIVER ID: P3

Reason:

A file transfer event was received from product P1 via the EPS receiver ID P3 . However, the P1 events handler procedure P2 is not current/y active. The procedure is started.

System Action:

The *P1* events procedure *P2* is started.

User Action:

None.

RFCDEVR08**FILE TRANSFER EVENTS RECEIVER ATTEMPTING EPS RECONNECTION****Reason:**

This message follows message RFCDEVR01. The recovery is attempted after an EPS request failure (see RFCDEVR01).

System Action:

The system attempts to reconnect to EPS.

User Action:

See message RFCDEVR01 for information about the error causing the retry. If the problem cannot be resolved, contact Technical Support.

RFCDEVR09**FILE TRANSFER EVENTS RECEIVER WAITING FOR EPS SERVICES AVAILABILITY****Reason:**

This message follows message RFCDEVR01. The required EPS services are currently unavailable. File transfer events monitoring will resume as soon as EPS services are restored.

System Action:

Waiting on EPS to become available.

User Action:

Ensure that an SSI region is currently active with its event processor enabled. Enter the /PARMS shortcut, and check the SSI parameter group. Ensure that the Sub- System Interface ID field contains the correct ID.

RFCDEVR10

FILE TRANSFER EVENTS RECEIVER TERMINATED - EPS SERVICES UNUSABLE

Reason:

This message follows message RFCDEVR01. An unrecoverable error occurred during an EPS request (see message RFCDEVR01). File transfer events monitoring has stopped.

System Action:

The file transfer events receiver is terminated.

User Action:

Contact Technical Support.

RFCDEVR11

P1 IS NOT A VALID PARAMETER VALUE FOR KEYWORD P2

Reason:

The file transfer events receiver procedure was invoked with an invalid parameter *P1* for keyword(s) *P2* .

System Action:

The request is rejected. The interface procedure ends with return code 8.

User Action:

Contact Technical Support.

RFCDEVR20

FILE EVENTS RECEIVER PROCEDURE P1 CURRENTLY SERVICING RECEIVER ID P2 - PROCEDURE WILL BE SHARED

Reason:

A request to start a file transfer events receiver procedure for EPS Receiver ID *P2* was initiated. EPS Receiver ID *P2* is currently serviced by procedure ID *P1* .

System Action:

Procedure ID *P1* will be shared.

User Action:

None.

RFCDEV21**FILE TRANSFER EVENTS RECEIVER PROCEDURE P1 SERVICING EPS
RECEIVER ID P2 FOR FILE TRANSFER PRODUCT P3 IS NO LONGER
REQUIRED****Reason:**

A request to start a file transfer events receiver procedure for the P3 product was initiated. The cleanup process identifies an existing procedure, P1 , which is no longer needed. The *P1* procedure is terminated.

System Action:

The *P1* procedure is terminated.

User Action:

None.

RFCDEV22**FILE TRANSFER EVENTS RECEIVER PROCEDURE P1 SERVICING EPS
FILE TRANSFER EVENTS FOR FILE TRANSFER PRODUCT P2 IS NO
LONGER REQUIRED****Reason:**

A request to terminate a file transfer events receiver procedure for the **P2** product was initiated. The cleanup process identified the **P1** procedure as no longer required and terminates the procedure.

System Action:

The *P1* procedure is terminated.

User Action:

None.

RFCDEVR23

PROCEDURE P1 NO LONGER SERVICING EPS FILE TRANSFER EVENTS FOR PRODUCT P2

Reason:

File transfer events processing for the **P2** product was disabled.

System Action:

The procedure with ID *P1* stopped file transfer events processing for the *P2* file transfer product.

User Action:

None.

RFCDEVR88

ID= P1 - P2

Reason:

The message displays a file transfer events receiver trace record. *P1* is the trace ID, and *P2* is the trace text.

System Action:

None.

User Action:

Contact Technical Support.

RFCDFTL01

\$RFCDFTL invoked without required keyword(s) P1

Reason:

The \$RFCDFTL procedure was invoked without the required keywords, *P1*.

System Action:

The request is ignored.

User Action:

Contact Technical Support.

RFCDFTL02**The SSI is unavailable - event flow disabled****Reason:**

An EPS request cannot complete due to an SSI failure. The monitoring of file transfer events has been suspended.

System Action:

The processing of file transfer events is suspended but will resume as soon as the SSI becomes available.

User Action:

Check the activity log for the associated RFCDEVRxx messages. The RFCDEVRxx messages gives the reason for the SSI failure.

Note: If you are viewing the file transfer log, you can jump directly to the relevant section of the activity log by placing the cursor on the RFCDFTL02 message and pressing F4 (ActLog).

If possible, correct the problem and restart the SSI; otherwise, contact Technical Support.

RFCDFTL03**The SSI is now available - event flow resumed****Reason:**

The SSI is now operational, and the flow of file transfer events has resumed.

System Action:

The region resumes the processing of file transfer events.

User Action:

None.

RFCDFTL04

The NetMaster Agent C:D EVENTS connection is unavailable. C:D events flow is disabled. The connection will be automatically retried.

Reason:

The C:D EVENTS connection has failed or is not available. The monitoring of CONNECT:Direct events is suspended. There will be an attempt to reestablish the connection.

System Action:

The processing of CONNECT:Direct events is suspended but will resume as soon as the EVENTS connection is reestablished.

User Action:

Check the transient log for the associated RMIPLN0x messages. The messages give the reason for the connection failure. If possible, correct the problem; otherwise, contact Technical Support.

RFCDFTL05

The NetMaster Agent C:D EVENTS connection is now available - C:D events flow is resumed

Reason:

The NetMaster Agent C:D events connection is now operational and the processing of CONNECT:Direct events has resumed.

System Action:

The processing of CONNECT:Direct file transfer events is resumed.

User Action:

None.

RFCDFTL06

The NetMaster Agent has been terminated. C:D events flow has stopped.

Reason:

The NetMaster Agent has been terminated, the monitoring of CONNECT:DIRECT events has stopped.

System Action:

The processing of CONNECT:Direct events has been terminated.

User Action:

No action required if the CDMGR was terminated by the user. Otherwise, check the transient log for associated error messages. If possible, correct the problem; otherwise, contact Technical Support.

RFCDFTL07

SSI policy monitoring available

Reason:

The status of the SSI policy monitor has changed to ACTIVE.

System Action:

None.

User Action:

None.

RFCDFTL08

SSI policy monitoring unavailable

Reason:

The SSI policy monitoring is currently not active.

System Action:

The status of the SSI policy monitoring will be checked periodically.

User Action:

If you require the SSI policy monitoring, check the activity log for the associated RFSDMONxx message(s). Review the help for these messages. If possible, correct the problem and restart the SSI region. Otherwise, contact Technical Support.

RFCDFTL09

P1 - P2 event receiver is now disabled.

Reason:

The *P2* Customizer Parameter Group is set to NO - *P1* events are not processed.

System Action:

The *P2* flow is disabled.

User Action:

None.

RFCDFTL10

P1 - P2 event receiver is now enabled.

Reason:

The *P2* Customizer Parameter Group is set to YES - *P1* events are processed.

System Action:

The *P2* Event flow is enabled.

User Action:

None.

RFCDHBT00

ID=*P1 - P2*

Reason:

This message displays a CA NetMaster FTM CONNECT:Direct Statistics exit heartbeat trace record.

System Action

None.

User Action

Contact Technical Support.

RFCDHBT01

~P1 not found

Reason:

The CONNECT:Direct (STC/JOB) P1 is not active.

System Action

None.

User Action

Activate the CDMGR resource, if applicable

RFCDHBT02

~P1 ASID: ~P2 - Started: ~P3

Reason:

The CONNECT:Direct (STC/JOB) P1 is active:
P2 is the CONNECT:Direct Address Space ID.
P3 is the CONNECT:Direct Start time and date.

System Action:

None.

User Action:

None.

RFCDHBT03

~P1 ASID: ~P2 - Started: ~P3

Reason:

The CONNECT:Direct (STC/JOB) P1 is active:
P2 is the CONNECT:Direct Address Space ID.
P3 is the CONNECT:Direct Start time and date.

System Action:

None.

User Action:

None.

RFCDHBT04

~P1 EXCP: ~P2

Reason:

The CONNECT:Direct (STC/JOB) P1 is active.
P2 is the CONNECT:Direct EXCP count.

System Action:

None.

User Action:

None.

RFCDHBT05

Exit poll response received from *P1*

Reason:

The *P1* CA NetMaster FTM CONNECT:Direct Statistics exit responded to a poll request.

System Action:

None.

User Action:

None.

RFCDHBT06

***P1* has no MCS support, Statistics Exit heartbeat polling cannot be executed**

Reason:

CDMGR *P1* has an entry in \$RFXPRMS (the CDMGR Configurable exit).
\$RFXPRMS is used when CONNECT:Direct is configured with no MCS user ID.

System Action:

Heartbeat to the CA NetMaster FTM CONNECT:Direct Statistics exit is not executed because it requires MCS support.

User Action:

None.

RFCDHBT07**The SSI is unavailable - event flow disabled****Reason:**

An EPS request cannot complete due to an SSI failure. The monitoring of file transfer events is suspended.

System Action:

The processing of file transfer events is suspended but will resume when the SSI is available.

User Action:

Check the activity log for the associated RFCDEVRxx messages. The RFCDEVRxx messages provides the reason for the SSI failure.

Note: If you are viewing the file transfer log, you can jump to the relevant section of the activity log by placing the cursor on the RFCDHBT07 message and pressing F4 (ActLog).

If possible, correct the problem and restart the SSI; otherwise, contact Technical Support.

RFCDHBT08

CONNECT:Direct Statistics Exit heartbeat procedure called with a missing or invalid parameter: ~P1.

Reason:

The CONNECT:Direct Statistics Exit heartbeat procedure is called by the process RFCDHCK1.

The missing or invalid parameter is P1.

Process RFCDHCK1 requires the following parameters:

DISPLAY=xxx TIMEOUT=ss

where xxx is YES when the process is specified in the CDMGR template Display and Heartbeat Details.

where xxx is NO when the process is specified in the CDMGR template Status Monitor Message Details (for MSG: RFCX01).

where ss is the heartbeat poll response timeout in seconds. Must be a positive number.

System Action:

The parameter is assigned the following default:

DISPLAY=YES

TIMEOUT=10

The processing continues.

User Action:

Specify or correct the required parameters.

RFCDHBT09**P1 is active with event receiver disabled****Reason:**

The CA NetMaster FTM CDMGR *P1* is active with CONNECT:Direct Event Receiver disabled.

System Action:

None.

User Action:

If you want to receive CONNECT:Direct transfer events, update Enable CONNECT:Direct Event Receiver in the Customizer Parameter Group, CDAPI. Set the CONNECT:Direct Interface to YES and press F6 (Action) to apply the change.

RFCDHBT10**P1 CONNECT:Direct Command Interface not usable, reason: P2****Reason:**

The *P1* CDMGR resource cannot be contacted using the CONNECT:Direct Command Interface. *P2* is the error description.

System Action:

Heartbeat to the CONNECT:Direct statistics exit is not executed because it requires the CONNECT:Direct Command Interface.

User Action:

Determine the cause of the failure. Correct it, and retry.

Following are some possible causes:

- *The CONNECT:Direct initialization parameter MCS.SIGNON specifies a user ID that is not defined in the CONNECT:Direct authorization data set.*
- *The CONNECT:Direct initialization parameter MCS.SIGNON password is incorrect.*

RFCDM001

HEARTBEAT INTERVAL INCREASED TO GLOBAL MINIMUM (P1)

Reason:

The heartbeat value in the resource definition was less than the minimum global value. The heartbeat value is increased automatically to *P1* .

System Action:

The heartbeat value is increased automatically to the minimum value.

User Action:

None.

RFCDMSG01

OPERAND P1 OMITTED OR IS NULL

Reason:

The NetMaster for File Transfer CONNECT:Direct message format procedure has failed because a mandatory operand either was omitted or has a null value. The operand in error, *P1* , is identified.

System Action:

The procedure terminates.

User Action:

Contact Technical Support.

RFCDMSG02

**MDO ASSIGN FAILED: RC= P1 FDBK= P2 MAP= P3 COMPONENT= P4
TAG= P5 TYPE= P 6**

Reason:

The NetMaster for File Transfer CONNECT:Direct message format procedure failed due to an MDO error. The failure is identified by the following:

- Statement type, ASSIGN
- MDO return code, **P1** (&ZMDORC)
- MDO feedback code, **P2** (&ZDMOFDBK)
- Map name, **P3** (&ZMDOMAP)
- Full map component name, **P4** (&ZMDONAME)
- Map component tag value, **P5** (&ZMDOTAG)
- ASN.1 type of the component, **P6** (&ZMDOTYPE)

System Action:

This message is written to the activity log and is followed by a series of messages (DD9003, DD9004, DD9006, and DD9007), which display the event in dump format. The event is ignored.

User Action:

Contact Technical Support, making available the following diagnostic information:

- Full text of this message
- Record dump

It is suggested that the information be obtained immediately as follows:

1. Locate the message and dump in the activity log.
2. Use the PRINT START and PRINT END commands to mark the lines. See the activity log help if you do not know how to do this. Ensure that the marked text contains this error message and the entire record dump (that is, up to and including the DD9007 message).
3. Use the PRINT command to print the marked section of the log.

Note: If you use a 3270 terminal emulator and choose to print the diagnostics by using the "cut and paste" procedure, ensure that you include an image where you scroll right to capture the end of this message.

RFCDMSG03

OPEN FOR DMMSGFIL FAILED: P1

Reason:

The NetMaster for File Transfer CONNECT:Direct message format procedure failed to open the CONNECT:Direct message file (DMMSGFIL). The file has not been opened previously (by using UDBCTL OPEN). The attempt to open it has failed. The failure reason, *P1* , identifies another message that provides additional explanation.

System Action:

The request is rejected.

User Action:

The most likely cause of this error is that the DMMSGFIL dataset was not allocated correctly. Use the SHOW ALLOCATE command to determine if the dataset is allocated, and if not, use the ALLOCATE command to allocate the dataset, ensuring that the DD name is DMMSGFIL.

RFCDMSG04

OPEN FOR DMMSGFIL FAILED: ID= P1 RC= P2 MSG= P3

Reason:

The NetMaster for File Transfer CONNECT:Direct message format procedure failed to open the CONNECT:Direct message file (DMMSGFIL) for processing in NCL. The open has failed and is identified by the:

- Current file ID, *P1*
- File return code, *P2* , which is the value of &FILERC
- System message, *P3* , if any (normally only relevant if the return code is 16)

System Action:

The request is rejected.

User Action:

Use the file return code and message to diagnose the problem. File return codes are listed in the NCL Reference. See the &FILE verb and &FILERC system variable. If a system message is included (MSG=), see the Help for that message to help you resolve the problem. If the problem cannot be resolved, contact Technical Support.

RFCDMSG05**READ FAILED: ID= P1 KEY= P2 RC= P3 FDBK= P4 MSG= P5****Reason:**

The NetMaster for File Transfer CONNECT:Direct message format procedure failed to read a message record from the CONNECT:Direct message file (DMMSGFIL). The failure is identified by the following:

- Current file ID, *P1*
- Key of the record, *P2* (this is the CONNECT:Direct message ID)
- File return code, *P3* , which is the value of &FILERC
- VSAM feedback code, *P4* , in hexadecimal format (normally only relevant if the return code is 8)
- System message, *P5* , if any (normally only relevant if the return code is 16)

System Action:

The request is rejected.

User Action:

Use the file return code, feedback code, and message to diagnose the problem.

File return codes are listed in the NCL Reference. See the &FILE verb and &FILERC system variable.

If a system message is included (MSG=), see the Help for that message to help you resolve the problem. If the VSAM feedback code is included (FDBK=), use that to refer to your VSAM reference manual and follow the problem diagnosis.

If the problem cannot be resolved, contact Technical Support.

RFCDMSG06**CONNECT:Direct Message ID= P1 NOT ON FILE****Reason:**

The NetMaster for File Transfer CONNECT:Direct message format procedure has failed because the requested message ID, *P1* , was not found in the CONNECT:Direct message file (DMMSGFIL).

System Action:

The request is rejected.

User Action:

Reissue the request with a correct message ID.

RFCDMSL01

SELECT OPTION P1 NOT SUPPORTED BY SERVICE PROCEDURE P2

Reason:

The selection list service procedure \$RFCDMSL was called with an option which it does not support.

System Action:

None.

User Action:

Contact your local support representative.

RFCDMSL02

INVALID PARAMETERS: P1

Reason:

Invalid parameters were passed to the \$RFCDMSL procedure.

System Action:

The procedure terminates.

User Action:

Contact your local support representative.

RFCMCMV01

VFS OPEN FAILED - FILERC= P1 - INSUFFICIENT ACCESS

Reason:

An attempt to open the VFS database failed with the FILERC, *P1* , which can be 0 or 12. If FILERC is 0, the file has been opened but cannot be written to. If FILERC is 12, the user does not have authority to access the database.

System Action:

None

User Action:

Contact your security administrator for assistance.

RFCMCMV02**Model Name P1 already exists****Reason:**

An attempt to save a CONNECT Model with a name *P1* failed because a record with this name already exists.

System Action:

The save fails.

User Action:

Choose a different name for the Model or set the 'Replace?' field to YES.

RFCMCMV03**VFS P1 FAILED FILERC= P2 KEY= P3 FDBK= P4 MSG= P5****Reason:**

An attempt to perform the function *P1* with key *P3* on the VFS file failed with the Return Code *P2* , the Feedback code *P4* (if FILERC=8), and message *P5* (if FILERC=16).

System Action:

The request is rejected. This message is also logged.

User Action:

Contact your system administrator for assistance.

RFCMCMV04**Model Name P1 saved****Reason:**

The Model Name *P1* was saved to the VFS file.

System Action:

None

User Action:

None

RFCMCMV05

No pre-defined Model Names found

Reason:

No Models have previously been saved for this panel.

System Action:

None

User Action:

None

RFCMCMV06

Model Name P1 not found

Reason:

An attempt to retrieve a CONNECT Model with a name *P1* failed because a record with this name was not found. This occurs if another system user has deleted the record.

System Action:

Model selection fails.

User Action:

Choose another Model.

RFCMCMV07

Model Name P1 loaded

Reason:

'CON' command parameters stored in Model Name *P1* were loaded into panel fields.

System Action:

None

User Action:

None

RFCMCON01**The CONNECT:Mailbox Manager CON command is not supported in background****Reason:**

An attempt was made to issue a CONNECT:Mailbox Manager CON command from a task which does not have access to a terminal window. The CON command is only supported for environments with a terminal window.

System Action:

The request for a CONNECT:Mailbox Auto Connect is rejected.

User Action:

If you want to issue an Auto Connect from an Automation Services process, use the SYSCMD macro to issue the CONNECT:Mailbox \$\$CONNECT command directly through the system modify (F) command.

RFCMCON02**No output from CONNECT:Mailbox command P1****Reason:**

A CONNECT:Mailbox Manager modify command *P1* was issued. However no output was received.

System Action:

The \$\$CONNECT command may not have been effective. Examine the system log to determine if the command was effective.

User Action:

Contact your local support representative.

RFCMCON03

CONNECT:Mailbox manager P1 status not ACTIVE

Reason:

An attempt was made to issue a CON command for a CONNECT:Mailbox manager *P1* . The command can not function unless the manager has ACTIVE status since the command depends on issuing a MODIFY system command for the CONNECT:Mailbox started task.

System Action:

The request is rejected.

User Action:

Activate the CONNECT:Mailbox resource if you want to issue the command.

RFCMCOS01

P1 contains invalid character/s P2

Reason:

Validation for field *P1* has detected one or more characters *P2* which are not permitted in this field.

System Action:

The field in error is highlighted.

User Action:

Correct the entry and retry.

RFCMCOS02

P1 requires data in P2.

Reason:

Validation has detected that a pre-requisite field *P2* is blank.

System Action:

The validated field is highlighted.

User Action:

Clear the field *P1* or enter data in *P2* .

RFCMCOS03**P1 is mutually exclusive with P2.****Reason:**

Validation for field *P1* has detected that a mutually exclusive field *P2* is not blank, or has an incompatible value (e.g. BSC values for Batch Separator for an SNA connect).

System Action:

Field *P1* is highlighted.

User Action:

Clear one of the fields or correct the incompatible values.

RFCMCOS04**P1 should be blank if P2 is P3****Reason:**

Validation for field *P1* has detected that this field is not blank, which it should be if the field *P2* has the value *P3* .

System Action:

Field *P1* is highlighted.

User Action:

Clear *P1* or change the value in *P2* .

RFCMD01**SIGNON DETAILS FOR USER(P1) FOR CDMGR(P2) CLEARED****Reason:**

Information retained for the user, *P1* , to sign on to CDMGR, *P2* , has been cleared. The next time the user signs on to this CDMGR, the user will be prompted for user ID and password.

System Action:

None.

User Action:

None.

RFCMD02

\$RFCMD INVOKED WITH INVALID VALUE FOR KEYWORD(P1) VALUE(P2)

Reason:

The \$RFCMD procedure was invoked with an invalid value, P2 , for the keyword, P1 .

System Action:

The request is rejected.

User Action:

Contact your local support representative.

RFCMD03

\$RFCMD INVOKED WITH CONFLICTING KEYWORDS - P1 AND P2

Reason:

The \$RFCMD procedure was invoked with keywords, *P1* and *P2* , which are either contradictory or mutually exclusive. For example, CDMGR= and NAME= may both have been specified, where only one is required to identify a CONNECT:Direct region.

System Action:

The request is rejected.

User Action:

Contact your local support representative.

RFCMDID01**The CONNECT:Mailbox Manager DIR command is not supported in background****Reason:**

An attempt was made to issue a CONNECT:Mailbox Manager DIR command from a task which does not have access to a terminal window. The DIR command is only supported for environments with a terminal window.

System Action:

The request for CONNECT:Mailbox directory information is rejected.

User Action:

If you want directory information from an Automation Services process, use the SYSCMD macro to issue the CONNECT:Mailbox \$\$DIR command directly through the system modify (F) command.

RFCMDID02**No batches found matching Mailbox Details****Reason:**

A CONNECT:Mailbox Manager DIR command was requested for the Mailbox Details as entered but no batches were found.

System Action:

The request for CONNECT:Mailbox directory information is rejected.

User Action:

Enter another Mailbox ID and/or User Batch ID.

RFCMDID03

CONNECT:Mailbox manager P1 status not ACTIVE

Reason:

An attempt was made to issue a DIR command for a CONNECT:Mailbox manager *P1* . The command can not function unless the manager has ACTIVE status since the command depends on issuing a MODIFY system command for the CONNECT:Mailbox started task.

System Action:

The request is rejected.

User Action:

Activate the CONNECT:Mailbox resource if you want to issue the command.

RFCMDIR01

P1 status flag change request/s issued

Reason:

One or more requests to change status flags has been actioned. The number of confirmatory CMB167I messages received from CONNECT:Mailbox was *P1* . Note that in some cases (e.g. locked batches) the flag will not be changed even though message CMB167I is issued.

System Action:

The Mailbox Batch List is always refreshed after a status flag change.

User Action:

None.

RFCMDIR04**Error P1 processing data for Mailbox ID P2****Reason:**

A CONNECT:Mailbox Manager DIR command was requested for the Mailbox *P2*. When processing output from the \$\$DIR command, an error condition *P1* was encountered. This error occurs if the data from CONNECT:Mailbox has changed format.

System Action:

The request for CONNECT:Mailbox directory information is terminated with batch data collected so far displayed.

User Action:

Contact your local support representative.

RFCMDIR05**Output truncated from CONNECT:Mailbox command P1****Reason:**

A CONNECT:Mailbox Manager modify command *P1* was issued. However not all of the expected output was received. This could be caused by a timeout whilst waiting for command output.

System Action:

If the command *P1* is a \$\$DIR command, then the directory information collected so far is displayed. If this message is in response to a line command against a batch, the line command may not have been effective.

User Action:

Examine the log and the system log to check the command and the command output. If the problem is a timeout, change the Command Response timeouts which are controlled by the values specified in the Console Specifications (System Command Controls) Customizer Parameters (/PARMS - TUNING - \$RM CONSOLES Console Specifications). If the problem occurs after increasing the timeouts, contact Technical Support.

RFCMDS01

INVALID KEYWORD VALUE RECEIVED, KEYWORD= P1 VALUE= P2

Reason:

The keyword parameter, *P1* , was specified with the invalid value, *P2* .

System Action:

The request is rejected, and processing terminates.

User Action:

Contact your local support representative.

RFCMDS03

MISSING KEYWORD PARAMETER, KEYWORD= P1

Reason:

A required keyword parameter was not specified. The keyword was *P1* .

System Action:

The request is rejected, and processing terminates.

User Action:

Contact your local support representative.

RFCMDS04

P1 NOT SUPPORTED ON C:D FOR P2

Reason:

The command, *P1* , is not supported by CONNECT:Direct for *P2* .

System Action:

Request is rejected.

User Action:

Contact your local support representative.

RFCMDS05**THE REQUIRED RESPONSE TEXT IS MISSING****Reason:**

There was no CONNECT:Direct command response text specified for this CHECK request.

System Action:

Request is rejected.

User Action:

Contact your local support representative.

RFCMEV01**P1 TRANSFER-ID: P2 STARTED - USER BATCH ID: P3****Reason:**

A notification has been received from CONNECT:Mailbox, indicating that a batch transfer has started.

P1 indicates the connection type. (A/C) is for AUTO CONNECT and (R/C) is for REMOTE CONNECT.

P2 is the batch transfer ID shown as *Batch ID(Batch Number)* .

P3 is the User Batch ID.

This message is followed by RFCMEV02, which provides additional connection details.

System Action:

None

User Action:

None

RFCMEV02

P1 TRANSFER-ID: P2 P3 P4 P5 P6

Reason:

A notification has been received from CONNECT:Mailbox, indicating that a batch transfer has started. This message follows message RFCMEV01.

P1 indicates the connection type. (A/C) is for AUTO CONNECT and (R/C) is for REMOTE CONNECT.

P2 is the batch transfer ID shown as *Batch ID*(*Batch Number*) .

P3 is the direction of the batch transfer (SENDING TO/RECEIVING FROM).

P4 is either *LINE* (for Remote Connect BSC) or *RMT* (for other).

P5 is the BSC Line Name (for Remote Connect BSC) or Remote Name (for other).

P6 is the List Name (AUTO CONNECT only).

System Action:

None

User Action:

None

RFCMEV03**P1 TRANSFER-ID: P2 COMPLETED - USER BATCH ID: P3****Reason:**

A notification has been received from CONNECT:Mailbox, indicating that a batch transfer successfully completed.

P1 indicates the connection type. (A/C) is for AUTO CONNECT and (R/C) is for REMOTE CONNECT.

P2 is the batch transfer ID shown as *Batch ID(Batch Number)* .

P3 is the User Batch ID.

This message is followed by RFCMEV04, which provides additional connection and transfer details.

System Action:

None

User Action:

None

RFCMEV04

P1 TRANSFER-ID: P2 P3 P4 - RMT: P5 P6

Reason:

A notification has been received from CONNECT:Mailbox, indicating that a batch transfer successfully completed. This message follows message RFCMEV03.

P1 indicates the connection type. (A/C) is for AUTO CONNECT and (R/C) is for REMOTE CONNECT.

P2 is the batch transfer ID shown as *Batch ID*(*Batch Number*) .

P3 is the direction of the batch transfer (SENT/RECEIVED).

P4 is 1) For AUTO CONNECT: The number of records transmitted. 2) For REMOTE CONNECT: The number of records and bytes transmitted.

P5 is the Remote Name.

P6 is the List Name (AUTO CONNECT only).

System Action:

None

User Action:

None

RFCMEV05**P1 TRANSFER-ID: P2 FAILED - USER BATCH ID: P3****Reason:**

A notification has been received from CONNECT:Mailbox, indicating that a batch transfer has failed.

P1 indicates the connection type. (A/C) is for AUTO CONNECT and (R/C) is for REMOTE CONNECT.

P2 is the batch transfer ID shown as *Batch ID(Batch Number)* .

P3 is the User Batch ID.

This message is followed by RFCMEV06/08, which provides additional connection and error details

System Action:

None

User Action:

None

RFCMEV06

P1 TRANSFER-ID: P2 Failure Code: P3 P4 RMT: P5 P6

Reason:

A notification has been received from CONNECT:Mailbox, indicating that a batch transfer has failed. This message follows message RFCMEV05.

P1 indicates the connection type. (A/C) is for AUTO CONNECT and (R/C) is for REMOTE CONNECT.

P2 is the batch transfer ID shown as *Batch ID*(*Batch Number*) .

P3 is the *CONNECT FAILURE CODE* (enter CMFC at the prompt line to display failure codes and their description).

P4 is the direction of the batch transfer (SENDING TO/RECEIVING FROM).

P5 is the Remote Name.

P6 is the List Name (AUTO CONNECT only).

System Action:

None

User Action:

None

RFCMEV07

THERE WAS NO MATCHING BATCH TRANSFER START FOR P1 TRANSFER-ID: P2 - USE R BATCH ID: P3

Reason:

NetMaster for File Transfer received a CONNECT:Mailbox batch termination log record for which no corresponding START EVENT had been processed.

System Action:

Processing continues.

User Action:

None.

RFCMEV08**P1 TRANSFER-ID: P2 Failure Reason: P3****Reason:**

A notification has been received from CONNECT:Mailbox, indicating that a batch transfer has failed. This message follows message RFCMEV06.

P1 indicates the connection type. (A/C) is for AUTO CONNECT and (R/C) is for REMOTE CONNECT.

P2 is the batch transfer ID shown as *Batch ID(Batch Number)* .

P3 is the *CONNECT FAILURE REASON* (enter CMFC command at the prompt line to display failure codes and their description).

System Action:

None

User Action:

None

RFCMEV11**CONNECT:MAILBOX EVENT HANDLER PROCEDURE HAS FAILED - REASON: P1****Reason:**

The NetMaster for File Transfer CONNECT:Mailbox event handler procedure has failed because of an internal system error. *P1* is the reason for the failure.

System Action:

The procedure terminates.

User Action:

Contact Technical Support.

RFCMEVI2

CONNECT:MAILBOX EVENT HANDLER PROCEDURE HAS ENCOUNTERED A RECOVERABLE ERROR

Reason:

The NetMaster for File Transfer CONNECT:Mailbox event handler procedure has encountered a recoverable error. Check previous messages for the cause of the error.

System Action:

Event processing continues. However, some events may have been lost.

User Action:

Contact Technical Support, making available the following diagnostic information:

- Full text of this message
- Relevant activity log messages
- CONNECT:Mailbox message log

RFCMEVI3

**MDO ASSIGN FAILED: RC= P1 FDBK= P2 MAP= P3 COMPONENT= P4
TAG= P5 TYPE= P 6**

Reason:

The NetMaster for File Transfer CONNECT:Mailbox event handler procedure has failed due to an MDO error. The failure is identified by the following:

- Statement type, ASSIGN
- MDO return code, **P1** =&ZMDORC
- MDO feedback code, **P2** =&ZDMOFDBK
- Map name, **P3** =&ZMDOMAP
- Full map component name, **P4** =&ZMDONAME
- Map component tag value, **P5** =&ZMDOTAG
- ASN.1 type of the component, **P6** =&ZMDOTYPE

System Action:

This message is written to the activity log and is followed by a series of messages (DD9003, DD9004, DD9006, and DD9007), which display the event in dump format. The event is ignored.

User Action:

Contact Technical Support, making available the following diagnostic information:

- Full text of this message
- Record dump

It is suggested that the information be obtained immediately as follows:

1. Locate the message and dump in the activity log.
2. Use the PRINT START and PRINT END commands to mark the lines. Refer to the activity log help if you do not know how to do this. Ensure that the marked text contains this error message and the entire record dump (that is, up to and including the DD9007 message).
3. Use the PRINT command to print the marked section of the log.

Note: If you use a 3270 terminal emulator and choose to print the diagnostics by using the "cut and paste" procedure, ensure that you include an image where you scroll right to capture the end of this message.

RFCMEVI4

**DATA ERROR AT LINE P1 IN PROC P2. RTN= P3 COND= P4 KWD= P5
EVENT= P6. STATEMENT= P7**

Reason:

The NetMaster for File Transfer CONNECT:Mailbox event handler procedure has failed due to a data error in the event received from CONNECT:Mailbox. The error is identified by the following:

- Line number, *P1* , and procedure name, *P2* , where the error occurred
- Subroutine name, *P3* , if applicable
- Error condition raised, *P4*
- Verb operand that has detected the error, *P5* , if applicable
- CONNECT:Mailbox log record type, *P6*
- Statement text where the error occurred, *P7*

System Action:

This message is written to the activity log and is followed by a series of messages (DD9003, DD9004, DD9006, and DD9007), which display the event in dump format. The event is then ignored.

If file transfer logging is active, it is also written to the file transfer log.

User Action:

Contact Technical Support, making available the following diagnostic information:

- Full text of this message
- Record dump

It is suggested that the information be obtained immediately as follows:

1. Locate the message and dump in the activity log.
2. Use the PRINT START and PRINT END commands to mark the lines. Refer to the activity log help if you do not know how to do this. Ensure that the marked text contains this error message and the entire record dump (that is, up to and including the DD9007 message).
3. Use the PRINT command to print the marked section of the log.

Note: If you use a 3270 terminal emulator and choose to print the diagnostics by using the "cut and paste" procedure, ensure that you include an image where you scroll right to capture the end of this message.

RFCMEV15**ID= P1 - P2****Reason:**

The message displays a file transfer event trace record. *P1* is the trace ID, and *P2* is the trace text.

System Action:

None

User Action:

Contact your local support representative.

RFCMM001**HEARTBEAT INTERVAL INCREASED TO GLOBAL MINIMUM (P1)****Reason:**

The heartbeat value in the resource definition was less than the minimum global value. The heartbeat value is increased automatically to *P1* .

System Action:

The heartbeat value is increased automatically to the minimum value.

User Action:

None.

RFCMMST01**CONNECT:Mailbox ISPF VSAM Admin file P1 not allocated****Reason:**

The NetMaster for File Transfer CONNECT:Mailbox Message Information procedure failed to open the CONNECT:Mailbox ISPF VSAM Administration file. The most likely cause of this error is that the data set was not allocated at region initialization. *P1* identifies the DD name for the file.

System Action:

The request for message information is rejected.

User Action:

If you want message information, enter a data set name in the \$RF CMAPI parameter group (/PARMS) and press F6 (Action) to action the changes immediately.

RFCMMST02

CONNECT:Mailbox P1= P2 not on file

Reason:

The NetMaster for File Transfer CONNECT:Mailbox Message Information procedure has failed because the requested item *P1* , value *P2* was not found in the CONNECT:Mailbox ISPF VSAM Administration file.

System Action:

The request is rejected.

User Action:

Reissue the request with a correct message ID or failure code. If the ID or code is correct, check that the latest messages have been loaded into the CONNECT:Mailbox ISPF VSAM Administration file.

RFCMMST03

READ FAILED: ID= P1 KEY= P2 RC= P3 FDBK= P4 MSG= P5

Reason:

The NetMaster for File Transfer CONNECT:Mailbox Message Information procedure failed to read a message record from the CONNECT:Mailbox ISPF VSAM Administration file. The failure is identified by:

- Current file ID, *P1*
- Key of the record, *P2* (bytes 11-18 = CONNECT:Mailbox message ID)
- File return code, *P3* , which is the value of &FILERC
- VSAM feedback code, *P4* , in hexadecimal format (normally only relevant if the return code is 8)
- System message, *P5* , if any (normally only relevant if the return code is 16)

System Action:

The request is rejected.

User Action:

Use the file return code, feedback code, and message to diagnose the problem.

See the NCL Reference manual for details of the &FILE verb and &FILERC system variable.

If a system message is included (MSG=), see the Help for that message to help you resolve the problem. If the VSAM feedback code is included (FDBK=), refer to your VSAM reference manual and follow the problem diagnosis.

If the problem cannot be resolved, contact Technical Support.

RFCMRUM01**UNABLE TO COLLECT UNSOLICITED MESSAGES. REASON: P1.****Reason:**

The region was unable to register for unsolicited messages from a CONNECT:Mailbox started task. *P1* is the reason for the failure. Messages from that task will not appear in the file transfer log.

System Action:

None.

User Action:

Contact Technical Support.

RFCMV1L01**NO RESPONSE FROM CONNECT:MAILBOX FOR CONSOLE CMD P1****Reason:**

You performed an action that issue the P1 command but received no response.

System Action:

The request is rejected.

User Action:

Ensure that the CONNECT:Mailbox region is still active. If it is active, other tasks may be degrading the response time and you can retry later.

RFCMV1L02**THE REQUESTED FUNCTION IS NOT AVAILABLE FOR THIS FILE****Reason:**

While the CONNECT:Mailbox region is active, you cannot deallocate its VSAM Control File (VCF) or VSAM Pointer File (VPF).

System Action:

The request is rejected.

User Action:

None.

RFCMV1L03

DEALLOCATION REQUEST CANCELED BY USER

Reason:

You canceled your request to deallocate the selected VSAM batch file from its CONNECT:Mailbox region.

System Action:

The request to deallocate the file is not processed.

User Action:

None.

RFCMV1L04

' P1' COMMAND PROCESSING COMPLETE

Reason:

The *P1* action has completed.

System Action:

None.

User Action:

None.

RFCMV1L05

ASSISTED REORG NOT COMPLETED FOR FILES : P1

Reason:

You exit the VSAM File Statistics panel without completing the assisted file reorganization process for the *P1* files.

System Action:

The region removes your exclusive online control of the files.

User Action:

You might need to complete the reorganization manually offline.

RFCMV1L06**ASSISTED REORG FORCE COMPLETED****Reason:**

You tried to allocate a VSAM batch file that has not completed reorganization, and the action is successful. The action forces the completion of the suspended reorganization.

System Action:

The region removes your exclusive online control of the file.

User Action:

None.

RFCMV1L07**ASSISTED REORG COMPLETED****Reason:**

You allocated a CONNECT:Mailbox VSAM batch file successfully after its reorganization was suspended after the copy task. The allocation task completes the reorganization process.

System Action:

The region removes your exclusive online control of the file.

User Action:

None.

RFCMV1L08**ASSISTED REORG IN PROGRESS by P1****Reason:**

You entered *AR* beside a CONNECT:Mailbox VSAM batch file, but another user, *P1*, is already performing that action on the file and has exclusive online control of that file. No action is possible until that control is released.

System Action:

The request is rejected.

User Action:

None.

RFCMV1L09

UNABLE TO ACCESS DATASET ATTRIBUTES

Reason:

You entered *AR* beside a *CONNECT:Mailbox VSAM* batch file, but the file attributes cannot be accessed. The reason may be:

- The dataset cannot be found.
- The file reorganization has been left in an incomplete state from a previous action.

System Action:

The request is rejected.

User Action:

Check the activity log for the RFCMV5S01 message. The message contains the *SYSPRINT* output from the *IDCAMS* program, which provides details of the failure.

Also, review the results of a previous assisted reorganization of the file. You might need to perform the reorganization manually by using batch jobs.

RFCMV1L10

P1 LISTCAT: P2

Reason:

This message contains an *IDCAMS* message, *P2* , generated during the processing of the *P1* file.

System Action:

None.

User Action:

None.

RFCMV2L01**PREVIOUS TASK NOT FINISHED****Reason:**

You tried to execute a task that requires the completion of a previous task. That previous task has not been completed.

System Action:

The request is rejected.

User Action:

Complete any previous tasks such that their status is Done.

RFCMV2L02**REDO NOT POSSIBLE - TASK IS FINISHED****Reason:**

You cannot redo a task that completed successfully (status Done).

System Action:

The request is rejected.

User Action:

None.

RFCMV2L03**NO INPUT PROVIDED****Reason:**

You did not provide input to a task that requires it.

System Action:

The task is not performed.

User Action:

Perform the task again providing the correct input.

RFCMV2L04

REQUEST CANCELED - NOTHING SAVED FROM INPUT

Reason:

You canceled a task that requires input.

System Action:

Default input is reapplied to the task.

User Action:

None.

RFCMV2L05

AUTO EXECUTION IS IN PROGRESS

Reason:

Automatic execution of the assisted CONNECT:Mailbox VSAM batch file reorganization tasks is taking place.

System Action:

The processing continues.

User Action:

If desired, you can stop the execution by pressing F6.

RFCMV2L06

REQUEST TO SUSPEND AUTO EXECUTION HAS BEEN ACCEPTED

Reason:

You pressed F6 (StopExec) to stop the automatic execution of the assisted CONNECT:Mailbox VSAM batch file reorganization tasks.

System Action:

Processing continues to complete the task in progress.

User Action:

If desired, you can restart automatic execution by pressing F6 (AutoExec).

RFCMV2L07**AUTO EXECUTION NOT POSSIBLE BECAUSE OF PREVIOUS ERROR****Reason:**

You entered AR beside a CONNECT:Mailbox VSAM batch file that encountered an error during a previous execution of the same action. Automatic execution of the file reorganization tasks is not possible until the error is cleared.

System Action:

The task list is displayed.

User Action:

Step 1. Enter *B* beside the task in error to review its output to determine the cause of the failure.

Step 2. Enter *R* beside the task to clear the error.

Step 3. If input needs to be corrected, enter *E* beside the task and correct it, then press F6 (Action) to action the task.

Step 4. To continue with automatic execution, press F6 (AutoExec).

RFCMV2L08**NO LINES TO DISPLAY****Reason:**

You entered *B* beside an assisted CONNECT:Mailbox VSAM batch file reorganization task, but there is nothing to display. Typically, you can browse tasks that have executed or tasks that have default input.

System Action:

None.

User Action:

None.

RFCMV2L09

NOTHING TO REDO

Reason:

You entered *R* beside a task that does not need to be redone. You can redo a task in error.

System Action:

The request is rejected.

User Action:

None.

RFCMV2L10

NOTHING TO DISPLAY FOR DEALLOCATE TASK

Reason:

The file was deallocated outside of the control of the Assisted REORG Facility. No output is available.

System Action:

None.

User Action:

None.

RFCMV2L11

ASSISTED REORG SUSPENDED - NEXT TASK P1 STATUS P2

Reason:

The assisted CONNECT:Mailbox VSAM batch file reorganization process was suspended before completion. The next task is *P1* with a *P2* status.

System Action:

Processing continues at the VSAM File Statistics panel, and the file remains under your exclusive control.

User Action:

You can resume the reorganization process by entering AR (Assisted REORG) beside the file. You can also try to release control of the file by entering A (Allocate) beside it.

RFCMV2L12**ASSISTED REORG COMPLETED****Reason:**

You have reorganized the selected file.

System Action:

Exclusive control of the file is released.

User Action:

If you want to delete the backup file, enter *E* beside the last task.

RFCMV2L13**P1 REORG: P2****Reason:**

This message contains an IDCAMS message, *P2* , generated during the assisted reorganization of the *P1* file.

System Action:

None.

User Action:

None.

RFCMV2L14**REQUEST CANCELED BY USER****Reason:**

You canceled the requested action.

System Action:

None.

User Action:

None.

RFCMV2L15

AUTO EXECUTION HALTED DUE TO ERRORS

Reason:

An error was encountered during automatic execution of the file reorganization tasks.

System Action:

The task list is displayed.

User Action:

Step 1. Enter B beside the task in error to review its output to determine the cause of the failure.

Step 2. Enter R beside the task to clear the error.

Step 3. If input needs to be corrected, enter E beside the task and correct it, then press F6 (Action) to action the task.

Step 4. To continue with automatic execution, press F6 (AutoExec).

RFCMV2L16

INPUT CHANGES ACCEPTED

Reason:

You used the FILE command to save the changed input for the dataset creation task. The task status is now Pending, and the task executes immediately when you next enter E beside it.

Note: The saved input is available to the current session only.

System Action:

None.

User Action:

Enter *E* beside the task to create the new dataset.

RFCMV2L17**INPUT DEFAULTS ACCEPTED****Reason:**

You used the FILE command to accept the default input for the dataset creation task. The task status is now Pending, and the task executes immediately when you next enter E beside it.

System Action:

None.

User Action:

Enter *E* beside the task to create the new dataset.

RFCMV3P01**NEW DATASET NAME REQUIRED****Reason:**

You must specify a dataset name in each of the highlighted NEWNAME fields.

System Action:

The fields in error are highlighted.

User Action:

Specify a valid dataset name in each of the highlighted NEWNAME fields.

RFCMV3P02**DUPLICATE DATASET NAME****Reason:**

You cannot specify the current dataset names in the NEWNAME fields.

System Action:

The fields in error are highlighted.

User Action:

Correct the names in the highlighted fields.

RFCMV3P03

INVALID VSAM DATASET NAME

Reason:

The highlighted fields contain invalid VSAM dataset names.

System Action:

The fields in error are highlighted.

User Action:

Ensure that the highlighted fields contain a valid VSAM dataset name.

RFCMV3P04

DUPLICATE DATASET NAME

Reason:

You specified the same dataset name in more than one NEWNAME fields.

System Action:

The affected fields are highlighted.

User Action:

Ensure that the dataset names in the NEWNAME fields are different from each other.

RFCMV3P05

DATASET NAME ALREADY EXISTS IN SYSTEM

Reason:

You specified a dataset name that already exists in the system.

System Action:

The field in error is highlighted.

User Action:

Ensure that the dataset name does not exist in the system.

RFCMV5S01**P1 IDCAMS: P2****Reason:**

This message contains an IDCAMS message, *P2* , generated during the processing of the *P1* file.

System Action:

None.

User Action:

None.

RFCMVFM01**REQUIRED PARAMETER P1 NOT AVAILABLE.****Reason:**

A required parameter was not available when this procedure was invoked.

System Action:

The procedure is terminated.

User Action:

Review the definition of the specified resource, and try again.

RFCMVFM02

VSAM FILE SERVER NAME NOT AVAILABLE

Reason:

The CONNECT:Mailbox VSAM File Server cannot be identified. You might have acted on a CMMGR class resource definition that does not have a VSAM File Server STC class resource definition as its parent.

System Action:

The action is not performed.

User Action:

Ensure that you have the VSAM File Server STC definition as a parent of the CONECT:Mailbox CMMGR definition.

If the Server definition is not in the knowledge base, define it based on the CMSVR template.

To relate the resources, proceed as follows:

Step 1. From any panel, enter *D.R.R.CMMGR* to list the CONNECT:Mailbox managers.

Step 2. Ensure that the managers belong to the correct system image, and enter *R* beside the manager to list any existing relationships.

Step 3. Press F11, and select the STC resource class.

Step 4. Make the appropriate VSAM File Server as a parent of the manager.

RFCONN01

ALERT AFTER P1 AND DROP CONNECTION P2

Reason:

The heartbeat procedure for TCP/IP connections has commenced processing. The message identifies the idle time setting before an alert is issued (*P1*) and the idle time setting after which the connection will be dropped (*P2*).

System Action:

None

User Action:

None

RFCONN02**CONNECTIONS MONITOR HEARTBEAT INVOKED WITHOUT IDLE TIME TO ALERT****Reason:**

The heartbeat procedure for TCP/IP connections has been invoked without the Idle Time to Alert parameter, which is required.

System Action:

Heartbeat processing is terminated.

User Action:

Update the definition of the affected resource, and specify the missing parameter.

RFCONN03**HOST(P1) CONNID(P2) IDLE TIME(P3) STATUS(P4) P5****Reason:**

This is an informational message issued by the TCP/IP connections monitor for each connection found.

P1 identifies the host at the other end of the connection.

P2 is the connection ID.

P3 is the actual idle time.

P4 is the connection status.

P5 is optional. It contains ALERT if the idle time exceeds the Idle Time to Alert value in the monitor resource definition. It contains DROPPED if the idle time exceeds the Idle Time to Drop value in the monitor resource definition and the connection was dropped.

System Action:

None

User Action:

None

RFCONN04

P1 P2 P3 CONNECTIONS CHECKED. ALL OK AT P4

Reason:

The TCP/IP connections of a file transfer resource were checked, and none were found to exceed the idle time limits specified in the connections monitor resource.

P1 identifies the owning file transfer resource.

P2 is the name of the monitor resource.

P3 is the number of connections checked.

P4 is the time.

System Action:

None

User Action:

None

RFCONN05

P1 P2 EXCESSIVE IDLE TIME P3 CONNECTIONS. P4 DROPPED. P5

Reason:

A file transfer resource has a number of TCP/IP connections (*P3*) that have exceeded the Idle Time limit value specified in the definition for the connections monitor. Of these, *P4* connections have been dropped automatically because they also exceeded the specified Idle Time to Drop value.

P1 identifies the owning file transfer resource.

P2 is the name of the monitor resource.

P3 is the number of connections that have exceeded the idle time limit.

P4 is the number of connections that have been terminated.

P5 is the time.

System Action:

None

User Action:

None

RFCONN06**TCP/IP SERVICES ARE NOT ACTIVE. STATUS IS P1****Reason:**

The TCP/IP interface is currently *P1*. The monitoring of this resource requires the status of the TCP/IP interface to be ACTIVE.

System Action:

Heartbeat processing does not take place.

User Action:

Display the current TCP/IP services status by issuing a *SHOW TCPIP* command. Message *N3AF05* shows the current TCP/IP INTERFACE status. If the TCP/IP INTERFACE status is *INACTIVE* - Issue a TCPIP START command. Wait for message N3B201 and then enter a CHK command against this resource.

If the TCP/IP INTERFACE status is *QUIESCING* or *STOPPING* - wait for the STATUS to change to INACTIVE and proceed as above.

If the TCP/IP INTERFACE status is *STARTING* - Wait for message N3B201 and then enter a CHK command against this resource.

RFCONN07**UNABLE TO OBTAIN TCP/IP PORT NUMBER FOR P1****Reason:**

The TCP/IP connections monitor was unable to ascertain the TCP/IP port number used by the file transfer resource manager, *P1* .

System Action:

Monitoring fails.

User Action:

This only applies when TCPaccess is being used.

For a CONNECT:Direct resource, the port number is either obtained automatically from CONNECT:Direct or provided in user exit \$RFXPRMS. One possible problem is that an old version of \$RFXPRMS is executed.

For a FTP resource, the port number must be specified in the resource definition.

RFCONN08

UNABLE TO MONITOR CONNECTIONS FOR P1

Reason:

Monitoring of TCP/IP connections is not available for CONNECT:Direct for *P1* .

System Action:

Request is rejected.

User Action:

Delete the CDMON resource as it serves no purpose.

RFCONN09

P1 P2 LISTENER PORT NOT FOUND AT P3

Reason:

The file transfer application requires an active listener port to receive requests for connection. The required listener port was not found or was not in a LISTEN state.

P1 identifies the owning file transfer resource.
P2 displays the name of the monitor resource.
P3 is the time.

System Action:

None

User Action:

Perform one or more the following to investigate the problem:

- Check the transient log of the monitor resource for additional details.
- If the port number of the file transfer application is specified on the Monitor Details panel of the resource definition, check its accuracy.
- Check the current state of the file transfer application, *P1* .
- Check the current state of the TCP/IP region.

RFCONN10**ID= P1 - P2****Reason:**

The message displays a TCP/IP connections monitor trace record. *P1* is the trace ID, and *P2* is the trace text.

System Action:

None.

User Action:

Contact Technical Support.

RFCONN11**Display not supported from this environment****Reason:**

A display command was received for a connections monitor, but the requestor is not in 3270 full-screen mode.

System Action:

The display command is rejected.

User Action:

Enter the display command from a 3270 session.

RFCR0401**' P1' IS NOT AVAILABLE FOR CUSTOM SEARCH****Reason:**

The field name *P1* is not available for performing an NDB custom search.

System Action:

Field highlighted in error.

User Action:

Enter a valid field name or place a '?' in the field to get a list of valid field names. You can also enter a field prefix followed by a ? for a list of fields with that prefix.

RFCR0402

SELECTION OF FIELDS CANCELLED BY USER

Reason:

Selection of fields from the list was cancelled.

System Action:

None

User Action:

None

RFCR0403

NO FIELDS SELECTED FOR EXTRACT

Reason:

No fields were selected from the Fields Selection List. The target file cannot be created.

System Action:

The request is terminated.

User Action:

Redo your request and select one or more fields.

RFCR0404

GET Error on vartable P1 for Key P2, Error Code P3

Reason:

An error occurred during a GET function on the vartable *P1* for key *P2* . The received error code is *P3* .

System Action:

The request is terminated and the procedure is ended.

User Action:

Contact your system administrator.

RFCR0405**FILE TRANSFER EVENT EXTRACT CANCELLED BY USER****Reason:**

A user cancelled the request to extract file transfer events from the EVNTDB database.

System Action:

The request to extract file transfer events is not processed.

User Action:

None.

RFCR0406**EXTRACT PROCESS SUBMITTED AS BACKGROUND TASK - CHECK LOG FOR PROGRESS****Reason:**

Your request to extract file transfer events starts the EVNTDB extract process as a background task that runs with your authority. Progress messages with the prefix RFLO82* are written to the activity log.

System Action:

The process is submitted to your background region.

User Action:

Check the activity log for progress. To access the list of available logs, enter the =H.L panel path.

RFCR0407**NO NDB RECORDS FOUND MATCHING SUPPLIED EXTRACT CRITERIA.****Reason:**

The NDB Search did not find any record(s) that match(es) the Extract Criteria.

System Action:

None

User Action:

Change your criteria and retry.

RFCR0408

SYNTAX ERROR IN NDB SCAN STATEMENT

Reason:

A syntax error was detected during execution of an NDB SCAN statement.

System Action:

None

User Action:

Review the scan and sort expression and retry the command.

RFCX01

NetMaster for File Transfer Statistics Exit P1 now active, Id: P2

Reason:

The NetMaster for File Transfer statistics exit, NMCDSTEX, is active.
P1 shows the module name and version number. *P2* identifies the ID from which CONNECT:Direct events can be received.

System Action:

None.

User Action:

None.

RFCX02**No active SOLVE SSI with "XEVNT" support found****Reason:**

The NetMaster for File Transfer statistics exit, NMCDSTEX, has requested the services of the event delivery facility, but the request was rejected because of one of the following:

- The required SSI is not active.
- The SSI is active but is running without the event delivery facility.

System Action:

Statistics records will be forwarded to the NetMaster for File Transfer region as soon as the SSI region (together with the event delivery facility) becomes active.

User Action:

Ensure that the SSI region is started with the event delivery facility (XEVNT=YES).

RFCX03**The SOLVE SSI REGION is not active****Reason:**

The NetMaster for File Transfer statistics exit, NMCDSTEX, has requested the services of the event delivery facility, but the request was rejected because the SSI region is not currently active.

System Action:

Statistics records will be forwarded to the NetMaster for File Transfer region as soon as the SSI region (together with the event delivery facility) becomes active.

User Action:

Ensure that the SSI region is started with the event delivery facility (XEVNT=YES).

RFCX04

The SOLVE SSI is in shutdown

Reason:

The NetMaster for File Transfer statistics exit, NMCDSTEX, requested the services of the event delivery facility, but the request was rejected because the SSI is shutting down.

System Action:

The statistics record is not forwarded to the region. As a result, not all CONNECT:Direct events are in the file transfer log.

User Action:

Ensure that the SSI region is restarted.

RFCX05

Unable to send EVENT R0= P1 R15= P2

Reason:

The NetMaster for File Transfer statistics exit, NMCDSTEX, issued a \$NMXEVT request to forward a CONNECT:Direct event to the event receiver. The request was rejected. The values of the R0 and R15 return codes from the \$NMXEVT request are *P1* and *P2* respectively.

System Action:

The event record is not forwarded to the region.

User Action:

Note the value of R0 and R15, and contact Technical Support.

RFCX06**ABEND AT P1 IN P2 P3 LEVEL P4****Reason:**

This message is the first of a group of messages that are issued when an abend occurs in the NetMaster for File Transfer CONNECT:Direct statistics exit, NMCDSTEX. The complete set of messages is:

RFCX06 ABEND AT +nnnn IN xxxxxxxx xxxx LEVEL xxxxxx

RFCX07 RECEIVED R1=xxxxxxx RECORD ADDR=xxxxxxx RECORD TYPE=xx

RFCX08 PSW=xxxxxxx xxxxxxxx INT=xxxxxxx

RFCX09 R0-R3 xxxxxxxx xxxxxxxx xxxxxxxx xxxxxxxx

RFCX09 R4- R7 xxxxxxxx xxxxxxxx xxxxxxxx xxxxxxxx

RFCX09 R8-R11 xxxxxxxx xxxxxxxx xxxxxxxx xxxxxxxx

RFCX09 R12-R15 xxxxxxxx xxxxxxxx xxxxxxxx xxxxxxxx

Message RFCX06 identifies the abend offset, module, version, and level.

Message RFCX07 identifies the parameters passed by CONNECT:Direct:

RECEIVED R1 is the value in R1 when the exit was called.

RECORD ADDR is the value of the first full word addressed by R1. If R1 was invalid, this is shown as UNKNOWN.

RECORD TYPE is the CONNECT:Direct statistics record type. If either R1 or the record address was invalid, this is shown as ??.

Message RFCX08 identifies the failing PSW and program interruption information.

Message(s) RFCX09 identify the general purpose registers at the time of the abend.

System Action:

The statistics record is ignored, and processing continues.

User Action:

Contact Technical Support. Ensure that you have the following information available:

- The entire group of messages (RFCX06 to RFCX09) - The version and maintenance level of CONNECT:Direct

RFCX07

RECEIVED R1= P1 RECORD ADDR= P2 RECORD TYPE= P3

Reason:

This message is one of a group of messages that are issued when an abend occurs in the NetMaster for File Transfer CONNECT:Direct statistics exit, NMCDSTEX.

For more information, see the help for message RFCX06.

System Action:

See RFCX06.

User Action:

See RFCX06.

RFCX08

PSW= P1 INT= P2

Reason:

This message is one of a group of messages that are issued when an abend occurs in the NetMaster for File Transfer CONNECT:Direct statistics exit, NMCDSTEX.

For more information, see the help for message RFCX06.

System Action:

See RFCX06.

User Action:

See RFCX06.

RFCX09**P1 P2 P3 P4 P5****Reason:**

This message is the last of a group of messages that are issued when an abend occurs in the NetMaster for File Transfer CONNECT:Direct statistics exit, NMCDSTEX.

For more information, see the help for message RFCX06.

System Action:

See RFCX06.

User Action:

See RFCX06.

RFCX10**STORAGE REQUEST FAILED: TYPE= P1 R15= P2****Reason:**

The CONNECT:Direct statistics exit, NMCDSTEX, was unable to obtain or free working storage. *P1* is the failing request, and *P2* is the value of the R15 code.

System Action:

The request cannot be processed.

User Action:

Use the R15 code to determine the cause of the error.

RFCX11

LOAD FAILED: MODULE NAME= P1 R0= P2 R15= P3

Reason:

The CONNECT:Direct statistics exit, NMCDSTEX, tried to load a load module, but the loading operation failed. The load module name is *P1*, and the values of the R0 and R15 return codes from the LOAD or BLDL instruction are *P2* and *P3* respectively.

System Action:

The load module is not loaded and is excluded from further processing, the result of which depends on which module has failed to load:

Module NMCDSTX No statistics records are forwarded to the region. As a result, its log file is incomplete.

Other Modules Other modules relate to your own exits. The result of not executing these modules depends on your implementation.

User Action:

Use the R0 and R15 return codes to determine the cause of the error. A common error is *R15=4* (accompanying an 806 system completion code), which indicates that the module could not be found in the load library list (that is, the list of libraries that are specified in the CONNECT:Direct STEPLIB). Ensure that the Management Services LPALOAD load library is either included in the CONNECT:Direct STEPLIB or included in the system link list.

Notes: - All libraries included in the STEPLIB must be APF authorized. - The CONNECT:Direct region must be recycled to restart the statistics exit.

RFCX12

Resuming events forwarding

Reason:

The forwarding of CONNECT:Direct statistics event has resumed. This message indicates a recovery from a previous error condition (for example, the required SSI region was successfully restarted).

System Action:

CONNECT:Direct statistics events are now sent to the event receiver.

User Action:

None.

RFCX13**Unable to obtain storage - EVENT not sent****Reason:**

The statistics exit, NMCDSTEX, has requested the services of the event delivery facility, but the request was rejected because the event delivery facility could not obtain storage (R0=7 and R15=28 returned from \$NMXEVT).

System Action:

The CONNECT:Direct statistic event is not sent to the event receiver.

User Action:

Contact Technical Support.

RFCX80

Type: ~P1/~P2 CD:~P3 XC:~P4 XP:~P5 ST:~P6 EPS:~P7/~P8

Reason:

This is a diagnostic trace message.

The statistics exit, NMCDSTEX, was called by CONNECT:Direct.

P1 is the Trace Type (A for Alert trace, T for solicited trace).

P2 is the CONNECT:Direct statistics record type.

P3 is the number of statistics records received by NMCDSTEX.

P4 is the number of statistics records received by NM000FCX.

P5 is the expected number of statistics records that should have been received by NM000FCX.

P6 is the current Exit Process Status byte.

P7 / R8 is the last EPS return code (R15/R0).

System Action:

None.

User Action:

For trace type A , contact Technical Support. Ensure that you have the following information available:

- The entire group of messages (RFCXxx)
- The version and maintenance level of CONNECT:Direct

RFCX90

CA NetMaster FTM Statistics Exit - *P1* trace is *P2*

Reason:

The CA NetMaster FTM statistics exit NMCDSTEX *P1* trace status has changed. *P2* is the current trace status.

System Action:

None.

User Action:

Contact Technical Support.

RFCX91

MODULE NAME= *P1* LOADED, EP= *P2*

Reason:

The statistics exit, NMCDSTEX, was called by CONNECT:Direct. The exit has successfully loaded another load module (*P1*), and its entry point address is shown (*P2*).

This is a diagnostic trace message.

System Action:

None.

User Action:

None.

RFCX92

TRACE PPI RC: R15= *P1*

Reason:

The statistics exit, NMCDSTEX, was called by CONNECT:Direct. The exit has called the PPI to send data to the this region, and the PPI return code is shown (*P1*).

This is a diagnostic trace message.

System Action:

None.

User Action:

None.

RFCX93**P1 RECEIVED. ACTION= P2 IDENTIFIER= P3****Reason:**

The statistics exit, NMCDSTEX, was called by CONNECT:Direct. The statistics record type is shown (*P1*). The exit processing (*P2*) is either IGN, if the record is ignored by the exit, or SES, if the record is to be forwarded to this region. Identification data from the record is shown (*P3*), which depends on the record type.

This is a diagnostic trace message.

System Action:

None.

User Action:

None.

RFCX94**TCA ADDRESS IS UNAVAILABLE - NO START EVENT SENT****Reason:**

The statistics exit, NMCDSTEX, was unable to retrieve the basic START event data. The problem was in accessing the internal CONNECT:Direct data structure via the Task Control Area (TCA).

System Action:

The event is discarded.

User Action:

Contact Technical Support, making available the following diagnostic information:

- Full text of this message
- CONNECT:DIRECT message log

RFCX95

TCA VALIDATION ERROR - NO START EVENT SENT

Reason:

The statistics exit, NMCDSTEX, was unable to retrieve the basic START event data. The problem was in validating the internal CONNECT:Direct data structure through the Task Control Area (TCA).

System Action:

The event is discarded.

User Action:

Contact Technical Support, making available the following diagnostic information:

- Full text of this message
- CONNECT:DIRECT message log

RFDATF01

P1 : P2

Reason:

The \$RFDATFU procedure issues this message when the debugging option is enabled (&GLBL\$RFDATDU=YES).

P1 identifies the phase the procedure is in, and *P2* is the supporting text.

System Action:

None.

User Action:

None.

RFDATF02**Invalid procedure call. \$RFDATFU processing ended****Reason:**

An initialization error occurred when processing the ReportCenter or Neugent data feed.

System Action:

The processing terminates.

User Action:

If the error persists, contact Technical Support.

RFDATF03**Reporting not active for P1 - Inactivate Request Ignored****Reason:**

You tried to inactivate a NetMaster *P1* data feed when no data feed processing was active.

System Action:

The attempted action is not performed.

User Action:

None.

RFDATF04**Report Feeder Processing Active (P1)****Reason:**

The ReportCenter or Neugent data feed is active. The NCL ID of the procedure is *P1* .

System Action:

None.

User Action:

None.

RFDATF05

Reporting already active for P1 - Activate request rejected

Reason:

You tried to start an active ReportCenter or Neugent data feed.

System Action:

The attempted action is not performed.

User Action:

None.

RFDATF06

Reporting already inactive for P1 - Inactivate request rejected

Reason:

You tried to inactivate an inactive NetMaster *P1* data feed.

System Action:

The attempted action is not performed.

User Action:

None.

RFDATF07

Neugent/ReportCenter Data Feed Inactive

Reason:

The Neugent or ReportCenter data feed has terminated.

System Action:

None.

User Action:

None.

RFDATF08**Report Data Feed Processing activated for P1****Reason:**

The *P1* data feed has become active.

System Action:

P1 data feed is active.

User Action:

None.

RFDATF09**Report Data Feed Processing inactivated for P1****Reason:**

The *P1* data feed has become inactive.

System Action:

P1 data feed is inactive.

User Action:

None.

RFDATF10**Unrecoverable error assigning P1 MDO. (P2)****Reason:**

The *P1* data feed has terminated because of a mapping failure.

P1 is either the REPORTER or the NEUGENT data feed.

P2 is the MDO diagnostic information.

System Action:

The data feed is terminated.

User Action:

Restart the data feed. If the problem persists, contact Technical Support and provide a copy of this message to aid resolution.

RFDATF11

File transfer event missing key fields and not sent to ReportCenter

Reason:

The file transfer event is missing a source or target address, taskname or product field. The event is not sent to ReportCenter for statistical analysis.

System Action:

None.

User Action:

Check the historical File Transfer record (*/FTHIST*) and if the problem persists, contact Technical Support.

RFEVCHK01

KEYWORD PARAMETERS P1 IS REQUIRED

Reason:

P1 is a required keyword parameter, but it was not passed by the calling process.

System Action:

The procedure sets a return code of 8 and returns processing to the caller.

User Action:

Contact your local Support Center.

RFEVCHK02

INVALID KEYWORD VALUE KEYWORD= P1 VALUE= P2

Reason:

An invalid keyword value was passed. The keyword is *P1* , and the invalid value is *P2* .

System Action:

The request is rejected.

User Action:

Contact your local Support Center.

RFEVCHK03**REPORT SUBMITTED - PRINT REQ# P1****Reason:**

A report was submitted for printing in background mode. The request number is *P1* .

System Action:

The report is being printed by the Print Services Manager.

User Action:

None.

RFEVCHK04**NO RECORDS FOUND FOR SPECIFIED PERIOD****Reason:**

No Records were found for the specified reporting period.

System Action:

The processing terminates.

User Action:

None.

RFEVCHK05**P1 NOT STARTED.****Reason:**

The *P1* file transfer events EVNTDB NDB has not been started.

System Action:

The processing terminates.

User Action:

Check the Initialization log for the \$RF EVENTLOG parameter group, and determine why *P1* has not been started.

Access the log as follows:

Step 1. Enter the */PARMS* shortcut to list the parameter groups.

Step 2. Enter *S* beside the EVENTLOG parameter group to display its settings.

Step 3. Press F5 to display the activities logged for the parameter group.

RFEVCHK06

NDB ERROR: RC= P1 LINE= P2 P3 P4

Reason:

An NDB error was encountered during exception report processing.

P1 is an NDB response (or error) code.

P2 is the line number that locates the error in the procedure.

P3 is the NDB command that is being processed when the error occurred.

P4 shows the operands used in the *P3* command.

System Action:

The processing terminates.

User Action:

For information about the NDB codes, enter the */NDBERR* shortcut at a *===>* prompt to display the Browse NDB Error Codes panel. Determine the reason for the error, and take appropriate action.

RFEVCHK07

FILE TRANSFER END EVENTS FOUND FOR ALL FILTER ITEMS

Reason:

All the file transfer END events required by the exception report filter were found in the specified reporting period.

System Action:

The processing terminates normally.

User Action:

None.

RFEVCHK08**EVNTDB P1 in progress since P2****Reason:**

The EVNTDB file transfer events database is not available due to maintenance operation, *P1* . No exception report processing is possible.

System Action:

The processing terminates.

User Action:

Retry later.

RFEVCHK09

FILE TRANSFER END EVENTS NOT FOUND FOR SOME FILTER ITEMS

Reason:

Not all the file transfer END events required by the exception report filter were found in the specified reporting period.

System Action:

The processing completes normally.

The following output variables are available at completion:

&\$RMMCHKFTOT contains the number of criteria lines in the filter.

&\$RMMCHKCRnnn contains the identifier for the nnth criteria line in the filter.

The syntax is the concatenation of the following with > as the delimiter:

- Source Data or Target Data or Transfer ID
- Type
- Number
- Source System/Node
- Target System/Node
- Minimum File Size
- Maximum File Size

For example, SOLVE.SOFT.CD%>TGT>10>>>> is the criteria for 10 received datasets with names beginning with SOLVE.SOFT.CD.

&\$RMMCHKEXnnn contains the number of transfers expected for the nnth criteria line.

&\$RMMCHKFNnnn contains the number of transfers found for the nnth criteria line.

&\$RMMCHKPREQ# contains the print request number if you requested a printed report.

User Action:

None.

RFEVCHK10**FILE TRANSFER END EVENTS NOT FOUND FOR SOME FILTER ITEMS****Reason:**

Not all the file transfer END events required by the exception report filter were found in the specified reporting period.

System Action:

The processing completes normally.

The following output variables are available at completion:

`&$RMMCHKFTOT` contains the number of criteria lines in the filter.

`&$RMMCHKCRnnn` contains the identifier for the *nnn*th criteria line in the filter.

The syntax is the concatenation of the following with `>` as the delimiter:

- Source Data or Target Data or Transfer ID - Type - Number - Source System/Node - Target System/Node - Minimum File Size - Maximum File Size
For example, `SOLVE.SOFT.CD%>TGT>10>>>>` is the criteria for 10 received datasets with names beginning with `SOLVE.SOFT.CD`.

`&$RMMCHKEXnnn` contains the number of transfers expected for the *nnn*th criteria line.

`&$RMMCHKFNnnn` contains the number of transfers found for the *nnn*th criteria line.

`&$RMMCHKPREQ#` contains the print request number if you requested a printed report.

Some information, however, is lost because the required value of *nnn* exceeds 999. This can happen if you included a control (CTL) file in the reporting filter.

User Action:

To view all exceptions, use the online reporting function from the Exception Reporting Menu. To access the menu from any panel, enter `H.ER`. Select the required type of filters, and enter `E` beside the required filter to generate the report.

RFEX0101

Invalid keyword value specified, Keyword= P1 Value= P2

Reason:

An invalid value has been given for keyword *P1* .

System Action:

The request is rejected and the procedure is terminated.

User Action:

Contact your system administrator.

RFEX0102

No NDB records found matching supplied Extract Criteria.

Reason:

The NDB Search did not find any record(s) that match(es) the Extract Criteria.

System Action:

None

User Action:

Change your criteria and retry.

RFEX0103

No Selected Fields

Reason:

The Exit Key has been entered on the Fields Selection List but no fields have been selected. The target file cannot be created without fields.

System Action:

The request is terminated.

User Action:

Redo your request and select one or more fields.

RFEX0104**GET Error on vartable P1 for Key P2, Error Code P3****Reason:**

An error occurred during a GET function on the vartable *P1* for key *P2* . The received error code is *P3*.

System Action:

The request is terminated and the procedure is ended.

User Action:

Contact your system administrator.

RFEX0105**Extract Operation Cancelled****Reason:**

The user has cancelled the Extract Operation.

System Action:

The Extract file is not created.

User Action:

None

RFEX0106**NDB P1 error for P2, NDBERRC is P3, NDBERRI is P4****Reason:**

An error occurred for the *P1* action on NDB *P2* . The NDB error code is *P3* and the NDB information code is *P4* .

System Action:

The request is terminated and the procedure is ended.

User Action:

Contact your system administrator.

RFEX0107

Search Operation Cancelled

Reason:

The user has cancelled the Search Operation.

System Action:

The Extract file is not created.

User Action:

None

RFEX0108

EXTRACT PROCESS SUBMITTED AS BACKGROUND TASK - CHECK LOG FOR PROGRESS

Reason:

Your request to extract file transfer events starts the EVNTDB extract process as a background task that runs with your authority. Progress messages with the prefix RFLO82* are written to the activity log.

System Action:

The process is submitted to your background region.

User Action:

Check the activity log for progress. To access the list of available logs, enter the =H.L panel path.

RFEX0109

FILE TRANSFER EVENT EXTRACT CANCELLED BY USER

Reason:

A user cancelled the request to extract file transfer events from the EVNTDB database.

System Action:

The request to extract file transfer events is not processed.

User Action:

None.

RFEX0201**VARIABLE P1 ERROR, FDBK: P2 ID: P3 KEY: P4****Reason:**

A request to present a field list failed because an error was encountered accessing a vartable. The request was *P1* , the identifier of the vartable was *P3* , the feedback code was *P2* and the key value used was *P4* .

System Action:

The request is rejected.

User Action:

Interpret the feedback code using the NCL Reference.

RFEX0202**VARIABLE P1 ERROR, FDBK: P2 ID: P3****Reason:**

A request to present a field list failed because an error was encountered allocating a vartable. The request was *P1* , the identifier of the vartable was *P3* and the feedback code was *P2* .

System Action:

The request is rejected.

User Action:

Interpret the feedback code using the NCL Reference.

RFEX0203**NDB P1 error for P2, NDBERRC is P3, NDBERRI is P4****Reason:**

An error occurred for the *P1* action on NDB *P2* . The NDB error code is *P3* and the NDB information code is *P4* .

System Action:

The request is terminated and the procedure is ended.

User Action:

Contact your system administrator.

RFEXCNF01

" P1 Date" MUST BE P2 THAN " P3 Date"

Reason:

You have specified invalid dates.

System Action:

The validation fails.

User Action:

Correct the dates in the highlighted fields.

RFEXCNF02

" P1 Date and Time" MUST BE P2 THAN " P3 Date and Time"

Reason:

You have specified an invalid date-time combination.

System Action:

The validation fails.

User Action:

Correct the date and time in the highlighted fields.

RFEXCNF03

INPUT REQUIRED FOR EXECUTION

Reason:

To generate the file transfer exception report, you must specify the period over which you want to report.

System Action:

The validation fails.

User Action:

Specify the date range and optionally, the time range, in the *From* and *To* fields.

Alternatively, you can specify a value in the *Within the last* field.

RFEXCNF04**MUTUALLY EXCLUSIVE FIELDS NOT ALLOWED****Reason:**

The *From* and *To* fields are mutually exclusive with the *Within the last* field.

System Action:

The validation fails.

User Action:

Specify value in either the *From* and *To* fields or the *Within the last* field, but not both.

RFEXCNF05**INPUT FIELDS(P1) OMITTED****Reason:**

The *P1* fields require valid value.

System Action:

The validation fails.

User Action:

Specify value in the *P1* fields.

RFFT0001**INVALID PARAMETER: P1(P2)****Reason:**

An invalid parameter *P1* with a value of *P2* was passed to \$RFFT00L.

System Action:

The procedure terminates.

User Action:

Contact Technical Support.

RFFT0002

'LOCATE' COMMAND IS NOT SUPPORTED, USE 'FIND' INSTEAD

Reason:

The File Transfer Monitor cannot support the LOCATE command due to the complex nature of its key structures and the ability to SORT the list on up to three fields. The FIND command should be used to locate the required information.

System Action:

The request is rejected.

User Action:

Use the FIND command as an alternative.

RFFT0003

ACTIVITY HAS OCCURRED OFF-SCREEN (P1) FOR P2

Reason:

This is an informational message issued by the File Transfer Monitor indicating that some change has occurred for the transfer identified by *P2* , which is not in the current window. *P1* is either ABOVE or BELOW and indicates the direction in which the change is to be found.

System Action:

None

User Action:

If you want to see the change which has occurred, scroll the list in the indicated direction.

RFFT0004**P1 SET TO (P2)****Reason:**

The Specified Profile element *P1* has been set to the displayed value *P2* .

System Action:

None

User Action:

The File Transfer Monitor will use the new value for its displays.

RFFT0005**INVALID P1 PARAMETER - P2. P3****Reason:**

An invalid parameter with value *P2* was supplied for the command *P1* .
P3 may contain information about the correct values.

System Action:

The request is rejected.

User Action:

Correct the invalid value and retry.

RFFT0006**VARIABLE ALLOCATION FAILED. FDBK: P1 TYPE: P2 NAME: P3 SCOPE: P4****Reason:**

An attempt by the File Transfer Monitor to allocate its internal tables has failed, probably due to insufficient storage.

System Action:

The Monitor terminates.

User Action:

Contact your support representative.

RFFT0007

FILTER(P1) NOT DEFINED - RESET TO NULL

Reason:

The requested filter was not found. The File Transfer Monitor Filter has been reset.

System Action:

None

User Action:

Define a new File Transfer Monitor Filter.

RFFT0008

P1 UNCHANGED FROM (P2)

Reason:

The Specified Profile Element *P1* was not changed from its previous value *P2* and a redisplay was not done.

System Action:

None

User Action:

None

RFFT0009

TRANSFER IS NO LONGER CURRENT

Reason:

The selected file transfer no longer resides in the internal file transfer table. ENDED or FAILED transfers only remain current for a short time before being removed from the table.

System Action:

The request is rejected. The display is updated and the transfer in question is removed.

User Action:

If information about the transfer in question is required, it may be obtained from the File Transfer Event Database through the Reporting Menu.

RFFT0010**' P1' IS INVALID FOR A TERMINATED TRANSFER****Reason:**

The request *P1* may only be issued against an active transfer.

System Action:

The request is rejected.

User Action:

None

RFFT0011**REAL TIME MONITORING IS NOT SUPPORTED FOR ' P1'****Reason:**

Real Time Monitoring is not available for the File Transfer product *P1* .

System Action:

The request is rejected.

User Action:

None

RFFT0012**THIS TRANSFER IS P1 BEING MONITORED****Reason:**

A request was made to either START or STOP Real Time Monitoring of a file transfer. If the request was to START Monitoring, then *P1* will be *ALREADY* , if the request was to STOP Monitoring then *P1* will be *NOT* .

System Action:

The request is rejected.

User Action:

None

RFFT0013

TERMINATE NOT SUPPORTED FOR P1

Reason:

The TERMINATE command is not available for the File Transfer product *P1* .

System Action:

The request is rejected.

User Action:

None

RFFT0014

THE FILE TRANSFER MANAGER P1 DOES NOT EXIST ON P2

Reason:

The request requires access to a file transfer manager named *P1*. The file transfer manager *P1* does not exist in the *P2* database.

System Action:

The request is rejected.

User Action:

Define a file transfer manager resource.

RFFT0015

ETA MONITOR NOT SUPPORTED FOR CONNECT:MAILBOX BSC BATCH TRANSFER

Reason:

Status monitoring is not available for BSC batch transmissions as CONNECT:Mailbox does not currently provide transmission block/byte count for BSC line activity.

System Action:

The request is rejected.

User Action:

None

RFFT0016**P1 TERMINATED SUCCESSFULLY BY USER P2****Reason:**

The *P1* file transfer was terminated by the user, *P2* .

System Action:

The TCP/IP connection is dropped, and the file transfer is terminated.

User Action:

None.

RFFT0017**The TCP/IP FTP Data Connection no longer exists****Reason:**

You entered T beside a file transfer to terminate it. However, the associated TCP/IP FTP data connection no longer exists because, for example, the connection failed.

System Action:

The request is aborted.

User Action:

None. The status of the transfer will be updated when the FTP control connection times out.

RFFT0018**ETA MONITOR NOT SUPPORTED FOR XCOM 'EXECUTE' BATCH TRANSFERS****Reason:**

In-progress status monitoring is not available for CA-XCOM file transfers that are executed immediately. Currently, the CA-XCOM application does not provide a command interface to transfers of the EXECUTE type.

System Action:

The request is rejected.

User Action:

None.

RFFT0019

P1 TERMINATED SUCCESSFULLY BY USER P2

Reason:

The *P1* file transfer was terminated by the user, *P2* .

System Action:

The file transfer is terminated.

User Action:

None.

RFFT0020

P1 FAILED TO TERMINATE (P2)

Reason:

The *T* (Terminate) command failed to terminate the *P1* file transfer. *P2* provides the reason.

System Action:

The CA-XCOM application indicates that it cannot terminate the *P1* transfer. If the transfer is active, it will continue.

User Action:

Review the activity log and the CA-XCOM log to determine the cause, and correct the problem as required.

RFFT0021

TERMINATE not supported for CA-XCOM 'EXECUTE' batch transfers

Reason:

The TERMINATE command is not supported for CA-XCOM transfers that are executed immediately.

System Action:

The request is rejected.

User Action:

None.

RFFT0022**ETA MONITOR NOT SUPPORTED FOR GENAPI TRANSFERS****Reason:**

In-progress status monitoring is not available for GENAPI file transfers.

System Action:

The request is rejected.

User Action:

None.

RFFT0023**TERMINATE not supported for GENAPI transfers****Reason:**

The TERMINATE command is not supported for GENAPI transfers.

System Action:

The request is rejected.

User Action:

None.

RFFT0024**ETA Monitor not supported for IBM z/OS Communications Server FTP transfers****Reason:**

In-progress status monitoring is not available for IBM z/OS Communications Server FTP Client/Sever transfers.

System Action:

The request is rejected.

User Action:

None.

RFFTALT01

INVALID PARAMETERS

Reason:

The process \$RFFTALT was called with invalid parmeters.

System Action:

The request is rejected and the process stops.

User Action:

Contact Technical Support.

RFFTALT02

COMMAND P1 IS INVALID

Reason:

The command *P1* is invalid and not supported.

System Action:

The request is rejected.

User Action:

Enter a valid command and retry.

RFFTALT03

UPDATE CANCELLED

Reason:

The update of a message definition was cancelled by the user.

System Action:

None.

User Action:

None.

RFFTLAP01**No Activity Log data files are available.****Reason:**

An attempt was made to browse the FTLogs Logs or perform Log Administration but no VSAM log data files are available.
By default, three FTLogs Log VSAM files are defined at NetMaster installation time and allocated and opened at region startup.
FTLogs Logs are VSAM datasets named ?dsnqual.FTLOG01, FTLOG02, FTLOG03 They should be allocated to the region as DD's FTLOG01, FTLOG02, FTLOG03 and a UDBCTL OPEN performed with the same names as the FILEIDs.
Up to 7 files, FTLOG01 - FTLOG03, may be used.

System Action:

Activity Log browse or administration functions are not available.

User Action:

Ensure that at least one FT log VSAM file is correctly allocated and opened.
Use SH VSAM=FTLOG* to check that correctly defined VSAM datasets are allocated as DDNAMEs FTLOG01 and so on.
A UDBCTL OPEN.. should have been performed for each file - recommended parameters are DEFER, LSR, SIS
Refer to the Common Services documentation for more information.

RFFTMON00**ID= P1 - P2****Reason:**

The message displays a file transfer event monitor trace record.
P1 is the trace ID, and *P2* is the trace text.

System Action:

None.

User Action:

Contact Technical Support.

RFFTMON01

No active Ruleset defined - Reactive File Transfer Monitoring INACTIVE

Reason:

No File Transfer Ruleset is loaded in the region so Reactive File Transfer Monitoring cannot proceed.

System Action:

Monitoring by File Transfer Rules is not available.

User Action:

If monitoring by File Transfer Rules is desired, a File Transfer Ruleset must be loaded as follows:

1. Enter the /PARMS shortcut to display the list of parameter groups.
2. Beside the *AUTOIDS* parameter group, enter *U* .
3. In the *Active Ruleset for File Transfer* field, name the File Transfer Ruleset to be loaded.
4. Press *F6* (Action) to load the Ruleset.

RFFTMON02

The File Transfer Monitor procedure has encountered an error. Reason P1

Reason:

The File Transfer Monitor procedure has encountered an internal system error. P1 is the reason for the failure.

System Action:

Processing continues.

User Action:

Contact Technical Support.

RFFTMON03

There is no file transfer event receiver currently active; the event is discarded

Reason:

A normalised file transfer event cannot be delivered as, there is no active event receiver.

System Action:

The normalised file transfer event is discarded.

User Action:

The FILE TRANSFER EVENT LOGGER (\$RFLO81Z) procedure may have terminated.

From an OCS window issue the following command:

SHOW NCL=ALL PROC=\$RFLO81Z

Print the activity log from before the time of the first occurrence of message RFFTMON03 till the time just after the above SHOW COMMAND.

Contact Technical Support with this diagnostic data.

RFFTMON04

The File Transfer Rules management table size limit of *P1* alerts has been exceeded

Reason:

The number of concurrent file transfer rule alerts in the File Transfer Rules management table has reached the supported limit of *P1*.

System Action:

File transfer rule alerts are still raised; however, the oldest alerts may not be updated or cleared.

User Action:

This condition can occur when a large number of alerts is raised because too many file transfer events meet the criteria set by one or more file transfer rules. Review the following criteria:

- A generic filter
Review the active file transfer rule set, and specify less generic filters.
- Alert Autoclear set to NO
Close active file transfer rule alerts, and consider setting Alert Autoclear to YES.
- Alert Autoclear set to a time-out period (*hh.mm*)
Reduce the time-out period.

RFFTMON05

The Active File Transfer Monitor table size limit of *P1* transfers has been exceeded

Reason:

The number of active file transfers in the Active File Transfer Monitor table has reached the supported limit of *P1*.

System Action:

The oldest file transfers are removed from the Active File Transfer Monitor table (and display) to accommodate newer transfers.

User Action:

Review the FTMONITOR (File Transfer Monitor) Customizer parameter group. Consider reducing the Transfer Visibility values. For example, if you are expecting a large number of file transfer failures in a relatively short period of time, you can reduce the *Failed Transfer Visibility* from 30 minutes (the default) to 5 minutes.

RFFTPEN00

ID= P1 - P2

Reason:

This message displays an FTP transfer event trace record. *P1* is the trace ID and *P2* is the trace text.

System Action:

None.

User Action:

Contact Technical Support.

RFFTPEN01

FTP event handler procedure has failed - reason: *P1*

Reason:

The CA NetMaster FTP event handler procedure failed because of an internal system error. *P1* is the reason for the failure.

System Action:

The procedure terminates.

User Action:

Contact Technical Support with the diagnostic data provided.

RFFTPEN02

The NMFTP Monitor cannot be contacted. The error code is *P1* - Reason: *P2*

Reason:

The NMFTP Monitor cannot be contacted. The associated error code is *P1* and the reason is *P2*.

The FTP event handler procedure requires an active EPS connection to the NMFTP Monitor (NMFTPMON) for the monitoring of FTP transfer events.

Use the error code *P1* to determine why the NMFTP Monitor cannot be contacted:

39

Indicates that the NMFTP Monitor (NMFTPMON) is not responding to an EPS poll.

70

Indicates that the SSI (to which this region is connected) is not available or does not provide EPS event support.

Other

Indicates that an internal error has occurred.

System Action:

Processing continues, but FTP events from IBM FTP servers and clients are not available until the problem is corrected.

User Action:

Take appropriate action based on the error code:

39

- Check that the NMFTP Monitor (NMFTPMON) started task is active.
- Use the \$\$SYSPRO NMIPDIAG command to verify the status of the Network Monitoring SMF API.

70

- Use the SHOW SYSPARM=SSID command to determine the SSID value. Ensure that the correct SSID is specified and that the SSI started task is active.
- Use the \$\$SYSPRO NMIPDIAG command to verify the status of the SOLVE SSI interface.
- Enter the /PARMS shortcut, and check the SSI parameter group. Ensure that the Sub-System Interface ID field contains the correct ID.

other

Contact your local support representative with a copy of the activity log.

RFFTPEN03**Backup copy of procedure \$RFFTPEN (id: P1) has started, FTP event may have been lost****Reason:**

The CA NetMaster FTP event handler procedure \$RFFTPEN failed. A backup copy has been restarted; its NCL ID is *P1*. Some FTP file transfer events may have been lost.

System Action:

Processing continues; however, some FTP events from IBM FTP Servers/Client may have been lost.

User Action:

Check the activity log to determine the reason for the initial \$RFFTPEN procedure failure.

Contact Technical Support with the diagnostic data obtained from the activity log.

RFFTPEN04

The NMFTP Monitor is operational

Reason:

The CA NetMaster NMFTP Monitor was previously unavailable and is now operational.

System Action:

The FTP events processing from IBM FTP Servers/Clients resumes.

User Action:

Check for the earliest *RFFTPEN02* message in the activity log. This message was issued when the NMFTP Monitor (NMFTPSSI) could not be contacted and gives the associated error code and text. Any IBM FTP Servers/Clients file transfer events from the time of first *RFFTPEN02* message until now are lost.

RFF TSA01

Unable to obtain transfer details for P1 link: P2 - Reason: P3

Reason:

An error occurred whilst retrieving the transfer details. The reason is one of the following:

1- REQUEST NOT FOUND The SHOW XMIT command returned the N43C14 or N43D14 message (TRANSMISSION REQUEST DOES NOT EXIST). The command was retried unsuccessfully.

2- INTREAD FAILED WITH xx An INTREAD has failed. xx is the INTREAD failure code.

System Action:

The file transfer event is incomplete. Normal processing continues.

User Action:

Contact Technical Support.

RFFTSM00**THE FTS MESSAGE HANDLER FOR FTSMGR P1 IS READY TO RECEIVE FTS MESSAGES OVER LINK: P2****Reason:**

The NetMaster for File Transfer FTS message handler is ready and is waiting for FTS messages from the FTS region that is managed by FTSMGR, *P1* . The name of the link is *P2* .

System Action:

The NetMaster for File Transfer region waits for FTS messages.

User Action:

None.

RFFTSM01**LOST CONTACT WITH FTS REGION P1 - LINKNAME: P2 RECOVERY INITIATED (RETRY COUNT: P3)****Reason:**

The NetMaster for File Transfer FTS message handler has lost contact with the FTS region, **P1** , due to a link failure. Recovery of the link, **P2** , is being attempted. The retry count indicates the current number of consecutive attempts. This message will be followed by message RFFTSM02 or RFFTSM03.

System Action:

The system attempts to restart the link.

User Action:

None.

RFFTSM02

RETRYING TO CONTACT FTS REGION P1 OVER LINK: P2 - REASON: P3 (RETRY COUNT P4)

Reason:

The NetMaster for File Transfer FTS message handler is attempting to re-contact the FTS region, **P1** , over the link, **P2** , following the failure, **P3** . Retry count indicates the current number of consecutive attempts.

System Action:

The system will attempt to re-contact the FTS region.

User Action:

None.

RFFTSM03

FTS MESSAGE HANDLER FOR FTS REGION P1 HAS FAILED - REASON: P2

Reason:

The NetMaster for File Transfer FTS message handler for the FTS region, P1 , has failed. The reason for the failure is P2 .

System Action:

The message handler procedure terminates.

User Action:

Proceed as follows according to the reason for the failure:

Reason Action

RETRY LIMIT EXCEEDED Check the status of the link to the FTS region and correct any problems. This message follows messages RFFTSM01 and RFFTSM02.

SIGNON CMD TIMEOUT Check that the BSYS background user of this region has been defined on the FTS region.

The BSYS user ID is of the form xxxxBSYS . To determine the ID for this region, issue *SHOW USERS* to list the logon users.

xxxxxx CMD TIMEOUT Check the current status of the FTS region and correct any problems.

All other reasons Contact Technical Support.

RFFTSM04**THE FTS MESSAGE HANDLER FOR FTSMGR P1 IS ATTEMPTING TO START P2****Reason:**

The NetMaster for File Transfer FTS message handler detects that there are currently no receivers for events from the FTS region that is managed by FTSMGR, P1 . The event procedure, P2 , will be started.

System Action:

The required event receiver procedure is started.

User Action:

None.

RFFTSM05**FTS MESSAGE HANDLER FOR FTSMGR P1 WAS UNABLE TO DERIVE THE DATA SET NAMES FOR P2 TO/FROM P3****Reason:**

The FTS transmission request, P2 (to or from the FTS region, P3), has started. However, the transmission start event could not be generated because the required file names could not be obtained.

System Action:

The generation of the transmission start event is deferred, waiting for message N44x07.

User Action:

If the request specifies DDNAME, check that the BSYS background user of this region is defined to the origin and destination FTS regions. The ID is of the form xxxxBSYS . To determine the ID for this region, issue *SHOW USERS* to list the logon users.

If the problem is not because of the above causes, contact Technical Support.

RFFTSM06

FTS REQUEST P3 HAS COMPLETED (FTSMGR: P1) - EXPECTED FTS MESSAGE P2 WAS NOT RECEIVED

Reason:

The FTS request, *P3* ,has completed. However, the expected completion message, *P2* , was not received.

System Action:

If the missing FTS message is N44x01 or N44x03, then the transmission end event cannot be generated because the required request name and destination/origin names are unavailable.

If the missing FTS message is N44x07, then the transmission end event is generated. However, the source and/or the target file names cannot be obtained.

User Action:

If the request specifies DDNAME, check that the BSYS background user of this region is defined to the origin and destination FTS regions. The ID is of the form *xxxxBSYS* . To determine the ID for this region, issue *SHOW USERS* to list the logon users.

If the problem is not because of the above causes, contact Technical Support.

RFFTSM07

THE FTS MESSAGE HANDLER FOR FTS REGION P1 IS ALREADY RUNNING

Reason:

A copy of the NetMaster for File Transfer FTS message handler procedure for the FTS region, *P1* , was started. However, this procedure is already running.

System Action:

The procedure start is ignored.

User Action:

None.

RFFTSM08**THE REQUIRED NCL PROCEDURE P1 DOES NOT EXIST IN THE
COMMANDS LIBRARY ON FTS REGION P2****Reason:**

The *P1* NCL procedure could not be loaded on the *P2* FTS region. This procedure is required for the FTS file transfer monitoring.

System Action:

The FTS message handler is terminated.

User Action:

Check that the *P1* NCL procedure has been installed on the required FTS region. This NCL procedure is distributed with the NetMaster for File Transfer product.

If the problem is not because of the above, contact Technical Support.

RFFTSM09**FTS AGENT PROCEDURE P1 HAS BEEN SUCCESSFULLY INITIALIZED ON
THE FTS REGION P2****Reason:**

The FTS agent NCL procedure **P1** successfully initialized on the FTS region **P2**.

System Action:

None.

User Action:

None.

RFFTSM10

A PSEUDO FTS TRANSMISSION "START EVENT" GENERATED FOR REQUEST P1 P2 P3

Reason:

The current FTS transmission status indicates an active FTS transmission for which no prior notification has been received. The request name is **P1** , the direction is **P2** , and the name of the link to the FTS region is **P3** .

System Action:

The missing start event is generated.

User Action:

None

RFFTSM11

COMMAND P1 ROUTED TO P2 HAS FAILED

Reason:

The command *P1* could not be routed via *P2* . *P2* is not currently active.

System Action:

The command is rejected. Recovery of the INMC link *P2* will be attempted.

User Action:

Wait for the automatic INMC link recovery. If the recovery fails use the SHOW LINKS command to determine the status of the link *P2*.

RFFTSM12**SIGNON PROCESS TO P1 HAS FAILED. RETRY WILL BE ATTEMPTED IN P2 MINUTES****Reason:**

An error has occurred during the signon process to **P1**. A signon retry will be attempted.

System Action:

The current Signon process is aborted. The cause of the error has been logged in the FTSMGR *P1* Transient Log. Signon retry will be attempted.

User Action:

Check the FTSMGR *P1* Transient Log for error message(s) to determine the reason for the signon failure. Correct if required and wait for the signon retry.

RFFTSM13**ERROR AT LINE P1 IN PROC P2 COND= P3 KWD= P4 STATEMENT= P5****Reason:**

The NetMaster for File Transfer FTS message handler procedure has failed due to a possible data error. The error is identified by the following:

- Line number, *P1* , and procedure name, *P2* , where the error occurred
- Error condition raised, *P3* - *Verb* operand that has detected the error, *P4* , if applicable
- Statement text where the error occurred, *P5*

System Action:

Message monitoring continues. However, an incomplete File Transfer event may have been generated. If file transfer logging is active, this message is also written to the file transfer log.

User Action:

Contact Technical Support, making available the following diagnostic information:

- Full text of this message
- A copy of the activity log

RFFTSM14

ERROR THRESHOLD REACHED. THE NETMASTER FOR FILE TRANSFER FTS MESSAGE HAN DLER IS TERMINATED.

Reason:

Recursive errors have been detected in the File Transfer FTS message handler procedure. This message follows messages RFFTSM13 which describe the errors. This message is followed by several NM304xx diagnostic messages.

System Action:

The File Transfer FTS message handler procedure is terminated. If file transfer logging is active, this message is also written to the file transfer log.

User Action:

Contact Technical Support, making available the following diagnostic information:

- Full text of the preceding RFFTSM13 messages
- Full text of the related NM304xx messages
- A copy of the activity log

RFFTSM88

ID= P1 - P2

Reason:

This message displays a file transfer FTS message and events handler trace record. *P1* is the trace ID, and *P2* is the trace text.

System Action:

None.

User Action:

Contact Technical Support.

RFFX00**FTP-Cmd: *P1*, Reply-Code: *P2 P3* - RcvID: *P4*****Reason:**

This is a diagnostic trace message.

The CA NetMaster FTM FTP post processing exit (NM000FPX) was called by the IBM Communication Server FTP post processing user exit (FTPOSTPR) and the TRACE is currently active.

The FTP event processing selection is identified as follows:

- *P1* is the FTP command.
- *P2* is the FTP reply code.
- *P3* is one of the following:
 - selected-The FTP event is selected for processing by CA NetMaster FTM.
 - not selected-The FTP event is not selected for processing by CA NetMaster FTM.
- *P4* is the Event Receiver ID.

System Action:

If *P3* = *selected*, the FTP Event is forwarded to the CA NetMaster FTM region receiving events with a receiver ID of *P4*.

If *P3* = *not selected*, the FTP Event is not forwarded.

User Action:

Contact Technical Support.

RFFX01

NM000FPX called by FTPOSTPR without parameter list

Reason:

The CA NetMaster FTM FTP post processing exit (NM000FPX) was called by the IBM Communication Server FTP post processing user exit (FTPOSTPR) without the required parameter list.

System Action:

The FTP Event processing is aborted.

User Action:

If you provided the IBM Communication Server FTP post processing user exit (FTPOSTPR), check the exit source code to ensure that the CA NetMaster FTP post processing exit (NM000FPX) was called with register one (R1) pointing to the FTP exit parameter list.

If you are using the IBM Communication Server FTP post processing user exit (FTPOSTPR) distributed with CA NetMaster FTM, contact Technical Support.

RFFX02

No active SOLVE SSI with "XEVNT" support found

Reason:

The CA NetMaster FTM FTP post processing exit (NM000FPX) requested the services of the event delivery facility, but the request was rejected because of one of the following:

- *The required SSI is not active.*
- The SSI is active but is running without the event delivery facility.

System Action:

FTP event records are forwarded to the CA NetMaster FTM region when the SSI region (with the event delivery facility) becomes active.

User Action:

Ensure that the SSI region is started with the event delivery facility (XEVNT=YES).

RFFX03**The SOLVE SSI region is not active****Reason:**

The CA NetMaster FTM FTP post processing exit (NM000FPX) requested the services of the event delivery facility, but the request was rejected because the SSI region is not active.

System Action:

FTP event records are forwarded to the CA NetMaster FTM region when the SSI region (with the event delivery facility) becomes active.

User Action:

Ensure that the SSI region is started with the event delivery facility (XEVT=YES).

RFFX04**The SOLVE SSI is in shutdown****Reason:**

The CA NetMaster FTM statistics exit, NMCDSTEX, requested the services of the event delivery facility, but the request was rejected because the SSI is shutting down.

System Action:

The statistics record is not forwarded to the region.

User Action:

Ensure that the SSI region is restarted.

RFFX05

Unable to send EVENT R0=*P1* R15=*P2*

Reason:

The CA NetMaster FTM FTP post processing exit (NM000FPX) issued a \$NMXEVT request to forward an FTP event to the event receiver. The request was rejected. The values of the R0 and R15 return codes from the \$NMXEVT request are *P1* and *P2*, respectively.

System Action:

The event record is not forwarded to the CA NetMaster region.

User Action:

Note the value of R0 and R15, and contact Technical Support.

RFFX06**ABEND at P1 in P2 P3 Level P4****Reason:**

This message is the first of a group of messages that are issued when an abend occurs in the CA NetMaster FTM FTP post processing exit NM000FPX. The following is the complete set of messages:

```
RFFX06 ABEND at +nnnn in xxxxxxxx xxxx Level xxxxxx
RFFX07 R1 at entry: xxxxxxxx, Event add: xxxxxxxx, RcvID: xxxxxxxx, Cmd: xxxx
RFFX08 PSW=xxxxxxxx xxxxxxxx Interrupt-Code: xx
RFFX09 R0 - R3: xxxxxxxx xxxxxxxx xxxxxxxx xxxxxxxx
RFFX09 R4 - R7: xxxxxxxx xxxxxxxx xxxxxxxx xxxxxxxx
RFFX09 R8 - R11: xxxxxxxx xxxxxxxx xxxxxxxx xxxxxxxx
RFFX09 R12-R15: xxxxxxxx xxxxxxxx xxxxxxxx xxxxxxxx
```

Message RFFX06 identifies the abend offset, module, version, and level.

Message RFFX07 identifies the following:

- the value of R1 as passed to NM000FPX by FTPOSTPR on entry.
- the event address (if available or 'Not-Set' if not).
- the event Receiver ID.
- the FTP command code (if available or '????' if not).

Message RFFX08 identifies the failing PSW and program interruption information.

Messages RFFX09 identify the general purpose registers at the time of the abend.

System Action:

The FTP event record is ignored and processing continues.

User Action:

Contact Technical Support. Ensure that you have the following information available:

- The entire group of messages (RFFX06 to RFFX09)
- The version and maintenance level of the IBM Communication Server
- The FTPOSTPR source code (if you provided the IBM Communication Server FTP post processing user exit)

RFFX07

R1 at entry: *P1*, Event add: *P2*, RcvID: *P3*, Cmd: *P4*

Reason:

This message is one of a group of messages issued when an abend occurs in the CA NetMaster FTM FTP post processing exit NM000FPX.

For more information, see the help for message RFFX06.

System Action:

See RFFX06.

User Action:

See RFFX06.

RFFX08

PSW=*P1* Interrupt-Code: *P2*

Reason:

This message is one of a group of messages issued when an abend occurs in the CA NetMaster FTM FTP post processing exit NM000FPX.

For more information, see the help for message RFFX06.

System Action:

See RFFX06.

User Action:

See RFFX06.

RFFX09**P1 P2 P3 P4 P5****Reason:**

This message is one of a group of messages issued when an abend occurs in the CA NetMaster FTM FTP post processing exit NM000FPX.

For more information, see the help for message RFFX06.

System Action:

See RFFX06.

User Action:

See RFFX06.

RFFX10**Requires IBM Communication Server V1R7 or above****Reason:**

The CA NetMaster FTM FTP post processing exit (NM000FPX) was called by the IBM Communication Server FTP post processing user exit (FTPOSTPR), which is executing on an unsupported version of the IBM Communication Server.

System Action:

The FTP event is ignored.

User Action:

Do one of the following:

- Upgrade to a supported version of the IBM Communication Server.
- Update your IBM Communication Server FTP post processing user exit (FTPOSTPR) to remove the call to the CA NetMaster FTM FTP post processing exit (NM000FPX).
- Remove the distributed CA IBM Communication Server FTP post processing user exit (FTPOSTPR).

RFFX11

Unable to obtain storage - EVENT not sent

Reason:

The CA NetMaster FTM FTP post processing exit (NM000FPX) requested the services of the event delivery facility, but the request is rejected because the event delivery facility cannot obtain storage (R0=7 and R15=28 returned from \$NMXEVT).

System Action:

The FTP event is not sent to the CA NetMaster FTM region.

User Action:

Contact Technical Support.

RFFX12

Storage Request Failed: Type=*P1* R15=*P2*

Reason:

The CA NetMaster FTM FTP post processing exit (NM000FPX) cannot obtain or free working storage. *P1* is the failing request and *P2* is the value of the R15 code.

System Action:

The request cannot be processed.

User Action:

Use the R15 code to determine the cause of the error.

RFGE01

XFRID: P1 Type: P2 forwarded to: P3 Status: P4 RC: P5

Reason:

This is a diagnostic trace message.

The Generic Data Transfer API, NM000FGX, was called with TRACE OPTION ON. The Generic Event record was identified as follows:

P1 is the Transfer ID.

P2 is the Generic Event Type. The valid types are:

S for Transfer Start event

E for Transfer End event

F for Transfer Failure event

P3 is the receiver ID from which Generic Events can be received.

P4 is Generic Event Status and is set to one of the following:

COMPLETE indicates that the Generic Event record was validated and will be forwarded to the NetMaster File Transfer region(s).

INCOMPLETE indicates that an error has occurred. The reason is described by *P5* (the return code).

P5 is the return code and is set as follows:

RC IN Hex	Reason	System Action	User Action
0	Normal Completion	(1)	None
4	Transfer ID is missing	(1)	(1)
8	Transfer ID is invalid	(1)	(1)

RC IN Hex	Reason	System Action	User Action
40	NM000FGX Abended	(2)	(1) (3)
44	Unable to obtain storage	(2)	(3)

System Action:

For Return Code System Action notes:

- (1) The Generic Event is forwarded.
- (2) The Generic Event is not forwarded.

User Action:

For Return Code User Action notes:

- (1) Check and correct the Generic Event record contents and format.
- (2) Ensure that the SSI region is started with the event delivery facility (XEVNT=YES).
- (3) Check system log for associated RFGEnn message(s).

RFGE04**The SOLVE SSI is in shutdown mode.****Reason:**

The Generic Data Transfer API, NM000FGX, requested the services of the event delivery facility, but the request was rejected because the SSI is shutting down.

System Action:

The Generic Event record is not forwarded to this region. This data transfer event is lost.

User Action:

To enable this region to receive Generic Events again, ensure that the SSI region is restarted.

RFGE05**Unable to send Generic Event R0= P1 R15= P2****Reason:**

The Generic Data Transfer API, NM000FGX, issued a \$NMXEVT request to forward a Generic Event to the event receiver. The request was rejected. The values of the R0 and R15 return codes from the \$NMXEVT request are *P1* and *P2* respectively.

System Action:

The Generic Event is not forwarded to this region.

User Action:

Note the value of R0 and R15, and contact Technical Support.

RFGE06**ABEND at P1 in P2 P3 Level P4****Reason:**

This message is the first of a group of messages that are issued when an abend occurs in the Generic Data Transfer API, NM000FGX. The complete set of messages is:

RFGE06 ABEND AT +nnnn IN xxxxxxxx xxxx LEVEL xxxxxx

RFGE07 R1 at entry=xxxxxxx, Event add=xxxxxxx, RcvID=xxxxxxx,
XfrID:xxxxxxx--xxxxx, Type:x

RFGE08 PSW=xxxxxxx xxxxxxxx INT=xxxxxxx

RFGE09 R0-R3 xxxxxxxx xxxxxxxx xxxxxxxx xxxxxxxx

RFGE09 R4-R7 xxxxxxxx xxxxxxxx xxxxxxxx xxxxxxxx

RFGE09 R8-R11 xxxxxxxx xxxxxxxx xxxxxxxx xxxxxxxx

RFGE09 R12-R15 xxxxxxxx xxxxxxxx xxxxxxxx xxxxxxxx

Message RFGE06 identifies the abend offset, module, version, and level.

Message RFGE07 identifies the parameters passed by the caller:

R1 at entry is the value in R1 when the API was called.

Event add is the address of the Generic Event record.

RcvID is the receiver ID from which Generic Events can be received. If either R1 or the event address was invalid, this is shown as ???????.

Xfrid is the first 16 characters of the Transfer ID. If either R1 or the event address was invalid, this is shown as ??????????????.

Type is the Generic Event type. If either R1 or the event address was invalid, this is shown as ?.

Message RFGE08 identifies the failing PSW and program interruption information.

Messages RFGE09 identify the general purpose registers at the time of the abend.

System Action:

The Generic Event is ignored, and processing continues.

User Action:

Check and correct the calling module.

If the problem is not in the calling module, then Contact Technical Support.

Ensure that you have the following information available:

- The entire group of messages (RFGE06 to RFGE09)
- The assembly listing of the caller module.

RFGE07

R1 at entry= P1, Event add= P2, RcvID= P3, XfrID: P4, Type: P5

Reason:

This message is one of a group of messages that are issued when an abend occurs in the Generic Data Transfer API, NM000FGX.
R1 at entry is the value in R1 when the API was called.
Event add is the address of the Generic Event record.
RcvID is the receiver ID from which Generic Events can be received. If either R1 or the event address was invalid this is shown as ????????.
Xfrid is the first 16 characters of the Transfer ID. If either R1 or the event address was invalid, this is shown as ????????????????.
Type is the Generic Event type. If either R1 or the event address was invalid, this is shown as ?.
For more information, see the help for message RFGE06.

System Action:

See RFGE06.

User Action:

See RFGE06.

RFGE08

PSW= P1 INT= P2

Reason:

This message is one of a group of messages that are issued when an abend occurs in the Generic Data Transfer API, NM000FGX.
For more information, see the help for message RFGE06.

System Action:

See RFGE06.

User Action:

See RFGE06.

RFGE09

P1 P2 P3 P4 P5

Reason:

This message is the last of a group of messages that are issued when an abend occurs in the Generic Data Transfer API, NM000FGX.
For more information, see the help for message RFGE06.

System Action:

See RFGE06.

User Action:

See RFGE06.

RFGE11

Unable to obtain storage - Generic Event not sent

Reason:

The Generic Data Transfer API, NM000FGX, requested the services of the event delivery facility, but the request was rejected because the event delivery facility could not obtain storage (R0=7 and R15=28 returned from \$NMXEVT).

System Action:

The Generic Event is not sent to the event receiver.

User Action:

Contact Technical Support.

RFGE14

Storage Request Failed: Type='P1 R15= P2

Reason:

The Generic Data Transfer API, NM000FGX, was unable to obtain or free up working storage. *P1* is the failing request, and *P2* is a code that indicates the reason of the failure.

System Action:

The request cannot be processed.

User Action:

Use the R15 code to determine the cause of the error.

RFGEV01**TRANSFER-ID: P1 STARTED - Initiated by: P2 on node: P3****Reason:**

A Generic Data Transfer API file transfer has started:

- *P1* identifies the transfer as Unique transfer ID.
- *P2* is the initiator user Id and *P3* is the initiator node.

This message is followed by RFGEEV02 which provides additional details.

System Action:

None.

User Action:

None.

RFGEV02**TRANSFER-ID: P1 Source Node: P2 Target Node: P3****Reason:**

A Generic Data transfer API file transfer has started:

- *P1* identifies the transfer as the transfer ID.
- *P2* is source node and *P3* is the target node.

This message follows message RFGEEV01.

System Action:

None.

User Action:

None.

RFGEV03

TRANSFER-ID: P1 COMPLETED - Source Node: P2 Target Node: P3

Reason:

A Generic Data Transfer API file transfer has completed successfully:

- P1 identifies the transfer as a Unique transfer ID.
- P2 is source node and P3 is the target node.

System Action:

None.

User Action:

None.

RFGEV05

TRANSFER-ID: P1 FAILED - Source Node: P2 Target Node: P3

Reason:

A notification has been received from Generic Data Transfer API, indicating a failed file transfer:

- P1 identifies the transfer as a Unique transfer ID.
- P2 is source node and P3 is the target node.

This message is followed by RFGEV11 which provides error details.

System Action:

None.

User Action:

None.

RFGEV06

Generic Event API P1 has terminated unexpectedly

Reason:

A non-orderly GENAPI shutdown notification was received from P1 .

System Action:

A file transfer failure event will be raised for each currently active GENAPI transfer (if any).

User Action:

If desired, restart the GENAPI application.

RFGEV07

There was no matching File Transfer START Event for TRANSFER- ID: P1

Reason:

The region received a file transfer completion event for the P1 file transfer but never received the corresponding START event.

System Action:

The region will create a dummy START event for this file transfer. Processing continues.

Important! The created START event uses data from the END event. The start time, the user name, and the transfer rate might be incorrect.

User Action:

None.

RFGEV08

No error details available from the GENAPI - Please review SYSLOG for more information

Reason:

A Generic Data Transfer API file transfer failed, but no error message was received from the Generic Event API region.

System Action:

None.

User Action:

Review the system log and check the User Product region to determine the cause of the failure.

RFGEV09

GENAPI has terminated unexpectedly.

Reason:

A non-orderly GENAPI shutdown notification was received from P1 .

System Action:

A file Transfer FAILURE event is raised.

User Action:

You may want to review the reasons for the GENAPI termination.

RFGEV11

TRANSFER-ID: P1 - Reason: P2

Reason:

A notification has been received from the GENAPI, indicating a failed file transfer:

- *P1* identifies the transfer as a Unique transfer ID.
- *P2* is error text.

This message follows message RFGEV05.

System Action:

None.

User Action:

None.

RFGEV12

P1 of START Event Pool is used. You may not be receiving all END Events associated with START Events.

Reason:

This is a warning message and notifies you that *P1* of the Start Event pool allocated in the GE API parameter group is being used. This may be because END or FAILURE Events are not being passed for all START Events.

System Action:

Event processing continues.

User Action:

Monitor these messages and associated alerts, if the problems persists ensure that Start Events have corresponding End or Failure Events. You can issue FTMGEST at the command prompt to view detail of START Events yet to be processed by the Generic Data Transfer API Event Manager.

RFGEV14

START Event Pool 100% Utilized. Event Lost P1

Reason:

The START Event Pool is 100% Utilized. The Event is lost. *P1* provides detail of the event.

System Action:

Event processing continues.

User Action:

Ensure the GENAPI is passing END/FAILURE events for all processed start events. Use the FTGESTAT command to view details of all current start events yet to be processed by the GENAPI Event Manager.

RFGEevi1

GENAPI EVENT HANDLER PROCEDURE HAS FAILED - REASON: P1

Reason:

The Generic Data Transfer API Event Manager procedure has failed because of an internal system error. *P1* is the reason for the failure.

System Action:

The procedure terminates.

User Action:

Contact Technical Support.

RFGEevi10

GENAPI received an End Event without a Start Date (system date used in event)

Reason:

The Generic Data Transfer API Event Manager did not receive a Start Event for a transfer and no Start Date was specified in the End Event. The End Event is generated with the Start Date being equal to the end time.

System Action:

The event is processed.

User Action:

Correct the data passed by the Generic Data Transfer API from your data transfer application.

RFGEevi11**GENAPI received an End with an invalid Start Date (system date used in event)****Reason:**

The Generic Data Transfer API Event Manager did not receive a Start Event for a transfer and no Start Date was specified in the End Event. The End Event is generated with the Start Date equal to the end time.

System Action:

The event is processed.

User Action:

Correct the data passed by the Generic Data Transfer API from your data transfer application.

RFGEevi2**GENAPI Event Manager has encountered a recoverable error****Reason:**

The Generic Data Transfer API Event Manager procedure has encountered a recoverable error. Check previous messages for the cause of the error.

System Action:

Event processing continues. However, some events may have been lost.

User Action:

Contact Technical Support, making available the following diagnostic information:

- Full text of this message
- Relevant activity log messages
- Generic Application log messages

RFGEV13

**MDO ASSIGN FAILED: RC= P1 FDBK= P2 MAP= P3 COMPONENT= P4
TAG= P5 TYPE= P 6**

Reason:

The Generic Data Transfer API Event Manager procedure has failed due to an MDO error. The failure is identified by the following:

- Statement type, ASSIGN
- MDO return code, **P1** =&ZMDORC
- MDO feedback code, **P2** =&ZDMOFDBK
- Map name, **P3** =&ZMDOMAP - Full map component name, **P4** =&ZMDONAME
- Map component tag value, **P5** =&ZMDOTAG
- ASN.1 type of the component, **P6** =&ZMDOTYPE

System Action:

This message is written to the activity log and is followed by a series of messages (DD9003, DD9004, DD9006, and DD9007), which display the event in dump format. The event is ignored.

User Action:

Contact Technical Support, making available the following diagnostic information:

- Full text of this message
- Record dump

It is suggested that the information be obtained immediately as follows:

1. Locate the message and dump in the activity log.
2. Use the *PRINT START* and *PRINT END* commands to mark the lines. See the activity log help if you do not know how to do this. Ensure that the marked text contains this error message and the entire record dump (that is, up to and including the DD9007 message).
3. Use the *PRINT* command to print the marked section of the log.

Note: If you use a 3270 terminal emulator and choose to print the diagnostics by using the "cut and paste" procedure, ensure that you include an image where you scroll right to capture the end of this message.

RFGEEVI4

**DATA ERROR AT LINE P1 IN PROC P2. RTN= P3 COND= P4 KWD= P5
EVENT= P6. STATEMENT= P7**

Reason:

The Generic Data Transfer API Event Manager procedure has failed due to a data error in the event received from your data transfer application. The error is identified by the following:

- Line number, *P1* , and procedure name, *P2* , where the error occurred
- Subroutine name, *P3* , if applicable
- Error condition raised, *P4*
- Verb operand that has detected the error, *P5* , if applicable
- Statement text where the error occurred, *P6*

System Action:

This message is written to the activity log and is followed by a series of messages (DD9003, DD9004, DD9006, and DD9007), which display the event in dump format. The event is then ignored.

If file transfer logging is active, it is also written to the file transfer log.

User Action:

Contact Technical Support, making available the following diagnostic information:

- Full text of this message
- Record dump

It is suggested that the information be obtained immediately as follows:

1. Locate the message and dump in the activity log.
2. Use the *PRINT START* and *PRINT END* commands to mark the lines. See the activity log help if you do not know how to do this. Ensure that the marked text contains this error message and the entire record dump (that is, up to and including the DD9007 message).
3. Use the *PRINT* command to print the marked section of the log.

Note: If you use a 3270 terminal emulator and choose to print the diagnostics by using the "cut and paste" procedure, ensure that you include an image where you scroll right to capture the end of this message.

RFGEV15

ID= P1 - P2

Reason:

The message displays a file transfer event trace record. *P1* is the trace ID, and *P2* is the trace text.

System Action:

None.

User Action:

Contact Technical Support.

RFGEV17

GENAPI event data - P1

Reason:

The Generic Data Transfer API Event Manager could not process an event. This results in the loss of the event.

P1 describes the field in error.

System Action:

The event is discarded.

User Action:

Contact Technical Support, making available the following diagnostic information:

- Full text of this message
- Generic Application message log

RFGEV8**GENAPI event data - P1****Reason:**

The Generic Data Transfer API Event Manager could not process an event.
P1 describes the field in error.
MDO information follows the message.

System Action:

The event is discarded.

User Action:

Correct the Event Type information passed by the Generic Data Transfer API from your data transfer application.
If the problem cannot be rectified contact Technical Support, making available the following diagnostic information:

- Full text of this message
- Generic Application message log

RFGEV9**GENAPI event data - P1****Reason:**

The Generic Data Transfer API Event Manager cannot process a value received from your data transfer application.

P1 describes the field in error.
MDO information follows the message.

System Action:

The event is processed.

User Action:

Correct the data passed by the Generic Data Transfer API from your data transfer application.
If the problem cannot be rectified, contact Technical Support with the following diagnostic information:

- Full text of this message
- Generic Application message log

RFGELST01

No Event Data Available for GENAPI

Reason:

No Generic Data Transfer Application API Event data is available.

System Action:

None.

User Action:

None.

RFGELST02

No ACTIVE Transfers Available for P1

Reason:

There is no active transfer event data available for product *P1* .

System Action:

None.

User Action:

None.

RFGELST03

Delete of ACTIVE Transfer *P1* failed.

Reason:

The delete of ACTIVE Transfer *P1* failed. The transfer is no longer active.

System Action:

Delete processing fails.

User Action:

Press F6 (Refresh) to ensure that the selected transfer is available.

If the problem persists, contact Technical Support.

RFGELST04**Delete of ACTIVE Transfer P1 successful.****Reason:**

The delete of ACTIVE Transfer *P1* was successful.

System Action:

None.

User Action:

None.

RFGELST05**Delete of Product Event Data for P1 successful****Reason:**

The delete of all Event Data for Product ID *P1* is successful.

System Action:

None.

User Action:

None.

RFGELST06

MDO ASSIGN failed, RC=*P1* FDBK=*P2* Map=*P3* Component=*P4* Tag=*P5* Type=*P6*

Reason:

The Generic Data Transfer API FTGESTAT Command Display Procedure failed due to an MDO error. The failure is identified by the following:

- Statement type, ASSIGN
- MDO return code, *P1*=&ZMDORC
- MDO feedback code, *P2*=&ZDMOFDBK
- Map name, *P3*=&ZMDOMAP
- Full map component name, *P4*=&ZMDONAME
- Map component tag value, *P5*=&ZMDOTAG
- ASN.1 type of the component, *P6*=&ZMDOTYPE

System Action:

This message is written to the activity log and is followed by a series of messages (DD9003, DD9004, DD9006, and DD9007), which display the event in dump format. The event is ignored.

User Action:

Contact Technical Support with the following diagnostic information:

- Full text of this message
- Record dump

We recommend that you obtain the information immediately as follows:

1. Locate the message and dump in the activity log.
2. Use the PRINT START and PRINT END commands to mark the lines. For more information, see the activity log help. Ensure that the marked text contains this error message and the entire record dump (that is, up to and including the DD9007 message).
3. Use the PRINT command to print the marked section of the log.

Note: If you use a 3270 terminal emulator and print the diagnostics using the cut and paste procedure, ensure that you include an image where you scroll right to capture the end of this message.

RFGELST07**Active transfer event not deleted, GENAPI event handler is not active****Reason:**

The Generic Data Transfer API Event Manager procedure is not active or is no longer profiled to accept ACTIVE Transfer deletion requests.

System Action:

Delete processing is aborted.

User Action:

Contact Technical Support.

RFGEN01**NO MONITORS SELECTED FOR RESOURCE GENERATION****Reason:**

A list of CDMON Templates was presented for generation of Monitor resources, but the list was exited without any being selected.

System Action:

No Monitor resources are generated.

User Action:

If Monitor resources are to be generated, select the template(s) on which these resources will be modelled by entering *s* beside them.

RFINWI01**P1 IS REQUIRED****Reason:**

The field *P1* is required and must not be null.

System Action:

Field is set in error.

User Action:

Specify a value for *P1* .

RFINWI02

P1 TIMED OUT FOR FILE P2

Reason:

The file *P2* could not be allocated or unallocated or the process timed out. *P1* indicated if the action was to allocate the file *P2* or to unallocate it.

System Action:

Processing terminates.

User Action:

Check the activity log for messages that may indicate why the process timed out. Retry by actioning the parameter group.

RFINWI03**The ReportCenter data feed is not yet activated on this region****Reason:**

This region includes the capability to send data to ReportCenter, but this function is not yet activated. Until it is, the Send Event Rate Data to ReportCenter field must remain set to NO.

This message occurs if the REPORTDATA or REPORTCENTER parameter group is present In this region but has never been updated.

The ReportCenter data feed will remain dormant until either of these groups is updated and actioned.

System Action:

None.

User Action:

If you have not or do not want to implement the ReportCenter feature, leave this field set to NO.

If you want to enable this region to send data to ReportCenter, you must update and action the REPORTDATA or the REPORTCENTER parameter group, whichever is present In this region.

Implement the ReportCenter control region and the ReportCenter Java Task first to ensure that there is an application to receive the data feed.

Note: For more information on ReportCenter implementation, see the *ReportCenter Guide*.

If you do not implement ReportCenter, you can still see example reports at the following URL:

`http://?your-host-and-port/public/reports/reportexpo.esp`

?your-host-and-port is the IP address of this system and the port number of your WebCenter web interface port

Example: `http://192.168.66.44:8744/public/reports/reportexpo.esp`

RFINWI04

P1 REQUIRED IF P2 SPECIFIED

Reason:

The field *P1* is required if the field *P2* is specified.

System Action:

The field is set in error.

User Action:

Specify a value for *P1* , or blank out the value for *P2* .

RFINWI06

THE VALUE P1 HAS ALREADY BEEN SPECIFIED

Reason:

When customizing a parameter group that allows for multiple occurrences of an item, you entered a value, *P1*, in a field; however, the value is in use by another field of the same type. This is invalid because values must be unique.

For example, when defining the file transfer logs, you can enter details for up to seven log files. The file IDs and the data set names must be unique. This message is issued if a file ID or a data set name that matches an existing entry is entered.

System Action:

Field is set in error.

User Action:

Specify a unique value.

RFINWI10

P1 IS REQUIRED

Reason:

The field *P1* is required and must not be null.

System Action:

Field is set in error.

User Action:

Specify a value for *P1* .

RFINWI14**LOG FILE P1 NOT ALLOCATED, KEY LENGTH P2 IS INVALID****Reason:**

The file transfer log file with ID *P1* was not allocated because the key length of the file was invalid. The key length of the file was *P2* , but it should have a length of 22.

System Action:

The log file is not available for use.

User Action:

Review the \$RF FTLOGS parameter group. Ensure that the correct dataset name is specified.

If the name is incorrect, change it to the correct dataset name.

If the name is correct, this indicates that the VSAM cluster was not defined correctly. Use Access Method Services to delete and redefine the cluster, ensuring that a key length of 22 is specified.

When you have corrected the problem, action the \$RF FTLOGS parameter group.

RFINWI15**FILE FTSCHD NOT ALLOCATED KEY LENGTH P1 IS INVALID****Reason:**

There was an error during the allocation of file FTSCHD in ICS Parameter Group FTSCHD. The key length shown in *P1* is incorrect.

System Action:

None.

User Action:

The correct key length should be 46. Ensure that file FTSCHD has been allocated with a key length of 46.

RFINWI16

FILE FTSCHD NOT ALLOCATED SCHEDULE LOGGING DISABLED

Reason:

There was an error during the allocation of file FTSCHD in ICS parameter group FTSCHD.

System Action:

None.

User Action:

Refer to previous messages in the log to correct this error.

RFINWI22

FILE TRANSFER LOGGING NOT REQUIRED. LOGGING DEACTIVATED/NOT ACTIVATED.

Reason:

The \$RF FTLOGS parameter group has specified that file transfer logging is not required.

System Action:

If file transfer logging is currently enabled, the existing file transfer log procedure is flushed. The file transfer log files are not unallocated and may still be viewed.

User Action:

File transfer logging may be reactivated by updating the \$RF FTLOGS parameter group to specify that logging is now required and then activating the updated group.

RFINWI23**INVALID ID. P1 REQUIRES NAME IN RANGE P2 TO P3****Reason:**

The specified file ID, *P1* , is invalid. File IDs for file transfer logs must be of the following form:

- A fixed prefix (FTLOG)
 - A two digit numeric suffix (01 through 10)
- The file ID must be in the range *P2* through *P3* .

System Action:

Field is set in error.

User Action:

Correct the file ID to conform to the required format.

RFINWI24**NO LOG FILES ALLOCATED, FILE TRANSFER LOGGING DISABLED****Reason:**

No file transfer log files were allocated because of errors. Logging cannot be enabled until at least one file transfer log file is available for logging.

System Action:

File transfer logging is disabled.

User Action:

From the Customizer : Parameter Groups panel (/PARMS), enter **L** beside the FTLOGS parameter group to view the messages relating to this group. Use the messages to determine the reason for the error. Correct the situation, then action the group to reactivate the logging function. File it when its parameters are set successfully.

RFINWI25

FILE TRANSFER LOG FILE ERRORS OCCURRED, SOME LOGS NOT ALLOCATED

Reason:

One or more, but not all, file transfer log files were successfully allocated, and logging has started. Additional messages are written to the initialization log.

System Action:

File transfer logging continues with those logs that were successfully allocated.

User Action:

From the Customizer : Parameter Groups panel (/PARMS), enter **L** beside the FTLOGS parameter group to view the messages relating to this group. Use the messages to determine the reason for the error. Correct the situation, then action the group to reactivate the logging function. File it when its parameters are set successfully.

RFINWI26

DELETE OF RECORD ON FILE FTSCHD FAILED RC= P1 VSAM FDBK= P2

Reason:

There was an error during the delete of a record from file FTSCHD in ICS Parameter Group FTSCHD. The File Return Code is shown in P1 and the VSAM Feedback Code is shown in P2.

System Action:

None.

User Action:

Investigate the VSAM Feedback Code and take the appropriate action.

RFINWI27**P1 RECORDS DELETED FROM FILE FTSCHD****Reason:**

When disabling schedule logging in ICS parameter group FTSCHD the number of records specified by *P1* were deleted from file FTSCHD.

System Action:

None.

User Action:

None.

RFINWI31**EVENT RECEIVER ID= P1 STATUS= P2****Reason:**

The event receiver identified by *P1* has status indicated by *P2* .

System Action:

None.

User Action:

None.

RFINWI32**SSI NOT AVAILABLE. EVENT RECEIVER CANNOT BE ACTIVATED.****Reason:**

The region is unable to activate the FTP event receiver at this time because it is not connected to an SSI region. The SSI region is required for FTP event delivery.

System Action:

Activation of the FTPCNTL parameter group fails.

User Action:

Check the SSI parameter group. Ensure that a value has been specified in the Sub- System Interface ID field and that the specified SSI is set up to provide EndPoint Servies (EPS). Activate the SSI parameter group, then reactivate the FTPCNTL parameter group.

RFINWI33

ACTIVATION OF EVENT RECEIVER FAILED. SEE ACTIVITY LOG FOR DETAILS.

Reason:

An attempt to activate the FTP event receiver has failed. More information can be found in the activity log.

System Action:

None.

User Action:

Check the activity log for further information.

RFINWI34

ACTIVATION OF EVENT RECEIVER UNSUCCESSFUL. RETRYING.

Reason:

An attempt to activate the FTP event receiver has been initially unsuccessful.

System Action:

Activation will be retried at regular intervals until it succeeds.

User Action:

This situation may occur if the SSI region is unavailable at the time the receiver is activated. Check that the SSI region is available.

RFINWI40**File Transfer ReportCenter data feed has been enabled****Reason:**

This region includes the capability to send data to ReportCenter. The procedure to collect file transfer event rate data and forward it to the ReportCenter database has been started.

System Action:

File Transfer reporting data collection will commence.

User Action:

If this is the very first start of this region, ensure that either the REPORTDATA or REPORTCENTER parameter group has also been correctly updated and actioned. If this is not the case, update and action the group immediately. This region will include the REPORTCENTER group if it has been set up to be the ReportCenter Control Region, otherwise it will include the REPORTDATA group. These groups provide the underlying infrastructure to send data to ReportCenter. The REPORT* group on this region must have been successfully actioned before any data can be sent.

The EVENTLOG group controls the generation of file transfer report data at an application level, but is not concerned with its transportation.

RFINWI41

File Transfer ReportCenter data feed has been stopped.

Reason:

The procedure to collect file transfer data and forward it to the ReportCenter database has been stopped.

System Action:

File transfer data collection for ReportCenter is disabled. No reporting data will be produced until data collection is restarted.

User Action:

To ensure continuity of report data, if you are using the ReportCenter file transfer reports, data collection should run continually.

Data collection should generally only be stopped for environmental reasons, such as the ReportCenter database being unavailable for a prolonged period of time.

For short time periods, collected data will be accumulated for sending to the database when full service resumes.

To start file transfer data collection for ReportCenter, set the "Send Event Rate Data to ReportCenter?" field in the EVENTLOG parameter group to YES, and action the group. Ensure that the REPORTCENTER or REPORTDATA group has also been correctly updated and actioned.

RFINWI42**ReportCenter is not enabled on this region: FT data feed disabled****Reason:**

This region does not include the ReportCenter component. The procedure to collect the file transfer data and forward it to the ReportCenter database has been stopped.

System Action:

None. ReportCenter functions are not available from this region.

User Action:

If you do not want to use ReportCenter, this message may be disregarded.

If you want to enable ReportCenter in this region, redo the region setup to include the ReportCenter component. This adds PROD=REPORTER to the region's U28 input parameter member.

After starting the region, you need to:

- Set up the ReportCenter region components.
- Update and action the REPORTCENTER parameter group.

Note: For details, see the *ReportCenter Guide*.

Start file transfer data collection for ReportCenter. Set the Send Event Rate Data to ReportCenter? field in the EVENTLOG parameter group to YES, and action the group.

RFINWI51**P1 IS NOT A VALID P2****Reason:**

The data set, *P1* , is not defined with the properties of a *P2* data set.

System Action:

Validation fails.

User Action:

Redefine the data set, or specify another data set in the input field provided. For information about the attributes of the EVNTDB and EVNTARC data sets, see the Installation and Setup Instructions.

RFINWI52

GDG DETAILS ARE INCOMPLETE - SEE NOTES BELOW

Reason:

A generation dataset was specified for the EVNTARC dataset, but the dataset attributes are incomplete.

System Action:

Field in error is highlighted.

User Action:

Supply the required attributes.

RFINWI53

P1 IS NOT A VALID SPACE TYPE. VALID VALUES ARE CYL OR TRK.

Reason:

The value, *P1* , is not a valid measure for dataset space. Valid values are CYL and TRK.

System Action:

None

User Action:

Enter one of the following values in the Space Type field:

- *CYL* to request that the space be allocated in cylinders.
- *TRK* to request that the space be allocated in tracks.

RFINWI54

P2 ALLOCATION MUST BE NUMERIC.

Reason:

The value, *P1* , is not a valid dataset space allocation amount. The value must be numeric.

System Action:

None

User Action:

Enter a number for the space allocation amount.

RFINWI55**ENTER EITHER MODEL DSCB OR SMS DATA CLASS****Reason:**

Enter either model DSCB name or SMS data class for GDG to model the new generation dataset. You cannot use model DSCBs with SMS-managed generation datasets.

System Action:

None.

User Action:

Specify either the model DSCB name or the SMS data class for GDG to model the new generation dataset, but not both.

RFINWI56**USER NOT ADDED TO UAMS - &P1****Reason:**

The automatic password option of the CDAPI parameter group requires the CONNECT:Direct user to be defined to UAMS. If the option is set to YES the system will attempt to automatically add the user to the UAMS file. If the attempt is unsuccessful this message is displayed.&P1&is the message returned by the &SECCALL ADD function.

System Action:

Message displayed. Processing allowed to continue.

User Action:

Determine why the ADD failed (the user may already be defined) and if required, correct the problem and manually add the user.

RFINWI57

NO SECURITY EXIT INSTALLED

Reason:

The option is not available because the security exit is not installed.

System Action:

Message displayed. Processing is allowed to continue.

User Action:

If required, install the security exit.

RFINWI58

EVENTSEQ dataset P1 is required.

Reason:

The EVENTLOG is currently in a failed state and requires the use of *P1* that contains the event records unloaded during a failure. The EVENTSEQ dataset specified is different from the dataset used for the unload of the event records.

System Action:

Message displayed. Processing is allowed to continue.

User Action:

Specify the required dataset for this field if the unloaded event records are to be used for recovery. A null value for this field will discard any previously unloaded records.

RFINWI59

DMPRINT dataset P1 will be allocated at initialization

Reason:

The dataset *P1* will be allocated at system initialization since a DMPRINT is in use by another dataset.

System Action:

Message displayed. Processing allowed to continue.

User Action:

None

RFINWI60**EVNTDB REORG UNLOAD parms for P1 are invalid****Reason:**

The parameters necessary for REORG UNLOAD are invalid. The required parameters are:

Enable Event Logging NO (required)

EVNTDB Database Name *P1* (EVNTDB to be reorganized)

EVNTSEQ Reorg Dataset sequential dataset (work dataset for REORG)

System Action:

Error message displayed. Validation is allowed to continue.

User Action:

Correct the parameters and press PF6 to initiate the REORG UNLOAD.

RFINWI61**EVNTDB REORG RELOAD parms from P1 are invalid****Reason:**

The parameters necessary for REORG RELOAD are invalid. The required parameters are:

Enable Event Logging YES (required)

EVNTDB Database Name VSAM dataset name (must have space to at LEAST contain all the unloaded records)

EVNTSEQ Reorg Dataset *P1* (must be the same dataset used in the UNLOAD step)

System Action:

Error message displayed. Validation is allowed to continue.

User Action:

Correct the parameters and press F6 (Action) to initiate the REORG RELOAD.

RFINWI62

EVNTDB REORG processing will be ignored

Reason:

The parameters provided will skip REORG processing and instead attempt to format and use a new EVNTDB. The required parameters are:

Enable Event Logging YES

EVNTDB Database Name VSAM dataset (newly defined VSAM dataset)

EVNTSEQ Reorg Dataset (null value - no work dataset)

System Action:

Warning message displayed. Validation is allowed to continue.

User Action:

If reorganization is to be ignored, press F6 (Action) to start logging using the new EVNTDB, and to release the lock.

RFINWI63

NO EVNTSEQ REORG DATASET SPECIFIED.

Reason:

No EVNTSEQ Reorg dataset was provided. Automatic reorganization is not possible with this setting.

System Action:

Warning message displayed. Processing continues.

User Action:

If automatic reorganization is required, provide a valid dataset for EVNTSEQ and press F6 (Action) to implement the change.

RFINWI64**NO RESPONSE FROM EVNTDB LOGGER.****Reason:**

The EVNTDB Logger failed to respond and indicate its current status.

System Action:

Processing continues.

User Action:

Check the log for possible initialization errors and take corrective action if necessary.

RFINWI65**Invalid Field Separator Character****Reason:**

An invalid field separator character was specified. The valid characters are:

` ! * - + | \ : ; < > ? / ,

The literal delimiter character TAB is also valid and internally represented as EBCDIC X'05'. If nothing is specified, the separator defaults to a comma (,).

System Action:

Processing continues.

User Action:

Specify a valid character separator.

RFINWI66**EVNTDB AUTOMATIC REORGANIZATION IN PROGRESS****Reason:**

An attempt to action the Event Log parameter group failed because automatic reorganization of the EVNTDB is in progress.

System Action:

Request rejected.

User Action:

Check log to monitor the progress of the reorganization. Retry the action after successful completion of the reorganization process.

RFINWI67

Data Space Monitoring has been disabled

Reason:

The *FTPCNTL* parameter group disabled data space monitoring.

System Action:

Data space monitoring is disabled.

User Action:

None.

RFINWI68

SPECIFIED TIME PERIOD CANNOT BE LESS THAN 30 SECONDS

Reason:

The specified time period cannot be less than 30 seconds.

System Action:

Validation fails.

User Action:

Specify a valid time period.

RFINWI69

Invalid value, must be between 10 and 9999

Reason:

The field contains an invalid value. The only valid values are a number between 10 and 9999.

System Action:

Field is set in error.

User Action:

Specify a number between 10 and 9999.

RFINWI70**Cannot change EVNTDB Database Name - logging enabled****Reason:**

The EVENT DB Database name cannot be changed while event logging is set to YES.

System Action:

Error message displayed.

User Action:

To change the EVNTDB Database Name:

- 1- Set the Enable Event Logging field to NO.
- 2- Change the name of the EVNTDB.
- 3- Set the Enable Event Logging field to YES.

RFINWI71**TCPaccess FTP Server event receipt has been disabled****Reason:**

The *FTPCNTL* parameter group disabled TCPaccess FTP Server event receipt.

System Action:

TCPaccess FTP Server event receipt is disabled.

User Action:

None.

RFINWI72**Non TCPaccess FTP Server event receipt has been disabled****Reason:**

The *FTPCNTL* parameter group disabled Non TCPaccess event receipt.

System Action:

Non TCPaccess event receipt is disabled.

User Action:

None.

RFINWI73

DMPRINT file has been allocated as a temporary file

Reason:

The CONNECT:Direct Command API work file DDNAME: *DMPRINT* has been allocated to a temporary file.

System Action:

Processing continues.

User Action:

None.

RFINWI74

DMPRINT file is already allocated

Reason:

The CONNECT:Direct Command API work file DDNAME: *DMPRINT* is already allocated and will be reused.

System Action:

Processing continues.

User Action:

None.

RFINWI75

DMPRINT file cannot be allocated; reason: P1

Reason:

An internal error has occurred.
The CONNECT:Direct Command API work file DDNAME: *DMPRINT* cannot be allocated. *P1* is the error text.

System Action:

The CONNECT:Direct Command API responses are disabled.

User Action:

Contact Technical Support with the full text of this message.

RFIPRMS01**REQUIRED FILE NAMES(P1) FOR CDMGR(P2) WERE UNAVAILABLE****Reason:**

The CONNECT:Direct Command Interface procedure was invoked for a CDMGR but was unable to ascertain the values for the NETMAP and MSGFIL datasets. The file names which could not be derived are identified by P1 while P2 identifies the CONNECT:Direct manager.

The reason for the failure could be because the INQUIRE INITPARMS command issued to CONNECT:Direct was unsuccessful or because the \$RFXPRMS exit was not modified to provide the required file names.

Including the CDMGR resource's file names in the \$RFXPRMS exit will bypass the need for the command API to issue the INQUIRE INITPARMS command to obtain these file names.

NB. For V1.8 of CONNECT:Direct the \$RFXPRMS exit MUST be modified as this release of CONNECT:Direct does not support the INQUIRE INITPARMS command.

System Action:

The request is rejected. The interface procedure ends with return code 16.

User Action:

Update the \$RFXPRMS exit to include the file names of the NETMAP and MSGFIL datasets for the nominated CDMGR resource. If running a version of CONNECT:Direct later than V1.8 the file names should be able to be dynamically extracted by use of the INQUIRE INITPARMS command. In this case check that the userid defined in the CDAPI parameter group is defined to CONNECT:Direct and has the necessary authority. Also check that the CMD clist is available in the CONNECT:Direct OPLIST dataset.

RFLG0201

NO FILE TRANSFER LOG IS AVAILABLE - LOGGING TERMINATING

Reason:

No file transfer log files are available. Logging of file transfer details terminates.

System Action:

The file transfer log procedure terminates.

User Action:

From the Customizer : Parameter Groups panel (/PARMS), enter **L** beside the \$RF FTLOGS parameter group and review the displayed initialization log.

If the log indicates that errors have occurred, correct them.

If the log shows no errors, enter **L** beside a logged message and browse the displayed activity log for related messages. Correct any errors indicated by these messages.

RFLG0301

NO FILE TRANSFER LOG IS AVAILABLE - LOGGING TERMINATING

Reason:

No file transfer log files are available. Logging of file transfer details terminates.

System Action:

The file transfer log procedure terminates.

User Action:

From the Customizer : Parameter Groups panel (/PARMS), enter **L** beside the \$RF FTLOGS parameter group and review the displayed initialization log.

If the log indicates that errors have occurred, correct them.

If the log shows no errors, enter **L** beside a logged message and browse the displayed activity log for related messages. Correct any errors indicated by these messages.

RFLG0302**NCLID P1 FLUSHED BY P2****Reason:**

The executing process with the specified NCL ID has been flushed to enable a log swap to take place. If a user is associated with this process (for example, the user might be browsing the log), the user region will be terminated.

System Action:

The file transfer log swap commences when there are no users.

User Action:

None

RFLG0303**USER P1 CANCELLED BY P2****Reason:**

The user, *P1*, was accessing a file transfer log file for which a log swap was required. For example, the user might be browsing the log. The user region was terminated to enable the log swap to take place.

System Action:

The file transfer log swap commences when there are no users for the log file.

User Action:

None

RFLGPR01

FILE TRANSFER LOG PROCEDURE ID= P1 RECYCLED TO ID= P2

Reason:

The NetMaster for File Transfer log procedure has been started, but there is already an active file transfer log procedure. The current procedure, with NCL ID *P1* , is flushed. The new log procedure has an NCL ID of *P2* .

System Action:

The old file transfer log procedure terminates, and the new log procedure runs in its place. Additional messages are written to the activity log as a result of the old log procedure being flushed.

User Action:

No action is required. This message is for information and audit trail only.

RFLGPR02

FILE TRANSFER LOG SWAPPED TO FILE ID= P1

Reason:

The NetMaster for File Transfer log procedure has received an event where the date is different to the previous event (or this is the first event since the procedure was started). The procedure swaps to the file indicated in the message. (File transfer events raised on different dates are logged to different log files.)

File transfer messages are now written to the log file with file ID= *P1* .

System Action:

File transfer logging continues.

User Action:

No actions are required. The message is for information and audit trail only.

RFLGPR03

**FILE TRANSFER LOG WRITE FAILED: ID= P1 REQ= P2 KEY= P3 RC= P4
FDBK= P5 M SG= P6**

Reason:

The NetMaster for File Transfer log procedure has failed to write a message to the current file transfer log file. The current file will be swapped, and logging will continue.

The failure is identified by the following:

- Current file ID, **P1**
 - File request, **P2** , that indicates either OPEN or ADD, and the NCL &FILE operation that has failed
 - Key of the record, **P3** (only relevant if the file request is ADD)
 - File return code, **P4** , which is the &FILERC value
 - VSAM feedback code, **P5** , in hexadecimal format (normally only relevant if the return code is 8)
 - System message, **P6** , if any (normally only relevant if the return code is 16)
- A full file is indicated by the following conditions:
- File request is ADD. - File return code is 8. - VSAM feedback code is 1C.

System Action:

File transfer logging continues.

User Action:

If the message indicates that the file is full, no action is required as the next log file will be used. If a secure copy of the file is needed, you should arrange to copy the file before it is reset during the normal cycling of log files.

Other errors indicate problems with the region or the particular file. If a system message is included (MSG=), see to the help for that message to help you resolve the problem. If the VSAM feedback code is included (FDBK=), use the request type and feedback code to reference your VSAM reference manual and follow the problem diagnosis.

If the problem cannot be resolved, contact Technical Support.

RFLGPR04

Local time offset moved *P1* from *P2* to *P3*

Reason:

The log procedure for CA NetMaster FTM received a local time offset change notification.

P1 is the direction of the local time offset move; it is forward or backward.

P2 is the previous local time offset (*d.hhmm* - day hours minutes)

P3 is the new local time offset (*d.hhmm* - day hours minutes)

Note: File Transfer Log lines always display the local system time. When a backward time change occurs, for example, for daylight saving, the local system time moves back; however, log records may already be written for this time interval.

System Action:

Logging continues.

User Action:

None.

RFLINK01

LINK STATUS FOR *P1* IS *P2*

Reason:

This message is issued when an FTSMON link monitor detects an inactive link to a monitored region or a link check is requested by message RFLINK05.

P1 is the link name.

P2 is the link status.

System Action:

The monitor procedure issues message RFLINK02, which causes the related FTSMGR and FTSMON resources to change status.

User Action:

None.

RFLINK02**P1 P2 P3 UNABLE TO COMMUNICATE WITH P1****Reason:**

An FTSMON link monitor resource is unable to communicate with its FTSMGR resource.

P1 is the FTSMGR name.

P2 is the FTSMON name.

P3 is the time.

System Action:

The extended display of the FTSMON and FTSMGR resources is set.

User Action:

The problem can be due to the following possible causes:

- No DEFLINK command has been issued from the FTSMGR region.

To correct the problem, issue a DEFLINK command from the FTSMGR region, for example:

DEFLINK MASK=* PREFIX=link-prefix

To enable the automatic execution of the command during the startup of the FTSMGR region, include the command in the NMREADY procedure for the region.

- The BSYS user of the NetMaster for File Transfer region is not defined to the FTSMGR region.

To correct the problem, define the user to the FTSMGR region.

To determine the user ID, issue *SHOW USERS* from the NetMaster for File Transfer region to display the list of logon users.

After you corrected the problem, enter *CHK* beside the FTSMON resource.

RFLINK03

P1 P2 P3 P4 LINK TO P4 NOT ACTIVE

Reason:

An FTSMON resource has detected that its monitored link is not active.

P1 is the FTSMGR name.

P2 is the FTSMON name.

P3 is the TIME.

P4 is the LINK name.

System Action:

The EXTENDED DISPLAY of the FTSMGR and FTSMON resources is set.

User Action:

Determine the cause of the link being inactive and rectify.

RFLINK04

P1 P2 P3 P4 LINK TO P4 ACTIVE

Reason:

An FTSMON resource has found its monitored link to be active.

P1 is the FTSMGR name.

P2 is the FTSMON name.

P3 is the TIME.

P4 is the LINK name.

System Action:

The EXTENDED DISPLAY of the FTSMON resource is set.

User Action:

None.

RFLINK05**P1 P2 PERFORM LINK CHECK****Reason:**

An FTSMON resource whose monitored link was previously inactive has now detected that the link is active. This message is issued to cause the FTSMGR to reset any error display and other FTSMON resources to check their links.

P1 is the FTSMGR name.

P2 is the FTSMON name.

System Action:

The FTSMGR's EXTENDED DISPLAY is reset. All other FTSMON resources check their links and set errors as appropriate.

User Action:

None.

RFLINK06**HEARTBEAT INTERVAL INCREASED TO GLOBAL MINIMUM (P1)****Reason:**

The heartbeat value in the resource definition was less than the minimum global value. The heartbeat value is increased automatically to *P1* .

System Action:

The heartbeat value is increased automatically to the minimum value.

User Action:

None.

RFLO8100**ID= P1 - P2****Reason:**

The message displays a file transfer events logger trace record.

P1 is the trace ID, and *P2* is the trace text.

System Action:

None

User Action:

Contact your local support representative.

RFLO8101

EVENT LOGGER IS ALREADY RUNNING

Reason:

An attempt was made to start the Event Logger, but it was already running.

System Action:

The existing Event Logger continues to operate.

User Action:

None

RFLO8102

EVNTDB NDB ERROR: ACTION= P1 RETURN-CODE= P2 STATUS= P3

Reason:

The Event Logger encountered an error when trying to perform a P1 command on the EVNTDB database. The return code is P2 . The Event Logger may terminate or continue processing as indicated by its status.

System Action:

The Event Logger may terminate if it cannot continue processing.

User Action:

Check the activity log for further messages indicating why the NDB error occurred. To display the log, enter the =H.L panel path.
If the NDB is full, redefine it with more space. For information about the attributes of the distributed database, see the Installation and Setup Instructions.

RFLO8103

P1 EVNTDB I/O ERROR, LOGGING HAS STOPPED, EXTRACT THE DATA AND RESET THE FILE**Reason:**

The event logger received a VSAM I/O error when trying to add a record to the EVNTDB database. This is a serious error resulting in the event logger terminating. The most likely reason for this error is that the EVNTDB database is full.

System Action:

The event logger cannot continue processing and has terminated. The EVNTDB database probably has a status of *BAD-LOCKED*.

User Action:

Check the activity log for further messages that indicate why the I/O error occurred. To access the log, enter the *=H.L* path.

If the NDB is full and is marked *BAD-LOCKED*, you must delete and redefine the NDB. However, before doing this, if you want to extract the data currently in the NDB, perform the following steps:

1. Issue the *NDB START EVNTDB UNLOCK INPUT* command to open the database as input-only. If you issue this command without the *INPUT* option, the region will attempt to reapply the last transaction, causing the NDB to remain *BAD-LOCKED*.
2. Type the name of your extract dataset into the field provided on the History Data menu (*=/FTHIST*), and select option *EX* to start the extract process.
3. Go to the activity log (*=H.L*) for progress messages on the extract process.
4. When the extract process has finished, deallocate the EVNTDB database by issuing the following commands:
 - *NDB STOP EVNTDB* to stop the database
 - *UDBCTL CLOSE=EVNTDB* to close the file
 - *DEALLOC DD=EVNTDB* to deallocate the file
5. After the EVNTDB database has been deallocated, submit your batch job to delete and redefine the dataset (optionally giving it more space). For information about the attributes of the distributed database, see the *Installation and Setup Instructions*.
6. Upon successful completion of the batch job, go to the list of parameter groups (*=/PARMS*), and enter *U* (Update) beside the *EVENTLOG* parameter group. You might want to decrease the number of days records are to be stored within the database.
7. Press *F6* (Action) to action the parameters. This reinitializes the event logging environment, and the event logger should restart with no problems.
8. Press *F3* (File) to save your current parameter settings and exit, or *F12* (Cancel) if you do not wish to save the changes you have made.

RFLO8104**P1 EVNTDB IS LOCKED, LOGGING HAS STOPPED****Reason:**

The event logger tried to add a record to the EVNTDB database and discovered that the database was locked. This is a serious error, and the event logger has terminated. The most likely reason for this error is that the EVNTDB database has become full.

System Action:

The event logger cannot continue processing and has terminated. The EVNTDB database is in a status of LOCKED or BAD-LOCKED.

User Action:

Check the activity log for further messages that indicate why the I/O error occurred. To access the log, enter the `=H.L` path.

It is uncommon for the NDB to have the *LOCKED* status. However, if this occurs, issue an *NDB START EVNTDB UNLOCK* command and then action the *EVENTLOG* parameter group. To access the list of parameter groups, enter the `=/PARMS` path.

If the NDB is full and has the *BAD-LOCKED* status, the only solution is to delete and redefine the NDB. However, before doing this, if you wish to extract the data currently in the NDB, perform the following steps:

1. Issue the *NDB START EVNTDB UNLOCK INPUT* command to open the database as input-only. If you issue this command without the *INPUT* option, the region will attempt to reapply the last transaction, causing the NDB to remain *BAD-LOCKED*.
2. Type the name of your extract dataset into the field provided on the History Data menu (`=/FTHIST`), and select option *EX* to start the extract process.
3. Go to the activity log (`=H.L`) for progress messages on the extract process.
4. When the extract process has finished, deallocate the EVNTDB database by issuing the following commands:
 - *NDB STOP EVNTDB* to stop the database
 - *UDBCTL CLOSE=EVNTDB* to close the file
 - *DEALLOC DD=EVNTDB* to deallocate the file
5. After the EVNTDB database has been deallocated, submit your batch job to delete and redefine the dataset (optionally giving it more space). For information about the attributes of the distributed database, see the *Installation and Setup Instructions*.
6. Upon successful completion of the batch job, go to the list of parameter groups (`=/PARMS`), and enter *U* (Update) beside the *EVENTLOG* parameter group. You might want to decrease the number of days worth of records to be stored within the database.
7. Press *F6* (Action) to action the parameters. This reinitializes the event logging environment, and the event logger should restart with no problems.
8. Press *F3* (File) to save your current parameter settings and exit, or *F12* (Cancel) if you do not wish to save the changes you have made.

RFLO8105**P1 Initiating EVNTDB database reorg****Reason:**

The Event Logger tried to add a record to a full EVNTDB database and failed. The EVNTDB database reorganization process is initialized.

System Action:

Event logging is paused while the reorganization is in process.

User Action:

None

RFLO8106**EVENT LOGGER TERMINATED DUE TO NDB ERROR: RC= P1 LINE= P2 P3 P4****Reason:**

During initialization of the Event Logger, an NDB error occurred while executing an NDB command P1 . The line number in error is P2 .

System Action:

The Event Logger terminates.

User Action:

Check the activity log for further messages indicating why the NDB error occurred.

If the NDB is full, redefine it with more space. For information about the attributes of the distributed database, see the Installation and Setup Instructions.

RFLO8107

EVENT Logger Initialization complete P1

Reason:

The Event logger initialization has completed. *P1* may indicate (*SUSPEND*) which means that no records are being written to the EVNTDB due to errors during startup.

System Action:

Event Logger continues processing.If *P1* indicates (*SUSPEND*) , then no records are being written to the EVNTDB.

User Action:

Check the initialization log to determine the cause of the failure if any.

RFLO8108

EVENT LOGGER HAS TERMINATED REASON: P1

Reason:

Event Logger has stopped due to *P1* .

System Action:

Processing terminated.

User Action:

Review the activity log if the termination was due to an error.

RFLO8109

EVNTDB NDB INFO QUERY FAILED. RETCODE P1

Reason:

The Event Logger encountered an error when trying to gather information about the EVNTDB database. The return code is *P1* . The Event Logger continues processing.

System Action:

NONE.

User Action:

Check the activity log for further messages indicating why the NDB error occurred. To display the log, enter the =H.L panel path.

RFLO8110**Field P1 Exceeds Key Length P2. The value passed is P3.****Reason:**

The Event Logger encountered an error when processing event data. The keyed field exceeded the maximum key length. The field data is truncated to the key length.

P1 is the field name.

P2 is the key length.

P3 is the field data.

System Action:

Message is logged and processing continues.

User Action:

Contact Technical Support and provide message details and the name of the File Transfer Product that you are monitoring.

RFLO8111**EVNTDB Processing changed from 'ALL' to 'SUSPEND'****Reason:**

An NDB error has prevented records from being written to EVNTDB and has caused the logger to suspend logging.

System Action:

Logger remains active but no records are written to the EVNTDB.

User Action:

Check the initialization log to determine the cause of the failure.

RFLO8112

EVNTDB Processing changed from 'SUSPEND' to 'ALL'

Reason:

The EVNTDB has been recovered and the logger has resumed writing records to the NDB.

System Action:

Logging continues.

User Action:

None.

RFLO8113

File P1 error - File(P2) RC(P3) MSG(P4)

Reason:

An error was encountered when attempting to access a file. *P1* is the operation being performed, *P2* is the ID of the file, *P3* is the return code, and *P4* is the message set by the FILE verb.

System Action:

Event logging continues, however, File Transfer SCHEDULES logging may be interrupted.

User Action:

Contact your local support representative.

RFLO8114

Unable to locate File Transfer Schedule P1 in file P2

Reason:

File Transfer Schedule *P1* has completed. Schedule details could not be logged as the required records could not be located in file *P2*.

System Action:

Event logging continues, however, File Transfer SCHEDULES logging for schedule *P1* is terminated.

User Action:

Contact your local support representative.

RFLO8115**First P1 characters of Source or Target filename truncated****Reason:**

While logging a file transfer event, a Source/Target Data filename's first *P1* characters were truncated and the last 255 characters retained in the log record. The succeeding message RFLO8116 shows the complete filename.

System Action:

Event logging continues.

User Action:

Contact your local support representative.

RFLO8116**P1 filename: P2****Reason:**

This message follows RFLO8115 message, which displays the complete Source/Target filename *P2* .

System Action:

None.

User Action:

None.

RFLO8201**EVENT LOG P1 PROCESS STARTED - ELIGIBLE RECORDS: P2****Reason:**

An Event Log process has started. The process extracts records from the EVNTDB event logging database and writes them in comma-delimited format to a sequential dataset. *P1* indicates the type of process. If it is ARCHIVE, the records are deleted from the database.

System Action:

The indicated Event Log process starts to extract EVNTDB records.

User Action:

None

RFLO8202

EVENT LOG P1 PROCESS ENDED

Reason:

An Event Log process has finished. The process extracts records from the EVNTDB event logging database and writes them in comma-delimited format to a sequential dataset. *P1* indicates the type of process. If it is ARCHIVE, the records are deleted from the database.

System Action:

The indicated Event Log process finishes.

User Action:

None

RFLO8203

EVNTDB P1 ERROR: ACTION= P2 RC= P3 FDBK= P4

Reason:

An error occurred during an EVNTDB *P1* operation. The action being performed was *P2* . The Dataset Services interface return code was *P3* , and the feedback code was *P4* . The dataset in use at the time of the error is shown in a following message.

System Action:

Processing terminated.

User Action:

Check the activity log for further messages to determine the cause of the error. See the Network Control Language Reference for the meaning of the Dataset Services interface feedback codes. The online Help for the N16Cxx messages (where xx is *P4*) provides possible user actions.

RFLO8204**EVNTDB NDB ERROR: ACTION= P1 RETURN-CODE= P2 STATUS= P3****Reason:**

An error occurred when a P1 command is being performed on the EVNTDB event logging database. The NDB return code is P2 .

System Action:

The process is placed in the displayed status, P3 .

User Action:

Determine why the NDB error occurred. Contact your System Administrator for further assistance.

RFLO8205**WRITING RECORDS TO P1 DD= P2****Reason:**

The ARCHIVE or EXTRACT procedure is starting to write to the P1 dataset. The DD name of the dataset is P2 .

System Action:

The process continues.

User Action:

None

RFLO8206**DELETING P1 LOG RECORDS FROM EVNTDB****Reason:**

The Event Log ARCHIVE process is commencing the DELETE step of its processing.

System Action:

The Event Log process continues running.

User Action:

None

RFLO8207

INVALID KEYWORD VALUE SPECIFIED, KEYWORD= P1 VALUE= P2

Reason:

The call to the procedure failed because the keyword, *P1* , has an invalid value, *P2* .

System Action:

The request is rejected.

User Action:

Contact your local System Administrator.

RFLO8208

NO EVENT LOG RECORDS QUALIFY FOR P1 PROCESSING

Reason:

The Event Log process did not find any records that can be extracted or archived, as indicated by *P1* .

System Action:

The Event Log process terminates.

User Action:

None

RFLO8209

P1 RECORDS WRITTEN TO THE P2 DATASET DD= P3

Reason:

The ARCHIVE or EXTRACT process has written *P1* records to the *P2* dataset. The DD name of the dataset is *P3* .

System Action:

The process continues.

User Action:

None

RFLO8210**ERROR CREATING EVNTDB NDB FROM DATASET P1****Reason:**

An error occurred when dataset *P1* is being formatted as an NDB.

System Action:

Event logging and reporting is not made available.

User Action:

Determine why the NDB error occurred. Contact your System Administrator for further assistance.

RFLO8211**EXTRACT PROCESS SUBMITTED AS BACKGROUND TASK - CHECK LOG FOR PROGRESS****Reason:**

Your request to extract file transfer events starts the EVNTDB extract process as a background task that runs with your authority. Progress messages with the prefix RFLO82* are written to the activity log.

System Action:

The process is submitted to your background region.

User Action:

Check the activity log for progress. To access the log, enter the *H.L* path.

RFLO8212**P1 RECORDS DELETED FROM THE EVNTDB DATABASE****Reason:**

The Event Log archive process has deleted *P1* records from the EVNTDB database.

System Action:

The Event Log archive process continues running.

User Action:

None.

RFLO8213

THE P1 DATASET IS P2 DD= P3

Reason:

Processing has finished.

P1 is the function that has been performed, either ARCHIVE or EXTRACT.

P2 is the name of the dataset.

P3 is the DD name of the dataset.

System Action:

None.

User Action:

None.

RFLO8214**No sequential dataset defined for the EVNTDB reorg****Reason:**

The EVNTDB reorganization process could not continue as no sequential dataset has been defined for the reorganization.

System Action:

Reorganization processing terminates.

User Action:

Define a sequential dataset with a record length of 4096, a block size of 23445, and a record format of VB. Then add the dataset name to the EVNTSEQ Reorg Dataset field on the Event Logging Initialization Parameters panel.

To restart a failed REORG:

1. Go to the Event Logging Customizer panel (= /PARMS, Update \$RF EVENTLOG).
2. Review the dataset allocation for EVNTSEQ to determine if it has enough space to hold all records from EVNTDB.
3. Set the Enable Event Logging field to *NO*.
4. Press PF6 to unload the data from EVNTDB to EVNTSEQ.
5. Set the EVNTDB Database Name field to a newly defined VSAM dataset. It is necessary for a new dataset name to be provided, and when appropriate increase the space allocation.
6. Set the Enable Event Logging field to *YES*.
7. Press PF6 to reload the data from EVNTSEQ to EVNTDB and restart event logging.
8. Review the customizer log.

RFLO8215**EVNTDB REORG processing started****Reason:**

The EVNTDB reorganization process has started.

System Action:

Reorganization processing continues.

User Action:

None.

RFLO8216

EVNTDB REORG Unloading records to P1

Reason:

The EVNTDB reorganization process is beginning step 1, copying all records from the EVNTDB NDB to the sequential dataset indicated by *P1*.

System Action:

Reorganization processing continues.

User Action:

None.

RFLO8217

EVNTDB REORG Reloading records from P1

Reason:

The EVNTDB reorganization process is beginning step 2, copying all records from the sequential dataset indicated by *P1* , to the EVNTDB NDB.

System Action:

Reorganization processing continues.

User Action:

None.

RFLO8218

EVNTDB REORG: P1

Reason:

This is an IDCAMS message produced by the EVNTDB reorganization process.

System Action:

Reorganization processing continues.

User Action:

None.

RFLO8219**EVNTDB REORG processing P1****Reason:**

The EVNTDB reorganization process has successfully finished.

System Action:

Reorganization processing has finished. NetMaster for File Transfer event logging should resume normally if the reorganization was successful.

User Action:

None.

RFLO8220**EVNTDB REORG P2 processing FAILED RC= P1****Reason:**

The EVNTDB reorganization process has failed.

System Action:

Reorganization terminates.

User Action:

Check the activity log for message ID RFLO8219, which contains the SYSPRINT output from IDCAMS, to determine the cause of the failure.

To restart a failed REORG:

1. Go to the Event Logging Customizer panel (=/PARMS), and update \$RF EVENTLOG.
2. Review the data set allocation for EVNTSEQ to determine if it has enough space to hold all records from EVNTDB. For information about the data set attributes, see the Installation and Setup Instructions.
3. Set the Enable Event Logging field to *NO* .
4. Press F6 (Action) to unload the data from EVNTDB to EVNTSEQ.
5. Set the EVNTDB Database Name field to a VSAM data set that has enough space to contain all the unloaded records and start logging new events. For information about the data set attributes, see the Installation and Setup Instructions.
6. Set the Enable Event Logging field to *YES* .
7. Press F6 (Action) to reload the data from EVNTSEQ to EVNTDB and restart event logging.
8. Review the initialization log.

RFLO8221

EVNTDB P1 in progress since P2

Reason:

EVNTDB is not available due to database maintenance. No further action is possible.

System Action:

Request is rejected.

User Action:

Retry later.

RFLO8222

EVNTDB started successfully

Reason:

An NDB START command for the EVNTDB completed without errors.

System Action:

None

User Action:

None

RFLO8223**EVNTDB START failed RC= P1****Reason:**

An NDB START command for the EVNTDB failed with RC= *P1* .

System Action:

Processing terminates and the EVNTDB logger is not restarted.

User Action:

To restart a failed REORG:

1. Go to Event Logging customizer panel (= /PARMS), and update \$RF EVENTLOG.
2. Review the data set allocation for EVNTSEQ to determine if it has enough space to hold all records from EVNTDB.
3. Set the Enable Event Logging field to *NO* .
4. Press F6 (Action) to unload the data from EVNTDB to EVNTSEQ.
5. Set the EVNTDB Database Name field to a VSAM data set that has enough space to contain all the unloaded records and start logging new events.
6. Set the Enable Event Logging field to *YES* .
7. Press F6 (Action) to reload the data from EVNTSEQ to EVNTDB and restart event logging.
8. Review the initialization log.

RFLO8225

Unable to process EVNTDB status is P1

Reason:

The EVNTDB could not be processed because an NDB START command has not been issued or has failed.

System Action:

Processing terminates.

User Action:

Check the initialization log to determine the appropriate action.

To restart a failed REORG:

1. Go to Event Logging customizer panel (=/PARMS), and update \$RF EVENTLOG.
2. Review the data set allocation for EVNTSEQ to determine if it has enough space to hold all records from EVNTDB.
3. Set the Enable Event Logging field to *NO* .
4. Press F6 (Action) to unload the data from EVNTDB to EVNTSEQ.
5. Set the EVNTDB Database Name field to a VSAM data set that has enough space to contain all the unloaded records and start logging new events.
6. Set the Enable Event Logging field to *YES* .
7. Press F6 (Action) to reload the data from EVNTSEQ to EVNTDB and restart event logging.
8. Review the initialization log.

RFLO8226**EVNTDB STOP failed RC= P1****Reason:**

An NDB STOP command for the EVNTDB failed with RC= *P1* .

System Action:

Processing terminates, and the EVNTDB logger is not restarted.

User Action:

To restart a failed REORG:

1. Go to Event Logging customizer panel (= /PARMS), and update \$RF EVENTLOG.
2. Review the data set allocation for EVNTSEQ to determine if it has enough space to hold all records from EVNTDB.
3. Set the Enable Event Logging field to *NO* .
4. Press F6 (Action) to unload the data from EVNTDB to EVNTSEQ.
5. Set the EVNTDB Database Name field to a VSAM data set that has enough space to contain all the unloaded records and start logging new events.
6. Set the Enable Event Logging field to *YES* .
7. Press F6 (Action) to reload the data from EVNTSEQ to EVNTDB and restart event logging.
8. Review the initialization log.

RFLO8227**EVNTDB REORG initialization****Reason:**

The EVNTDB reorganization initialization has started.

System Action:

None

User Action:

None

RFLO8228

EVNTDB PURGE failed RC= P1

Reason:

An NDB PURGE command for the EVNTDB failed with RC= *P1* .

System Action:

Processing terminates, and the EVNTDB logger is not restarted.

User Action:

To restart a failed REORG:

1. Go to Event Logging customizer panel (= /PARMS), and update \$RF EVENTLOG.
2. Review the data set allocation for EVNTSEQ to determine if it has enough space to hold all records from EVNTDB.
3. Set the Enable Event Logging field to *NO* .
4. Press F6 (Action) to unload the data from EVNTDB to EVNTSEQ.
5. Set the EVNTDB Database Name field to a VSAM data set that has enough space to contain all the unloaded records and start logging new events.
6. Set the Enable Event Logging field to *YES* .
7. Press F6 (Action) to reload the data from EVNTSEQ to EVNTDB and restart event logging.
8. Review the initialization log.

RFLO8229**EVENT LOGGING NOT STARTED DUE TO ERROR IN P1 PROCESSING****Reason:**

Event Logging was not started due to errors during P1 processing.

System Action:

Error messages are written to the initialization log, and the process is terminated.

User Action:

Check the cause of the error from the log entries and determine the appropriate action.

To restart a failed REORG:

1. Go to Event Logging customizer panel (=/PARMS), and update \$RF EVENTLOG.
2. Review the data set allocation for EVNTSEQ to determine if it has enough space to hold all records from EVNTDB. For information about the data set attributes, see the Installation and Setup Instructions.
3. Set the Enable Event Logging field to *NO* .
4. Press F6 (Action) to unload the data from EVNTDB to EVNTSEQ.
5. Set the EVNTDB Database Name field to a VSAM data set that has enough space to contain all the unloaded records and start logging new events. For information about the data set attributes, see the Installation and Setup Instructions.
6. Set the Enable Event Logging field to *YES* .
7. Press F6 (Action) to reload the data from EVNTSEQ to EVNTDB and restart event logging.
8. Review the initialization log.

RFLO8230**EVNTDB REORG P1 step successful****Reason:**

The EVNTDB REORG *P1* step completed without errors.

System Action:

Reorganization processing continues.

User Action:

None

RFLO8231

EVENT LOG ARCHIVE/EXTRACT PROCESSING FAILED.

Reason:

The EVENT LOG archive/extract process has failed.

System Action:

Processing terminates.

User Action:

Check the EVNTDB Initialization Log for details of the failure and determine the appropriate action.

RFLO8232

NO RESPONSE FROM EVNTDB LOGGER.

Reason:

The EVNTDB Logger failed to respond and indicate its current status.

System Action:

Processing continues.

User Action:

Check the log for possible initialization errors and take corrective action if necessary.

RFLO8233

EVNTDB REORGANIZATION ABORTED: POSSIBLE INSUFFICIENT SPACE IN EVNTDB

Reason:

During initialization it was determined that a reorganization had been performed in the last 24 hours. This indicates that the EVNTDB may not have enough space, and repeated reorganizations will have no effect.

System Action:

Reorganization aborted.

User Action:

Review the initialization log to determine the time of the last reorganization and determine the current usage of the EVNTDB using IDCAMS. If necessary allocate more space for the EVNTDB.

RFLO8234**THE P1 DATASET IS P2 DD= P3****Reason:**

Processing has failed.

P1 is the function that has been performed, either ARCHIVE or EXTRACT.

P2 is the name of the dataset.

P3 is the DD name of the dataset.

System Action:

Processing terminated.

User Action:

See message RFLO8203 or the succeeding N16Cxx messages for possible user actions.

RFLO8235**EVNTDB BACKUP Unable to rename the current dataset****Reason:**

During EVNTDB START or automatic REORG, it was determined that the current dataset is no longer usable. An attempt was made to backup and rename the current EVNTDB but the new name is already in use. The backup dataset name would have the format:

&ZDNSQLCL.&ZJOBNAME.EVNTDB.annnv

where:

&ZDNSQLCL = value of the local dataset qualifier as set in the DSNQLCL JCL parameter
&ZJOBNAME = jobname of the NetMaster region
a = is an alphabetic character from A to J and is indexed by the last digit of the current year + 1
nnn = current Julian day
v = version number from 0 to 9

System Action:

Processing terminates with the logger processing in SUSPEND mode.

User Action:

Specify a new EVNTDB dataset in the EVENTLOG parameter panel.

RFLO8236

EVNTDB BACKUP Unable to determine VSAM component names

Reason:

The VSAM DATA and INDEX component names of the current EVNTDB could not be determined from an IDCAMS LISTCAT.

System Action:

Processing terminates with the logger processing in SUSPEND mode.

User Action:

Specify a new EVNTDB dataset in the EVENTLOG parameter panel.

RFLO8237

EVNTDB BACKUP: P1

Reason:

This is an IDCAMS message produced during renaming of the EVNTDB.

System Action:

Processing continues.

User Action:

None.

RFLO8238

EVNTDB BACKUP unable to create a new dataset

Reason:

During EVNTDB START or automatic REORG, it was determined that the current dataset is no longer usable. An attempt to define a new EVNTDB dataset failed.

System Action:

Processing terminates with the logger processing in SUSPEND mode with no records being logged.

User Action:

Review the initialization log to determine the cause of the failure or specify a new EVNTDB dataset form the EVENTLOG parameter display panel.

RFLO8239**EVNTDB P1 dataset P2****Reason:**

The EVNTDB dataset has been *RENAMED* or *RESTORED* to *P1* .

System Action:

Processing continues.

User Action:

None.

RFLO8240**EVNTDB resizing in progress****Reason:**

The EVNTDB is being resized. The new size is determined by the product of the average record length and the total number of records rounded up the the next megabyte.

System Action:

Processing continues with records being cached during resizing.

User Action:

None.

RFLO8241

SMS Data Class P1 does not exist or is invalid.

Reason:

The EVNTARC archive data set cannot be created because the specified SMS Data Class *P1* does not exist or does not contain the required attributes to create the data set.

System Action:

Processing of event records terminates.

User Action:

Consult the storage administrator to determine the SMS Data Class to use or specify override values for the data set attributes in the customizer panels (/PARMS) for the EVENTLOG parameter group. When using an SMS Data Class, the following values must be specified:

- AVGREC
- AVG VALUE
- SPACE PRIMARY
- SPACE SECONDARY

For more information about defining an SMS Data Class, see z/OS DFSMS: Using the Interactive Storage Management Facility.

RFLO8242

EVNTDB data set not compatible with current release

Reason:

Initialization for event logging is incomplete because the supplied data set is not compatible with the current release of the product.

System Action:

Logging continues without an event log data set.

File transfer events are not logged.

User Action:

Ensure that you are using the Event Log data set defined by the region Setup JCL (member S01LCALC).

RFLO8301**EVNTDB MONITOR IS ALREADY RUNNING****Reason:**

An attempt was made to start the EVNTDB Monitor, but it is already running.

System Action:

Processing terminates.

User Action:

None

RFLO8302**EVNTDB OR EVENT LOGGER NOT STARTED****Reason:**

An attempt to query the status of the EVNTDB failed because it is not allocated or the Event Logger was disabled.

System Action:

Processing terminates.

User Action:

Review the initialization log to determine why logging has been stopped.

RFLO8303**EVNTDB REORG WAS NOT SUCCESSFUL.****Reason:**

Automatic EVNTDB reorganization processing has failed.

System Action:

Process terminates and re-scheduled at the next monitoring cycle.

User Action:

Review the EVENTLOG Initialization log to determine the cause of the failure.

RFLO8304

EVNTDB P1 COMPONENT UTILIZATION P2

Reason:

The EVNTDB *P1* component currently has a space of utilization of *P2* .

System Action:

The EVNTDB Monitor continues processing.

User Action:

None

RFLO8305

NO SIGNIFICANT SPACE RECLAIMED: DU(P1%) IU(P2%) T2(P3%)

Reason:

The EVNTDB Monitor determined that no significant space was reclaimed after an Automatic REORG was performed. The DU(*P1*) and IU(*P2*) values display the Data and Index utilization respectively after completion of a REORG.

System Action:

Processing continues. In the next monitoring cycle, EVNTDB Monitor will not attempt to do an automatic REORG until the utilization falls below *P3* percent

User Action:

Review space utilization. If necessary, reallocate the EVNTDB with more space or schedule an ARCHIVE to delete old records.

RFLO8306

EVNTDB MONITOR MODE IS DISABLED.

Reason:

The EVNTDB Monitor failed to initialize since it was not enabled.

System Action:

Processing terminates.

User Action:

ENABLE logging from the EVENTLOG Initialization Parameters. If the situation persists, call your local support.

RFLO8307**AUTO REORG ABORTED. LAST REORG: P1****Reason:**

EVNTDB Automatic Reorg has determined that the last execution did not alleviate the EVNTDB full condition. A new reorganization will not be scheduled.

System Action:

Processing terminates and logging remains inactive.

User Action:

Schedule an archive to delete old records or allocate more space to the EVNTDB.

RFLOLH01**EVENT LOGGING AND REPORTING HAS NOT BEEN CONFIGURED****Reason:**

You selected an Event Logging and Reporting option, but the feature has not been configured.

System Action:

The selected option is not processed.

User Action:

Review the EVENTLOG parameter group. Ensure that logging is enabled. To list the parameter groups, enter the */PARMS* shortcut.

RFLOLH02

EVENT LOGGING DATABASE IS CURRENTLY P1

Reason:

The event logging database (EVNTDB NDB) is in a status of *P1* and is not available for reporting.

System Action:

The selected report is not processed.

User Action:

In the EVENTLOG parameter group, ensure that the value of *Enable Event Logging* is *YES* and action the group to make the EVNTDB database available for reporting. To list the groups, enter the */PARMS* shortcut.
If the database is still not available, check the activity log for further error messages. To display the log, enter the *=H.L* panel path.

RFLOLH03

NO EVENT RECORDS FOUND

Reason:

There were no File Transfer event records in the EVNTDB for the selected Schedule or File Filter Entry.

System Action:

None.

User Action:

None.

RFLOLH04

EVNTDB P1 in progress since P2

Reason:

EVNTDB is not available due to database maintenance. No further action is possible.

System Action:

Request is rejected.

User Action:

Retry later.

RFLOLH05**ERROR ACCESSING EVNTDB NDBRC: P1****Reason:**

An error occurred getting a record from the NDB while building the list. The NDB return code was *P1* .

System Action:

Selection List terminates.

User Action:

To determine the appropriate action, check the following:

- EVENTLOG in the initialization log
- Return code

RFLOHL01**VARIABLE P1 ERROR, FDBK= P2 ID= P3****Reason:**

A request to present an Events List failed because an error was encountered allocating a variable table. The request was *P1* , the identifier of the variable table was *P3* , and the feedback code was *P2* .

System Action:

The request is rejected.

User Action:

Interpret the feedback code using the NCL Reference.

RFLOHL02

VARIABLE P1 ERROR, FDBK= P2 ID= P3 KEY= P4

Reason:

A request to present an Events List failed because an error was encountered accessing a variable table. The request was *P1* , the identifier of the variable table was *P3* , the feedback code was *P2* , and the key value used was *P4* .

System Action:

The request is rejected.

User Action:

Interpret the feedback code using the NCL Reference.

RFLOHL03

Invalid keyword value specified, Keyword= P1 Value= P2

Reason:

An invalid value has been given for keyword *P1* .

System Action:

The request is rejected and the procedure is terminated.

User Action:

Contact your system administrator.

RFLOLS01

EVNTDB P1 in progress since P2

Reason:

EVNTDB is not available due to database maintenance. No further action is possible.

System Action:

Request is rejected.

User Action:

Retry later.

RFLOLS02**NO P1 RECORDS FOUND****Reason:**

No records found for the selected entry.

System Action:

None

User Action:

None

RFLOLS201**EVNTDB ERROR: ACTION= P1 NDBRC= P2 NDBERRI= P3****Reason:**

The Summary Reports Service Procedure received an error when trying to perform a *P1* command on the EVNTDB database. The NDB response code is *P2* and the NDBERRI information is *P3* .

System Action:

The report request is terminated.

User Action:

Contact your system administrator for assistance.

RFLOLS202**\$CACALL ERROR: ACTION= P1 NAME= P2 RC= P3****Reason:**

The Summary Reports Service Procedure received an error when executing a call to the CAS Programming Interface (\$CACALL). *P1* is the purpose of the call, *P2* is the name of the entity requested and *P3* is the Feedback Code (Return Code). If *P3* is 1 then entity *P2* does not exist.

System Action:

The report request is terminated.

User Action:

Contact your system administrator for assistance.

RFLORWL01

VARIABLE P1 ERROR, FDBK= P2 ID= P3

Reason:

A request to present a Report List failed because an error was encountered allocating a variable table. The request was *P1* , the identifier of the variable table was *P3* , and the feedback code was *P2* .

System Action:

The request is rejected.

User Action:

Interpret the feedback code using the NCL Reference.

RFLORWL02

VARIABLE P1 ERROR, FDBK= P2 ID= P3 KEY= P4

Reason:

A request to present a Report List failed because an error was encountered accessing a variable table. The request was *P1* , the identifier of the variable table was *P3* , the feedback code was *P2* , and the key value used was *P4* .

System Action:

The request is rejected.

User Action:

Interpret the feedback code using the NCL Reference.

RFLORWL03

NO REPORTS DEFINED WITHIN SPECIFIED RANGE

Reason:

A request to present a Report List failed because there were no reports defined within the range specified.

System Action:

The request is rejected.

User Action:

None.

RFLORWL04**REPORT P1 DELETED BY ANOTHER USER****Reason:**

The selection of a report from the Report List failed because the report was deleted by another user since the Report List was displayed. The name of the report selected was *P1* .

System Action:

The selection of the report is rejected.

User Action:

None.

RFLORWL05**Invalid keyword value specified, Keyword= P1 Value= P2****Reason:**

An invalid value has been given for keyword *P1* .

System Action:

The request is rejected and the procedure is terminated.

User Action:

Contact your system administrator.

RFLSTNR01

HOST(P1) COMMUNITY(P2) PORT(P3) RETRY LIMIT(P4) RETRY INTERVAL(P5)

Reason:

A heartbeat procedure for the file transfer resource listener port is initiated.

P1 is the SNMP host name.

P2 is the SNMP community name.

P3 is the port number which the listener should be on.

P4 is the number of retry attempts.

P5 is the interval, in seconds, between each retry.

System Action:

None.

User Action:

None.

RFLSTNR02

LISTENER PORT HEARTBEAT INVOKED WITHOUT RETRY P1

Reason:

The file transfer resource listener port monitor is invoked without one of the necessary parameters. *P1* identifies the missing parameter.

System Action:

Heartbeat processing is terminated.

User Action:

Update the definition of the affected resource, and specify the missing parameter.

RFLSTNR03**P1 P2 LISTENER PORT P3 FOUND AT P4****Reason:**

The file transfer resource listener port monitor has found the active listener port.

P1 identifies the owning file transfer resource.

P2 displays the name of the monitor resource.

P3 is the listener port

P4 is the time.

System Action:

None.

User Action:

None.

RFLSTNR04**P1 P2 LISTENER PORT NOT FOUND AT P3****Reason:**

The file transfer application requires an active listener port to receive requests for connection. The required listener port was not found or was not in a LISTEN state.

P1 identifies the owning file transfer resource.

P2 is the name of the monitor resource.

P3 is the time.

System Action:

None.

User Action:

Perform one or more of the following to investigate the problem:

- Check the transient log of the monitor resource for additional details.
- If the port number of the file transfer application is specified on the Monitor Details panel of the resource definition, check its accuracy.
- Check the current state of the file transfer application, *P1*.
- Check the current state of the TCP/IP region.

RFLSTNR05

TCP/IP INTERFACE IS NOT ACTIVE. STATUS IS P1

Reason:

The TCP/IP interface is currently *P1* s. To verify the current status of the listener port, the status of the TCP/IP interface must be ACTIVE.

System Action:

Heartbeat processing does not take place.

User Action:

Display the current TCP/IP services status by issuing a *SHOW TCPIP* command. Message *N3AF05* shows the current TCP/IP INTERFACE status. If the TCP/IP INTERFACE status is *INACTIVE* - Issue a TCPIP START command. Wait for message N3B201 and then enter a CHK command against this resource.

If the TCP/IP INTERFACE status is *QUIESCING* or *STOPPING* - wait for the STATUS to change to INACTIVE and proceed as above.

If the TCP/IP INTERFACE status is *STARTING* - Wait for message N3B201 and then enter a CHK command against this resource.

RFLSTNR06

LOCAL PORT(P1) STATUS(P2) CONNID(P3)

Reason:

This is an informational message issued by the TCP/IP Listener monitor for each connection found until the Listener is found.

P1 identifies the local port.

P2 is the connection status.

P3 is the connection id.

System Action:

None

User Action:

None

RFLSTNR07**SOCKET P1 FAILED: ZFDBK= P2 ZSOCERRN= P3 ZSOVERR= P4****Reason:**

The action described in *P1* could not be performed on the TCP/IP socket. The Feedback Code *P2* , Error Number *P3* and/or Vendor Error *P4* are displayed for further diagnosis.

System Action:

The procedure terminates with a return code of 12.

User Action:

See the NCL Reference for suggested actions that pertain to feedback code ZFDBK.

RFLSTNR08**ENCODE FAILED: P1****Reason:**

The encoding of data from EBCDIC to ASCII failed. Refer to the additional details found in *P1* for further information.

System Action:

The procedure terminates with a return code of 12.

User Action:

Take actions as indicated by the additional details.

RFLSTNR09

**SOCKET P1 FAILED: RETCODE= P2 ZFDBK= P3 ERRN= P4 MDORC= P5
MDOFDBK= P6**

Reason:

The SOCKET action that failed is described in **P1** . **P2** through **P6** contain the return, error, and feedback codes that can assist with problem diagnosis. A RECEIVE which times out (RC=4) could indicate that the user is not authorized to access SNMP, that SNMP is not active, or possibly the Community name is invalid.

System Action:

The procedure terminates with a return code of 12.

User Action:

See the NCL Reference for suggested user actions that pertain to feedback code ZFDBK.

RFLSTNR10

P1 P2 PORT: P3 STATE: P4

Reason:

This message is the response to a D command against a file transfer listener port monitor resource.

P1 identifies the owning file transfer resource.

P2 is the name of the file transfer listener port monitor resource.

P3 is the TCP/IP port number *P1* uses for TCP/IP access.

P4 is the state of *P3* . This is the tcpConnState value as described by the SNMP Working Group's RFC 1213.

System Action:

None.

User Action:

None.

RFLSTNR11**UNEXPECTED ERROR STATUS RECEIVED P1 ERROR INDEX P2****Reason:**

The response received from the listener contained an unexpected error status *P1* . The error index was *P2* .

System Action:

The procedure terminates with a return code of 12.

User Action:

Analyze the error status and error index codes to determine what corrective actions to perform.

RFLSTNR12**UNABLE TO OBTAIN TCP/IP PORT NUMBER FOR P1****Reason:**

The TCP/IP connections monitor was unable to ascertain the TCP/IP port number used by file transfer resource manager, *P1* .

System Action:

Monitoring fails.

User Action:

This only applies when TCPAccess Version 4.1 is being used.
For a CONNECT:Direct resource, the port number is either obtained automatically from CONNECT:Direct or provided in user exit \$RFXPRMS. One possible problem is that an old version of \$RFXPRMS is executed.
For an FTP resource, the port number must be specified in the resource definition.

RFLSTNR13

NO ERROR STATUS RETURNED AND NO RESPONSE DATA RECEIVED

Reason:

The response received from SNMP did not contain any data. However, no error status was returned.

System Action:

The procedure terminates with a return code of 12.

User Action:

This error condition indicates a problem with the SNMP services on the resource being monitored. Report the problem to your resource administrator.

RFLSTNR14

P1 TCP/IP STACK(P2) VERSION(P3)

Reason:

A heartbeat procedure for the file transfer resource listener port is initiated.

P1 is the name of the manager for the file transfer product

P2 is the TCP/IP software type

P3 is the TCP/IP software version (if available)

System Action:

None.

User Action:

None.

RFLSTNR15**P1 LISTENING FOR CONNECTIONS ON PORT NUMBER P2****Reason:**

The heartbeat procedure for the file transfer resource listener port has established that the *P1* file transfer product is currently listening for connections on port *P2* .

System Action:

None.

User Action:

None.

RFLSTNR16**ID= P1 - P2****Reason:**

The message displays a TCP/IP listener port monitor trace record. *P1* is the trace ID, and *P2* is the trace text.

System Action:

None.

User Action:

Contact Technical Support.

RFLSTNR17**Display not supported from this environment****Reason:**

A display command was received for a listener monitor, but the requestor is not in 3270 full-screen mode.

System Action:

The display command is rejected.

User Action:

Enter the display command from a 3270 session.

RFM01002

Data Space is ACTIVE, Policy Mode= P1 Ruleset= P2

Reason:

The data space is active. The FTP policy mode is *P1* , and the name of the loaded ruleset is *P2* .

System Action:

FTP policy rules are enforced.

User Action:

None.

RFM01003

Data Space is ACTIVE, no ruleset loaded

Reason:

The data space is active, but no FTP policy ruleset is loaded. No FTP policies are in force.

System Action:

None.

User Action:

If you want to enforce FTP policies, select *L* on the FTP Policy Maintenance menu to load an FTP policy ruleset in the data space.

RFM01004

Data Space is NOT ACTIVE

Reason:

The data space is not active, and FTP policy rules cannot be enforced.

System Action:

FTP policy rules are not enforced.

User Action:

To enforce any loaded policy rules, start the data space manager task (for example, *S SOLVEDSP*).

You can also monitor and control the data space manager from the status monitor by defining an STC class resource for the manager.

RFM01005**Data Space ERROR****Reason:**

The data space is in error, and FTP policy rules cannot be enforced.

System Action:

FTP policy rules are not enforced.

User Action:

It is likely that a wrong version of the Data Space Manager is active. To find out the version of the Data Space Manager, issue the following command from a Command Entry panel:

SYSCMD F manager-task,DISPLAY

The returned N6DQ41 message contains the version of the data space. Ensure that the version is at least 0410.

If you are using an old manager, replace it with the new version.

If you are using the correct manager, note the feedback code and contact Technical Support.

RFM01006**Request rejected, Data Space is not active****Reason:**

The request cannot be processed when the data space is inactive.

System Action:

None.

User Action:

To perform this action, start the data space manager task first (for example, S SOLVEDSP).

RFM01007

Request rejected, no communication with Data Space - FDBK= P1

Reason:

An error occurred when communicating with the Data Space Manager. The most likely cause is that you are using an old version of the manager. *P1* is the feedback code that identifies the error.

System Action:

The request is not processed.

User Action:

To find out the version of the Data Space Manager, issue the following command from a Command Entry panel:

SYSCMD F manager-task,DISPLAY

The returned N6DQ41 message contains the version of the data space. Ensure that the version is at least 0410.

If you are using an old manager, replace it with the new version.

If you are using the correct manager, note the feedback code and contact Technical Support.

RFM01201

Invalid Sysname(P1) and Version(P2) specified

Reason:

Sysname and Version specified is unknown to the system.

System Action:

The request is rejected.

User Action:

Use '?' to list a selection list of Sysname and Version known to system.

RFM01202**EVNTDB NDB is not active, option P1 is not available****Reason:**

The Event Logging Database, EVNTDB, is not in an ACTIVE state. Any reporting or extract functions that use the database are not available.

System Action:

The request is rejected.

User Action:

You can start the EVNTDB database by initializing event logging and reporting as follows:

1. Access the list of region parameter groups.
2. Enter *U* beside the EVENTLOG parameter group.
3. Press F6 (Action).

RFM01203**P1 is not a valid extract dataset****Reason:**

The specified dataset is not valid. Either it does not exist, or it is not sequential with a variable blocked record format (RECFM=VB) and a logical record length of at least 502 (LRECL=502).

System Action:

The request is rejected.

User Action:

Specify a valid extract dataset, and retry.

RFM01204

No extract dataset defined

Reason:

You selected the EX option, but no extract dataset name was provided either by the you or by the EVNTARC Archive Dataset field in the EVENTLOG parameter group.

System Action:

The request to extract file transfer events is not processed.

User Action:

Specify an extract dataset name in the field provided.

RFM01205

P1 IS NOT A GDG BASE NAME

Reason:

The extract dataset entry contained a GDG relative number (for example, A.B(+1)). However, the dataset name was not a GDG base name.

System Action:

The request is rejected.

User Action:

Correct the GDG base name and retry.

RFMN0101

Invalid keyword value specified - Keyword(P1) Value(P2)

Reason:

An invalid keyword was passed to the service procedure.

System Action:

The request is rejected.

User Action:

Contact Technical Support.

RFMN0102**SSI is ACTIVE, Policy Mode= P1 Ruleset= P2****Reason:**

The SSI is active. The FTP policy mode is *P1* , and the name of the loaded ruleset is *P2* .

System Action:

FTP policy rules are enforced.

User Action:

None.

RFMN0103**SSI is ACTIVE, no ruleset loaded****Reason:**

The SSI is active, but no FTP policy ruleset is loaded. No FTP policies are in force.

System Action:

None.

User Action:

If you want to enforce FTP policies, select *L* on the FTP Policy Maintenance menu to load an FTP policy ruleset in the SSI.

RFMN0104**SSI is NOT ACTIVE****Reason:**

The SSI is not active, and FTP policy rules cannot be enforced.

System Action:

FTP policy rules are not enforced.

User Action:

To enforce any loaded policy rules, start the SOLVESSI task (for example, S SOLVESSI).

RFMN0105

SSI ERROR

Reason:

The SSI is in error, and FTP policy rules cannot be enforced.

System Action:

FTP policy rules are not enforced.

User Action:

It is likely that a wrong version of the SSI is active.

If you are using an old SSI, replace it with the new version.

If you are using the correct SSI, contact Technical Support.

RFMN0106

Request rejected, SSI is not active

Reason:

The request cannot be processed when the SSI is inactive.

System Action:

None.

User Action:

To perform this action, start the data space manager task first (for example, S SOLVESSI).

RFMN0107

Request rejected, no communication with SSI - FDBK= P1

Reason:

An error occurred when communicating with the SSI. The most likely cause is that you are using an old version of the manager.

P1 is the feedback code that identifies the error.

System Action:

The request is not processed.

User Action:

If you are using an old SSI, replace it with the new version.

If you are using the correct SSI, contact Technical Support.

RFMN0201**INVALID KEYWORD VALUE SPECIFIED - KEYWORD(P1) VALUE(P2)****Reason:**

An invalid keyword was passed to the service procedure.

System Action:

The request is rejected.

User Action:

Contact your local Support Center.

RFMN0202**NOT ALLOWED TO ACCESS SYSNAME(\$TEMPLAT) FROM THIS PANEL****Reason:**

Template definitions are special and cannot be accessed from this panel.

System Action:

The request is rejected.

User Action:

Access template definitions from the Template Definition Menu. To access that menu, enter the */RADMIN.T* path.

RFMX01**NetMaster for File Transfer Log Exit P1 now active, Id: P2****Reason:**

The NetMaster for File Transfer CONNECT:Mailbox log exit, NMCMLGEX, is active. *P1* shows the module name and version number. *P2* identifies the EPS ID from which CONNECT:Mailbox events can be received.

System Action:

None.

User Action:

None.

RFMX02

No active SOLVE SSI with "XEVNT" support found

Reason:

The NetMaster for File Transfer CONNECT:Mailbox log exit, NMCMLGEX, has requested the services of the event delivery facility, but the request was rejected because of one of the following:

- The required SSI is not active.
- The SSI is active but is running without the event delivery facility.

System Action:

Log records will be forwarded to the NetMaster for File Transfer region as soon as the SSI region (together with the event delivery facility) becomes active.

User Action:

Ensure that the SSI region is started with the event delivery facility (XEVNT=YES).

RFMX03

The SOLVE SSI REGION is not active

Reason:

The NetMaster for File Transfer CONNECT:Mailbox log exit, NMCMLGEX, has requested the services of the event delivery facility, but the request was rejected because the SSI region is not currently active.

System Action:

Log records will be forwarded to the NetMaster for File Transfer region as soon as the SSI region (together with the event delivery facility) becomes active.

User Action:

Ensure that the SSI region is started with the event delivery facility (XEVNT=YES).

RFMX04**The SOLVE SSI is in shutdown****Reason:**

The NetMaster for File Transfer CONNECT:Mailbox log exit, NMCMLGEX, requested the services of the event delivery facility, but the request was rejected because the SSI is shutting down.

System Action:

The log record is not forwarded to this region. This file transfer event is lost.

User Action:

Ensure that the SSI region is restarted.

RFMX05**Unable to send EVENT R0= P1 R15= P2****Reason:**

The NetMaster for File Transfer CONNECT:Mailbox log exit, NMCMLGEX, issued a \$NMXEVT request to forward a CONNECT:Mailbox event to the event receiver. The request was rejected, the values of the R0 and R15 return codes from the \$NMXEVT request are *P1* and *P2* respectively.

System Action:

The event record is not forwarded to this region.

User Action:

Note the value of R0 and R15, and contact Technical Support.

RFMX06**ABEND AT P1 IN P2 P3 LEVEL P4****Reason:**

This message is the first of a group of messages that are issued when an abend occurs in the NetMaster for File Transfer CONNECT:Mailbox log exit, NMCMLGEX. The complete set of messages is:

RFMX06 ABEND AT +nnnn IN xxxxxxxx xxxx LEVEL xxxxxx

RFMX07 RECEIVED R1=xxxxxxx RECORD ADDR=xxxxxxx RECORD TYPE=xx

RFMX08 PSW=xxxxxxx xxxxxxxx INT=xxxxxxx

RFMX09 R0-R3 xxxxxxxx xxxxxxxx xxxxxxxx xxxxxxxx

RFMX09 R4- R7 xxxxxxxx xxxxxxxx xxxxxxxx xxxxxxxx

RFMX09 R8-R11 xxxxxxxx xxxxxxxx xxxxxxxx xxxxxxxx

RFMX09 R12-R15 xxxxxxxx xxxxxxxx xxxxxxxx xxxxxxxx

Message RFXM06 identifies the abend offset, module, version, and level.

Message RFXM07 identifies the parameters passed by CONNECT:Mailbox:

RECEIVED R1 is the value in R1 when the exit was called.

RECORD ADDR is the value of the first full word addressed by R1. If R1 was invalid, this is shown as UNKNOWN.

RECORD TYPE is the CONNECT:Mailbox log record type. If either R1 or the record address was invalid, this is shown as ??.

Message RFXM08 identifies the failing PSW and program interruption information.

Messages RFXM09 identify the general purpose registers at the time of the abend.

System Action:

The log record is ignored, and processing continues.

User Action:

Contact Technical Support. Ensure that you have the following information available:

- The entire group of messages (RFMX06 to RFXM09)
- The version and maintenance level of CONNECT:Mailbox

RFMX07**RECEIVED R1= P1 RECORD ADDR= P2 RECORD TYPE= P3****Reason:**

This message is one of a group of messages that are issued when an abend occurs in the NetMaster for File Transfer CONNECT:Mailbox log exit, NMCMLGEX.

For more information, see the help for message RFXM06.

System Action:

See RFXM06.

User Action:

See RFXM06.

RFMX08**PSW= P1 INT= P2****Reason:**

This message is one of a group of messages that are issued when an abend occurs in the NetMaster for File Transfer CONNECT:Mailbox log exit, NMCMLGEX.

For more information, see the help for message RFXM06.

System Action:

See RFXM06.

User Action:

See RFXM06.

RFMX09

P1 P2 P3 P4 P5

Reason:

This message is the last of a group of messages that are issued when an abend occurs in the NetMaster for File Transfer CONNECT:Mailbox log exit, NMCMLGEX.

For more information, see the help for message RFMX06.

System Action:

See RFMX06.

User Action:

See RFMX06.

RFMX10

Resuming events forwarding

Reason:

The forwarding of CONNECT:Mailbox log events has resumed. This message indicates a recovery from a previous error condition (for example, the required SSI region was successfully restarted).

System Action:

CONNECT:Mailbox log events are now sent to the event receiver.

User Action:

None.

RFMX11**Unable to obtain storage - EVENT not sent****Reason:**

The NetMaster for File Transfer CONNECT:Mailbox log exit, NMCMLGEX, requested the services of the event delivery facility. The request was rejected because the event delivery facility could not obtain storage (R0=7 and R15=28 returned from \$NMXEVT).

System Action:

The CONNECT:Mailbox log event is not sent to the event receiver.

User Action:

Contact Technical Support.

RFMX12**P1 / P2 Received. Action= P3 Data= P4****Reason:**

This is a diagnostic trace message.

The NetMaster for File Transfer CONNECT:Mailbox log exit, NMCMLGEX, was called by CONNECT:Mailbox. The log record is identified as follows:

P1 is the log record EXIT type - usually 6.

P2 is the log record type (Key code) - usually A, B, or D.

P3 is NMCMLGEX action:

SES indicates that log record will be forwarded to this region *IGN* indicates that log record is ignored

P4 is the log record data (the first 55 characters only)

System Action:

None.

User Action:

None.

RFMX13

Received an unexpected Log record - Exit type: P1 , Key code: P2

Reason:

The NetMaster for File Transfer CONNECT:Mailbox log exit, NMCMLGEX, was called by CONNECT:Mailbox. The log record is not recognized as a valid CONNECT:Mailbox log exit record.

P1 is the log record EXIT type (the expected type is 6).

P2 is the log record type (Key code) (the expected values is A, B, or C).

System Action:

The event record is not forwarded to this region.

User Action:

Contact Technical Support. Ensure that you have available details of the version and maintenance level of CONNECT:Mailbox.

RFMX20

LOAD FAILED: MODULE NAME= P1 R0= P2 R15= P3

Reason:

The CONNECT:Mailbox log exit for NetMaster for File Transfer, NMCMLGEX, tried to load a load module, but the loading operation failed. The load module name is *P1* and the values of the R0 and R15 return codes from the LOAD or BLDL instruction are *P2* and *P3* respectively.

System Action:

The load module is not loaded and is excluded from further processing, the result of which depends on which module has failed to load:

Module NMCMLGEX No events will be forwarded to the region.

Other Modules Other modules relate to your own exits. The result of not executing these modules depends on your implementation.

User Action:

Use the R0 and R15 return codes to determine the cause of the error.

A common error is *R15=4* (accompanying an 806 system completion code), which indicates that the module could not be found in the load library list (that is, the list of libraries that are specified in the CONNECT:Mailbox STEPLIB). Ensure that the Management Services LPALOAD load library is either included in the CONNECT:Mailbox STEPLIB or included in the system link list.

Notes: - All libraries included in the STEPLIB must be APF authorized. - The CONNECT:Mailbox region must be recycled to restart the log exit.

RFMX21**STORAGE REQUEST FAILED: TYPE= P1 R15= P2****Reason:**

The CONNECT:Mailbox log exit for NetMaster for File Transfer, NMCMLGEX, was unable to obtain or free working storage. *P1* is the failing request and *P2* is the value of the R15 code.

System Action:

The request cannot be processed.

User Action:

Use the R15 code to determine the cause of the error.

RFQAPPC01**No process(es) found matching the search criteria.****Reason:**

No process(es) were found matching the search criteria requested.

System Action:

None.

User Action:

None.

RFQLIST01**PROCESS P1 CHANGED SUCCESSFULLY BY USER P2****Reason:**

The process definition identified by *P1* was changed successfully by the user *P2* .

System Action:

None.

User Action:

None. This message is informational only.

RFQLIST02

PROCESS P1 DELETED SUCCESSFULLY BY USER P2

Reason:

The process definition identified by *P1* was deleted successfully by the user *P2* .

System Action:

None.

User Action:

None. This message is informational only.

RFQLIST03

PROCESS P1 FLUSHED SUCCESSFULLY BY USER P2

Reason:

The process definition identified by *P1* was flushed successfully by the user *P2* .

System Action:

None.

User Action:

None. This message is informational only.

RFQLIST04

PROCESS P1 HELD SUCCESSFULLY BY USER P2

Reason:

The process definition identified by *P1* was held successfully by the user *P2* .

System Action:

None.

User Action:

None. This message is informational only.

RFQLIST05**PROCESS P1 RELEASED SUCCESSFULLY BY USER P2****Reason:**

The process definition identified by *P1* was released successfully by the user *P2* .

System Action:

None.

User Action:

None. This message is informational only.

RFQUEUE01**QUEUE TYPE(P1) STATUS(P2) QUEUE DEPTH THRESHOLD(P3)****Reason:**

The heartbeat procedure for a queue commences processing. The message identifies the queue type, *P1* , the status to be checked, *P2* , and the depth threshold, *P3* .

System Action:

None

User Action:

None

RFQUEUE02**QUEUE MONITOR HEARTBEAT INVOKED WITHOUT QUEUE P1****Reason:**

A queue monitor heartbeat procedure is invoked without one of the necessary parameters. *P1* identifies the missing parameter.

System Action:

Heartbeat processing is terminated.

User Action:

Update the definition of the affected resource, and specify the missing parameter.

RFQUEUE03

P1 P2 NO RESPONSE OR UNEXPECTED RESPONSE

Reason:

A heartbeat procedure for a CONNECT:Direct monitor resource issued a command to solicit information from the CONNECT:Direct region and received either no response or a response which was not expected. The response received is in the resource transient log.

P1 identifies the owning CONNECT:Direct region.

P2 is the name of the monitor resource.

System Action:

None

User Action:

Check the transient log for the resource for the response, if any, that was received. The response may indicate a degradation within CONNECT:Direct that is causing it not to respond, in which case remedial action might be necessary.

RFQUEUE04**P1 P2 QUEUE(P3) P4 CNT(P5) AT P6****Reason:**

A CONNECT:Direct queue monitor has checked for processes in the queue that have the displayed status (if status is applicable).

This message displays the number of such processes found when the number does not exceed the defined threshold.

P1 identifies the owning CONNECT:Direct region.

P2 is the name of the monitor resource.

P3 identifies the type of queue.

P4 identifies the process status. (Not available for C:D for OS/400)

P5 is the number of CONNECT:Direct processes in the *P3* queue that are in the *P4* state (if applicable).

P6 shows the time when the information was obtained.

System Action:

None

User Action:

None

RFQUEUE05

P1 P2 QUEUE(P3) P4 CNT(P5) AT P6

Reason:

A CONNECT:Direct queue monitor has checked for processes in the queue that have the displayed status (if status is applicable).

This message displays the number of such processes found when the number exceeds the defined threshold.

P1 identifies the owning CONNECT:Direct region.

P2 is the name of the monitor resource.

P3 identifies the type of queue.

P4 identifies the process status. (Not available for C:D for OS/400)

P5 is the number of CONNECT:Direct processes in the *P3* queue that are in the *P4* state (if applicable).

P6 shows the time when the information was obtained.

System Action:

None

User Action:

None

RFQUEUE06

QUEUE TYPE P1 IS NOT VALID FOR P2

Reason:

QUEUE TYPE *P1* is not supported by CONNECT:Direct for *P1* .

System Action:

Request is rejected.

User Action:

Delete the CDMON resource as it serves no purpose.

RFREMND01**CHECKING AVAILABILITY OF P1****Reason:**

The heartbeat procedure for a CONNECT:Direct remote node monitor has commenced processing. The message identifies the remote node whose availability is to be checked (*P1*).

System Action:

None

User Action:

None

RFREMND02**REMOTE NODE MONITOR HEARTBEAT INVOKED WITHOUT REMOTE NODE NAME****Reason:**

The heartbeat procedure for a remote node monitor has been invoked without the required remote node name.

System Action:

Heartbeat processing is terminated.

User Action:

Update the definition of the affected resource. On the Monitor Details panel of the resource monitor definition, complete the Remote Node Name field.

RFREMND03

P1 P2 REMOTE NODE P3 AVAILABLE AT P4

Reason:

The remote node monitor has determined that the monitored remote node is available:

P1 identifies the owning file transfer resource.

P2 is the name of the monitor resource.

P3 is the name of the remote node.

P4 is the time.

System Action:

None

User Action:

None

RFREMND04

P1 P2 REMOTE NODE P3 NOT AVAILABLE AT P4

Reason:

The remote node monitor has determined that the monitored remote node is unavailable:

P1 identifies the owning file transfer resource.

P2 is the name of the monitor resource.

P3 is the name of the remote node.

P4 is the time.

System Action:

None

User Action:

None

RFREMND05***P1 P2 Remote node P3 P4 at P5*****Reason:**

The monitored remote node is unknown to the remote node monitor because of one of the following reasons:

- For CONNECT:Direct, the monitored remote node is not defined in the CONNECT:Direct network map.
- For FTP, the remote host name cannot be resolved.

P1 identifies the owning file transfer resource.

P2 is the name of the monitor resource.

P3 is the name of the remote node.

P4 is the cause of the error.

P5 is the time.

System Action:

None

User Action:

For a CONNECT:Direct remote node, check the CONNECT:Direct network map.

For an FTP remote server node, check the Domain Name System (DNS) definition.

RFREMND06***P1 P2 REMOTE NODE CHECK FOR P3 TIMED OUT AT P4*****Reason:**

A request to check the availability of the monitored remote node has timed out:

P1 identifies the owning file transfer resource.

P2 is the name of the monitor resource.

P3 is the name of the remote node.

System Action:

None

User Action:

None

RFREMND07

TCP/IP SERVICES ARE NOT ACTIVE. STATUS IS P1

Reason:

The TCP/IP interface is currently P1. The monitoring of this resource requires the status of the TCP/IP interface to be ACTIVE.

System Action:

Heartbeat processing does not take place.

User Action:

Display the current TCP/IP services status by issuing a *SHOW TCPIP* command. Message *N3AF05* shows the current TCP/IP INTERFACE status. If the TCP/IP INTERFACE status is *INACTIVE* - Issue a TCPIP START command. Wait for message N3B201 and then enter a CHK command against this resource.

If the TCP/IP INTERFACE status is *QUIESCING* or *STOPPING* - wait for the STATUS to change to INACTIVE and proceed as above.

If the TCP/IP INTERFACE status is *STARTING* - Wait for message N3B201 and then enter a CHK command against this resource.

RFREMND08

MONITORING OF REMOTE FTP SERVER P1 FAILED FDBK: P2 SOCKET ERROR: P3

Reason:

The monitoring of the remote FTP server P1 has failed due to a socket error, P3 . The feedback code is P2 .

System Action:

Heartbeat processing does not take place.

User Action:

See the NCL Reference for an explanation of the feedback and error codes and suggested user action.

RFREMND09**REMOTE NODE MONITOR HEARTBEAT INVOKED WITHOUT TCP/IP HOST NAME/ADDRESS****Reason:**

The heartbeat procedure for a remote node monitor has been invoked without the required remote node TCP/IP host name or address.

System Action:

Heartbeat processing is terminated.

User Action:

Update the definition of the affected resource. On the Monitor Details panel of the monitor definition, complete the TCP/IP Host Name/Addr field.

RFREMND10**REMOTE NODE MONITOR HEARTBEAT INVOKED WITHOUT PORT NUMBER****Reason:**

The heartbeat procedure for a remote node monitor has been invoked without the required remote node port number.

System Action:

Heartbeat processing is terminated.

User Action:

Update the definition of the affected resource. On the Monitor Details panel of the monitor definition, complete the TCP/IP Port Number field.

RFREMND11

P1

Reason:

P1 is a text line returned as the result of an FTPMON remote node D (display) command. It describes the operation and remote node details. This message is usually followed by one or more RFREMNDxx message(s) that indicate the outcome of the command.

System Action:

None

User Action:

None

RFREMND12

COMMAND INVALID FOR REMOTE RESOURCES

Reason:

You have issued a command against a resource from a remote system. The command is only valid against local resources.

System Action:

The command is rejected.

User Action:

Log on to the resource's local system and issue the command from there.

RFREMND13

COMMAND INVALID FOR CLASS ~P1

Reason:

You have issued a command against a resource of class *P1*. The command is not valid for this resource class.

System Action:

The command is rejected.

User Action:

None.

RFREMND14***P1 P2 IPv6 socket support not enabled. Cannot check P3 availability*****Reason:**

The remote FTP Server address *P3* specifies an IPv6 address. The monitoring of the remote FTP server failed because the current sockets API supports IPv4 addresses only.

P1 identifies the owning file transfer resource.

P2 is the name of the monitor resource.

System Action:

Heartbeat processing does not occur.

User Action:

Check the SOCKETS parameter group (/PARMS) and ensure that the TCP/IP Software Type specifies IBMV6.

RFSCHED00**ID: P1 P= P2 - P3****Reason:**

The message displays a file transfer schedule trace record.

P1 is the trace ID, *P2* is the procedure ID and *P3* is the trace text.

System Action:

None

User Action:

Contact your local support representative.

RFSCHED01

PRE-PROCESSING PERIOD STARTED

Reason:

A File Transfer Schedule has begun its pre-processing period.

System Action:

Monitoring for required file transfers begins. The actual state of the File Transfer Schedule resource is set to INACTIVE.

User Action:

None.

RFSCHED02

PRO-ACTIVE MONITORING STARTED

Reason:

A File Transfer Schedule's pre-processing period has terminated and the processing period begun.

System Action:

Monitoring for required file transfers continues. The actual state of the File Transfer Schedule resource is set to STARTING.

User Action:

None.

RFSCHED03

LONGEST TRANSFER LIMIT

Reason:

A File Transfer Schedule has reached the point where the processing time left is equal to the Longest Transfer Duration.

System Action:

If not all required transfers have begun by this point the Schedule resource's actual state is set to DEGRADED.

User Action:

None.

RFSCHED04**POST-PROCESSING PERIOD STARTED****Reason:**

A File Transfer Schedule's processing period has ended and the post-processing period begun.

System Action:

If not all required transfers have ended by this point the Schedule resource's actual state is set to FAILED otherwise it will be set to ACTIVE.

User Action:

None.

RFSCHED05**POST-PROCESSING PERIOD ENDED****Reason:**

A File Transfer Schedule's post-processing period has ended.

System Action:

If not all required transfers have ended by this point the Schedule resource's actual state is set to FAILED otherwise it will be set to INACTIVE.

User Action:

None.

RFSCHED06**QUERY STATUS****Reason:**

This is the message issued by the display command to cause the transient log records for an active monitoring period to be displayed.

System Action:

Display active schedule's transient log records.

User Action:

None.

RFSCHED07

SCHEDULE IS NOT CURRENTLY ACTIVE

Reason:

A display command was issued against a File Transfer Schedule resource which is not currently monitoring for file transfers.

System Action:

The display command is rejected.

User Action:

None.

RFSCHED08

ACTIVATE IS NOT ALLOWED OUTSIDE SCHEDULED TIMES

Reason:

An activate command was issued against a File Transfer Schedule resource which was not scheduled to monitor file transfers.

System Action:

The activate command is rejected.

User Action:

None.

RFSCHED09

ALL REQUIRED TRANSFERS HAVE NOT YET BEGUN

Reason:

The file transfer schedule specifies a period (Longest Transfer) within which the monitored transfer is expected to complete. The schedule is now within that period from the end of processing, but all required files have not yet been detected. The indication is that the transfer might not complete in time.

System Action:

The actual state of the File Transfer Schedule resource is set to DEGRADED.

User Action:

None

RFSCHED10**WRITE TO FTSCHD FILE FAILED AS FILE IS FULL****Reason:**

The file FTSCHD, which stores Schedule Details so that they are still available after a system outage, is full.

System Action:

Processing continues, however schedule related events will not be stored in the FTSCHD file.

User Action:

Either clear out the records in the file using the ICS Parameter Group FTSCHD (A.C.P), or unallocate the file FTSCHD, and then allocate the FTSCHD file with more space.

RFSCHED11**READ OF FTSCHD FILE FAILED RC - P1 VSAM REASON CODE - P2****Reason:**

There was an error reading the FTSCHD file. *P1* is the file return code and *P2* is the VSAM reason code. The file FTSCHD stores schedule events so that they are still available after a system outage.

System Action:

Processing continues, however schedule related events may not be recovered from the FTSCHD file.

User Action:

Contact your system administrator.

RFSCHED12

DELETE OF FTSCHD RECORD FAILED RC - P1 VSAM REASON CODE - P2

Reason:

There was an error deleting a record from the FTSCHD file. P1 is the file return code and P2 is the VSAM reason code. The file FTSCHD stores schedule events so that they are still available after a system outage.

System Action:

Processing continues, however schedule related events may not be deleted from the FTSCHD file.

User Action:

Contact your system administrator.

RFSCHED13

WRITE TO FTSCHD FILE FAILED RC - P1 VSAM REASON CODE - P2

Reason:

There was an error writing to the FTSCHD file. P1 is the file return code and P2 is the VSAM reason code. The file FTSCHD stores schedule events so that they are still available after a system outage.

System Action:

Processing continues, however schedule related events may not be written to the FTSCHD file.

User Action:

Contact your system administrator.

RFSCHED14**SCHEDULE EVENTS NOT RESTORED AS FILTERS HAVE BEEN CHANGED****Reason:**

The schedule related events saved on the FTSCHD file have not been restored as the filters have been changed since the schedule was started.

System Action:

Processing continues, however schedule related events have not been recovered.

User Action:

No action required.

RFSCHED15**READ OF FTSCHD FILE FAILED RC - P1 SYMSG P2****Reason:**

There was an error reading the FTSCHD file. *P1* is the file return code and *P2* is the Sysmsg returned. The file FTSCHD stores schedule events so that they are still available after a system outage.

System Action:

Processing continues, however schedule related events may not be recovered from the FTSCHD file.

User Action:

Contact your system administrator.

RFSCHE16

Deletion of FTSCHD record failed RC - P1

Reason:

There was an error deleting a record from the FTSCHD file. *P1* is the associated error message. The file FTSCHD stores schedule events so that they are still available after a system outage.

System Action:

Processing continues, however, schedule related events may not be deleted from the FTSCHD file.

User Action:

Contact your System Administrator.

RFSCHE17

System image P1 is being loaded - FTSCHD file has been reset

Reason:

A System Image *P1* is being loaded but the FTSCHD file contains records that are not related to this System Image. The file FTSCHD stores schedule events so that they are still available after a system outage.

System Action:

All records are deleted from the FTSCHD file.

User Action:

None.

RFSCHE18

UNABLE TO DETERMINE OBJECT ID PARAMETER

Reason:

Object ID not found and can not be created because there is not enough information passed to the procedure.

System Action:

The request is rejected.

User Action:

Contact System Administrator.

RFSCHED19

Schedule not allowed to extend because it is not in PROC/POST stage.

Reason:

There is no active schedule (in PROC OR POST stage) found for the related FTSCHD resource.

System Action:

The request is rejected.

User Action:

Wait until the Schedule is in *PROC* or *POST* stage before extending.

RFSCHED20

Dialogue between P1 and the process \$RFSCHED has been timed- out

Reason:

The dialogue with \$RFSCHED has been timed-out.

System Action:

The request is rejected.

User Action:

Contact System Administrator.

RFSCHED21

ERROR ENCOUNTERED DURING THE REPLY FROM PROCESS \$RFSCHED

Reason:

Unknown Reply from process \$RFSCHED.

System Action:

The request is rejected.

User Action:

Contact System Administrator.

RFSCHED22

INVALID KEYWORD VALUE SPECIFIED - KEYWORD(P1) VALUE(P2)

Reason:

An invalid keyword was passed to the service procedure.

System Action:

The request is rejected.

User Action:

Correct the calling procedure to the service procedure and rerun exec.

RFSCHED23

REQUEST TO EXTEND(P1) IS REJECTED, USER(P2) HAS THE LOCK

Reason:

Another procedure is running. You cannot extend the monitoring period at this time.

System Action:

The request is rejected.

User Action:

Try later after other procedure finishes.

RFSCHED24

BROWSING OF SCHEDULE TIME OF(P1) COMPLETED

Reason:

A browsing of schedule time is completed.

System Action:

The request is completed.

User Action:

At this time you can only browse the schedule. The line command can be rerun later.

RFSCHED25**ATTEMPT TO EXTEND MONITORING AFTER PROCESSING TIME****Reason:**

This is a warning message.

System Action:

The request needs confirmation before proceeding.

User Action:

Press PF6 to confirm or PF12 to cancel without any change.

RFSCHED26**SCHEDULE NOT ELIGIBLE TO BE EXTENDED****Reason:**

This schedule is not eligible to be extended.

System Action:

The request is rejected.

User Action:

Contact System Administrator.

RFSCHED27**INVALID COMMAND****Reason:**

The command entered on the command line was not recognized by the procedure.

System Action:

The command is rejected.

User Action:

Correct the command and retry.

RFSCHE29

TIMERS UPDATED SUCCESSFULLY

Reason:

The request to extend the timers for schedule monitoring has completed successfully.

System Action:

The request is completed.

User Action:

No action is required.

RFSCHE30

TIMERS UPDATE FAILED - LOCK IS HELD BY NCL(P1)

Reason:

An attempt to extend the timers of an active schedule failed due to another procedure holding the system lock.

System Action:

The request is rejected.

User Action:

Try later after other procedure finishes.

RFSCHE31

SUCCESSFUL EXTENSION OF MONITORING PERIOD FOR FTSCHD(P1) TO PROCESSING TIME(P2) POST-PROCESSING TIME(P3) REQUESTED BY USERID(P4)

Reason:

The request to extend timers for schedule monitoring has completed successfully.

System Action:

The request is completed.

User Action:

No action is required.

RFSCHED33**THE EXTENSION PERIOD OF SCHEDULE IS NOT ACCEPTABLE****Reason:**

The attempt to extend the schedule monitoring period was not acceptable.

System Action:

The request is rejected.

User Action:

Try again using another monitoring period.

RFSCHED34**NEW END PROCESSING TIME IS OVERLAPPED WITH NEXT START TIME(P1)****Reason:**

There is a time overlap problem in the schedule extension.

System Action:

The request is rejected.

User Action:

Try the extension with another time.

RFSCHED35**NEW END PROCESSING TIME REFERENCES AN ELAPSED TIME****Reason:**

The time for end processing has elapsed.

System Action:

The request is rejected.

User Action:

Try the extension with another time.

RFSCHE36

P1 OF SYSTEM FILE FTSCHD FAILED RC - P2, VSAM REASON CODE - P3

Reason:

An attempt to access the Schedule Checkpoint dataset failed. The above Retcode and VSAM error code were generated.

System Action:

The request is rejected.

User Action:

Interpret the error code using the appropriate IDCAMS manual.

RFSCHE37

P1 OF SYSTEM TABLE \$RF\$SCHEDULE FAILED FDBK CODE - P2

Reason:

An attempt to access the System Table failed. The above Feedback Code was generated.

System Action:

The request is rejected.

User Action:

Interpret the feedback code using the NCL Reference.

RFSCHE38

FAILURE IN \$RMDBMS RC - P1 SYMSG - P2

Reason:

The execution of procedure \$RMDBMS failed. The above Retcode was generated.

System Action:

The request is rejected.

User Action:

Interpret the error code using the appropriate IDCAMS manual.

RFSCHED39**ALL TRANSFERS STARTED EXIT (P1) TRIGGERED FOR P2****Reason:**

All File Transfers Started Exit have been triggered for this resource.

System Action:

The system has started the user defined procedure for this exit.

User Action:

None.

RFSCHED40**TRANSFER FAILURE EXIT (P1) TRIGGERED FOR P2****Reason:**

File Transfer Failed Exit has been triggered for this resource.

System Action:

The system has started the user defined procedure for this exit.

User Action:

None.

RFSCHED41**ALL TRANSFER COMPLETED EXIT (P1) TRIGGERED FOR P2****Reason:**

All File Transfer Completed Exits have been triggered for this resource.

System Action:

The system has started the user defined procedure for this exit.

User Action:

None.

RFSCHE42

SCHEDULE COMPLETED BY EXIT FOR P1

Reason:

The schedule has been completed by the exit for this resource.

System Action:

The schedule has completed by Exit for this resource. The monitoring is stopped.

User Action:

None.

RFSCHE43

Schedule force off for P1

Reason:

Schedule was forced off for this resource.

System Action:

The schedule was forced off for this resource. The monitoring is stopped.

User Action:

None.

RFSCHE44

Schedule deleted for P1

Reason:

Schedule deleted for this resource.

System Action:

All schedule(s) have been deleted for this resource. The monitoring is stopped.

User Action:

None.

RFSCHED45**Schedule P1 transfer counts reset****Reason:**

Schedule's *P1* transfer counts have been reset.

System Action:

The schedule's transfer counts have been reset. The counting of transfer is resumed.

User Action:

None.

RFSCHED46**OFF command is not allowed for inactive schedule****Reason:**

Only active schedule can be forced off.

System Action:

The request is rejected.

User Action:

None.

RFSCHED47**Error in the filter definition control file (CTL) *P1*, reason: *P2*****Reason:**

The file transfer schedule filter definition control file *P1* cannot be evaluated. The error is described by *P2*.

System Action:

The file transfer schedule terminates.

User Action:

Correct the filter entry in the filter definition control file.

RFSDMON01

SSI policy monitoring active

Reason:

The Managed FTP SSI policy monitor has established that the SSI is active and ready for Managed FTP actions and events.

System Action:

Monitoring of the SSI policy monitor continues.

User Action:

None.

RFSDMON02

SSI policy monitoring unavailable, retry within P1 seconds

Reason:

The Managed FTP SSI policy monitor established that the SSI is either inactive, or is not ready for Managed FTP actions and events. The status of the Managed FTP SSI policy monitor will be rechecked within *P1* seconds.

System Action:

The status of the Managed FTP SSI policy monitor is monitored.

User Action:

This message is preceded by RMEV25** messages. Refer to the explanation for those messages.

RFSDMON06

Another copy of \$RFSDMON is currently running - NCL ID: P1

Reason:

A request to start a copy of the \$RFSDMON procedure was ignored because another copy is currently running. This message may be issued if the FTPCNTL Customizer parameter group is actioned more than once.

System Action:

The request to start a new instance of the procedure is ignored.

User Action:

None.

RFSDMON88**ID= P1 - P2****Reason:**

The message displays a Managed FTP SSI policy monitor trace record. *P1* is the trace ID, and *P2* is the trace text.

System Action:

None.

User Action:

None.

RFSEFT01**P1 DATE MUST BE P2 THAN P3 DATE****Reason:**

You have specified invalid dates.

System Action:

Validation of the search criteria fails.

User Action:

Correct the dates in the indicated fields.

RFSEFT02**P1 DATE AND TIME MUST BE P2 THAN P3 DATE AND TIME****Reason:**

You have specified an invalid date-time combination.

System Action:

Validation of the search criteria fails.

User Action:

Correct the date and time in the indicated fields.

RFSEFT04

VFS P1 FAILED FILERC: P2 VSAM FDBK: P3 VFS KEY: P4

Reason:

The VFS operation, *P1* , failed with file return code *P2* and VSAM feedback code *P3* for the VFS key, *P4* .

System Action:

None.

User Action:

Contact your system administrator.

RFSEFT05

VFS OPEN FAILED - USER IS NOT AUTHORIZED

Reason:

An attempt to open the VFS database failed as the user does not have the authority to access the database.

System Action:

None.

User Action:

Contact your Security Administrator for assistance.

RFSEFT06

CANNOT UPDATE VFS - USER IS NOT AUTHORIZED

Reason:

An attempt to update the VFS database failed as the user does not have the update authority.

System Action:

None.

User Action:

Contact your Security Administrator for assistance.

RFSEFT07**P1 VALUE MUST BE P2 THAN P3****Reason:**

The *P1* field has an invalid value. The OVER Byte field must be LESS than the UNDER Byte. And the UNDER Byte field must be GREATER than zero.

System Action:

Validation terminates.

User Action:

Correct the Over or Under Byte value and retry.

RFSEFT08**SELECTION OF FIELDS CANCELLED BY USER****Reason:**

Selection of fields from the list was cancelled.

System Action:

None

User Action:

None

RFSEFT09**NO FIELDS SELECTED FOR EXTRACT****Reason:**

No fields were selected from the Fields Selection List. The target file cannot be created.

System Action:

The request is terminated.

User Action:

Redo your request and select one or more fields.

RFSEFT10

GET Error on variable P1 for Key P2, Error Code P3

Reason:

An error occurred during a GET function on the variable *P1* for key *P2* . The received error code is *P3*.

System Action:

The request is terminated and the procedure is ended.

User Action:

Contact your system administrator.

RFSEFT11

FILE TRANSFER EVENT EXTRACT CANCELLED BY USER

Reason:

A user cancelled the request to extract file transfer events from the EVNTDB database.

System Action:

The request to extract file transfer events is not processed.

User Action:

None.

RFSEFT12

EXTRACT PROCESS SUBMITTED AS BACKGROUND TASK - CHECK LOG FOR PROGRESS

Reason:

Your request to extract file transfer events starts the EVNTDB extract process as a background task that runs with your authority. Progress messages with the prefix RFLO82* are written to the activity log.

System Action:

The process is submitted to your background region.

User Action:

Check the activity log for progress. To access the log, enter the *H.L* path.

RFSEFT13**NO NDB RECORDS FOUND MATCHING SUPPLIED EXTRACT CRITERIA.****Reason:**

The NDB Search did not find any record(s) that match(es) the Extract Criteria.

System Action:

None.

User Action:

Change your criteria and retry.

RFSEFT14**SYNTAX ERROR IN NDB SCAN STATEMENT****Reason:**

A syntax error was detected during execution of an NDB SCAN statement.

System Action:

None.

User Action:

Review the scan and sort expression and retry the command.

RFSEFT15**INPUT FIELDS(P1) OMITTED****Reason:**

The *P1* fields require valid value.

System Action:

The validation fails.

User Action:

Specify value in the *P1* fields.

RFSESC01

P1 DATE MUST BE P2 THAN P3 DATE

Reason:

You have specified invalid dates.

System Action:

Validation of the search criteria fails.

User Action:

Correct the dates in the indicated fields.

RFSESC02

P1 DATE AND TIME MUST BE P2 THAN P3 DATE AND TIME

Reason:

You have specified an invalid date-time combination.

System Action:

Validation of the search criteria fails.

User Action:

Correct the date and time in the indicated fields.

RFSESC03

NO RECORDS FOUND

Reason:

No records are defined in the database for the requested schedule name.

System Action:

None.

User Action:

Display the list of valid schedule names by placing a question mark (?) in this field.

RFSESC04**VFS P1 FAILED FILERC: P2 VSAM FDBK: P3 VFS KEY: P4****Reason:**

The VFS operation, *P1* , failed with file return code *P2* and VSAM feedback code *P3* for the VFS key, *P4* .

System Action:

None.

User Action:

Contact your system administrator.

RFSESC05**VFS OPEN FAILED - USER IS NOT AUTHORIZED****Reason:**

An attempt to open the VFS database failed because the user does not have authority to access the database.

System Action:

None.

User Action:

Contact your security administrator for assistance.

RFSESC06**CANNOT UPDATE VFS - USER IS NOT AUTHORIZED****Reason:**

An attempt to update the VFS database failed because the user does not have update authority.

System Action:

None.

User Action:

Contact your security administrator for assistance.

RFSESC07

REQUIRED FIELD(S) OMITTED

Reason:

The fields SYSTEM NAME and VERSION are required if a SCHEDULE NAME is provided.

System Action:

The field in error is highlighted.

User Action:

Enter a value.

RFSESC08

VALUE NOT SELECTED FROM LIST

Reason:

You did not select a value for the highlighted field.

System Action:

None

User Action:

None

RFSESC09

INPUT FIELDS(P1) OMITTED

Reason:

The *P1* fields require valid value.

System Action:

The validation fails.

User Action:

Specify value in the *P1* fields.

RFSESS06**UNABLE TO MONITOR SNA SESSIONS ON CD FOR P1****Reason:**

Monitoring of SNA sessions is not available on CONNECT:Direct for *P1* .

System Action:

Request is rejected.

User Action:

Delete the CDMON resource as it serves no purpose.

RFSF0101**INVALID KEYWORD VALUE SPECIFIED - KEYWORD(P1) VALUE(P2)****Reason:**

An invalid keyword was passed to the service procedure.

System Action:

The request is rejected.

User Action:

Correct the calling procedure to the service procedure and rerun exec.

RFSF0102**NO RECORD FOUND****Reason:**

No records exist.

System Action:

None

User Action:

None

RFSF0103

ALREADY IN P1 MODE

Reason:

The search mode has already been activated.

System Action:

None.

User Action:

None.

RFSF0104

INVALID SELECTION VALUE SPECIFIED - VALUE(P1)

Reason:

An invalid selection was passed to the service procedure.

System Action:

The request is rejected.

User Action:

Correct the calling procedure to the service procedure and rerun exec.

RFSF0105

VARIABLE P1 ERROR, FDBK= P2 ID= P3

Reason:

A request to present an Schedule List failed because an error was encountered allocating a variable table. The request was *P1* , the identifier of the variable table was *P3* , and the feedback code was *P2* .

System Action:

The request is rejected.

User Action:

Interpret the feedback code using the NCL Reference.

RFSF0106**PRINT REQUEST P1 SENT TO PRINTER P2****Reason:**

This is an informational message indicating that a print request has successfully been sent to the requested printer.

System Action:

None

User Action:

None

RFSF0201**INVALID KEYWORD VALUE SPECIFIED - KEYWORD(P1) VALUE(P2)****Reason:**

An invalid keyword was passed to the service procedure.

System Action:

The request is rejected.

User Action:

Correct the calling procedure to the service procedure and rerun exec.

RFSF0202**DATABASE P1 FAILED, RC(P2)****Reason:**

Request action on the database failed with non zero return code.

System Action:

The request is rejected.

User Action:

Contact System Administrator.

RFSF0203

P1 WAS PREVIOUSLY SELECTED

Reason:

An attempt was made to select the element described by *P1* which had previously been selected.

System Action:

Request rejected.

User Action:

None.

RFSF0204

VARIABLE GET FAILED, FDBK= P1, KEY= P2

Reason:

A VARIABLE GET failed during System Image Selection.

System Action:

System image selection terminates.

User Action:

Determine the reason for the VARIABLE error.

RFSF0205

P1 WAS NOT PREVIOUSLY SELECTED

Reason:

An attempt was made to unselect the element described by *P1* which had not previously been selected.

System Action:

Request rejected.

User Action:

None.

RFSF0206**VARIABLE ADD FAILED, FDBK= P1, KEY= P2****Reason:**

A VARIABLE ADD failed during System Image Selection.

System Action:

System image selection terminates.

User Action:

Determine the reason for the VARIABLE error.

RFSF0207**DATABASE P1 FAILED, RC(P2)****Reason:**

Request action on the database failed with non zero return code.

System Action:

The request is rejected.

User Action:

Contact System Administrator.

RFSF0208**NO MATCHING SYSTEM IMAGE(P1) STARTS WITH " P2"****Reason:**

No system images with names or versions that start with *P2* were found.
P1 is either SYSNAME or VERSION.

System Action:

None.

User Action:

If required, create the system image. You can use any of the following methods to create a system image:

- Use the AutoAssist Express Setup Facility (/RADMIN.AD.E).
- Use the System Images option on the Resource Administration menu (/RADMIN).
- Use the AutoAssist Auto Populate Facility (/RADMIN).

RFSF0209

P1 SYSTEM IMAGES FOUND

Reason:

No system images of the type *P1* were found.

System Action:

None.

User Action:

If required, create the system image. You can use any of the following methods to create a system image:

- Use the AutoAssist Express Setup Facility (/RADMIN.AD.E).
- Use the System Images option on the Resource Administration menu (/RADMIN).
- Use the AutoAssist Auto Populate Facility (/RADMIN).

RFSF0210

UNKNOWN COMMAND ENTERED

Reason:

An unknown command was passed to the criteria procedure.

System Action:

The request is rejected.

User Action:

Correct the command to the criteria procedure and rerun.

RFSF0211

NO SYSTEM IMAGE SELECTED

Reason:

No system image has been selected for schedule forecasting.

System Action:

The request has been abandoned.

User Action:

Select at least one system image and rerun.

RFSF0212**Wrong ACTION key entered at this time****Reason:**

You pressed the *ACTION* key before entering values for all required fields: *FROMDATE/TODATE/FROMTIME/TOTIME* and *System Image* .

System Action:

The request has been abandoned.

User Action:

Enter values in the *FROMDATE/TODATE/FROMTIME/TOTIME/System Image* fields and press the *ACTION* key again.

RFSF0213**P1 AND P2 DATE CANNOT BE GREATER THAN P3 DAYS****Reason:**

You have specified an invalid date-time combination.

System Action:

Validation of the search criteria fails.

User Action:

Correct the date and time in the indicated fields.

RFSF0214**P1 DATE AND TIME MUST BE P2 THAN P3 DATE AND TIME****Reason:**

You have specified an invalid date-time combination.

System Action:

Validation of the search criteria fails.

User Action:

Correct the date and time in the indicated fields.

RFSF0215

INPUT FIELDS(P1) OMITTED

Reason:

The *P1* fields require valid value.

System Action:

The validation fails.

User Action:

Specify value in the *P1* fields.

RFSF0216

NO MATCHED SCHEDULE FOUND

Reason:

A matched schedule was not found.

System Action:

The search is completed without a matched schedule.

User Action:

Try again with different criteria.

RFSF0217

Field(P1) cannot be greater than or equal to field(P2)

Reason:

The *P2* field should be less than *p1* field.

System Action:

The validation fails.

User Action:

Specify new values in the *P1* and *P2* fields.

RFSS01L01**No SNA session activity found matching the search criteria****Reason:**

There is no SNA session activity on the Remote Names defined in the monitor definition.

System Action:

None.

User Action:

None.

RFSSMON02**Remote P1 Mailbox P2 Batch Number P3 is in a stalled status****Reason:**

The transfer has stopped updating its record count and is in a stalled status.

System Action:

None.

User Action:

Investigate the reason for the stalled SNA session.

RFSSMON03**STALLED SNA SESSION CHECK TIMED OUT AT P1****Reason:**

The Stalled SNA Session Monitor has issued a heartbeat at the time indicated by *P1* to the CONNECT:Mailbox STC and has not received a response.

System Action:

None.

User Action:

None.

RFSSMON04

NO STALLED SNA SESSIONS. ALL OK AT P1

Reason:

The Stalled SNA Session Monitor has found no SNA sessions in a stalled status. *P1* is the time the monitor performed the heartbeat.

System Action:

None.

User Action:

None.

RFSSMON05

STALLED SNA SESSIONS CNT(P1) AT P2

Reason:

The Stalled SNA Session Monitor has found that there are *P1* sessions in a stalled state. This means that the record count has stopped updating. *P2* is the time the monitor performed the heartbeat.

System Action:

The Monitor is set to a degraded state under ResourceView and an alert is sent to the Alert Monitor. If the field 'Stalled Time To Stop' is defined in the monitor definition then a stop command will be issued against the session.

User Action:

Issue the display command to check the list of stalled SNA sessions.

RFTPEV01

There was no matching FTP transfer start for TRANSFER-ID: P1

Reason:

The region received an FTP transfer termination event that does not have a corresponding START event.

System Action:

Processing continues.

User Action:

None.

RFTPEV02**There was no matching FTP transfer start for TRANSFER-ID: P1****Reason:**

The region received an FTP transfer in progress event that does not have a corresponding START event.

System Action:

A START event is raised.

User Action:

None.

RFTPEV03**TRANSFER-ID: P1 STARTED - UserID: P2 P3 file: P4 From: P5 To: P6****Reason:**

The region received an FTP event indicating that an FTP transfer has started.

P1 is the allocated transfer ID.

P2 is the User ID that initiated the FTP transfer.

P3 qualifies the local file as *SOURCE* or *TARGET*.

P4 is the local file name.

P5 is the SOURCE address.

P6 is the TARGET address.

System Action:

A file transfer START event is raised.

User Action:

None.

RFTPEV04

TRANSFER-ID: P1 COMPLETED - P2 file: P3 (P4 Bytes) From: P5 To: P6

Reason:

The region received an FTP event indicating that an FTP transfer has successfully completed.

P1 is the allocated transfer ID.

P2 qualifies the local file as *SOURCE* or *TARGET* .

P3 is the local file name.

P4 is the number of bytes transmitted.

P5 is the SOURCE address.

P6 is the TARGET address.

System Action:

A file transfer END event is raised.

User Action:

None.

RFTPEV05

TRANSFER-ID: P1 FAILED P2 file: P3 From: P4 To: P5

Reason:

The region received an FTP event indicating that an FTP transfer has failed.
The message is followed by the RFTOEV06 message, which provides additional information about the failure.

P1 is the allocated transfer ID.

P2 qualifies the local file as *SOURCE* or *TARGET* .

P3 is the local file name.

P4 is the SOURCE address.

P5 is the TARGET address.

System Action:

A file transfer FAILURE event is raised.

User Action:

None.

RFTPEV06**TRANSFER-ID: P1 Failure Code: P2 P3 P4****Reason:**

The region received an FTP event indicating that an FTP transfer has failed. The message follows the RFFTPV05 message.

P1 is the allocated transfer ID.

P2 is the FTP server error code.

P3 is the text "Reason:" if error text is available.

P4 is the associated error text (if available).

System Action:

None.

User Action:

None.

RFTPEV11**P1 event handler procedure has failed - Reason: P2****Reason:**

The event handler procedure for the *P1* product failed because of an internal error. *P2* is the reason for the failure.

System Action:

The procedure terminates.

User Action:

Contact Technical Support.

RFTPEV12

P1 event handler procedure has encountered a recoverable error

Reason:

The event handler procedure for the *P1* product encountered a recoverable error. Check previous message(s) for the cause of the error.

System Action:

Event processing continues. However, some events might have been lost.

User Action:

Contact Technical Support, making available the following diagnostic information:

- Full text of this message - Relevant messages in the activity log

RFTPEVI3

MDO ASSIGN failed: RC= P1 FDBK= P2 MAP= P3 Component= P4 Tag= P5 Type= P 6 - File Transfer Product is P7

Reason:

The event handler procedure for the *P7* product failed because of an MDO error. The failure is identified by the following:

- Statement type, ASSIGN
- MDO return code, *P1* =&ZMDORC
- MDO feedback code, *P2* =&ZDMOFDBK
- Map name, *P3* =&ZMDOMAP
- Full map component name, *P4* =&ZMDONAME
- Map component tag value, *P5* =&ZMDOTAG
- ASN.1 type of the component, *P6* =&ZMDOTYPE

System Action:

The message is written to the activity log and is followed by a series of messages (DD9003, DD9004, DD9006, and DD9007), which display the event in dump format. The event is ignored.

User Action:

Contact Technical Support, making available the following diagnostic information:

- Full text of this message
- Record dump

It is suggested that the information be obtained immediately as follows:

1. Locate the message and dump in the activity log.
2. Use the PRINT START and PRINT END commands to mark the lines. See the activity log help if you do not know how to do this. Ensure that the marked text contains this error message and the entire record dump (that is, up to and including the DD9007 message).
3. Use the PRINT command to print the marked section of the log.

Note: If you use a 3270 terminal emulator and choose to print the diagnostics by using the "cut and paste" procedure, ensure that you include an image where you scroll right to capture the end of this message.

RFTPEVI4

**Data error at line P1 in Proc P2 RTN= P3 COND= P4 KWD= P5 EVENT=
P6 STATEMENT= P7 - File Transfer product is: P8**

Reason:

The event handler procedure failed because of a data error in the event received from the P8 product. The error is identified by the following:

- Line number, P1 , and procedure name, P2 , where the error occurred
- Subroutine name, P3 , if applicable
- Error condition raised, P4
- Verb operand that has detected the error, P5 , if applicable
- CONNECT:Mailbox log record type, P6
- Statement text where the error occurred, P7

System Action:

This message is written to the activity log and is followed by a series of messages (DD9003, DD9004, DD9006, and DD9007), which display the event in dump format. The event is then ignored.

If file transfer logging is active, it is also written to the file transfer log.

User Action:

Contact Technical Support, making available the following diagnostic information:

- Full text of this message
- Record dump

It is suggested that the information be obtained immediately as follows:

1. Locate the message and dump in the activity log.
2. Use the PRINT START and PRINT END commands to mark the lines. See the activity log help if you do not know how to do this. Ensure that the marked text contains this error message and the entire record dump (that is, up to and including the DD9007 message).
3. Use the PRINT command to print the marked section of the log.

Note: If you use a 3270 terminal emulator and choose to print the diagnostics by using the "cut and paste" procedure, ensure that you include an image where you scroll right to capture the end of this message.

RFTPEVI5**ID= P1 - P2****Reason:**

The message displays a file transfer event trace record. *P1* is the trace ID, and *P2* is the trace text.

System Action:

None.

User Action:

Contact Technical Support.

RFTPEVI6**Another copy of \$RFTPEVM is currently running - NCL ID: P1****Reason:**

A request to start a copy of the \$RFTPEVM procedure was ignored because another copy is currently running.

System Action:

A new copy of the procedure is not started.

User Action:

None.

RFTPM001**HEARTBEAT INTERVAL INCREASED TO GLOBAL MINIMUM (P1)****Reason:**

The heartbeat value in the resource definition was less than the minimum global value. The heartbeat value is increased automatically to *P1* .

System Action:

The heartbeat value is increased automatically to the minimum value.

User Action:

None.

RFTPSCT01

Procedure \$RFTPSCT was invoked without the required keyword(s) P1

Reason:

A TCPaccess FTP server FTPMGR resource changed state and invoked the \$RFTPSCT procedure. However, the procedure was invoked without the required P1 keyword.

System Action:

The procedure ends with return code 8.

User Action:

Ensure that you created the FTPMGR resource definition by applying the supplied template. If you modified the parameters for the \$RFTPSCT procedure on the State Change Exits panel, ensure that you have not removed the *OWNER=* or the *SERVER=* keyword. Otherwise, contact Technical Support.

RFTRAN01

STALLED TIME TO ALERT(P1). STALLED TIME TO FLUSH(P2)

Reason:

The heartbeat procedure for stalled file transfers has commenced processing. The message shows the stalled time before an alert is issued, *P1* , and the stalled time before the file transfer is flushed, *P2* .

System Action:

None.

User Action:

None.

RFTRAN02**STALLED TRANSFERS MONITOR HEARTBEAT INVOKED WITHOUT TIME TO ALERT****Reason:**

The heartbeat procedure of the stalled transfers monitor was invoked without the required Stalled Time to Alert parameter.

System Action:

Heartbeat processing is terminated.

User Action:

Update the definition of the affected resource. On the Monitor Details panel of the definition, specify the missing value in the Stalled Time to Alert field.

RFTRAN03**P1 P2 P3 TRANSFERS CHECKED, ALL OK AT P4****Reason:**

The transfer monitor has found no file transfers, for the owning CONNECT:Direct application, that exceed the specified stalled time limit.

P1 identifies the owning CONNECT:Direct application.

P2 is the name of the monitor resource.

P3 is the total number of transfers checked.

P4 is the time.

System Action:

None.

User Action:

None.

RFTRAN04

P1 P2 NO RESPONSE OR UNEXPECTED RESPONSE

Reason:

The heartbeat procedure for a CONNECT:Direct monitor resource issued a command to solicit information from the CONNECT:Direct application, and received either no response or a response that was not expected. The response received is in the resource transient log.

P1 identifies the owning CONNECT:Direct region.

P2 is the name of the monitor resource.

System Action:

None.

User Action:

Check the resource transient log for the response, if any, that was received. The response may indicate a degradation within CONNECT:Direct that is causing it not to respond. In which case, remedial action might be necessary.

RFTRAN05

P1 P2 P3 TRANSFERS CHECKED, P4 IN ALERT AND P5 FLUSHED AT P6

Reason:

Alerts were raised for *P4* CONNECT:Direct file transfers because the transfers exceeded the Stalled Time to Alert value specified for the transfer monitor. *P5* transfers were flushed because they exceeded the Stalled Time to Flush value specified for the monitor.

P1 identifies the owning CONNECT:Direct application.

P2 is the name of the monitor resource.

P3 is the number of file transfers checked.

P4 is the number of file transfers for which alerts were raised.

P5 is the number of file transfers flushed.

P6 is the time.

System Action:

None.

User Action:

None.

RFTRAN06**P1 P2 NO TRANSFERS IN EXECUTION QUEUE, ALL OK AT P3****Reason:**

The transfer monitor has found no file transfers in the execution queue of the CONNECT:Direct application being monitored.

P1 identifies the owning CONNECT:Direct application.

P2 is the name of the monitor resource.

P3 is the time.

System Action:

None.

User Action:

None.

RFTRAN07**UNABLE TO MONITOR STALLED PROCESSES FOR P1****Reason:**

Monitoring of CONNECT:Direct stalled processes is not available for CONNECT:Direct for *P1* .

System Action:

Request is rejected.

User Action:

Delete the CDMON resource as it serves no purpose.

RFUC0001

Unable to obtain exclusive control to manage C:D Agents.

Reason:

A request to act as the manager for CONNECT:Direct agents failed because another process was already performing the function. If KILLPREV=YES was specified, then this process could not be flushed.

System Action:

The request is rejected, and processing terminates.

User Action:

Contact Technical Support.

RFUC0002

P1 failed for P2. Unable to start C:D Agent manager process.

Reason:

A request to activate or inactivate a CONNECT:Direct agent failed because the manager process could not be started. The request being performed is *P1* , and the name of the agent manager is *P2* .

System Action:

The request is rejected, and processing terminates.

User Action:

Contact Technical Support.

RFUC0003

Invalid request ignored. Request=" P1"

Reason:

An invalid request was received by the CONNECT:Direct agent manager process. The request data was *P1* .

System Action:

The request is rejected, and processing continues.

User Action:

Contact Technical Support.

RFUC0004**P1 request failed for P2. MSG=" P3"****Reason:**

A request was received by the CONNECT:Direct agent manager process, but the request failed. The request was *P1* , and the resource being actioned was *P2* . The reason for the failure is given by the message, *P3* .

System Action:

Processing continues.

User Action:

Proceed according to message *P3* as follows:

Unknown Agent indicates that an invalid agent was named as the file transfer agent. Check this name on the C:D File Transfer Manager General Description panel, and change if appropriate.

Host not known to UNIX agent indicates that the UNIX agent has no record of the named remote host. Check the list of remote hosts defined to the UNIX BMC PATROL agent.

RFUC0005**P1 request completed for P2****Reason:**

A request was successfully completed by the CONNECT:Direct agent manager process. The request was *P1* , and the resource to be actioned was *P2* .

System Action:

None.

User Action:

None.

RFUC0006

P1 has combined status P2, event status P3, cmd status P4 and CD status P5

Reason:

A request was received by the CONNECT:Direct agent manager process to determine the status of the agent. The resource object ID is P1 , the combined status for the resource is P2 , the status of the event receiver is P3 , and the status of the command broker is P4 . The status of CONNECT:Direct is P5 .

System Action:

None.

User Action:

None.

RFUC0007

Invalid keyword value received, Keyword= P1 Value=" P2".

Reason:

A keyword parameter was either not specified or was specified with an invalid value. The keyword parameter was P1 and the value was P2.

System Action:

The request is rejected and processing terminates.

User Action:

Specify the keyword parameter with a valid value.

RFUC0008

Starting P1 connection for P2 to port P3 host name/address P4

Reason:

The CONNECT:Direct agent manager process has started the connection to the agent at port number P3 and host name/address P4 . The type of connection is P1 , and the resource name is P2 .

System Action:

None.

User Action:

None.

RFUC0009**Command failed, connection status for commands is P1****Reason:**

A command request to the CONNECT:Direct agent failed because the connection to the agent is not active. The current status for the connection is *P1* .

System Action:

Command is rejected.

User Action:

Try later when the connection is active.

RFUC0010**Command request timed out****Reason:**

A command request to the CONNECT:Direct agent timed out.

System Action:

The command has been sent to the agent, but the command processor will terminate. If the timeout is caused by processing delay, then the command responses will eventually be written to the activity log. If there is an error, it will be reflected in the CDMGR resource.

User Action:

Check the activity log later, or check the status of the CDMGR resource.

RFUC0011

Wait for final command responses timed out. Only P1 messages received.

Reason:

A command request was issued to the CONNECT:Direct agent, but only some of the expected command responses were received within the time allowed. The total number of responses actually received was P1 .

System Action:

The command has been sent to the agent, but the command processor will terminate. If the timeout is caused by processing delay, then the command responses will eventually be written to the activity log. If there is an error, then it will be reflected in the CDMGR resource.

User Action:

Check the activity log later, or check the status of the CDMGR resource.

RFUC0012

Link manager process inactive, reason= P1.

Reason:

An event arrived indicating that a link manager process was inactive. *P1* indicates the reason, which can be FAILED or ENDED.

System Action:

If the CDMGR is being automated then it will be restarted automatically, otherwise a manual restart of the resource will be required.

User Action:

If the reason for the inactivation is because the process FAILED then check the activity log for related messages and contact your local support representative.

RFUC0013**P1 issued command P2****Reason:**

The user *P1* issued the command *P2*.

System Action:

The command is passed to the remote system for execution.

User Action:

None.

RFUC0014**CONNECT:Direct *P1* Init Complete on *P2* at *P3* for *P4*****Reason:**

CONNECT:Direct for *P1* last completed initialization on the date, *P2*, at the time, *P3*, on the system, *P4*.

System Action:

None.

User Action:

None.

RFUC0015**P1 CONNECT:Direct for P2 is at Version P3****Reason:**

The current version of the CONNECT:Direct server for *P2* for CDMGR *P1* is at version *P3*.

System Action:

None.

User Action:

None.

RFUC0016

CONNECT:Direct for P1 SERVER P2 - P3

Reason:

A status query for CONNECT:Direct server for *P1* for CDMGR *P2* has returned *P3*.

System Action:

None.

User Action:

None.

RFUC0017

CONNECTION ABORTED. AGENT ID P1 REASON: P2

Reason:

A connection to a CONNECT:Direct agent was aborted because of an unrecoverable error. *P1* is the associated SOLVE Agent ID and *P2* is the error condition.

System Action:

The connection is aborted and processing terminates. The CDMGR resource status is set to FAILED.

User Action:

Possible causes are Host Name or Host Address conflicts between the CDMGR resource definition and the remote agent definitions.
Issue a RES or a CHK CDMGR command to inactivate the resource.
Review and correct any conflicting parameters.
If the problem cannot be resolved, contact Technical Support.

RFUC0099**TID: P1 NCLID: P2 - P3****Reason:**

The message displays an Agent Link Manager trace record. *P1* is the trace ID, *P2* is the NCL ID, and *P3* is the trace text.

System Action:

None.

User Action:

Contact Technical Support.

RFUCDA01**Command request timed out.****Reason:**

The command requested was rejected because the server was already processing other commands. The timeout period expired before the command could be processed.

System Action:

Command rejected.

User Action:

Wait until all other commands have completed or use a higher timeout period.

RFUCDA02**Command accepted.****Reason:**

The command requested was sent to the remote host for execution.

System Action:

None.

User Action:

Wait for the command responses.

RFUCDA03

Command request failed with a communication error.

Reason:

The command requested could not be executed because of a communication failure with the remote host.

System Action:

Command rejected.

User Action:

Check the log for additional messages that explain the actual error.

RFUCDA04

Invalid data received on Port= P1 Host Name/Address= P2

Reason:

Invalid data was received from a remote host. The remote host name/address was *P2* and the port number was *P1*.

System Action:

The data is rejected. Subsequent messages will indicate the error and contents of the data received.

User Action:

Contact your local support representative.

RFUCDA05

Offset Dump of Received Data (Length= P1/ P2) Data in EBCDIC

Reason:

This is the first message of a group of messages showing the data that was received from a remote host. This message is the header for the dump of the data. *P1* is the total length (in decimal) of the data and *P2* is the total length in hexadecimal.

System Action:

None.

User Action:

Note this message and subsequent messages. Contact your local support representative.

RFUCDA06**P1****Reason:**

This is an informational message showing the invalid data received from a remote host.

System Action:

None.

User Action:

None.

RFUCDA07****END******Reason:**

This is an informational message indicating the end of the display of invalid data received from a remote host.

System Action:

None.

User Action:

None.

RFUCDA08**P1 connection protocol complete. Linked to P2 V P3 on P4. ID= P5
NCLI D= P6****Reason:**

A connection was successfully established with a remote system using the protocol P1. The remote system is P2 version P3 on operating system platform P4. The process ID *on* the remote system is P5 and the NCLID on the local system is P6.

System Action:

None.

User Action:

None.

RFUCDA09

Command completed.

Reason:

This is the last of a set of messages returned in response to a command issued at a remote host.

System Action:

None.

User Action:

None.

RFUCDA10

Token(s) P1 to P2 were null.

Reason:

The tokens *P1* to *P2* of the data received were null.

System Action:

None.

User Action:

Note this message and subsequent messages. Contact your local support representative.

RFUCDA11

Invalid data received. Component= P1 Data=" P2" P3

Reason:

Invalid data was received from a remote host. The received data was intended for component *P1* but was not of the correct data type. Part of the data was *P2* and optional type check is *P3*.

System Action:

The data is rejected. Subsequent messages show the entire data string received.

User Action:

Contact your local support representative.

RFUCDA12**Token Offset Dump of Tokenized Received Data****Reason:**

This is the first message of a group of messages showing the data that was received from a remote host. This message is the header for the dump of the data. The data dumped has already been translated and tokenized.

System Action:

None.

User Action:

Note this message and subsequent messages. Contact your local support representative.

RFUCDA13**No responses for command****Reason:**

A command request to the remote CONNECT:Direct completed and no response messages resulted from the command.

System Action:

None.

User Action:

None.

RFUCDA14**Invalid data for record type P1. Total data length is P2****Reason:**

The data received from a remote host was invalid for a record type of *P1*. The total length of the data received was *P2*. More messages will follow which dump out the tokenised data.

System Action:

None.

User Action:

Note this message and subsequent messages. Contact your local support representative.

RFUCDA15

Command output was truncated.

Reason:

The command output was truncated to 1000 lines. The maximum number of lines allowed for a command response is 1000.

System Action:

Only the first 1000 lines of output are returned.

User Action:

None.

RFUCDA16

P1 failed. Already connected via P2, host name/address P3.

Reason:

The protocol connection *P1* failed because the remote host, whose name/address is *P3* was already connected to this region via the resource name *P2*.

System Action:

Connection rejected, processing terminates. The CDMGR resource status is set to FAILED.

User Action:

Issue a RES or a CHK CDMGR command to inactivate the resource. You are only allowed to connect to the same remote host ONCE per region. Specify a different remote host name/address and retry.

RFUCDA17

P1 rejected. IP address cannot be determined, host name is P2.

Reason:

The protocol connection *P1* was rejected because an attempt to get the IP address for the specified host name failed/timed out. The host name was *P2*.

System Action:

Connection rejected, processing terminates. The CDMGR resource status is set to FAILED.

User Action:

Issue a RES or a CHK CDMGR command to inactivate the resource.
See related messages to determine the reason for the error or specify the IP address in the resource definition.

RFUCDA18

P1 could not determine host name for address P2.

Reason:

The protocol connection *P1* could not determine the host name for address *P2*.

System Action:

Processing continues.

User Action:

See related messages to determine the reason for the error.

RFUCDA99

TID: P1 NCLID: P2 - P3

Reason:

The message displays an Agent Connection trace record. *P1* is the trace ID, *P2* is the NCL ID, and *P3* is the trace text.

System Action:

None.

User Action:

Contact Technical Support.

RFUCDX01

CONNECT:Direct on P1 at port P2 is P3 P4

Reason:

This message is a status message from the agent that monitors CONNECT:Direct. *P1* is the host name of the system, *P2* is the port number on which CONNECT:Direct is listening for API connections, and *P3* is the status of CONNECT:Direct. The status can be either *UP* or *DOWN* . *P4* provides additional information if the status is DOWN.

System Action:

None.

User Action:

If CONNECT:Direct is up, no action is required.
If CONNECT:Direct is down or the CONNECT:Direct user exit is down, you must start or restart CONNECT:Direct.

RFUCDX02

Established PATROL connection between P1 and P2

Reason:

This message is a status message from the primary CONNECT:Direct agent on *P1* . It indicates that the primary agent has established BMC PATROL connection to the secondary agent on *P2* .

System Action:

The region will commence monitoring the status of CONNECT:Direct on *P2* .

User Action:

None.

RFUCDX03**Lost PATROL connection between P1 and P2****Reason:**

This is a status message from the primary CONNECT:Direct agent on *P1* . It indicates that the primary agent has lost BMC PATROL connection to the secondary agent on *P2* .

System Action:

The status of the CDMGR resource for *P2* is set to FAILED.

User Action:

Check the status of the BMC PATROL connection between *P1* and *P2* .

RFUCDX04**Attempt # n to re-establish PATROL connection between P1 and P2****Reason:**

This is a status message from the primary CONNECT:Direct agent on *P1* . It indicates that the primary agent is attempting for the nth time to reestablish the BMC PATROL connection to the secondary agent on *P2* .

System Action:

None.

User Action:

None.

RFUCDX05

Maximum retries reached. PATROL connection between P1 and P2 can not be established.

Reason:

This is a status message from the primary CONNECT:Direct agent on **P1** . Following an earlier failure, the primary agent has attempted to reestablish the BMC PATROL connection to the secondary agent on **P2** , but the attempts have failed.

System Action:

None.

User Action:

Investigate the state of the BMC PATROL agents on the remote hosts.

RFUCDX06

P1

Reason:

This is a status message about the *Agent for CONNECT:Direct* service that monitors CONNECT:Direct, and generates file transfer events and status events as they occur. *P1* identifies the service and its status, which can be either *UP* or *DOWN* .

System Action:

None.

User Action:

If the service is up, no action is required.
If it is down, then the agent has failed to restart the service and assistance is required.

RFUCDX07**PATROL Error: P1****Reason:**

An error occurred while a command (for example, a sys or CONNECT:Direct command) was being passed to a PATROL agent. *P1* is the error text.

System Action:

None.

User Action:

See the PATROL agent message documentation for a full explanation. The most common reason for the error is that the PATROL agent on the system to which you are sending the command is inactive.

RFVIEW01**NCL LOG FILEID P1 IS NOT AVAILABLE. FILERC: P2****Reason:**

The log file, file ID *P1* , is not available for processing because an attempt to open the file resulted in a file return code of *P2* .

System Action:

The \$RFVIEW log browsing procedure terminates.

User Action:

Refer to the NCL Reference to evaluate the file return code; this is the &FILERC system variable as set by &FILE OPEN. Use the SHOW ALLOC and SHOW UDB commands to determine why the file is not available. Correct the problem, and retry.

RFVIEW02

TIME MUST BE SPECIFIED

Reason:

The time must be specified as an operand of the TIME command.

System Action:

The command is not executed.

User Action:

Specify a time as an operand of the TIME command (for example, TIME 13.12.10).

RFVIEW03

AN INVALID TIME HAS BEEN SPECIFIED

Reason:

The specified time was invalid.

System Action:

The command is not executed.

User Action:

The time should be in the format hh.mm.ss.hs (for example, 10.30.25.05). Only the first two digits, which represent the hours, are mandatory.

RFVIEW04

NO LOG DATA PRESENT FOR THE SPECIFIED DATE

Reason:

No log data was found for the date that you specified on the DATE command.

System Action:

None

User Action:

If appropriate, specify a different date. For a list of dates that contain log data, enter the DATE command without specifying a date.

RFVIEW05**COMMAND MUST BE SPECIFIED****Reason:**

The / command was specified, indicating that any text following the / shall be issued as a command, but no text was specified.

System Action:

None.

User Action:

Specify a product command after the / .

RFVIEW06**NOT AUTHORIZED TO ISSUE COMMANDS****Reason:**

The / command was specified, indicating that any text following the / shall be issued as a command, but you are not authorized to issue commands.

System Action:

None

User Action:

Contact your system administrator to review your privileges.

RFVIEW07**COMMAND ISSUED****Reason:**

A command was issued by the use of the / command.

System Action:

None

User Action:

None

RFVIEW09

REGION CANNOT BE GREATER THAN 8 CHARACTERS IN LENGTH

Reason:

You have entered the REGION or HLREGION command, specifying a value that contains too many characters.

System Action:

The command is not executed.

User Action:

Specify a value that is less than or equal to eight characters in length.

RFVIEW13

ORIGIN CANNOT BE GREATER THAN 8 CHARACTERS IN LENGTH

Reason:

You have entered the ORIGIN or HLORIGIN command, specifying an origin that is more than eight characters long.

System Action:

None

User Action:

Specify a value that is less than or equal to eight characters in length.

RFVIEW26**ONLY PREDEFINED LABELS CAN BE LOCATED****Reason:**

The LOCATE command on this panel enables you to jump to any labels that you have previously defined.

System Action:

None

User Action:

The following is an example of how to define a label:

Command==> *.TOP*

The following is an example of how to locate a label:

Command==> *LOCATE .TOP*

The following is an example of how to get a pick list of defined labels:

Command==> *LOCATE .?*

If you wish to locate a time or date, use the TIME or DATE command.

RFVIEW28**NUMBER OF RECORDS TO SEARCH MUST BE SPECIFIED****Reason:**

The number of records to be searched must be entered as an operand of the FINDMAX command.

System Action:

Command field placed in error.

User Action:

Specify the number of records to be searched as an operand of the FINDMAX command.

RFVIEW29

AN INVALID NUMBER OF RECORDS TO SEARCH HAS BEEN SPECIFIED

Reason:

The number of lines specified to search was invalid.

System Action:

Command field placed in error.

User Action:

The number of lines to search should be specified and must be in the range 500 to 10000.

RFVIEW40

CURRENT PRINT RANGE CANCELLED

Reason:

A print range that was defined previously has been cancelled.

System Action:

None

User Action:

None

RFVIEW41

POSITION CURSOR AND REISSUE PRINT START TO MARK START OF PRINT RANGE

Reason:

You have attempted to mark the start of a print range without indicating from which log record you wish the print range to start.

System Action:

None

User Action:

Mark the start of the range by using one of the following methods:

- To mark by cursor: Type *PRINT START* at the Command *==>* prompt.
- Place your cursor on a log record within the scrollable window. - Press ENTER.
- To mark by time, use the DATE and TIME operands.

RFVIEW42**PRINT RANGE START MARKER SET****Reason:**

The start of the print range was set successfully.

System Action:

None

User Action:

None

RFVIEW43**ERROR - SPECIFIED START RANGE IS AFTER END OF PRINT RANGE****Reason:**

You attempted to mark the start of the print range after the end-of- print range marker that you have set previously.

System Action:

The start-of-print position is not marked.

User Action:

Ensure that the start-of-print marker is always before the end-of-print marker. If necessary, you can enter the PRINT CANCEL command to remove any existing markers and then specify the new *markers*.

RFVIEW44**PRINT RANGE START MARKER MODIFIED****Reason:**

The start of the print range was changed successfully.

System Action:

None

User Action:

None

RFVIEW45

POSITION CURSOR AND REISSUE PRINT END TO MARK END OF PRINT RANGE

Reason:

You have attempted to mark the end of a print range without indicating at which log record you wish the print range to end.

System Action:

None

User Action:

Mark the end of the range by using one of the following methods:

- To mark by cursor:
- Type PRINT END at the Command ==> prompt. - Place your cursor on a log record within *the scrollable* window. - Press ENTER.
- To mark by time, use the DATE and TIME operands.

RFVIEW46

PRINT RANGE END MARKER SET

Reason:

The end of the print range was set successfully.

System Action:

None

User Action:

None

RFVIEW47**ERROR - SPECIFIED END RANGE IS BEFORE START OF PRINT RANGE****Reason:**

You attempted to mark the end of the print range before the start-of- print range marker that you have set previously.

System Action:

The end-of-print position is not marked.

User Action:

Ensure that the end-of-print marker is always after the start-of-print marker. If necessary, you can enter the PRINT CANCEL command to remove any existing markers and then specify the new *markers*.

RFVIEW48**PRINT RANGE END MARKER MODIFIED****Reason:**

The end of the print range was changed successfully.

System Action:

None

User Action:

RFVIEW49**' P1' IS AN INVALID PRINT OPERAND****Reason:**

An invalid operand was specified with the PRINT command.

System Action:

The command is not executed.

User Action:

Valid operands are START, END, and CANCEL. Press F1 (Help) for further information about the operands for the PRINT command.

RFVIEW50

AN INVALID PRINT OPERAND HAS BEEN SPECIFIED

Reason:

One of the operands you specified with the PRINT START or PRINT END command is invalid.

System Action:

The command is not executed.

User Action:

Specify a valid PRINT operand. Valid operands are DATE and TIME. The following are examples of valid PRINT commands:

PRINT START DATE=-1 TIME=13.30

PRINT END DATE=15/07/97 TIME=23.30.28

RFVIEW51

AN INVALID DATE HAS BEEN SPECIFIED

Reason:

The specified date was invalid.

System Action:

The command is not executed.

User Action:

The date should be in the format *dd/mm/yy* (for example, 21/07/97). For more information about date formats, press F1 (Help).

RFVIEW52

LOG IS IN THE PROCESS OF BEING SWAPPED

Reason:

The log you have selected is being swapped by the file transfer log process.

System Action:

The request is rejected.

User Action:

Wait a minute, then try again.

RFVIEW53**NO FILE TRANSFER LOG ACTIVE****Reason:**

The Log View procedure has been invoked without a specific file ID. The default of the currently active file transfer log cannot be used as there is no current active log.

System Action:

The request is rejected.

User Action:

Contact your systems administrator.

This message indicates that file transfer logging is inactive. The file transfer log is defined by the \$RF FTLOGS parameter group. Review the group as follows:

- Ensure that file transfer logging has been requested.
- If logging is not active, consider starting it.
- If it is active, check the initialization log to ensure that the parameter group initialized successfully.
- If there are no apparent errors, re-activate the parameter group to restart the file transfer logging process. Review the activity log for additional messages.

RFVIEW54

ERROR ON FILE GET, ID=(P1) KEY(P2) FILERC(P3) VSAMFDBK(P4)

Reason:

Processing stopped because an error was encountered during an attempt to read from the file transfer log file.

System Action:

The Log View procedure, \$RFVIEW, terminates.

User Action:

Contact your systems administrator.

This message indicates a file transfer logging failure. Use the key, return code, and VSAM feedback code values to determine the specific nature of the error:

- FILEID(P1) is the current file ID.

- FILERC(P2) is the value for &FILERC as set by the &FILE GET NCL verb.

Refer to the NCL Reference for an explanation of the value.

- VSAMFDBK(P3) is the VSAM Feedback code. Refer to your VSAM Reference manual for an explanation of the value.

The file transfer log is defined by the \$RF FTLOGS parameter group. Review the group as follows:

- Check the file transfer log parameters, particularly the log file VSAM options. Ensure that these are consistent with the explanation of the VSAM feedback code.

- If there are no apparent errors, re-activate the parameter group to restart the file transfer logging process. Review the activity log for additional messages.

If the problem cannot be resolved, contact your local support representative.

RFVIEW55

REMOTE FILE TRANSFER LOG DATE REQUIRED

Reason:

When issuing a DATE command for a remote log, the starting date must be specified.

System Action:

The command is rejected.

User Action:

The starting date must be specified with a DATE command. The date should be in the format dd/mm/yy (for example, 21/07/97). Refer to the help for further information about the date formats.

RFVIEW56**PRINT REMOTE LOG CURRENTLY NOT AVAILABLE****Reason:**

Currently, there is no support for printing remote log records.

System Action:

The command is rejected.

User Action:

Log on to the remote region, and print the log records from there.

RFVIEW57**CURSOR SENSITIVE HELP CURRENTLY NOT AVAILABLE ON REMOTE LOG****Reason:**

Currently, there is no support available on cursor sensitive help for the remote file transfer activity log.

System Action:

The command is rejected.

User Action:

Help for messages is only available in the local region. Log on to the remote region, and view its file transfer log. You may then use the HELP command, normally assigned to the F1 key.

RFVIEW58

APPC ERROR, TYPE(P1) RC(P2) FDBK(P3) MSG(P4)

Reason:

The region received an unexpected return code while retrieving information from a remote file transfer log. This message displays the details of the failing NCL &APPC verb.

System Action:

The operation is terminated.

User Action:

A return code of 16 may indicate that the INMC link to the remote system is inactive. If the cause of the error cannot be determined, contact Technical Support.

RFVIEW59

UNEXPECTED "WHAT RECEIVED" STATE - STATE(P1)

Reason:

Unexpected APPC *WHAT RECEIVED* state was encountered when attempting to retrieve data from a remote log.

System Action:

None

User Action:

Contact your local support representative.

RFVIEW60

INVALID KEYWORD VALUE SPECIFIED - KEYWORD(P1) VALUE(P2)

Reason:

An invalid keyword was passed to a procedure.

System Action:

The request is rejected.

User Action:

Contact your local support representative.

RFVIEW61**START AND/OR END MARKERS HAVE NOT BEEN DEFINED****Reason:**

The PRINT command was entered, but the section of the log for printing was not selected.

System Action:

The print request is rejected.

User Action:

Use the PRINT START and PRINT END commands to mark the section of the log that you wish to print, and then reissue the PRINT command.

RFVIEW62**SWAPPED TO NEW LOG FILE (P1) FROM (P2)****Reason:**

You have scrolled past either the beginning or the end of the log file, resulting in the log being swapped for the next log file in sequence.

System Action:

None

User Action:

The message is informational only.

RFVIEW63**CHANGED TO LOG FOR P1****Reason:**

You have scrolled past either the beginning or the end of a day's log, resulting in records for the next or previous day being displayed.

System Action:

None

User Action:

The message is informational only.

RFVIEW64

CURSOR NOT POSITIONED ON A LOG LINE WITH A VALID TIMESTAMP

Reason:

The cursor was not on a line with a valid timestamp.
The F4 (ActLog) function key (which issues the ACTLOG command) enables you to access the activity log from the file transfer log. The part of the activity log displayed is determined by the timestamp of the entry the cursor is on.

System Action:

The command is rejected.

User Action:

Place the cursor on a log entry in the file transfer log, and press F4 again. If there are no valid lines in the log, the ACTLOG function is not available.

RFVIEW65

SEARCH TERMINATED BY OPERATOR

Reason:

A search for records has been cancelled by the operator from the confirm search panel.

System Action:

The search is terminated.

User Action:

None.

RFVIEW66

NO LOG DATA PRESENT FOR THE SPECIFIED TIME

Reason:

No log data was found for the time that you specified on the TIME command or as part of the PRINT TIME= command operand.

System Action:

None

User Action:

Review the logs to determine a valid time stamp.

RFVIEW67**No file transfer log messages to display****Reason:**

No file transfer events have been recorded by the region.

System Action:

None.

User Action:

None.

RFVIP01**THE FILE TRANSFER MANAGER RESOURCE IS NOT ACTIVE - CURRENTLY P1****Reason:**

The current state of the file transfer manager resource is not ACTIVE, as indicated by P1 .

System Action:

The VIP command is terminated.

User Action:

Investigate why the file transfer manager resource is not active, and take the necessary steps to rectify the situation.

RFVIP02

Unable to obtain TCP/IP port number for &P1

Reason:

The VIP command has been issued against resource P1 . The listener TCP/IP port is required for command processing but cannot be obtained.

System Action:

The VIP command terminates.

User Action:

A possible cause of this condition is that you have not defined an FTP Server Monitor (FTPMON) resource of Type TC (TCP-CONNECT, TCP/IP Connection Monitor) for this FTPMGR.

Press F4 (Add) to define a TCP/IP Connection Monitor.

RFVIP03

TCP/IP SERVICES ARE NOT ACTIVE. CURRENT STATUS IS P1

Reason:

The current state of the TCP/IP services is not ACTIVE, as indicated by P1 .

System Action:

The VIP command is terminated.

User Action:

Investigate why the TCP/IP services is not active, and take the necessary steps to rectify the situation.

RFVIP04

COMMAND NOT SUPPORTED ON C:D for P1

Reason:

The command is not supported by CONNECT:Direct for P1 .

System Action:

The command is rejected.

User Action:

None

RFWEBCD01**Process P1 changed successfully by user P2****Reason:**

The process definition identified by *P1* was changed successfully by the user *P2* .

System Action:

None.

User Action:

None. This message is informational only.

RFWEBCD02**Process P1 deleted successfully by user P2****Reason:**

The process definition identified by *P1* was deleted successfully by the user *P2* .

System Action:

None.

User Action:

None. This message is informational only.

RFWEBCD03**Process P1 flushed successfully by user P2****Reason:**

The process definition identified by *P1* was flushed successfully by the user *P2* .

System Action:

None.

User Action:

None. This message is informational only.

RFWEBCD04

Process P1 held successfully by user P2

Reason:

The process definition identified by *P1* was held successfully by the user *P2* .

System Action:

None.

User Action:

None. This message is informational only.

RFWEBCD05

Process P1 released successfully by user P2

Reason:

The process definition identified by *P1* was released successfully by the user *P2* .

System Action:

None.

User Action:

None. This message is informational only.

RFWEBCD06

Process P1 suspended successfully by user P2

Reason:

The process definition identified by *P1* was suspended successfully by the user *P2* .

System Action:

None.

User Action:

None. This message is informational only.

RFWEBCM01**P1 mail box P2 batch P3 p4 successfully by user P5****Reason:**

The *P1* mail box *P2* batch *P3* was *p4* by *P5* .

System Action:

None.

User Action:

None.

RFWEBIP01**Command P1 requested by userid P2 for host P3 with following details
connid p4 local port P5 task name P6****Reason:**

This message appears in the transient log for a resource and indicates which command was requested by which user for this resource.

System Action:

None.

User Action:

None.

RFWEBPK01**Invalid parameters passed to \$RFWEBPK:GetCDProcess****Reason:**

The following parameters were not passed to the GetCDProcess procedure within the \$RFWEBPK package:

Parameter 1 - must specify the resource type (for example, STC).

Parameter 2 - must specify the queue type (for example, HOLD).

Parameter 3 - must specify the resource object ID.

System Action:

Package procedure fails.

User Action:

Update the parameters passed to this procedure.

RFWEBPK02

Resource status is ACTIVE

Reason:

The resource status is active.

System Action:

None.

User Action:

None.

RFWEBPK03

Resource status is P1

Reason:

The resource status is *P1*.

System Action:

None.

User Action:

None.

RFWEBPK04

CONNECT:Direct process is no longer active

Reason:

The selected process is no longer active.

System Action:

None.

User Action:

Close the displayed window, refresh the list and select another process.

RFWEBXC01**Transfer request P1 held successfully by user P2****Reason:**

The *P1* CA-XCOM transfer request was held by *P2* .

System Action:

None.

User Action:

None.

RFWEBXC02**Transfer request P1 released successfully by user P2****Reason:**

The *P1* CA-XCOM transfer request was released by *P2* .

System Action:

None.

User Action:

None.

RFWEBXC03**Transfer request P1 resumed successfully by user P2****Reason:**

The *P1* CA-XCOM transfer request was resumed by *P2* .

System Action:

None.

User Action:

None.

RFWEBXC04

Transfer request P1 suspended successfully by user P2

Reason:

The *P1* CA-XCOM transfer request was suspended by *P2* .

System Action:

None.

User Action:

None.

RFWEBXC05

Transfer request P1 terminated successfully by user P2

Reason:

The *P1* CA-XCOM transfer request was terminated by *P2* .

System Action:

None.

User Action:

None.

RFWEBXC06

Transfer request P1 deleted successfully by user P2

Reason:

The *P1* CA-XCOM transfer request was deleted by *P2* .

System Action:

None.

User Action:

None.

RFWBXC07**Transfer request P1 altered successfully by user P2****Reason:**

The *P1* CA-XCOM transfer request was altered by *P2* .

System Action:

None.

User Action:

None.

RFWH0001**Invalid object for transformation. Appl= P1 DataClass= P2 RC/Fdbk= P3 Co mp= P4****Reason:**

An attempt to translate an object into an XML document for transmission to a data warehouse failed. The data was sourced from application *P1*, data class *P2*. The error occurred in mapping the object, the return code and feedback codes for the action were *P3*. *P4* is the name of the component in error.

System Action:

The object is discarded and processing continues.

User Action:

Contact your local support representative.

RFXCALT01**An invalid date has been specified.****Reason:**

A specified date was invalid. A valid format is *dd-mmm-yyy* (for example, 21-JUL-2001).

System Action:

None.

User Action:

Correct the date.

RFXCALT02

An invalid time has been specified.

Reason:

A specified time was invalid. A valid format is *hh.mm* (for example, 17.10). *hh* is in the range 0 through 23; *mm* is in the range 0 through 59.

System Action:

None.

User Action:

Correct the time.

RFXCALT03

Value must be numeric and between 0 - 255

Reason:

The specified priority must be in the range 0 through 255.

System Action:

None.

User Action:

Specify the correct priority.

RFXCALT04

Specify a parameter or press PF12 to cancel.

Reason:

You pressed F6 (Action) without specifying a value. You cannot perform the Alter action if there is nothing to alter.

System Action:

None.

User Action:

If you do not want to alter anything, press F12 (Cancel).

RFXCCMD01**XCOM Command Processing APPC Allocation Failed with Retcode P1 and Fdbk P2****Reason:**

The command processor failed to start an APPC conversation with a CA-XCOM region. P1 and P2 are the return and feedback codes for the APPC allocation.

System Action:

APPC allocation fails, and CA-XCOM command processing terminates.

User Action:

At the status monitor, review the extended display of the XCOM resource. If you cannot resolve the problem, contact Technical Support.

RFXCCMD02**XCOM Command Processing APPC Prepare To Receive failed with Retcode P1 and Fdbk P2.****Reason:**

The command processor failed while changing from sending to receiving in an APPC conversation. **P1** and **P2** are the return and feedback codes for the APPC PREPARE_TO_RECEIVE verb.

System Action:

CA-XCOM command processing terminates.

User Action:

At the status monitor, review the extended display of the XCOM resource. If you cannot resolve the problem, contact Technical Support.

RFXCCMD03

XCOM Command Processing APPC Receive failed with Retcode P1 and Fdbk P2.

Reason:

The command processor failed while in the receiving mode. P1 and P2 are the return and feedback codes for the APPC RECEIVE verb.

System Action:

CA-XCOM command processing terminates.

User Action:

At the status monitor, review the extended display of the XCOM resource. If you cannot resolve the problem, contact Technical Support.

RFXCCMD04

XCOM Command Processing APPC Send Failed with Retcode P1 and Fdbk P2.

Reason:

The command processor failed while in the sending mode. P1 and P2 are the return and feedback codes for the APPC SEND verb.

System Action:

CA-XCOM command processing terminates.

User Action:

At the status monitor, review the extended display of the XCOM resource. If you cannot resolve the problem, contact Technical Support.

RFXCCMD06

XCOM Command issued successfully

Reason:

The command (action) on a CA-XCOM transfer request was successful.

System Action:

The command is processed by the CA-XCOM region.

User Action:

None.

RFXCCMD07**XCOM Command P1 Is Invalid****Reason:**

The *P1* CA-XCOM command issued to the \$RFXCCMD command processor is invalid. Ensure that one of the following values is specified in the **COMMAND** parameter passed to the processor:

ACTIVE to display active transfer requests.

QUEUED to display queued transfer requests.

HOLD to hold a transfer request. The **CORR** parameter is also required.

RELEASE to release a transfer request. The **CORR** parameter is also required.

SUSPEND to suspend a transfer request. The **CORR** parameter is also required.

RESUME to resume a transfer request. The **CORR** parameter is also required.

DELETE deletes a transfer request. The **CORR** parameter is also required.

ALTER to alter a transfer request. The following parameters are also required:
- **CORR** - **ALTERFLG** - **ALTERDATA**

System Action:

The command processor (\$RFXCCMD) fails.

User Action:

Contact Technical Support.

RFXCCMD08**XCOM Command processor failed for XCOM Manager P1 with P2****Reason:**

The command processor failed to define the transaction ID for communicating with the *P1* CA-XCOM manager. *P2* identifies the message that provides information about the failure.

System Action:

CA-XCOM command processing terminates.

User Action:

Copyright © 2016 IBM Corporation. All rights reserved. This document is a technical document. It contains information that is confidential and proprietary to IBM Corporation. It is not to be distributed outside of IBM Corporation without the prior written permission of IBM Corporation.

RFXCCMD09

Cannot Determine LU Name for XCOM Manager P1

Reason:

The command processor cannot determine the LU name of the *P1* CA XCOM region.

System Action:

The \$RFXCCMD command processor terminates, and the extended display of the affected CA XCOM manager and monitors are updated.

User Action:

Ensure that the *P1* CA XCOM region is set up correctly for the CA NetMaster FTM CA XCOM event exit.

For more information, see the *CA NetMaster File Transfer Management Installation Guide*.

Correct any problems, and then enter **CHK** beside the *P1* manager.

If the event exit is implemented correctly and the problem still occurs, contact Technical Support.

RFXCCMD10

Command P1 issued to P2 failed with P3.

Reason:

The *P1* command to the *P2* CA-XCOM region failed. *P3* identifies the message that provides information about the failure.

A possible cause is that the command was issued to the CA-XCOM region to perform an action on a transfer request that did not have the correct status.

System Action:

CA-XCOM command processing terminates.

User Action:

If the problem persists, contact Technical Support.

RFXCCMD11**APPC Deallocate from P1 failed with RC= P2 FDBK= P3.****Reason:**

The command processor failed to terminate an APPC conversation with the *P1* CA-XCOM region and deallocate the associated resources. *P2* and *P3* are the return and feedback codes for the APPC DEALLOCATE verb.

System Action:

CA-XCOM command processing terminates, and the extended display of the affected CA-XCOM manager and monitors is updated.

User Action:

Enter *CHK* beside the *P1* manager. If a problem still exists, contact Technical Support.

RFXCCMD12**APPC call to system P1 failed with RC= P2 FDBK= P3****Reason:**

An APPC request to the *P1* remote system failed. *P2* and *P3* are the return and feedback codes for the APPC RPC verb.

System Action:

CA-XCOM heartbeat processing terminates, and the extended display of the affected CA-XCOM manager and monitors is updated.

User Action:

Contact Technical Support.

RFXCCMD14**Manager Resource for P1 is INACTIVE.****Reason:**

The *P1* manager resource is inactive.

System Action:

CA-XCOM command processing terminates.

User Action:

Activate the *P1* resource. If the problem persists, contact Technical Support.

RFXCCMD15

**MDO ASSIGN FAILED: RC= P1 FDBK= P2 MAP= P3 COMPONENT= P4
TAG= P5 TYPE= P 6**

Reason:

The NetMaster for File Transfer CA-XCOM command processor failed because of an MDO error. The failure is identified by the following:

- Statement type, ASSIGN
- MDO return code, **P1** =&ZMDORC
- MDO feedback code, **P2** =&ZDMOFDBK
- Map name, **P3** =&ZMDOMAP
- Full map component name, **P4** =&ZMDONAME
- Map component tag value, **P5** =&ZMDOTAG
- ASN.1 type of the component, **P6** =&ZMDOTYPE

System Action:

This message is written to the activity log and is followed by a series of messages (DD9003, DD9004, DD9006, and DD9007), which display the event in dump format. The event is ignored.

User Action:

Contact Technical Support, making available the following diagnostic information:

- Full text of this message
- Record dump

It is suggested that the information be obtained immediately as follows:

1. Locate the message and dump in the activity log.
2. Use the *PRINT START* and *PRINT END* commands to mark the lines. See the activity log help if you do not know how to do this. Ensure that the marked text contains this error message and the entire record dump (that is, up to and including the DD9007 message).
3. Use the *PRINT* command to print the marked section of the log.

Note: If you use a 3270 terminal emulator and choose to print the diagnostics by using the "cut and paste" procedure, ensure that you include an image where you scroll right to capture the end of this message.

RFXCCMD16

**Profile EDS in \$RFXCCMD failed for P1 Command= P2 with RC= P3
FDBK= P4**

Reason:

The \$RFXCCMD CA-XCOM command processor failed to profile for EDS notification of events for the P1 LU. The associated command is P2 . P3 and P4 are the return and feedback codes.

System Action:

CA-XCOM remote node processing terminates.

User Action:

Contact Technical Support.

RFXCCMD20**P1 P2****Reason:**

This message provides debugging information for the CA-XCOM command processor.

System Action:

None.

User Action:

None.

RFXCCOM01

APPC call to system P1 failed with RC= P2 FDBK= P3

Reason:

An APPC request to the *P1* remote system failed. *P2* and *P3* are the return and feedback codes for the APPC RPC verb.

System Action:

CA-XCOM command processing terminates.

User Action:

Contact Technical Support.

RFXCCOM02

Modify Command processing failed with P1.

Reason:

A MODIFY command to the CA-XCOM region failed. *P1* provides the reason for the failure.

System Action:

CA-XCOM MODIFY command processing terminates.

User Action:

Review the activity log to determine if remedial action is required. If the problem persists, contact Technical Support.

RFXCCOM03

The Command has failed, invalid data may have been specified.

Reason:

A MODIFY command to the CA-XCOM region failed. This may have occurred because invalid data was entered in the previously displayed panel, or the response received from XCOM was not complete.

System Action:

CA-XCOM MODIFY command processing terminates.

User Action:

Review the displayed output for indication of the failure. Perform any required remedial action, and reissue the command. If the problem persists, contact Technical Support.

RFXCCOM04

The response to the CA-XCOM command timed out.

Reason:

A MODIFY command was issued to the CA-XCOM region, and the response timed out.

System Action:

CA-XCOM MODIFY command processing terminates.

User Action:

Reissue the command. If the problem persists, contact Technical Support.

RFXCCTL01**Value must be a valid member name****Reason:**

The specified value must be a valid data set member name.

System Action:

The value is rejected.

User Action:

Correct the name.

RFXCCTL02**APPC call to system P1 failed with RC= P2 FDBK= P3****Reason:**

An APPC request to the *P1* remote system failed. *P2* and *P3* are the return and feedback codes for the APPC RPC verb.

System Action:

CA-XCOM command processing terminates.

User Action:

Contact Technical Support.

RFXCCTL03**Modify Command processing failed with RC= P1.****Reason:**

A MODIFY command to the CA-XCOM region failed. *P1* is the return code from the \$RMCMDRG procedure.

System Action:

CA-XCOM MODIFY command processing terminates.

User Action:

Review the activity log to determine what remedial action is required. If you cannot correct the problem, contact Technical Support.

RFXCCTL04

Specify a member name or press F12(Cancel)

Reason:

No member name has been specified.

System Action:

None.

User Action:

Specify a member name or press F12(Cancel).

RFXCDFT01

Value must be numeric between 0 - 9999

Reason:

A specified value must be numeric and in the displayed range.

System Action:

The value is rejected.

User Action:

Correct the value.

RFXCDFT02

APPC call to system P1 failed with RC= P2 FDBK= P3

Reason:

An APPC request to the *P1* remote system failed. *P2* and *P3* are the return and feedback codes for the APPC RPC verb.

System Action:

CA-XCOM command processing terminates.

User Action:

Contact Technical Support.

RFXCDFT03**Modify Command processing failed with P1****Reason:**

A MODIFY command to the CA-XCOM region failed. *P1* provides the reason for the failure.

System Action:

CA-XCOM MODIFY command processing terminates.

User Action:

Review the activity log to determine if remedial action is required. If the problem persists, contact Technical Support.

RFXCDFT04**P1 cannot exceed Maximum Tasks****Reason:**

You specified a value for *P1* that exceeded the value you specified for the maximum number of tasks allowed. The value in the Maximum Local Tasks Allowed or the Maximum Remote Tasks Allowed field must be less or equal to the value in the Maximum Tasks Allowed field.

System Action:

The value is rejected.

User Action:

Correct the value.

RFXCDFT05**Specify at least one Tasks Allowed value****Reason:**

You pressed F6 (Action) without specifying a value.

System Action:

None.

User Action:

Specify a value, or press F12 (Cancel) to cancel the operation.

RFXCEV01

TRANSFER-ID: P1 STARTED - Initiated by: P2 on node: P3

Reason:

A CA-XCOM file transfer has started:

P1 identifies the transfer as CA-XCOM transfer ID(request number).

P2 is the initiator user Id and *P3* is the initiator node.

This message is followed by RFXCEV02 which provides additional details.

System Action:

None.

User Action:

None.

RFXCEV02

TRANSFER-ID: P1 Source Node: P2 Target Node: P3

Reason:

A CA-XCOM file transfer has started:

P1 identifies the transfer as CA-XCOM transfer ID(request number).

P2 is source node and *P3* is the target node.

This message follows message RFXCEV01.

System Action:

None.

User Action:

None.

RFXCEV03**TRANSFER-ID: P1 COMPLETED - Source Node: P2 Target Node: P3****Reason:**

A CA-XCOM file transfer has completed successfully:
P1 identifies the transfer as CA-XCOM transfer ID(request number).
P2 is source node and P3 is the target node.

System Action:

None.

User Action:

None.

RFXCEV05**TRANSFER-ID: P1 FAILED - Source Node: P2 Target Node: P3****Reason:**

A notification has been received from CA-XCOM, indicating a failed file transfer:
P1 identifies the transfer as CA-XCOM transfer ID(request number).
P2 is source node and P3 is the target node.
This message is followed by RFXCEV11 which provides error details.

System Action:

None.

User Action:

None.

RFXCEV06**CA-XCOM P1 has terminated unexpectedly****Reason:**

A non-orderly CA-XCOM shutdown notification was received from P1 .

System Action:

A file transfer failure event will be raised for each currently active CA-XCOM transfer (if any).

User Action:

If desired, restart the CA-XCOM application.

RFXCEV07

There was no matching File Transfer START Event for TRANSFER- ID: P1

Reason:

The region received a file transfer completion event for the P1 CA-XCOM file transfer but never received the corresponding START event.

System Action:

The region will create a dummy START event for this file transfer. Processing continues.

Important! The created START event uses data from the END event. The start time, the user name, and the transfer rate might be incorrect.

User Action:

None.

RFXCEV08

No error details available from CA-XCOM NMFT exit - Please review SYSLOG for more information

Reason:

A CA-XCOM file transfer failed, but no error message was received from the CA-XCOM region.

System Action:

None.

User Action:

Review the system log and check the CA-XCOM region to determine the cause of the failure.

RFXCEV09**CA-XCOM has terminated unexpectedly****Reason:**

An unexpected CA-XCOM SHUTDOWN notification has been received.

System Action:

A file Transfer FAILURE event is raised.

User Action:

You may want to review the reasons for the CA-XCOM termination.

RFXCEV11**TRANSFER-ID: P1 - Reason: P2****Reason:**

A notification has been received from CA-XCOM, indicating a failed file transfer:

P1 identifies the transfer as CA-XCOM transfer ID(request number).

P2 is error text.

This message follows message RFXCEV05.

System Action:

None.

User Action:

None.

RFXCEV1**CA-XCOM EVENT HANDLER PROCEDURE HAS FAILED - REASON: P1****Reason:**

The NetMaster for File Transfer CA-XCOM event handler procedure has failed because of an internal system error. P1 is the reason for the failure.

System Action:

The procedure terminates.

User Action:

Contact Technical Support.

RFXCEVI1

\$RFXCEVM - XCOM Event Manager - ACTIVE

Reason:

The NetMaster for File Transfer CA-XCOM event message format procedure has initialized successfully.

System Action:

None.

User Action:

None.

RFXCEVI2

CA-XCOM EVENT HANDLER PROCEDURE HAS ENCOUNTERED A RECOVERABLE ERROR

Reason:

The NetMaster for File Transfer CA-XCOM event handler procedure has encountered a recoverable error. Check previous messages for the cause of the error.

System Action:

Event processing continues. However, some events may have been lost.

User Action:

Contact Technical Support, making available the following diagnostic information:

- Full text of this message
- Relevant activity log messages
- CA-XCOM message log

RFXCEVI3

**MDO ASSIGN FAILED: RC= P1 FDBK= P2 MAP= P3 COMPONENT= P4
TAG= P5 TYPE= P 6**

Reason:

The NetMaster for File Transfer CA-XCOM event handler procedure has failed due to an MDO error. The failure is identified by the following:

- Statement type, ASSIGN
- MDO return code, **P1** =&ZMDORC
- MDO feedback code, **P2** =&ZDMOFDBK
- Map name, **P3** =&ZMDOMAP
- Full map component name, **P4** =&ZMDONAME
- Map component tag value, **P5** =&ZMDOTAG
- ASN.1 type of the component, **P6** =&ZMDOTYPE

System Action:

This message is written to the activity log and is followed by a series of messages (DD9003, DD9004, DD9006, and DD9007), which display the event in dump format. The event is ignored.

User Action:

Contact Technical Support, making available the following diagnostic information:

- Full text of this message
- Record dump

It is suggested that the information be obtained immediately as follows:

1. Locate the message and dump in the activity log.
2. Use the *PRINT START* and *PRINT END* commands to mark the lines. See the activity log help if you do not know how to do this. Ensure that the marked text contains this error message and the entire record dump (that is, up to and including the DD9007 message).
3. Use the *PRINT* command to print the marked section of the log.

Note: If you use a 3270 terminal emulator and choose to print the diagnostics by using the "cut and paste" procedure, ensure that you include an image where you scroll right to capture the end of this message.

RFXCEVI4

**DATA ERROR AT LINE P1 IN PROC P2. RTN= P3 COND= P4 KWD= P5
EVENT= P6. STATEMENT= P7**

Reason:

The NetMaster for File Transfer CA-XCOM event handler procedure has failed due to a data error in the event received from CA-XCOM. The error is identified by the following:

- Line number, *P1* , and procedure name, *P2* , where the error occurred
- Subroutine name, *P3* , if applicable
- Error condition raised, *P4*
- Verb operand that has detected the error, *P5* , if applicable
- CA-XCOM log record type, *P6*
- Statement text where the error occurred, *P7*

System Action:

This message is written to the activity log and is followed by a series of messages (DD9003, DD9004, DD9006, and DD9007), which display the event in dump format. The event is then ignored.

If file transfer logging is active, it is also written to the file transfer log.

User Action:

Contact Technical Support, making available the following diagnostic information:

- Full text of this message
- Record dump

It is suggested that the information be obtained immediately as follows:

1. Locate the message and dump in the activity log.
2. Use the *PRINT START* and *PRINT END* commands to mark the lines. See the activity log help if you do not know how to do this. Ensure that the marked text contains this error message and the entire record dump (that is, up to and including the DD9007 message).
3. Use the *PRINT* command to print the marked section of the log.

Note: If you use a 3270 terminal emulator and choose to print the diagnostics by using the "cut and paste" procedure, ensure that you include an image where you scroll right to capture the end of this message.

RFXCEVI5**ID= P1 - P2****Reason:**

The message displays a file transfer event trace record. *P1* is the trace ID, and *P2* is the trace text.

System Action:

None.

User Action:

Contact Technical Support.

RFXCEVI6**XFERID= P1 (P2) INVALID COMPRESSION****Reason:**

Incomplete or invalid data were received for the *P1* CA-XCOM file transfer. Its compression could not be determined. *P2* shows the number of compressed and uncompressed bytes.

System Action:

Processing continues with the compression percentage set to INCOMPLETE.

User Action:

In the CA-XCOM region, review the transfer details. If the compression data and byte counts are correct, contact Technical Support.

RFXCEV17

CA-XCOM event data - P1 is invalid

Reason:

The NetMaster for File Transfer CA-XCOM event manager could not process an event. This results in the loss of the event.

P1, describes the field in error.

System Action:

The event is discarded.

User Action:

Contact Technical Support, making available the following diagnostic information:

- Full text of this message
- CA-XCOM message log

RFXCLNK01

Profile EDS in \$RFXCLNK failed with P1 for Object= P2 with RC= P3 FDBK= P4

Reason:

The \$RFXCLNK transfer request monitor procedure failed to profile for Event Distribution Services (EDS) notification of events from the P1 manager. P3 and P4 are the return and feedback codes.

System Action:

CA-XCOM heartbeat processing terminates, and the extended display of the affected CA-XCOM manager and monitors is updated.

User Action:

Contact Technical Support.

RFXCLNK02**P1 P2 Link to P1 INACTIVE.****Reason:**

The link to the *P1* CA-XCOM region is inactive. *P2* is the monitor affected by the link.

System Action:

Heartbeat and command processing terminate.

User Action:

If the *P1* XCMGR resource is active, enter *CHK* beside it. If the problem persists, contact Technical Support.

If the *P1* XCMGR resource is inactive, the message is issued as part of a CA-XCOM termination and is for information only.

RFXCLNK03**Manager Resource for P1 is INACTIVE.****Reason:**

The *P1* manager resource is inactive.

System Action:

Heartbeat and command processing terminates.

User Action:

Activate the *P1* resource. If the problem persists, contact Technical Support.

RFXCLST01**No Transfer Requests found with a status of P1****Reason:**

There were no CA-XCOM transfer requests with a *P1* status.

System Action:

None.

User Action:

None.

RFXCLST02

APPC call to system P1 failed with RC= P2 FDBK= P3

Reason:

An APPC request to the *P1* remote system failed. *P2* and *P3* are the return and feedback codes for the APPC RPC verb.

System Action:

CA-XCOM heartbeat processing terminates, and the extended display of the affected CA-XCOM manager and monitors is updated.

User Action:

Contact Technical Support.

RFXCLST03

**MDO ASSIGN FAILED: RC= P1 FDBK= P2 MAP= P3 COMPONENT= P4
TAG= P5 TYPE= P 6**

Reason:

The NetMaster for File Transfer CA-XCOM display and action service procedure failed due to an MDO error. The failure is identified by the following:

- Statement type, ASSIGN
- MDO return code, **P1** =&ZMDORC
- MDO feedback code, **P2** =&ZDMOFDBK
- Map name, **P3** =&ZMDOMAP
- Full map component name, **P4** =&ZMDONAME
- Map component tag value, **P5** =&ZMDOTAG
- ASN.1 type of the component, **P6** =&ZMDOTYPE

System Action:

This message is written to the activity log and is followed by a series of messages (DD9003, DD9004, DD9006, and DD9007), which display the event in dump format. The event is ignored.

User Action:

Contact Technical Support, making available the following diagnostic information:

- Full text of this message
- Record dump

It is suggested that the information be obtained immediately as follows:

1. Locate the message and dump in the activity log.
2. Use the PRINT START and PRINT END commands to mark the lines. Refer to the activity log help if you do not know how to do this. Ensure that the marked text contains this error message and the entire record dump (that is, up to and including the DD9007 message).
3. Use the PRINT command to print the marked section of the log.

Note: If you use a 3270 terminal emulator and choose to print the diagnostics by using the "cut and paste" procedure, ensure that you include an image where you scroll right to capture the end of this message.

RFXCLST04

RFXCLST12

Transfer P1 is no longer P2. Press F6 to refresh.

Reason:

The *P1* transfer was not in the *P2* state. The applied action could not be processed.

System Action:

None.

User Action:

Press F6 (Refresh) to refresh the list.

RFXCLST14**P1 invalid for a transfer with a status of P2****Reason:**

You issued the *P1* command against a transfer request with an incorrect status. The valid actions are as follows:

Transfer Request Status Actions ACTIVE S, /, V, A, SP, and T HELD S, /, V, A, D, and R INACTIVE S, /, V, A, D, and H SUSPENDED S, /, V, A, D, and RES NETERROR S, /, V, A, and D

System Action:

None.

User Action:

Issue a valid command against the transfer request.

RFXCLST15**No Transfer Requests found.****Reason:**

CA-XCOM has no transfer requests.

System Action:

None.

User Action:

None.

RFXCLST16**Command Processing failed, &P1 is INACTIVE.****Reason:**

You entered a command beside a transfer request, but the CA-XCOM region that processed that transfer had become inactive. *P1* identifies the CA-XCOM region.

System Action:

CA-XCOM command processing terminates.

User Action:

When the CA-XCOM region is active again, retry the operation.

RFXCNTL01

APPC call to system P1 failed with RC= P2 FDBK= P3

Reason:

An APPC request to the *P1* remote system failed. *P2* and *P3* are the return and feedback codes for the APPC RPC verb.

System Action:

CA-XCOM heartbeat processing terminates, and the extended display of the affected CA-XCOM manager and monitors is updated.

User Action:

Contact Technical Support.

RFXCNTL02

P1 P2 Command Processing Failed (See Transient Log)

Reason:

CA-XCOM command processing failed at the \$RFXCNTL CA-XCOM transfer monitor controller. *P1 P2* identify the affected manager and monitor. Their transient logs contain messages about the failure.

System Action:

XCOM heartbeat processing terminates, and the extended display of the affected CA- XCOM manager and transfer request monitor is updated.

User Action:

Use the messages in the transient logs to help you correct the problem. If you are unable to correct the problem, contact Technical Support.

RFXCNTL03**XCOM Transfer Monitor Controller P1 Is Invalid****Reason:**

The *P1* command passed to the \$RFXCNTL CA-XCOM transfer monitor controller is invalid. Valid commands that can be specified in the COMMAND parameter passed to the controller are ACTIVE and QUEUED.

System Action:

CA-XCOM heartbeat processing fails.

User Action:

Contact Technical Support.

RFXCNTL20**P1 P2****Reason:**

This message provides debugging information for the CA-XCOM transfer monitor controller.

System Action:

None.

User Action:

None.

RFXCQUE01

**MDO ASSIGN FAILED: RC= P1 FDBK= P2 MAP= P3 COMPONENT= P4
TAG= P5 TYPE= P 6**

Reason:

The NetMaster for File Transfer CA-XCOM display and action service procedure failed due to an MDO error. The failure is identified by the following:

- Statement type, ASSIGN
- MDO return code, **P1** =&ZMDORC
- MDO feedback code, **P2** =&ZDMOFDBK
- Map name, **P3** =&ZMDOMAP
- Full map component name, **P4** =&ZMDONAME
- Map component tag value, **P5** =&ZMDOTAG
- ASN.1 type of the component, **P6** =&ZMDOTYPE

System Action:

This message is written to the activity log and is followed by a series of messages (DD9003, DD9004, DD9006, and DD9007), which display the event in dump format. The event is ignored.

User Action:

Contact Technical Support, making available the following diagnostic information:

- Full text of this message
- Record dump

It is suggested that the information be obtained immediately as follows:

1. Locate the message and dump in the activity log.
2. Use the PRINT START and PRINT END commands to mark the lines. Refer to the activity log help if you do not know how to do this. Ensure that the marked text contains this error message and the entire record dump (that is, up to and including the DD9007 message).
3. Use the PRINT command to print the marked section of the log.

Note: If you use a 3270 terminal emulator and choose to print the diagnostics by using the "cut and paste" procedure, ensure that you include an image where you scroll right to capture the end of this message.

RFXCREM01**Ping Command for Remote P1 failed with RC= P2 and FDBK= P3****Reason:**

A ping command to the *P1* CA-XCOM remote node failed. *P2* and *P3* are the return and feedback codes.

System Action:

CA-XCOM heartbeat processing terminates, and the extended display of the affected CA-XCOM manager and monitors is updated.

User Action:

Contact Technical Support.

RFXCREM02**P1 P2 CHECKING AVAILABILITY OF REMOTE(S)****Reason:**

The heartbeat procedure for the *P1 P2* CA-XCOM remote node monitor has commenced.

System Action:

None.

User Action:

None.

RFXCREM03**P1 P2 NO REMOTE NODE NAME SPECIFIED****Reason:**

The heartbeat procedure for the *P1 P2* CA-XCOM remote node monitor was invoked without the required remote node name.

System Action:

Heartbeat processing is terminated.

User Action:

Update the definition of the affected resource. On the Monitor Details panel of the definition, identify at least one CA-XCOM remote node to monitor.

RFXCREM04

P1 P2 REMOTE NODE P3 AVAILABLE AT P4

Reason:

The remote node monitor has determined that the monitored remote node is available:

P1 identifies the owning CA-XCOM region.

P2 is the name of the monitor resource.

P3 identifies the remote node.

P4 is the time when the information is obtained.

System Action:

None.

User Action:

None.

RFXCREM05

P1 P2 REMOTE NODE P3 NOT AVAILABLE AT P4

Reason:

The remote node monitor has determined that the monitored remote node is unavailable:

P1 identifies the owning CA-XCOM region.

P2 is the name of the monitor resource.

P3 identifies the remote node.

P4 is the time when the information is obtained.

System Action:

None.

User Action:

None.

RFXCREM08**TCP/IP SERVICES ARE NOT ACTIVE. STATUS IS P1****Reason:**

The TCP/IP interface is currently *P1* . The monitoring of this resource requires that the status of the TCP/IP interface is ACTIVE.

System Action:

Heartbeat processing does not take place.

User Action:

Display the current TCP/IP services status by issuing a *SHOW TCPIP* command. Message *N3AF05* shows the current TCP/IP interface status. If the TCP/IP interface status is *INACTIVE* , issue a *TCPIP START* command. Wait for message N3B201, and then enter a *CHK* command against this resource.

If the TCP/IP interface status is *QUIESCING* or *STOPPING* , wait for the status to change to INACTIVE and then proceed as above.

If the TCP/IP interface status is *STARTING* , wait for message N3B201 and then enter a *CHK* command against this resource.

RFXCREM09**P1 P2 REMOTE NODE P3 AVAILABLE - P4****Reason:**

The remote node monitor has determined that the monitored remote nodes are available:

P1 identifies the owning CA-XCOM region.

P2 is the name of the monitor resource.

P3 identifies the remote nodes.

P4 is the time when the information is obtained.

System Action:

None.

User Action:

None.

RFXCREM10

P1 P2 REMOTE NODE P3 UNAVAILABLE AT P4

Reason:

The remote node monitor has determined that the monitored remote nodes are unavailable:

P1 identifies the owning CA-XCOM region.

P2 is the name of the monitor resource.

P3 identifies the remote nodes.

P4 is the time when the information is obtained.

System Action:

None.

User Action:

None.

RFXCRUM01

UNABLE TO COLLECT UNSOLICITED MESSAGES. REASON: P1.

Reason:

The region was unable to register for unsolicited messages from a CA-XCOM application. *P1* is the reason for the failure. Messages from that application will not appear in the file transfer log.

System Action:

None.

User Action:

Contact Technical Support.

RFXCSTL01**STALLED TIME TO ALERT(P1). STALLED TIME TO FLUSH(P2)****Reason:**

The heartbeat procedure for the CA-XCOM stalled transfer monitor has commenced processing. The message shows the stalled time before an alert is issued, *P1* , and the stalled time before a file transfer is terminated, *P2* .

System Action:

None.

User Action:

None.

RFXCSTL02**STALLED TRANSFERS MONITOR HEARTBEAT INVOKED WITHOUT TIME TO ALERT****Reason:**

The heartbeat procedure of the CA-XCOM stalled transfer monitor was invoked without the required Stalled Time to Alert parameter.

System Action:

Heartbeat processing is terminated.

User Action:

Update the definition of the affected resource. On the Monitor Details panel of the definition, specify the missing value in the Stalled Time to Alert field.

RFXCSTL03

P1 P2 P3 TRANSFERS CHECKED, ALL OK AT P4

Reason:

The stalled transfer monitor has found no file transfers, for the owning CA-XCOM application, that exceed the specified stalled time limit.

P1 identifies the owning CA-XCOM application.

P2 is the name of the monitor resource.

P3 is the total number of transfers checked.

P4 is the time.

System Action:

None.

User Action:

None.

RFXCSTL04

P1 P2 TERMINATE FAILED FOR TRANSFER (P3)

Reason:

The *P1 P2* CA-XCOM stalled transfer monitor failed to terminate the *P3* file transfer.

P1 identifies the owning CA-XCOM region.

P2 is the name of the monitor resource.

P3 is the transfer request number.

System Action:

None.

User Action:

Check the *P2* resource transient log for messages that indicate the reason for the failure. Use the messages as a guide to correct the problem.

RFXCSTL05**P1 P2 P3 TRANSFERS CHECKED, P4 IN ALERT AND P5 TERMINATED AT P6****Reason:**

The P1 P2 CA-XCOM stalled transfer monitor:

- Raised alerts for *P4* file transfers because the transfers had been idle for the specified Stalled Time to Alert value.
- Terminated *P5* file transfers because the transfers had been idle for the specified Stalled Time to Terminate value.

P1 identifies the owning CA-XCOM application.

P2 is the name of the monitor resource.

P3 is the number of file transfers checked.

P4 is the number of file transfers for which alerts were raised.

P5 is the number of file transfers terminated.

P6 is the time when the information is obtained.

System Action:

None.

User Action:

None.

RFXCSTL06**P1 P2 NO TRANSFERS WITH STATUS OF ACTIVE, ALL OK AT P3****Reason:**

The CA-XCOM stalled transfer monitor has found no file transfers with a status of ACTIVE.

P1 identifies the owning CA-XCOM application.

P2 is the name of the monitor resource.

P3 is the time when the information is obtained.

System Action:

None.

User Action:

None.

RFXCTRM01

STATUS(P1) TRANSFER REQUEST THRESHOLD(P2)

Reason:

The heartbeat procedure starts processing for a CA-XCOM transfer request monitor. *P1* is the status of the requests to be monitored, and *P2* is the threshold specified for the number of requests.

System Action:

None.

User Action:

None.

RFXCTRM02

P1 P2 Command P3 is Invalid

Reason:

The *P3* command passed to the \$RFXCTRM CA-XCOM transfer request monitor procedure is invalid. *P1 P2* identify the affected monitor. Valid commands that can be specified in the COMMAND parameter passed to the procedure are ACTIVE and QUEUED.

System Action:

CA-XCOM heartbeat processing fails.

User Action:

Contact Technical Support.

RFXCTRM03**P1 P2 NO RESPONSE OR UNEXPECTED RESPONSE****Reason:**

The heartbeat procedure for a CA-XCOM monitor issued a command to solicit information from the CA-XCOM region but received either no response or a response that was not expected.

P1 identifies the owning CA-XCOM region.

P2 is the name of the monitor resource.

System Action:

None.

User Action:

Check the transient log. The log might indicate that a degradation in the CA-XCOM region is causing the region not to respond. When the degradation is removed, enter *CHK* beside the monitor.

RFXCTRM04**P1 P2 STATUS(P3) CNT(P4) AT P5****Reason:**

The *P1 P2* CA-XCOM transfer request monitor checked the status of the monitored requests, and the number of requests found to be in the *P3* state did not exceed the specified threshold.

P1 is the owning CA-XCOM region.

P2 is the name of the monitor.

P3 is the status of the monitored transfer requests.

P4 is the number of transfer requests that were in the *P3* state.

P5 is the time when the information was obtained.

System Action:

None.

User Action:

None.

RFXCTRM05

P1 P2 STATUS(P3) CNT(P4) AT P5

Reason:

The *P1 P2* CA-XCOM transfer request monitor checked the status of the monitored requests, and the number of requests found to be in the *P3* state exceeded the specified threshold.

P1 is the owning CA-XCOM region.

P2 is the name of the monitor.

P3 is the status of the monitored transfer requests.

P4 is the number of transfer requests that were in the *P3* state.

P5 is the time when the information was obtained.

System Action:

None.

User Action:

None.

RFXCTRM06

APPC call to system P1 failed with RC= P2 FDBK= P3

Reason:

An APPC request to the *P1* remote system failed. *P2* and *P3* are the return and feedback codes for the APPC RPC verb.

System Action:

CA-XCOM heartbeat processing terminates, and the extended display of the affected CA-XCOM manager and monitors is updated.

User Action:

Contact Technical Support.

RFXCTRM07

Profile EDS in \$RFXCTRM failed for P1 Object= P2 with RC= P3 FDBK= P4

Reason:

The \$RFXCTRM transfer request monitor procedure failed to profile for EDS notification of events from the P1 manager. P3 and P4 are the return and feedback codes.

System Action:

CA-XCOM heartbeat processing terminates, and the extended display of the affected CA-XCOM manager and monitors is updated.

User Action:

Contact Technical Support.

RFXCTRM20

P1 P2

Reason:

This message provides debugging information for the CA-XCOM transfer request monitor.

System Action:

None.

User Action:

None.

RFXX01

NetMaster for File Transfer Exit P1 now active, Id: P2

Reason:

The CA-XCOM NetMaster for File Transfer exit, NM000FXX, is active. *P1* shows the module name and version number. *P2* identifies the receiver ID from which CA-XCOM events can be received.

System Action:

None.

User Action:

None.

RFXX02

No active SOLVE SSI with "XEVNT" support found

Reason:

The CA-XCOM NetMaster for File Transfer exit, NM000FXX, has requested the services of the event delivery facility, but the request was rejected because of one of the following:

- The required SSI is not active.
- The SSI is active but is running without the event delivery facility.

System Action:

Event records will be forwarded to the NetMaster for File Transfer region(s) when the SSI region (together with the event delivery facility) becomes active.

User Action:

Ensure that the SSI region is started with the event delivery facility (XEVNT=YES). To determine the SSI used by this NetMaster region, see the SSI parameter group.

RFXX03

The SOLVE SSI REGION is not active

Reason:

The CA-XCOM NetMaster for File Transfer exit, NM000FXX, has requested the services of the event delivery facility, but the request was rejected because the SSI region is not currently active.

System Action:

Event records will be forwarded to the NetMaster for File Transfer region(s) as soon as the SSI region (together with the event delivery facility) becomes active.

User Action:

Ensure that the SSI region is started with the event delivery facility (XEVNT=YES). To determine the SSI used by this NetMaster region, see the SSI parameter group.

RFXX04**The SOLVE SSI is in shutdown****Reason:**

The CA-XCOM NetMaster for File Transfer exit, NM000FXX, requested the services of the event delivery facility, but the request was rejected because the SSI is shutting down.

System Action:

The event record is not forwarded to this region. This file transfer event is lost.

User Action:

To enable this region to receive CA-XCOM events again, ensure that the SSI region is restarted.

RFXX05**Unable to send EVENT R0= P1 R15= P2****Reason:**

The CA-XCOM NetMaster for File Transfer exit, NM000FXX, issued a \$NMXEVT request to forward a CA-XCOM event to the event receiver. The request was rejected. The values of the R0 and R15 return codes from the \$NMXEVT request are *P1* and *P2* respectively.

System Action:

The event record is not forwarded to this region.

User Action:

Note the value of R0 and R15, and contact Technical Support.

RFXX06**ABEND at P1 in P2 P3 Level P4****Reason:**

This message is the first of a group of messages that are issued when an abend occurs in the CA-XCOM NetMaster for File Transfer exit, NM000FXX. The complete set of messages is:

RFXX06 ABEND AT +nnnn IN xxxxxxxx xxxx LEVEL xxxxxx

RFXX07 Received R1=xxxxxxx RRD Addr=xxxxxxx Request #:xxxxxx

Status:x RFXX08 PSW=xxxxxxx xxxxxxxx INT=xxxxxxx

RFXX09 R0-R3 xxxxxxxx xxxxxxxx xxxxxxxx xxxxxxxx

RFXX09 R4-R7 xxxxxxxx xxxxxxxx xxxxxxxx xxxxxxxx

RFXX09 R8-R11 xxxxxxxx xxxxxxxx xxxxxxxx xxxxxxxx

RFXX09 R12-R15 xxxxxxxx xxxxxxxx xxxxxxxx xxxxxxxx

Message RFXX06 identifies the abend offset, module, version, and level.

Message RFXX07 identifies the parameters passed by CA-XCOM:

Received R1 is the value in R1 when the exit was called.

RRD ADDR is the address of the CA-XCOM RRD. If R1 was invalid, this is shown as UNKNOWN.

Request # is the CA-XCOM request number. If either R1 or the RRD address was invalid, this is shown as ??.

Status is the CA-XCOM Status flag. If either R1 or the RRD address was invalid, this is shown as ?.

Message RFXX08 identifies the failing PSW and program interruption information.

Messages RFXX09 identify the general purpose registers at the time of the abend.

System Action:

The event record is ignored, and processing continues.

User Action:

Contact Technical Support. Ensure that you have the following information available:

- The entire group of messages (RFXX06 to RFXX09)
- The version and maintenance level of the CA-XCOM application

RFXX07

Received R1= P1 RRD Addr= P2 Request #: P3 Status: P4

Reason:

This message is one of a group of messages that are issued when an abend occurs in the CA-XCOM NetMaster for File Transfer exit, NM000FXX.

Received R1 is the value in R1 when the exit was called.

RRD ADDR is the address of the CA-XCOM RRD. If R1 was invalid, this is shown as UNKNOWN.

Request # is the CA-XCOM request number. If either R1 or the RRD address was invalid, this is shown as ??.

Status is the CA-XCOM Status flag. If either R1 or the RRD address was invalid, this is shown as ?.

For more information, see the help for message RFXX06.

System Action:

See RFXX06.

User Action:

See RFXX06.

RFXX08

PSW= P1 INT= P2

Reason:

This message is one of a group of messages that are issued when an abend occurs in the CA-XCOM NetMaster for File Transfer exit, NM000FXX.

For more information, see the help for message RFXX06.

System Action:

See RFXX06.

User Action:

See RFXX06.

RFXX09

P1 P2 P3 P4 P5

Reason:

This message is the last of a group of messages that are issued when an abend occurs in the CA-XCOM NetMaster for File Transfer exit, NM000FXX. For more information, see the help for message RFXX06.

System Action:

See RFXX06.

User Action:

See RFXX06.

RFXX10

Resuming events forwarding

Reason:

The forwarding of CA-XCOM events has resumed. This message indicates a recovery from a previous error condition (for example, the required SSI region was successfully restarted).

System Action:

CA-XCOM events are now sent to the event receiver.

User Action:

None.

RFXX11

Unable to obtain storage - EVENT not sent

Reason:

The CA-XCOM NetMaster for File Transfer exit, NM000FXX, requested the services of the event delivery facility. The request was rejected because the event delivery facility could not obtain storage (R0=7 and R15=28 returned from \$NMXEVT).

System Action:

The CA-XCOM event is not sent to the event receiver.

User Action:

Contact Technical Support.

RFXX12

Request #: P1 - P2 - Status: P3 Req. Type: P4 Xfer Type: P5

Reason:

This is a diagnostic trace message.

The CA-XCOM NetMaster for File Transfer exit, NM000FXX, was called by CA-XCOM. The event record was identified as follows:

P1 is the CA-XCOM request number.

P2 is an NM000FXX action:

SELECTED indicates that the event record will be forwarded to the NetMaster for File Transfer region(s).

IGNORED indicates that the event record is ignored.

P3 is the CA-XCOM request status.

P4 is the CA-XCOM request type.

P5 is the CA-XCOM transfer type.

System Action:

None.

User Action:

None.

RFXX13

Received an unexpected XCOM record - The P1 P2

Reason:

The CA-XCOM NetMaster for File Transfer exit, NM000FXX, was called by XCOM. The event record is not recognized as a valid CA-XCOM event.

P1 and *P2* are the reasons for the error.

System Action:

The event record is not forwarded to this region.

User Action:

Contact Technical Support. Ensure that you have the version and maintenance level of the CA-XCOM application.

RFXX14

Storage Request Failed: Type='P1 R15= P2

Reason:

The CA-XCOM exit for NetMaster for File Transfer, NM000FXX, was unable to obtain or free up working storage. *P1* is the failing request, and *P2* is a code that indicates the reason of the failure.

System Action:

The request cannot be processed.

User Action:

Use the R15 code to determine the cause of the error.

RFXX15

NetMaster exit trace is now P1

Reason:

A request to initiate or terminate events tracing has been accepted by the CA-XCOM exit for NetMaster for File Transfer, NM000FXX. *P1* is either *ON* or *OFF*.

System Action:

CA-XCOM exit for NetMaster events tracing is activated or deactivated.

User Action:

None.

RFXX16

Immediate or abnormal XCOM shutdown

Reason:

The CA-XCOM exit for NetMaster for File Transfer, NM000FXX, has received a notification of an immediate or abnormal CA-XCOM shutdown.

System Action:

A CA-XCOM shutdown event is sent to the NetMaster for File Transfer region(s).

User Action:

None.

RFXX17**Command unrecognized: P1****Reason:**

The CA-XCOM exit for NetMaster for File Transfer, NM000FXX, has received an unsupported CA-XCOM operator command (*P1*).

System Action:

The command is ignored, and processing continues.

User Action:

Check the spelling of the command, and reissue the command.

RFXX18**Received command: P1****Reason:**

This is a diagnostic trace message.

The NetMaster for File Transfer CA-XCOM exit, NM000FXX, has received the *P1* CA-XCOM operator command.

System Action:

The *P1* command is processed.

User Action:

None.

RM010001**INVALID KEYWORD VALUE SPECIFIED - KEYWORD(~P1) VALUE(~P2)****Reason:**

An invalid keyword was passed to the service procedure.

System Action:

The request is rejected.

User Action:

Correct the calling procedure to the service procedure and rerun exec.

RM010002

SYSTEM AFFINITY IS REQUIRED FOR A SHARED SYSTEM IMAGE

Reason:

When adding a SHARED System Image it is required that the System Affinity is specified by using the F10=Affinity key.

System Action:

The request is rejected.

User Action:

Use F10 to specify the system affinity for the Shared System Image.

RM010003

INVALID COMMAND

Reason:

The command entered on the command line was not recognized by the procedure.

System Action:

The command is rejected.

User Action:

Correct the command and retry.

RM010101

INVALID KEYWORD VALUE SPECIFIED - KEYWORD(~P1) VALUE(~P2)

Reason:

An invalid keyword was passed to the service procedure.

System Action:

The request is rejected.

User Action:

Correct the calling procedure to the service procedure and rerun exec.

RM010103**INVALID COMMAND****Reason:**

The command entered on the command line was not recognized by the procedure.

System Action:

The command is rejected.

User Action:

Correct the command and retry.

RM010104**UNABLE TO DETERMINE OBJECT ID PARAMETER****Reason:**

Object ID not found and can not be created because there is not enough information passed to the procedure.

System Action:

The request is rejected.

User Action:

Contact System Administrator.

RM010201**INVALID KEYWORD VALUE SPECIFIED - KEYWORD(~P1) VALUE(~P2)****Reason:**

An invalid keyword was passed to the service procedure.

System Action:

The request is rejected.

User Action:

Correct the calling procedure to the service procedure and rerun exec.

RM010202

REQUIRED FIELD/S NOT ENTERED

Reason:

Validation found no entry specified on mandatory field/s.

System Action:

The request is rejected.

User Action:

Specify entry on field/s in error.

RM010203

INVALID COMMAND

Reason:

The command entered on the command line was not recognized by the procedure.

System Action:

The command is rejected.

User Action:

Correct the command and retry.

RM010204

UNABLE TO DETERMINE OBJECT ID PARAMETER

Reason:

Object ID not found and can not be created because there is not enough information passed to the procedure.

System Action:

The request is rejected.

User Action:

Contact System Administrator.

RM010205**VERSION MUST BE DIFFERENT TO THE VERSION YOU ARE COPYING FROM****Reason:**

You have specified a value in the version field that is the same as the version you are copying.

System Action:

The request is rejected.

User Action:

Change the value in the version field so that it is different to the version you are copying.

RM010301**INVALID KEYWORD VALUE SPECIFIED - KEYWORD(~P1) VALUE(~P2)****Reason:**

An invalid keyword was passed to the service procedure.

System Action:

The request is rejected.

User Action:

Correct the calling procedure to the service procedure and rerun exec.

RM010302**REQUIRED FIELD/S NOT ENTERED****Reason:**

Validation found no entry specified on mandatory field/s.

System Action:

The request is rejected.

User Action:

Specify entry on field/s in error.

RM010303

INVALID COMMAND

Reason:

The command entered on the command line was not recognized by the procedure.

System Action:

The command is rejected.

User Action:

Correct the command and retry.

RM010304

UNABLE TO DETERMINE OBJECT ID PARAMETER

Reason:

Object ID not found and can not be created because there is not enough information passed to the procedure.

System Action:

The request is rejected.

User Action:

Contact System Administrator.

RM010305

UPDATE IN PROGRESS BY ~P1

Reason:

Update is in progress on this definition by other user.

System Action:

The request is rejected.

User Action:

Try again later.

RM010306**CHANGING HOME SYSTEM WILL UNLINK ALL RELATED SHARED RESOURCES****Reason:**

You are changing the home system of a local system image and if you proceed with it, relationships with resources in shared system images will be deleted. Only resources with the same home system can form relationships.

System Action:

None.

User Action:

Either cancel the change, or save it and unlink all related shared resources.

RM010401**HOME SYSTEM CANNOT BE EXCLUDED****Reason:**

You cannot exclude the home system of a resource. The home system is displayed in *white* .

System Action:

The request is rejected.

User Action:

To exclude a system that is currently the home system, you must make another system the home system first. Proceed as follows:

- Step 1. Enter *H* beside another system to make it the new home system.
- Step 2. Enter *E* beside the original home system to exclude it.

RM010402

SYSTEM(P1) COULD NOT BE CONTACTED

Reason:

The region is unable to contact the selected system, *P1* .

System Action:

The request is rejected.

User Action:

Select a system that is displayed in green, indicating that the system is available.

RM010403

NO ACTIVE/LINKED SYSTEMS FOUND

Reason:

A command was issued against a shared resource but communication could not be established with any of the systems contained in the resource's system affinity list.

System Action:

The request is rejected.

User Action:

Ascertain why none of the systems in the affinity list are contactable. It may be that the region(s) on the system(s) are inactive or are not linked to the local region.

RM010404

Affinity command is only valid for resources in shared system images

Reason:

You issued the AFFINITY command against a resource that is not part of a shared system image. This is not valid because only resources in shared images have system affinity lists.

System Action:

The request is rejected.

User Action:

None.

RM010501**SYSTEM(P1) P2 RESOURCE(P3)****Reason:**

The *P1* system was either added to or removed from the system affinity list of the *P3* resource.

System Action:

None.

User Action:

None.

RM010502**RESOURCE(P1) ALREADY P2 SYSTEM(P3)****Reason:**

The message indicates whether the *P3* system is already included in or excluded from the affinity list of the *P1* resource.

System Action:

None.

User Action:

None.

RM010503**RESOURCE(P1) HAS SYSTEM(P2) SPECIFIED AS ITS HOME SYSTEM****Reason:**

The *P1* resource has the *P2* system as its home. The system was excluded from the affinity list of the owning shared system image, and you must specify another home system for the resource.

System Action:

The resources whose home systems need to be updated are listed.

User Action:

Update the home system of each affected resource.

RM010504

EXIT PROHIBITED. ALL RESOURCES MUST BE UPDATED BEFORE EXITING

Reason:

You must update the listed resource definitions before exiting the panel. For example, a system was excluded from the affinity list of the owning shared system image. However, the excluded system was the home system for a defined resource and you must update the definition to use a different home system.

System Action:

Exit from the list is prevented.

User Action:

Update each resource definition.

RM010601

No sysplex resource found that begins with *P1*

Reason:

A sysplex resource that begins with the supplied value *P1* was not found.

System Action:

None.

User Action:

Specify ? to display a selectable list of sysplex resources.

RM010602

No resource class found that begins with *P1*

Reason:

A resource class that begins with the supplied value *P1* was not found.

System Action:

None.

User Action:

Specify ? to display a selectable list of resource classes.

RM010603**No sysplex resource selected****Reason:**

No selection was made from the Sysplex Resource selection list.

System Action:

None.

User Action:

None.

RM010604**No resource class selected****Reason:**

No selection was made from the Resource Class selection list.

System Action:

None.

User Action:

None.

RM010605**Update in progress by *P1*****Reason:**

User *P1* is updating this system image.

System Action:

The request is rejected.

User Action:

Try again later.

RM010606

Wild character '*' must be specified at the end of generic name

Reason:

The wildcard character, *, is required at the end of a generic name.

System Action:

The field in error is highlighted.

User Action:

Correct the value, and retry.

RM010607

Found *P1* records : Press F6 to ACTION; Enter to RESUME

Reason:

This message displays the number of records for which the transient log size will be updated. You are prompted to confirm the updates.

System Action:

None.

User Action:

If the number of records found is excessively high, review the appropriateness of the specified transient log size as this can affect the overall performance of the region.

If you want to proceed with the updates, press F6 (Action) to confirm.

If you do not want to proceed with the updates, press Enter. You can then change the criteria to make it more restrictive.

RM02CR01

VARIABLE ERROR,ID(P1) OPT(P2) FDBK(P3) KEY(P4)

Reason:

An error occurred when accessing a vartable.

System Action:

None.

User Action:

Contact your local support representative.

RM02CR02**P1****Reason:**

Command Processor has returned the above error when attempting to issue a system command.

System Action:

Processing terminates in error.

User Action:

Determine the cause of the error from the returned message. Refer to the activity log for additional information.

RM02CR03**CONTAINMENT RESOURCE OBJECT ID NOT SUPPLIED****Reason:**

The containment resource object ID was not passed to exit process \$RM02CRP.

System Action:

The process fails.

User Action:

Contact your system administrator.

RM02CR04**INVALID PARAMETER PASSED TO \$RM02CRP, PARM(P1) VALUE(P2) CR(P3) OPT(P4)****Reason:**

An invalid parameter was passed to process \$RM02CRP. **P1** is the parameter name, **P2** is the parameter value, **P3** is the Containment Resource that contains the process call and **P4** is the call option.

System Action:

The process fails.

User Action:

Correct the process call parameter in the resource definition.

RM02CR05

RESOURCE(P1) IS NOT A CONTAINMENT RESOURCE

Reason:

The containment resource process (\$RM02CRP) was called to process an action for a resource that did not have a resource type of CONTAINMENT.

System Action:

The process fails.

User Action:

Update the resource definition and either set the resource type to CONTAINMENT or remove the call to process \$RM02CRP.

RM02CR06

P1

Reason:

An error was encountered by the Containment Resource Process.

System Action:

The containment process fails.

User Action:

Determine the cause of the error from the message content.

RM02CR07

ISSUING COMMAND(P1) FOR RESOURCE(P2)

Reason:

A system command was issued by the Containment Resource process for an actual resource belonging to the containment resource.

System Action:

None.

User Action:

None. This message is informational only.

RM02CR08**SETTING STATUS(P1) FOR RESOURCE(P2), MSG(P3)****Reason:**

The status of a resource belonging to the containment resource was set because the indicated message was received.

System Action:

None.

User Action:

None. This message is informational only.

RM02CR09**PARAMETER ERROR, PARM(P1)****Reason:**

An invalid parameter was passed to process \$RM02CRP.
P1 is the parameter value.

System Action:

The process fails.

User Action:

Correct the process call parameter in the resource definition.

RM02CR10**INVALID KEYWORD VALUE SPECIFIED - KEYWORD(P1) VALUE(P2)****Reason:**

An invalid keyword was passed to process \$RM02CRP.

System Action:

The process fails.

User Action:

Correct the process call parameter in the resource definition.

RM02E101

INVALID KEYWORD VALUE SPECIFIED - KEYWORD(~P1) VALUE(~P2)

Reason:

An invalid keyword was passed to the service procedure.

System Action:

The request is rejected.

User Action:

Correct the calling procedure to the service procedure and rerun exec.

RM02E102

INVALID COMMAND

Reason:

The command entered on the command line was not recognized by the procedure.

System Action:

The command is rejected.

User Action:

Correct the command and retry.

RM02E103

INVALID OPTION

Reason:

Invalid option specified.

System Action:

The request is rejected.

User Action:

Use '?' to display valid options, or check comment for valid options.

RM02E104**NO PROCESS SPECIFIED****Reason:**

Process name to be processed with the option specified not found.

System Action:

The request is rejected.

User Action:

None.

RM02E105**UNABLE TO DETERMINE OBJECT ID PARAMETER****Reason:**

Object ID not found and can not be created because there is not enough information passed to the procedure.

System Action:

The request is rejected.

User Action:

Contact System Administrator.

RM02E301**INVALID KEYWORD VALUE SPECIFIED - KEYWORD(~P1) VALUE(~P2)****Reason:**

An invalid keyword was passed to the service procedure.

System Action:

The request is rejected.

User Action:

Correct the calling procedure to the service procedure and rerun exec.

RM02E302

INVALID COMMAND

Reason:

The command entered on the command line was not recognized by the procedure.

System Action:

The command is rejected.

User Action:

Correct the command and retry.

RM02E303

INVALID OPTION

Reason:

Invalid option specified.

System Action:

The request is rejected.

User Action:

Use '?' to display valid options, or check comment for valid options.

RM02E304

NO PROCESS SPECIFIED

Reason:

Process name to be processed with the option specified not found.

System Action:

The request is rejected.

User Action:

None.

RM02E305**UNABLE TO DETERMINE OBJECT ID PARAMETER****Reason:**

Object ID not found and can not be created because there is not enough information passed to the procedure.

System Action:

The request is rejected.

User Action:

Contact System Administrator.

RM02E306**BLANK SCANTEXT SPECIFIED IN EXPRESSION****Reason:**

A scantext line specified in the relationship expression has a blank scantext value.

System Action:

Field in error is highlighted.

User Action:

Correct.

RM02E307**INVALID TOKEN SPECIFIED - TOKEN(~P1)****Reason:**

Invalid token value specified.

System Action:

Field in error highlighted.

User Action:

Correct.

RM02E308

MISMATCHED PARENTHESES

Reason:

Parentheses are not matched.

System Action:

Field in error is highlighted.

User Action:

Correct.

RM02E309

SCAN TEXT NOT REFERENCED IN EXPRESSION

Reason:

A defined Extended filter line is not specified in the current relationship expression.

System Action:

Field in error is highlighted.

User Action:

Correct.

RM02E310

LENGTH CANNOT EXCEED ~P1 CHARACTERS

Reason:

The length of this variable is restricted to P1 characters.

System Action:

Field in error is highlighted.

User Action:

Correct field value.

RM02E311**SCAN TEXT REQUIRED IF START POS, LINE NUM, WORD NUM OR OPERAND PRESENT****Reason:**

The scan text is a required field if any of the above fields are specified.

System Action:

Scan text is highlighted in error.

User Action:

Specify a scan text or clear the other specified fields for this line.

RM02E312**SCAN TEXT CONFLICTS WITH MESSAGE TEXT****Reason:**

There is a conflict between the extended filter and the message text.

System Action:

The scan text is highlighted in error.

User Action:

Correct message text or extended filter.

RM02E313**SYNTAX ERROR****Reason:**

Syntax error.

System Action:

Field in error is highlighted.

User Action:

Correct.

RM02E314

WORD NUMBER SPECIFIED - SCAN TEXT SHOULD NOT CONTAIN BLANKS

Reason:

If a word number is specified then the scan text should not contain any blanks.

System Action:

Field in error is highlighted.

User Action:

Correct.

RM02E322

REQUIRED FIELD OMITTED

Reason:

A required field has been omitted.

System Action:

Field in error is highlighted.

User Action:

Enter value.

RM02E323

INVALID P1 SPECIFIED

Reason:

Invalid *P1* value encountered during validation.

System Action:

The value is rejected.

User Action:

Specify a valid value.

RM02E324**INVALID CHARACTER(P1) SPECIFIED****Reason:**

Invalid character value specified.

System Action:

Field in error highlighted.

User Action:

Correct and try again.

RM02RL01**INVALID CHARACTER(P1) SPECIFIED****Reason:**

A field value contains an invalid character.

System Action:

The field is highlighted.

User Action:

Correct the value in the field.

RM02RL02**INVALID COMMAND****Reason:**

The command entered on the command line was not recognized.

System Action:

The command is rejected.

User Action:

Correct the command and retry.

RM02RL03

P1 MUST BE ENTERED

Reason:

No value was supplied for a mandatory field.

System Action:

The field is highlighted.

User Action:

Enter a value in the field.

RM02RL04

NAME MUST BE P1 CHARACTERS OR LESS FOR CLASS(P2)

Reason:

The value entered in the Name field is invalid because it is too long for the selected class.

System Action:

The field is highlighted.

User Action:

Correct the resource name.

RM02RL05

NAME IS NOT REQUIRED FOR CLASS(P1)

Reason:

A value was entered in the Name field, but resources in the nominated class are not named.

System Action:

The field is highlighted.

User Action:

Erase the name or correct the resource class.

RM02RL06**P1 MESSAGE WAS NOT SELECTED****Reason:**

An message was not selected from the list for inclusion in the resource definition. *P1* is the type of message that was being processed.

System Action:

Resource Learning continues.

User Action:

None.

RM02RL07**RESOURCE(P1) IS IN USE BY USER(P2)****Reason:**

Resource Learning could not obtain a lock for the resource being created because another user was creating or updating the resource.

System Action:

The current panel is redisplayed and Resource Learning cannot continue until the lock becomes available.

User Action:

This error indicates that another user is attempting to create or update the same resource. Coordinate resource maintenance with the other user.

RM02RL08**VARIABLE ERROR, NAME(P1) ACTION(P2) FDBK(P3) KEY(P4)****Reason:**

An unexpected feedback code was returned from an NCL variable verb.

System Action:

Resource Learning does not continue.

User Action:

Contact your support representative.

RM02RL09

NO PROMPT SUPPORT FOR CLASS P1

Reason:

A question mark (?) was entered in the Resource Name field but there is no prompt support for resource names in this class.

System Action:

The Resource Name field is highlighted as in error.

User Action:

Correct the resource name.

RM02RL10

FUNCTION NOT AVAILABLE TO USER (P1) - INSUFFICIENT AUTHORITY

Reason:

The user identified by P1 is being prevented from accessing the function selected due to insufficient access authority. A user requires AOM message receipt, All routcodes and console authority equal to or greater than 'C'.

System Action:

A message is displayed to the user.

User Action:

Contact your system administrator.

RM02SC01

INVALID CHARACTER(P1) SPECIFIED

Reason:

An invalid character was included in the field value.

System Action:

The field is highlighted as in error.

User Action:

Change the field value so it does not include the disallowed character.

RM02SC02**INVALID COMMAND****Reason:**

The command entered on the command line was not recognized by the procedure.

System Action:

The command is rejected.

User Action:

Correct the command and retry.

RM110501**INVALID KEYWORD VALUE SPECIFIED - KEYWORD(~P1) VALUE(~P2)****Reason:**

An invalid keyword was passed to the service procedure.

System Action:

The request is rejected.

User Action:

Correct the calling procedure to the service procedure and rerun exec.

RM110502**NO. OF PAGES REQUIRED FOR ~P1 COMMAND****Reason:**

This command requires the number of pages to be specified.

System Action:

The request is rejected.

User Action:

Enter number of pages and retry.

RM110503

INVALID COMMAND

Reason:

The command entered on the command line was not recognized by the procedure.

System Action:

The command is rejected.

User Action:

Correct the command and retry.

RM110504

UNABLE TO DETERMINE OBJECT ID PARAMETER

Reason:

Object ID not found and can not be created because there is not enough information passed to the procedure.

System Action:

The request is rejected.

User Action:

Contact System Administrator.

RM110505

INVALID OPTION

Reason:

Invalid option specified on the panel selection.

System Action:

The request is rejected.

User Action:

Specify valid option of the display.

RM110506**SET COMMAND ISSUED****Reason:**

The JES SET command has been issued to alter the Printer setup as requested.

System Action:

None.

User Action:

None.

RM110507**DISPLAY RESPONSE WAIT TIMEOUT****Reason:**

The display to solicit the Printer details has timed out without having retrieved all necessary information.

System Action:

Procedure terminates in error.

User Action:

Retry.

RM110508**SYSNAME(~P1) VERSION(~P2) NOT AN ACTIVE SYSTEM****Reason:**

The resource the display was requested for is not an active system image and therefore is not a valid request.

System Action:

Procedure terminates in error.

User Action:

None.

RM110509

REMOTE SIGNON WAIT TIMEOUT

Reason:

The resource selected is controlled by a remote region and therefore requires the display to be send to the remote region by ROF. A remote SIGNON was issued, but it timed out before success notification.

System Action:

No further processing is done.

User Action:

Ensure the INMC link to this region is available, and retry.

RM180501

INVALID KEYWORD VALUE SPECIFIED - KEYWORD(~P1) VALUE(~P2)

Reason:

An invalid keyword was passed to the service procedure.

System Action:

The request is rejected.

User Action:

Correct the calling procedure to the service procedure and rerun exec.

RM180502

VOLSER REQUIRED FOR MOUNT COMMAND

Reason:

The 'Mount' command requires the volser to be specified.

System Action:

The request is rejected.

User Action:

Enter the volser and retry.

RM180503**INVALID COMMAND****Reason:**

The command entered on the command line was not recognized by the procedure.

System Action:

The command is rejected.

User Action:

Correct the command and retry.

RM180504**UNABLE TO DETERMINE OBJECT ID PARAMETER****Reason:**

Object ID not found and can not be created because there is not enough information passed to the procedure.

System Action:

The request is rejected.

User Action:

Contact System Administrator.

RM180505**INVALID OPTION****Reason:**

Invalid option specified on the panel selection.

System Action:

The request is rejected.

User Action:

Specify valid option of the display.

RM24EV01

Invalid character(P1) specified

Reason:

An invalid character was included in the field value.

System Action:

The field is highlighted.

User Action:

Change the field value so it does not include the disallowed character.

RM24EV02

Invalid command

Reason:

The command entered on the command line was not recognized by the procedure.

System Action:

The command is rejected.

User Action:

Correct the command and retry.

RM24EV03

Line 1 of the parameter field is empty

Reason:

Parameter field line 2 was specified but line 1 was not.

System Action:

The missing parameter field line is highlighted.

User Action:

If line 2 is the only parameter field required, then move it to line 1. Otherwise, enter the missing parameter field(s) on line 1.

RM350002**User profile(P1) deleted. P2****Reason:**

The User Profile identified by *P1* has been deleted. *P2* may contain additional information from the call to the security system

System Action:

None

User Action:

None

RM350003**User profile(P1) not found****Reason:**

The User Profile specified does not exist.

System Action:

The request is rejected.

User Action:

Check User Profile specified, rerun procedure.

RM350004**Update in progress by P1****Reason:**

Update is in progress on this definition by other user.

System Action:

The request is rejected.

User Action:

Try again later.

RM350005

UAMS update on region(P1) failed - refer to remote log

Reason:

An attempt to maintain a user's UAMS record in a linked region failed because the updating procedure terminated abnormally. More information about the error was written to the activity log in the linked region.

System Action:

Processing continues. The UAMS record for the user was not updated in the linked region and is therefore not synchronized with the user's UAMS record in the current region.

User Action:

View the activity log in the region where the update failed to determine the cause of the error. After the problem has been rectified, retry to synchronize UAMS records with the linked regions.

RM350006

Link is not active

Reason:

An attempt to maintain a user's UAMS record in a linked region failed because either the region is not active or the link to the region is not active.

System Action:

Processing continues. The UAMS record for the user was not updated in the linked region and is therefore not synchronized with the user's UAMS record in the current region.

User Action:

When communication with the remote region is established, retry.

RM350007**UAMS record not found****Reason:**

An attempt to update a user's UAMS record on a linked region failed because there was no UAMS record for the user on that region. The record cannot be added because an initial password is required.

System Action:

Processing continues. The UAMS record for the user was not created on the linked region.

User Action:

If the remote system is configured using a (full or partial) security exit, simply update the user record via UAMS or the Automation Services User Profile. This will cause the record to be added to the remote region. You can then force an initial password.

If the remote system is not configured with a security exit, then you need to be able to add the user record specifying an initial password. You can do this using either of the following methods: * delete and redefine the user record on this system. The user's initial password is specified when you add the record.

* log on to the remote region and add the user record there, specifying the initial password.

RM350008**UAMS *P1* processed successfully****Reason:**

The UAMS record was successfully added, updated, deleted, or the password was forced on the current region.

P1 identifies the action performed. A value of "Focal Point Propagation" indicates an action has been performed by a focal point region on behalf of a subordinate region.

System Action:

None.

User Action:

None.

RM350101

INVALID KEYWORD VALUE SPECIFIED - KEYWORD(~P1) VALUE(~P2)

Reason:

An invalid keyword was passed to the service procedure.

System Action:

The request is rejected.

User Action:

Correct the calling procedure to the service procedure and rerun exec.

RM350102

INVALID COMMAND

Reason:

The command entered on the command line was not recognized by the procedure.

System Action:

The command is rejected.

User Action:

Correct the command and retry.

RM350103

UNABLE TO DETERMINE OBJECT ID PARAMETER

Reason:

Object ID not found and can not be created because there is not enough information passed to the procedure.

System Action:

The request is rejected.

User Action:

Contact System Administrator.

RM350301**INVALID KEYWORD VALUE SPECIFIED - KEYWORD(~P1) VALUE(~P2)****Reason:**

An invalid keyword was passed to the service procedure.

System Action:

The request is rejected.

User Action:

Correct the calling procedure to the service procedure and rerun exec.

RM350302**UPDATE IN PROGRESS BY ~P1****Reason:**

Update is in progress on this definition by other user.

System Action:

The request is rejected.

User Action:

Try again later.

RM350303**PROCESS TYPE(~P1) NOT SUPPORTED****Reason:**

Type specified for processing unknown to the procedure.

System Action:

The request is rejected.

User Action:

Contact System Administrator.

RM350304

REQUIRED FIELD/S NOT ENTERED

Reason:

Validation found no entry specified on mandatory field/s.

System Action:

The request is rejected.

User Action:

Specify entry on field/s in error.

RM350305

UNABLE TO DETERMINE OBJECT ID PARAMETER

Reason:

Object ID not found and can not be created because there is not enough information passed to the procedure.

System Action:

The request is rejected.

User Action:

Contact System Administrator.

RM350306

NOT AUTHORIZED BY UAMS (~P1=~P2)

Reason:

Operand value specified for the OCS profile is rejected because user does not have enough authorization in its UAMS definition.

System Action:

The request is rejected.

User Action:

Contact System Administrator.

RM350307**USERID(~P1) NOT DEFINED IN UAMS****Reason:**

Userid specified has not been defined in UAMS.

System Action:

The request is rejected.

User Action:

Define userid in UAMS and try again.

RM350308**"NEW" AND "CONFIRM NEW" PASSWORDS NOT IDENTICAL - PLEASE RE-ENTER BOTH****Reason:**

Values entered in the 'New Password' and 'Confirm New Password' fields were not exactly the same.

System Action:

The password change request is rejected.

User Action:

Reenter your new password in both the 'New Password' and 'Confirm New Password' fields.

RM350309**YOUR USER PASSWORD HAS EXPIRED AND MUST NOW BE CHANGED****Reason:**

Your user password has expired and an new password must be entered before continuing.

System Action:

None.

User Action:

Enter a new password.

RM350310

NEW USER DEFINITION - PASSWORD MUST BE CHANGED

Reason:

A userid is being used for the first time. The password must be changed before continuing.

System Action:

None.

User Action:

Enter a new password.

RM350311

CURRENT PASSWORD NOT MATCHED

Reason:

The value entered in the Current Password field does not match your existing user password for this region.

System Action:

The password change request is not processed.

User Action:

Correct the value in the Current Password field and retry.

RM350312

INVALID VALUE(P1) FOR P2

Reason:

The value entered *P1* is not valid for parameter *P2* .

System Action:

The value is rejected.

User Action:

Correct the value for the parameter and retry.

RM350313**UAMS RECORD NOT FOUND FOR USER(P1)****Reason:**

The prompt support character (=) was entered in a field on the User Description panel, which indicates that the field value should be sourced from the UAMS record for the nominated user ID. However, there was no UAMS record for the user.

System Action:

The value is rejected.

User Action:

Enter a value other than '=' in the field and retry.

RM350314**DEFINITION(P1) ALREADY EXISTS****Reason:**

The userid specified in a copy request is already present in the database.

System Action:

The request is rejected and the User ID field is highlighted in error.

User Action:

Change the user ID to create a new user profile record or use the update function to update an existing user profile record.

RM350315**IP Summary Display must be OFF if no components selected below****Reason:**

If the IP Summary Display field is set to *ON* , you must select at least one component to display from the list presented below this field; otherwise, you must set the IP Summary Display to *OFF* .

System Action:

Field set in error.

User Action:

Select a component to display in the IP Summary or set the IP Summary Display to OFF.

RM350401

UAMS record for P1 not found

Reason:

An attempt to update a user's UAMS record on a linked region failed because there was no UAMS record for the user on that region. The record cannot be added because an initial password is required.

System Action:

Processing continues. The UAMS record for the user was not created on the linked region.

User Action:

If the remote system is configured using a (full or partial) security exit, simply update the user record via UAMS or the Automation Services User Profile. This will cause the record to be added to the remote region. You can then force an initial password.

If the remote system is not configured with a security exit, then you need to be able to add the user record specifying an initial password. You can do this using either of the following methods: * delete and redefine the user record on this system. The user's initial password is specified when you add the record.

* log on to the remote region and add the user record there, specifying the initial password.

RM350402

UAMS(P1) for user(P2) from ACB(P3) processed successfully

Reason:

An update of a user's UAMS record in a linked region was propagated to the current region and was processed successfully.

P1 is the operation that was performed (Add, Update, Password_Force, or Delete).

P2 is the ID of the user.

P3 is the name of the ACB from where the request originated.

System Action:

None.

User Action:

None.

RM350403**UAMS P1 processed successfully****Reason:**

The UAMS record was successfully added, updated, deleted, or the password was forced on a linked region.

System Action:

None.

User Action:

None.

RM350404**Insufficient authority for UAMS P1 request****Reason:**

The UAMS record could not be added, updated, deleted, or the password forced because the requesting user does not have authority to update the record in the region.

System Action:

None.

User Action:

None.

RM350405

Remote UAMS update not permitted on this region

Reason:

A request to maintain a user's UAMS record on a linked region was rejected because the linked region is not configured to allow UAMS updates from other regions.

System Action:

The request is rejected.

User Action:

To configure a region to allow UAMS updates from other regions, go to /PARMS and update the SECSHIPPING parameter group.

Set "Ship to Linked Systems?" to YES to allow updates to be propagated. Set "Including Password Changes?" to YES to allow password changes to be propagated.

This process should be repeated on each region that will be involved in UAMS update propagation.

RM350406

Current password not matched

Reason:

Your password change request was passed to a linked region but could not be processed because the old value was not the same as on the current region.

System Action:

Processing continues. Your password is not updated on the linked region.

User Action:

Log on directly to the linked region and update your password so that it is the same as on the current region. Future password changes can then be propagated to the linked systems automatically.

RM350407**UAMS P1 details changed; password not changed****Reason:**

The UAMS record details were successfully added, updated, or deleted in a linked region. However, the request included a new password but the region was not configured for remote password change. As a result, the password was not changed in the remote region.

System Action:

The UAMS details were changed but the password was not changed.

User Action:

See the SECSHIPPING parameter group for specifications of remote UAMS update parameters.

RM360001**SERVICE PROCEDURE ~P1 INVOKED WITH INVALID KEYWORD
~P2(~P3)****Reason:**

The service procedure identified by P1 was invoked with an invalid value for the keyword identified by P2 or P3.

System Action:

Request rejected

User Action:

Correct the keyword value and re-try

RM360002**FILTER(~P1) SAVED SUCCESSFULLY****Reason:**

The filter identified by P1 has been successfully saved to disk.

System Action:

None

User Action:

None

RM360003

~P1 OF FILTER(~P2) CANCELLED

Reason:

The function P1 being performed on filter P2 was cancelled at the user's request.

System Action:

None

User Action:

None

RM360004

A MAXIMUM OF ~P1 CONDITIONS MAY BE SPECIFIED FOR A FILTER

Reason:

An attempt was made to Insert or Repeat a condition line which would cause the filter to exceed the maximum number of conditions allowed.

System Action:

Request rejected.

User Action:

None

RM360005

UNABLE TO INSERT A LINE - USE 'REFRESH'

Reason:

An error has occurred which prevents another condition line from being inserted. Use the REFRESH command in an attempt to re-sequence the existing conditions and allow inserts to be performed.

System Action:

Request rejected.

User Action:

Use REFRESH command

RM360006**REQUIRED FILTER(~P1) NOT FOUND****Reason:**

The filter identified by P1 was not found

System Action:

Request rejected

User Action:

Determine the correct name or the reason for the object's absence. Correct the error, and retry.

RM360007**VARIABLE ~P1 ERROR. ID=~P2. ZFDBK=~P3. KEY=~P4****Reason:**

A variable error occurred while performing function(P1) on variable(P2). The FDBK was P3 and the entry key was P4.

System Action:

Request rejected.

User Action:

Contact systems programmer

RM360008**'~P1' IS A REQUIRED FIELD****Reason:**

While defining a filter the field identified by P1 was not entered and is a required field.

System Action:

Field highlighted in error.

User Action:

Enter a value for the specified field

RM360009

'~P1' IS THE ONLY VALID VALUE FOR THIS FIELD

Reason:

While defining a filter the field highlighted as being in error will only accept the value identified by P1 as being valid.

System Action:

Field highlighted in error.

User Action:

Enter the valid value for the specified field

RM360010

'VALUE' MUST BE QUOTED

Reason:

The VALUE field of a filter condition line must be a quoted value. The data will automatically be quoted unless it is too long to fit into the field after being quoted, in which case this message will issue.

System Action:

Field highlighted in error.

User Action:

Quote the data in the field.

RM360011

INVALID FILTER LINE

Reason:

Right and left parentheses were entered without any filter information between them. This is an invalid situation.

System Action:

Field highlighted in error.

User Action:

Enter some filter information between the parentheses.

RM360012**'~P1' IS NOT A VALID VALUE FOR THIS FIELD****Reason:**

While defining a filter the field highlighted as being in error will not accept the value identified by P1 as being valid.

System Action:

Field highlighted in error.

User Action:

Enter a valid value for the specified field

RM360013**ENTER A '~P1' IN THE VALUE FIELD****Reason:**

An information only message. If ? is entered in the VALUE field for a FIELD which does not require a discrete set of values, this message will display, indicating the TYPE of data required.

System Action:

None

User Action:

Enter a valid value for the specified field

RM360014**FILTER(~P1) ALREADY EXISTS****Reason:**

The user has specified a Filter name on an Add or Copy which corresponds to an existing Filter.

System Action:

Request is rejected.

User Action:

Change the name of this Filter and continue.

RM360015

FILTER(~P1) DELETED

Reason:

The Filter definition identified by P1 has been successfully deleted.

System Action:

None

User Action:

None

RM360016

FILTER(~P1) ALREADY IN USE BY ~P2

Reason:

The Filter definition identified by P1 is currently being used by the user identified by P2

System Action:

Request is rejected

User Action:

Wait until the other user has finished with the filter

RM360017

WARNING, SYSNAME(P1) UNDEFINED TO THE SYSTEM

Reason:

The system name specified in the filter boolean expression does not exist in the system.

System Action:

None.

User Action:

None.

RM360018**PATTERN MATCHING CHARACTERS MAY ONLY BE USED WITH 'LIKE'****Reason:**

The pattern matching characters _ and % are only valid when the LIKE operator is specified.

System Action:

Field highlighted in error.

User Action:

Remove the pattern matching characters or use the LIKE operator.

RM360019**FIELD PROMPT(?) NOT ALLOWED WITH PATTERN MATCHING****Reason:**

The use of the Field Prompt ? is not supported when any of the Pattern Matching Characters, % or _ are present.

System Action:

Field highlighted in error.

User Action:

Remove either the Field Prompt or the Pattern Matching Characters.

RM360020**INVALID COMMAND****Reason:**

Command specified is not recognized by the system.

System Action:

The request is rejected.

User Action:

Specify a valid command.

RM360021

'STAMP' VALUE MUST BE OF THE FORM yyyymmddhhmmss

Reason:

The value for the STAMP field must be numeric, unless the operator is LIKE, in which case the wildcard characters % and _ are supported. The format of the STAMP field is YYYMMDDHHMMSS.

System Action:

Field highlighted in error.

User Action:

Enter a valid value for the specified field.

RM360022

VALUE MUST BE 'START', 'END' OR 'FAILURE'

Reason:

Valid values for transmission state are start, end and failure.

System Action:

Field highlighted in error.

User Action:

Enter a valid value in field specified.

RM360023

' P1' IS AN INVALID DSN

Reason:

Must be a valid Dataset.

System Action:

Field highlighted in error.

User Action:

Enter a valid value for the specified field.

RM360024**VALUE MUST BE 'ACTIVE' OR 'INACTIVE'****Reason:**

Valid values for the Rule Status field are ACTIVE and INACTIVE.

System Action:

The field in error, Rule Status, is highlighted.

User Action:

Correct the value in the Rule Status field.

RM360025**VALUE MUST BE 'SOURCE' OR 'TARGET'****Reason:**

File name can either be the 'source' filename or the 'target' filename.

System Action:

Field highlighted in error.

User Action:

Enter a valid value in the field specified.

RM360026**'TIME' VALUE MUST BE OF THE FORM HHMMSS****Reason:**

The value for the TIME field must be numeric in the format HHMMSS.

System Action:

Field highlighted in error.

User Action:

Enter a valid time value for the specified field.

RM360027

'HOURS' VALUE MUST BE 24 OR LESS (24 HOUR CLOCK)

Reason:

Within the time format HHMMSS, the HH (hours) value cannot exceed 24.

System Action:

Field highlighted in error.

User Action:

Enter a valid 'hours' value for the specified field.

RM360028

'MINUTE'/'SECOND' VALUES MUST BE LESS THAN 60 (24 HOUR CLOCK)

Reason:

Within the time format HHMMSS the MM (minute) value and the SS (second) values cannot exceed 59.

System Action:

Field highlighted in error.

User Action:

Enter a valid 'minutes' and/or 'seconds' value for the specified field.

RM360029

RULE(P1) SAVED SUCCESSFULLY

Reason:

The rule, *P1* , is saved.

System Action:

None

User Action:

None

RM360030**P1 OF RULE(P2) CANCELLED****Reason:**

You cancelled the function, *P1* , which you were performing on rule *P2* .

System Action:

None

User Action:

None

RM360031**A MAXIMUM OF P1 CONDITIONS MAY BE SPECIFIED FOR A RULE****Reason:**

You used the I or R action code to add a criteria line, but the rule filter already contains the maximum allowable number of lines, *P1* .

System Action:

Request is rejected.

User Action:

Redesign your filter expression so that the number of criteria lines is less than the displayed maximum.

RM360032**REQUIRED RULE(P1) NOT FOUND****Reason:**

The rule, *P1* , was not found.

System Action:

Request is rejected.

User Action:

Determine the correct name or the reason for the object's absence. Correct the error, and retry.

RM360033

INVALID RULE LINE

Reason:

You specified a criteria line that contains only a left and a right parenthesis. A pair of parentheses must enclose a criterion.

System Action:

The fields in error are highlighted.

User Action:

Enter a criterion expression between the parentheses.

RM360034

RULE(P1) ALREADY EXISTS

Reason:

While adding or copying a rule, you specified a name that is the same as the name of an existing rule.

System Action:

Request is rejected.

User Action:

Change the name of this rule, then continue.

RM360035

RULE(P1) DELETED

Reason:

The rule definition identified by *P1* has been successfully deleted.

System Action:

None

User Action:

None

RM360036**RULE(P1) ALREADY IN USE BY P2****Reason:**

The rule definition identified by *P1* is currently being updated by the user identified by *P2* .

System Action:

Request is rejected.

User Action:

Wait until the other user has finished with the rule.

RM360037**P1 INVALID UNLESS TRANSFER STATUS IS END****Reason:**

The number of bytes transferred and the transfer rate are valid filtering values only if the transfer status is END.

System Action:

The field in error is highlighted.

User Action:

Remove the value from the field in error, or change the transfer status criterion to END.

RM360038**'~' IS AN INVALID CHARACTER WITHIN THE FILTER EXPRESSION VALUE FIELD****Reason:**

The ~ character may not be used within the VALUE Field.

System Action:

Field highlighted in error.

User Action:

Remove the ~ character from the VALUE value.

RM360039

AT LEAST 1 FILE FILTER REQUIRED

Reason:

The filter requires at least one line of criteria entry.

System Action:

The fields in error are highlighted.

User Action:

Enter values for the fields in error.

RM360040

A MAXIMUM OF P1 FILTERS MAY BE SPECIFIED

Reason:

You used the I or R action code to add a criteria line, but the maximum allowable number of lines, *P1* , has already been reached.

System Action:

The request is rejected.

User Action:

Review your filter so that the number of entries is not more than the displayed maximum.

RM360041

'ELAPSED TIME' value must be specified HHH:MM Max HHH=999 Max MM=59 The maximum valid elapsed time is 999:59 i.e. 999 hours and 59 minutes

Reason:

The value for the ELAPSED TIME field is an amount of time, not the time of day. The amount of time is specified in hours and minutes, in the format HHH:MM. Hours must be in the range 0 to 999 (inclusive). Minutes must be in the range 0 to 59 (inclusive). A colon separates the hours and minutes.

System Action:

Field in error highlighted.

User Action:

Enter a valid elapsed time value for the specified field.

RM400001**INVALID KEYWORD VALUE SPECIFIED - KEYWORD(~P1) VALUE(~P2)****Reason:**

An invalid keyword was passed to the service procedure.

System Action:

The request is rejected.

User Action:

Correct the calling procedure to the service procedure and rerun exec.

RM400002**REQUIRED FIELD/S NOT ENTERED****Reason:**

Validation found no entry specified on mandatory field/s.

System Action:

The request is rejected.

User Action:

Specify entry on field/s in error.

RM400003**INVALID COMMAND****Reason:**

The command entered on the command line was not recognized by the procedure.

System Action:

The command is rejected.

User Action:

Correct the command and retry.

RM400101

INVALID KEYWORD VALUE SPECIFIED - KEYWORD(~P1) VALUE(~P2)

Reason:

An invalid keyword was passed to the service procedure.

System Action:

The request is rejected.

User Action:

Correct the calling procedure to the service procedure and rerun exec.

RM400103

INVALID COMMAND

Reason:

The command entered on the command line was not recognized by the procedure.

System Action:

The command is rejected.

User Action:

Correct the command and retry.

RM400104

UNABLE TO DETERMINE OBJECT ID PARAMETER

Reason:

Object ID not found and can not be created because there is not enough information passed to the procedure.

System Action:

The request is rejected.

User Action:

Contact System Administrator.

RM400201**INVALID KEYWORD VALUE SPECIFIED - KEYWORD(~P1) VALUE(~P2)****Reason:**

An invalid keyword was passed to the service procedure.

System Action:

The request is rejected.

User Action:

Correct the calling procedure to the service procedure and rerun exec.

RM400202**REQUIRED FIELD/S NOT ENTERED****Reason:**

Validation found no entry specified on mandatory field/s.

System Action:

The request is rejected.

User Action:

Specify entry on field/s in error.

RM400203**INVALID COMMAND****Reason:**

The command entered on the command line was not recognized by the procedure.

System Action:

The command is rejected.

User Action:

Correct the command and retry.

RM400204

UNABLE TO DETERMINE OBJECT ID PARAMETER

Reason:

Object ID not found and can not be created because there is not enough information passed to the procedure.

System Action:

The request is rejected.

User Action:

Contact System Administrator.

RM400301

INVALID KEYWORD VALUE SPECIFIED - KEYWORD(~P1) VALUE(~P2)

Reason:

An invalid keyword was passed to the service procedure.

System Action:

The request is rejected.

User Action:

Correct the calling procedure to the service procedure and rerun exec.

RM400302

REQUIRED FIELD/S NOT ENTERED

Reason:

Validation found no entry specified on mandatory field/s.

System Action:

The request is rejected.

User Action:

Specify entry on field/s in error.

RM400303**INVALID COMMAND****Reason:**

The command entered on the command line was not recognized by the procedure.

System Action:

The command is rejected.

User Action:

Correct the command and retry.

RM400304**UNABLE TO DETERMINE OBJECT ID PARAMETER****Reason:**

Object ID not found and can not be created because there is not enough information passed to the procedure.

System Action:

The request is rejected.

User Action:

Contact System Administrator.

RM400305**UPDATE IN PROGRESS BY ~P1****Reason:**

Update is in progress on this definition by other user.

System Action:

The request is rejected.

User Action:

Try again later.

RM400401

THIS CLASS ALREADY INCLUDED IN A COMMAND CALLED ' P1'

Reason:

You tried to include a class that was already included in another *P1* command with the INC class scope.

System Action:

The class is not selected for inclusion.

User Action:

If you want to include this class in the command, you can create a copy of the command specifically for this class.

RM40SUB1

UNABLE TO DETERMINE OBJECT ID PARAMETER

Reason:

Object ID not found and can not be created because there is not enough information passed to the procedure.

System Action:

The request is rejected.

User Action:

Contact System Administrator.

RM40SUB10

CLASSES INCLUDED WHICH ARE ALREADY IN A COMMAND CALLED ' P1'

Reason:

You tried to save a command that includes classes already included in another *P1* command with the INC class scope.

System Action:

The command definition is not saved.

User Action:

Review the *P1* command definitions with the INC class scope, and remove the duplicate classes.

RM40SUB11**'*' IS NOT REQUIRED TO DENOTE GENERIC MATCHING****Reason:**

When specifying a command's scope, it is not necessary to include an * in the Type or Name fields because they are automatically treated as generic entries.

System Action:

The field in error is highlighted.

User Action:

Remove the * .

RM40SUB2**REQUIRED FIELD/S NOT ENTERED****Reason:**

Validation found no entry specified on mandatory field/s.

System Action:

The request is rejected.

User Action:

Specify entry on field/s in error.

RM40SUB3**CONFIRMATION FLAG MUST BE 'YES' IF CONFIRMATION EXIT DETAILS PRESENT****Reason:**

If you specified a confirmation exit, the value of the Does This Command Require Confirmation? field must be YES.

System Action:

The field in error is highlighted.

User Action:

Either change the value of the Does This Command Require Confirmation? field to YES or remove the confirmation exit.

RM40SUB4

' P1' CANNOT BE SPECIFIED IF 'CLASS' IS ' P2'

Reason:

In the Command Scope window, you cannot specify the *P1* field if the value of the CLASS field is *P2* .

System Action:

The field in error is highlighted.

User Action:

If you want to use the *P1* field, specify a specific class in the CLASS field.

RM40SUB5

'NAME' CANNOT BE SPECIFIED IF 'TYPE' IS NOT SPECIFIED

Reason:

In the Command Scope window, you must specify a type in order to specify a name.

System Action:

The field in error is highlighted.

User Action:

Either specify a type or remove the name.

RM40SUB6**PROMPT TYPE ' P1' IS INVALID FOR CLASS ' P2' P3****Reason:**

The *P1* type of prompting is not valid for this command because the class scope is *P2* . If present, *P3* provides further detail as to the nature of the error.

If the class scope of the command is *ALL*, *INC*, or a *specific resource class* , the type of prompting must be RESOURCE. These class scopes indicate that the command must be issued against a resource and as such should support prompting for the resource name.

If the class scope of the command is *SNA* , you may use any type of prompting. However, if the type scope of the command is also specified, the type of prompting must be RESOURCE.

If the class scope of the command is *NONE* , the type of prompting may be either SYSTEM or NONE.

Commands with SYSTEM or NONE prompting may only be issued as primary commands rather than being issued against resources.

System Action:

The field in error is highlighted.

User Action:

If P2 is ... Then in the Type of Prompting Required field, enter ... ALL, INC, or a specific resource class RESOURCE SNA with a Type command scope RESOURCE SNA without a Type command scope NONE, SYSTEM, or RESOURCE NONE NONE or SYSTEM

RM40SUB8**'CLASSES' COMMAND IS ONLY VALID FOR CLASS(INC) OR CLASS(ALL)****Reason:**

You can use the F5 (Classes) function key only if the value in the CLASS field is INC or ALL. When the CLASS field contains one of these two values, preessing F5 will list the resource classes that you can include (INC) or exclude (ALL).

System Action:

The command is rejected.

User Action:

If you want to be able to include or exclude classes, specify INC or ALL in the CLASS field.

RM40SUB9

NO CLASSES HAVE BEEN INCLUDED

Reason:

The command definition you tried to save has a class scope of INC, but you have not included any classes.

System Action:

The command definition is not saved.

User Action:

Press F5 (Classes), and select the classes for inclusion.

RM410101

INVALID KEYWORD VALUE SPECIFIED - KEYWORD(~P1) VALUE(~P2)

Reason:

An invalid keyword was passed to the service procedure.

System Action:

The request is rejected.

User Action:

Correct the calling procedure to the service procedure and rerun exec.

RM410103

INVALID COMMAND

Reason:

The command entered on the command line was not recognized by the procedure.

System Action:

The command is rejected.

User Action:

Correct the command and retry.

RM410301**INVALID KEYWORD VALUE SPECIFIED - KEYWORD(~P1) VALUE(~P2)****Reason:**

An invalid keyword was passed to the service procedure.

System Action:

The request is rejected.

User Action:

Correct the calling procedure to the service procedure and rerun exec.

RM410302**REQUIRED FIELD/S NOT ENTERED****Reason:**

Validation found no entry specified on mandatory field/s.

System Action:

The request is rejected.

User Action:

Specify entry on field/s in error.

RM410303**INVALID COMMAND****Reason:**

The command entered on the command line was not recognized by the procedure.

System Action:

The command is rejected.

User Action:

Correct the command and retry.

RM410304

UNABLE TO DETERMINE OBJECT ID PARAMETER

Reason:

Object ID not found and can not be created because there is not enough information passed to the procedure.

System Action:

The request is rejected.

User Action:

Contact System Administrator.

RM410305

UPDATE IN PROGRESS BY ~P1

Reason:

Update is in progress on this definition by other user.

System Action:

The request is rejected.

User Action:

Try again later.

RM500001

INVALID KEYWORD VALUE SPECIFIED - KEYWORD(~P1) VALUE(~P2)

Reason:

An invalid keyword was passed to the service procedure.

System Action:

The request is rejected.

User Action:

Correct the calling procedure to the service procedure and rerun exec.

RM500002**PARAMETERS IN ERROR - FUNC(~P1) ALLPARMS(~P2)****Reason:**

Invalid parameters being passed to the procedure. Function must be specified.

System Action:

The request is rejected.

User Action:

Correct the calling procedure to the procedure and rerun exec.

RM500003**NO P1 specified for this resource****Reason:**

There is no availability map or monitoring map specified on this resource; therefore, a request to display it is ignored.

System Action:

The request is rejected.

User Action:

None.

RM500004**DELETE CANCELLED****Reason:**

Delete process cancelled.

System Action:

None.

User Action:

None.

RM500005

TABLE(~P1) FREED SUCCESSFULLY

Reason:

A successful request to free table.

System Action:

None.

User Action:

None.

RM500006

P1 not found

Reason:

The record identified by *P1* does not exist.

System Action:

The request is rejected.

User Action:

Refresh the list of records...as the selected record may have been deleted, previously or by another user.

RM500007

UPDATE IN PROGRESS BY ~P1

Reason:

Update is in progress on this definition by other user.

System Action:

The request is rejected.

User Action:

Try again later.

RM500008**P1 saved successfully****Reason:**

The record identified by *P1* has been successfully saved to the database.

System Action:

None

User Action:

None

RM500009**P1 of P2 canceled****Reason:**

The function *P1* being performed on resource *P2* was canceled at the user's request.

System Action:

None

User Action:

None

RM500010**A maximum of P1 timers may be specified****Reason:**

An attempt was made to insert or repeat a timer which would cause the maximum number of timers (*P1*) to be exceeded.

System Action:

Request rejected.

User Action:

None

RM500011

UNABLE TO INSERT A LINE - USE 'REFRESH'

Reason:

An error has occurred which prevents another's timer from being inserted. Use the REFRESH command in an attempt to re-sequence the existing timers and allow inserts to be performed.

System Action:

Request rejected.

User Action:

Use REFRESH command

RM500012

VARIABLE ~P1 ERROR. ID=~P2. ZFDBK=~P3. KEY=~P4

Reason:

A variable error occurred while performing function(P1) on variable(P2). The FDBK was P3 and the entry key was P4.

System Action:

Request rejected.

User Action:

Contact systems programmer

RM500013

' P1' is a required field

Reason:

While defining a resource availability map or monitoring map, the field identified by *P1* was not entered. It is a required field.

System Action:

Field in error highlighted.

User Action:

Enter a value for the specified field.

RM500014**'~P1' IS NOT A VALID VALUE FOR '~P2'****Reason:**

The value identified by P1 is not valid for the field identified by P2
This message may also have a list of valid values for the field appended to the end of it.

System Action:

Field highlighted in error.

User Action:

Enter a valid value for the specified field

RM500015**EITHER '~P1' OR '~P2' MUST BE SPECIFIED****Reason:**

One of the fields identified by P1 and P2, must be specified on this screen

System Action:

Field(s) highlighted in error.

User Action:

Enter a valid value for one of the specified fields

RM500016**Day, Date, Time, and Resource combination must be unique****Reason:**

When defining timers in an availability map or monitoring map, each combination of DAY, DATE, TIME, and RESOURCE must be unique. This message is issued if two or more timers have been defined with the same DAY, DATE, TIME, and RESOURCE name.

System Action:

Fields in error highlighted.

User Action:

Change details to make timers unique.

RM500017

DAY MUST BE BETWEEN 1 AND ~P1

Reason:

The DAY portion of a date must be a value between 1 and P1

System Action:

Field(s) highlighted in error.

User Action:

Change day to conform with message

RM500018

GENERIC DATE CANNOT BE ENTERED WHEN A DAY HAS BEEN ENTERED

Reason:

It is an invalid situation to specify a generic date AND a day on the one timer.

System Action:

Field(s) highlighted in error.

User Action:

Specify either a generic date or a DAY.

RM500019

P1 changed, resource(P2) may be affected

Reason:

The resource identified by *P2* may be affected by a change to the availability map or monitoring map identified by *P1* .

System Action:

None.

User Action:

Check the resource to ensure its desired state and mode or monitoring activity status are as required.

RM500020**UNABLE TO EXPAND TIMER ENTRY. TIMER LIMIT OF ~P1 WILL BE EXCEEDED****Reason:**

A generic value of '*' , 'W/D' or 'W/E' was specified, which would cause the maximum number of timers (P1) to be exceeded, if it were expanded out to one timer entry for each day covered.

System Action:

Field(s) highlighted in error.

User Action:

Correct the number of timer entries to remain below the limit.

RM500021**DATE CANNOT BE ENTERED WHEN A GENERIC DAY HAS BEEN ENTERED****Reason:**

It is an invalid situation to specify a date AND a generic day on the one timer. A generic day is either * for every day, W/E for Weekends and W/D for Weekdays.

System Action:

Field(s) highlighted in error.

User Action:

Specify either a date or a generic DAY.

RM500022**P1 deleted, resource (P2) status reset****Reason:**

The availability map or monitoring map identified by *P1* has been deleted, causing the resource identified by *P2* to have its status reset.

System Action:

None.

User Action:

None.

RM500023

P1 not P2 - already exists

Reason:

The Availability Map or Monitoring Map identified by *P1* was not saved or copied, because it already exists in the target system image.

System Action:

Request rejected.

User Action:

Specify a name that does not already exist in the target system image.

RM500024

P1 deleted

Reason:

The availability map or monitoring map identified by *P1* has been deleted.

System Action:

None.

User Action:

None.

RM500025

Resource (P2) detached from P1. Status reset.

Reason:

The resource status has been reset because no availability map or monitoring map is attached.

System Action:

None.

User Action:

None.

RM500027**P1, P2 OR P3 MUST BE SPECIFIED****Reason:**

There is no use of specifying a timer without specifying any of *P1* or *P2* or *P3* .

System Action:

Validation failed.

User Action:

Specify desired state, mode or a process.

RM500028**PARAMETER SPECIFIED WITHOUT PROCESS NAME****Reason:**

When a process parameter specified, the process name must be specified.

System Action:

Validation failed.

User Action:

Clear process parameter or specify a process name in the process name field.

RM500029**EXPIRED P1 SPECIFIED****Reason:**

Validation found an expired date and time specified.

System Action:

Validation failed.

User Action:

Specify future date and time.

RM500030

DATE MUST NOT BE GREATER THAN EXPIRY DATE

Reason:

A date entered in a timer detail line cannot be greater than the specified expiry date.

System Action:

Field highlighted in error.

User Action:

Specify a date less than the expiry date or specify later expiry date.

RM500031

NO MAP OVERRIDE CURRENTLY IN PLACE

Reason:

You have attempted to do a map reset (MPR) action against a resource that does not have a map override (MPO).

System Action:

Request rejected.

User Action:

None.

RM500032

P1 successfully P2

Reason:

The availability map or monitoring map *P1* was copied successfully from one system image to another system image. Either a copy was created or an existing map was replaced, as indicated by *P2* .

System Action:

None.

User Action:

None.

RM570001**INVALID KEYWORD VALUE SPECIFIED - KEYWORD(P1) VALUE(P2)****Reason:**

An invalid keyword was passed to the procedure.

System Action:

The request is rejected.

User Action:

Contact the system administrator.

RM570002**UPDATE IN PROGRESS BY P1****Reason:**

Update is in progress on this definition by another user.

System Action:

The request is rejected.

User Action:

Try again later.

RM570003**NO RECORDS FOUND****Reason:**

No records found to be displayed in the selection list.

System Action:

None.

User Action:

None.

RM570101

INVALID KEYWORD VALUE SPECIFIED - KEYWORD(P1) VALUE(P2)

Reason:

An invalid keyword was passed to the procedure.

System Action:

The request is rejected.

User Action:

Contact the system administrator.

RM570102

REQUIRED FIELD/S NOT ENTERED

Reason:

Validation found no entry specified on mandatory field/s.

System Action:

The request is rejected.

User Action:

Specify entry on field/s in error.

RM570103

UPDATE IN PROGRESS BY P1

Reason:

Update is in progress on this definition by another user.

System Action:

The request is rejected.

User Action:

Try again later.

RM570104**NO BLANKS ALLOWED FOR P1****Reason:**

Validation found an invalid value has been specified for *P1* .

System Action:

The value is rejected.

User Action:

Specify a value with no blanks.

RM600001**INVALID KEYWORD VALUE SPECIFIED - KEYWORD(~P1) VALUE(~P2)****Reason:**

An invalid keyword was passed to the service procedure.

System Action:

The request is rejected.

User Action:

Correct the calling procedure to the service procedure and rerun exec.

RM600002**REQUIRED FIELD/S NOT ENTERED****Reason:**

Validation found no entry specified on mandatory field/s.

System Action:

The request is rejected.

User Action:

Specify entry on field/s in error.

RM600003

INVALID OPTION

Reason:

Invalid option specified.

System Action:

The request is rejected.

User Action:

Use '?' to display valid options, or check comment for valid options.

RM600004

NO FILTER NAME SPECIFIED

Reason:

Filter name to be processed with the option specified not found.

System Action:

The request is rejected.

User Action:

Specify filter name or use '?' to select filter name.

RM600101

INVALID KEYWORD VALUE SPECIFIED - KEYWORD(~P1) VALUE(~P2)

Reason:

An invalid keyword was passed to the service procedure.

System Action:

The request is rejected.

User Action:

Correct the calling procedure to the service procedure and rerun exec.

RM600102**INVALID OPTION****Reason:**

Invalid option specified.

System Action:

The request is rejected.

User Action:

Use '?' to display valid options, or check comment for valid options.

RM600103**NO FILTER NAME SPECIFIED****Reason:**

Filter name to be processed with the option specified not found.

System Action:

The request is rejected.

User Action:

Specify filter name or use '?' to select filter name.

RM600201**INVALID KEYWORD VALUE SPECIFIED - KEYWORD(~P1) VALUE(~P2)****Reason:**

An invalid keyword was passed to the service procedure.

System Action:

The request is rejected.

User Action:

Correct the calling procedure to the service procedure and rerun exec.

RM600202

REQUIRED FIELD/S NOT ENTERED

Reason:

Validation found no entry specified on mandatory field/s.

System Action:

The request is rejected.

User Action:

Specify entry on field/s in error.

RM600203

INVALID OPTION

Reason:

Invalid option specified.

System Action:

The request is rejected.

User Action:

Use '?' to display valid options, or check comment for valid options.

RM600204

NO FILTER NAME SPECIFIED

Reason:

Filter name to be processed with the option specified not found.

System Action:

The request is rejected.

User Action:

Specify filter name or use '?' to select filter name.

RM600205**UNABLE TO DETERMINE OBJECT ID PARAMETER****Reason:**

Object ID not found and can not be created because there is not enough information passed to the procedure.

System Action:

The request is rejected.

User Action:

Contact System Administrator.

RM600301**INVALID KEYWORD VALUE SPECIFIED - KEYWORD(~P1) VALUE(~P2)****Reason:**

An invalid keyword was passed to the service procedure.

System Action:

The request is rejected.

User Action:

Correct the calling procedure to the service procedure and rerun exec.

RM600302**UPDATE IN PROGRESS BY ~P1****Reason:**

Update is in progress on this definition by other user.

System Action:

The request is rejected.

User Action:

Try again later.

RM600303

REQUIRED FIELD/S NOT ENTERED

Reason:

Validation found no entry specified on mandatory field/s.

System Action:

The request is rejected.

User Action:

Specify entry on field/s in error.

RM600304

INVALID OPTION

Reason:

Invalid option specified.

System Action:

The request is rejected.

User Action:

Use '?' to display valid options, or check comment for valid options.

RM600305

NO FILTER NAME SPECIFIED

Reason:

Filter name to be processed with the option specified not found.

System Action:

The request is rejected.

User Action:

Specify filter name or use '?' to select filter name.

RM600306**UNABLE TO DETERMINE OBJECT ID PARAMETER****Reason:**

Object ID not found and can not be created because there is not enough information passed to the procedure.

System Action:

The request is rejected.

User Action:

Contact System Administrator.

RM600307**COMPLEX ICON FILTER, CAN NOT USE OPTION 2****Reason:**

A complex icon filter, should use option 3 because option 2 is reserved for a simple icon filter

System Action:

The request is rejected.

User Action:

Use option 3 instead.

RM60SU01**INVALID KEYWORD VALUE SPECIFIED - KEYWORD(~P1) VALUE(~P2)****Reason:**

An invalid keyword was passed to the service procedure.

System Action:

The request is rejected.

User Action:

Correct the calling procedure to the service procedure and rerun exec.

RM60SU02

UPDATE IN PROGRESS BY ~P1

Reason:

Update is in progress on this definition by other user.

System Action:

The request is rejected.

User Action:

Try again later.

RM60SU03

REQUIRED FIELD/S NOT ENTERED

Reason:

Validation found no entry specified on mandatory field/s.

System Action:

The request is rejected.

User Action:

Specify entry on field/s in error.

RM60SU04

INVALID OPTION

Reason:

Invalid option specified.

System Action:

The request is rejected.

User Action:

Use '?' to display valid options, or check comment for valid options.

RM60SU05**NO FILTER NAME SPECIFIED****Reason:**

Filter name to be processed with the option specified not found.

System Action:

The request is rejected.

User Action:

Specify filter name or use '?' to select filter name.

RM60SU06**UNABLE TO DETERMINE OBJECT ID PARAMETER****Reason:**

Object ID not found and can not be created because there is not enough information passed to the procedure.

System Action:

The request is rejected.

User Action:

Contact System Administrator.

RM60SU07**COMPLEX ICON FILTER, CAN NOT USE OPTION B****Reason:**

A complex icon filter, should use option C because option B is reserved for a simple icon filter.

System Action:

The request is rejected.

User Action:

Use option C instead.

RM700001

INVALID KEYWORD VALUE SPECIFIED - KEYWORD(~P1) VALUE(~P2)

Reason:

An invalid keyword was passed to the service procedure.

System Action:

The request is rejected.

User Action:

Correct the calling procedure to the service procedure and rerun exec.

RM700002

REQUIRED FIELD/S NOT ENTERED

Reason:

Validation found no entry specified on mandatory field/s.

System Action:

The request is rejected.

User Action:

Specify entry on field/s in error.

RM700101

INVALID KEYWORD VALUE SPECIFIED - KEYWORD(~P1) VALUE(~P2)

Reason:

An invalid keyword was passed to the service procedure.

System Action:

The request is rejected.

User Action:

Correct the calling procedure to the service procedure and rerun exec.

RM700102**UNABLE TO DETERMINE OBJECT ID PARAMETER****Reason:**

Object ID not found and can not be created because there is not enough information passed to the procedure.

System Action:

The request is rejected.

User Action:

Contact System Administrator.

RM700201**INVALID KEYWORD VALUE SPECIFIED - KEYWORD(~P1) VALUE(~P2)****Reason:**

An invalid keyword was passed to the service procedure.

System Action:

The request is rejected.

User Action:

Correct the calling procedure to the service procedure and rerun exec.

RM700202**REQUIRED FIELD/S NOT ENTERED****Reason:**

Validation found no entry specified on mandatory field/s.

System Action:

The request is rejected.

User Action:

Specify entry on field/s in error.

RM700203

UNABLE TO DETERMINE OBJECT ID PARAMETER

Reason:

Object ID not found and can not be created because there is not enough information passed to the procedure.

System Action:

The request is rejected.

User Action:

Contact System Administrator.

RM700301

INVALID KEYWORD VALUE SPECIFIED - KEYWORD(~P1) VALUE(~P2)

Reason:

An invalid keyword was passed to the service procedure.

System Action:

The request is rejected.

User Action:

Correct the calling procedure to the service procedure and rerun exec.

RM700302

UPDATE IN PROGRESS BY ~P1

Reason:

Update is in progress on this definition by other user.

System Action:

The request is rejected.

User Action:

Try again later.

RM700303**REQUIRED FIELD/S NOT ENTERED****Reason:**

Validation found no entry specified on mandatory field/s.

System Action:

The request is rejected.

User Action:

Specify entry on field/s in error.

RM700304**UNABLE TO DETERMINE OBJECT ID PARAMETER****Reason:**

Object ID not found and can not be created because there is not enough information passed to the procedure.

System Action:

The request is rejected.

User Action:

Contact System Administrator.

RM710001**CHANGES MADE DURING INTERACTIVE SESSION. USE FILE OR CANCEL TO EXIT****Reason:**

This message is displayed on exit from an interactive session, if any changes have been made to a process using interactive edit.

System Action:

Re-enter interactive edit mode and allow user to select FILE or CANCEL

User Action:

Select FILE or CANCEL as appropriate

RM710002

NO STEPS IN PROCESS

Reason:

In interactive mode, the STEP command was issued but no steps have been defined in the process.

System Action:

Reject the request.

User Action:

Define steps and continue

RM710003

END OF PROCESS. 'REFRESH' ENVIRONMENT TO CONTINUE.

Reason:

The current process has been 'STEPPED' to the point where execution would normally terminate. To use the STEP command again the interactive environment will need to be reset by using the REFRESH command

System Action:

Request is rejected.

User Action:

Use the REFRESH key to reset the environment.

RM710004

INTERACTIVE PROCESS LOG HAS BEEN CLEARED

Reason:

The process log for this interactive session has been cleared.

System Action:

None

User Action:

None

RM710005**INTERACTIVE PROCESS LOG HAS BEEN CLEARED AND ENVIRONMENT RESET****Reason:**

The process log for this interactive session has been cleared, and the processing environment has been refreshed so that execution will re-commence from the first step if the STEP command is used.

System Action:

None

User Action:

None

RM710006**INTERACTIVE EDIT COMPLETE - PROCESSING ENVIRONMENT RESET****Reason:**

The user has been in interactive edit mode and has returned to RUN mode. The processing environment has been refreshed so that execution will re-commence from the first step if the STEP command is used.

System Action:

None

User Action:

None

RM710007**PROCESS(P1) SAVED SUCCESSFULLY****Reason:**

The process identified by *P1* has been successfully saved.

System Action:

None.

User Action:

None.

RM710008

~P1 OF PROCESS(~P2) CANCELLED

Reason:

The function P1 being performed on process P2 was cancelled at the user's request.

System Action:

None

User Action:

None

RM710009

INTERACTIVE PROCESS LOG IS EMPTY

Reason:

A request was made to view the process log for an interactive session but there were no log records found

System Action:

Request rejected

User Action:

None

RM710010

A MAXIMUM OF ~P1 STEPS MAY BE SPECIFIED FOR A PROCESS

Reason:

An attempt was made to Insert or Repeat a step which would cause the process to exceed the maximum number of steps allowed.

System Action:

Request rejected.

User Action:

None

RM710011**UNABLE TO INSERT A LINE - USE 'REFRESH'****Reason:**

An error has occurred which prevents another's step from being inserted. Use the REFRESH command in an attempt to re-sequence the existing steps and allow inserts to be performed.

System Action:

Request rejected.

User Action:

Use REFRESH command

RM710012**NO MACRO DETAILS ON THIS LINE****Reason:**

A request for parameter definition was made against a line which did not contain a macro name

System Action:

Request rejected

User Action:

Enter details before trying to define parameters

RM710013**P1(P2) WITH SYSNAME(P3) VERSION(P4) NOT FOUND****Reason:**

The object type identified by P1, with a name of P2, system name of P3 and system version of P4 was not found.

System Action:

Request rejected.

User Action:

Determine the correct name or the reason for the object's absence. Correct the error and retry.

RM710014

BAD RETURN CODE FROM MACRO(~P1). RC=~P2

Reason:

A request to browse/update parameters for the macro identified by P1 has ended with return code P2.

System Action:

None

User Action:

Contact systems programmer

RM710015

PARAMETERS FOR STEP(~P1), MACRO(~P2) REMAIN UNCHANGED

Reason:

A request to define parameters for the step identified by P1, which invokes the macro identified by P2, has ended without a change being made to the parameters.

System Action:

None

User Action:

None

RM710016

PARAMETERS FOR STEP(~P1), MACRO(~P2) SET SUCCESSFULLY

Reason:

A request to define parameters for the step identified by P1, which invokes the macro identified by P2, has ended successfully. The new parameter settings will be retained in memory and written to disk if/when the FILE or SAVE command is issued.

System Action:

None

User Action:

None

RM710017**VARIABLE ~P1 ERROR. ID=~P2. ZFDBK=~P3. KEY=~P4****Reason:**

A variable error occurred while performing function(P1) on variable(P2). The FDBK was P3 and the entry key was P4.

System Action:

Request rejected.

User Action:

Contact systems programmer

RM710018**'~P1' IS A REQUIRED FIELD****Reason:**

While defining a process the field identified by P1 was not entered and is a required field.

System Action:

Field highlighted in error.

User Action:

Enter a value for the specified field

RM710019**PROCESS(~P1) NOT SAVED, NO CHANGES MADE****Reason:**

The process identified by P1 has not been saved to disk as no changes had been made.

System Action:

None

User Action:

None

RM710020

'~P1' IS NOT A VALID VALUE FOR '~P2'

Reason:

The value identified by P1 is not valid for the field identified by P2

System Action:

Field highlighted in error.

User Action:

Enter a valid value for the specified field

RM710021

'~P1' IS A RESERVED WORD

Reason:

The value identified by P1 is not a valid value where it appears because it is reserved for internal use.

System Action:

Field highlighted in error.

User Action:

Enter a valid value for the specified field

RM710022

STEPNAME(~P1) IS NOT UNIQUE

Reason:

All steps which make up a process must have a unique name. This step is invalid because a step with the same name appears prior to it in the process.

System Action:

Field highlighted in error.

User Action:

Enter a unique step name

RM710023**ALL PARTS OF 'CONDITION' MUST BE ENTERED****Reason:**

If one part of a condition is entered then all three portions must be entered.

System Action:

Field(s) highlighted in error.

User Action:

Enter missing portions of condition expression

RM710024**'CONDITION' IS INVALID FOR FIRST STEP****Reason:**

No condition may be specified for the first step of a process

System Action:

Field(s) highlighted in error.

User Action:

Clear the condition in error.

RM710025**THERE IS NO STEP(P1) PRIOR TO THIS STEP****Reason:**

A condition expression is referencing a step name which does not appear prior to this step in the process

System Action:

Field highlighted in error.

User Action:

Enter another step name or define a step with the required name prior to the current step.

RM710026

NO MACROS FOUND

Reason:

A '?' was placed in the macro field and no macros were found to list.

System Action:

Field highlighted in error.

User Action:

Define some macros

RM710027

NO MACROS FOUND WHICH MATCH '~P1'

Reason:

No macros were found which match the generic portion entered in the macro field.

System Action:

Field highlighted in error.

User Action:

Change the generic portion and try again, or use '?' to list all macros

RM710028

PROCESS(~P1) DELETED

Reason:

The process identified by P1 has been successfully deleted.

System Action:

None

User Action:

None

RM710029**SERVICE PROCEDURE ~P1 INVOKED WITH INVALID KEYWORD
~P2(~P3)****Reason:**

The service procedure identified by P1 was invoked with an invalid value for the keyword identified by P2 of P3.

System Action:

Request rejected

User Action:

Correct the keyword value and re-try

RM710030**INTERACTIVE EDIT COMPLETE - NO CHANGES MADE****Reason:**

The user has been in interactive edit mode and has returned to RUN mode. The processing environment has not been refreshed as no changes were made during the interactive edit session.

System Action:

None

User Action:

None

RM710031**PROCESS(~P1) ALREADY EXISTS****Reason:**

The user has specified a Process name on an Add or Copy which corresponds to an existing Process.

System Action:

Request is rejected.

User Action:

Change the name of this Process and continue.

RM710032

~P1 STEP(S) DEFINED WITH MACRO(S) WITH NO PARAMETERS

Reason:

This is a warning message only. It indicates that P1 steps have been included in the process without having parameters defined for their macros. Issuing FILE or SAVE immediately will cause the process to be saved.

System Action:

None

User Action:

Either issue FILE or SAVE immediately to ignore the warning, or define parameters for the specified macros.

RM710033

PROCESS(\$NCL) IS AN INTERNAL PROCESS ONLY

Reason:

A function such as Browse or Update was attempted with the special internal process \$NCL as the target. This is invalid as \$NCL is not a real process definition.

System Action:

Request is rejected.

User Action:

None.

RM710034**PROCESS(P1) NOT COPIED - P2****Reason:**

The *P1* process definition was not copied because of *P2* .
If the definition is for a global process, the operation is inappropriate because a global process is available to all system images already.
If a definition of the same name already exists in the target image, the operation cannot be performed.

System Action:

The process definition is not copied.

User Action:

If the process definition already exists in the target system image, review the definition to determine whether you want to replace it.

RM710035**SUBMIT CANCELLED FOR PROCESS P1****Reason:**

The submit action for the process *P1* was cancelled as requested.

System Action:

None.

User Action:

None.

RM710036**UNDEFINED TARGET STEP " P1" RETURNED FROM STEP P2 BY MACRO P3****Reason:**

Step P2 which executed macro P3 returned an undefined step name as the next step to execute. The undefined step name is *P1*.

System Action:

The process is terminated in error.

User Action:

Correct the target step name returned from step *P2* by macro *P3*.

RM710037

LOOP CONTROL LIMIT FOR STEP P1 REACHED, LIMIT IS P2

Reason:

Step *P1* returned another step name that is to be the next step to execute, however, this step has already altered the flow of control in the process by the allowed limit of *P2* as specified in the macro or as defaulted. This limit cannot be exceeded and is used to prevent the process from looping continuously.

System Action:

The process is terminated in error.

User Action:

Correct the specifications in the process to prevent step *P1* from being executed more than the specified limit.

RM710038

PROCESS NOT IN THE CURRENT SYSTEM IMAGE OR IS A RESERVED PROCESS

Reason:

The process selected cannot be submitted to the scheduler because it is not in the currently loaded system image or the process is a special reserved process that cannot be submitted.

System Action:

The request is rejected.

User Action:

None.

RM710039**PROCESS(P1) SUCCESSFULLY P2****Reason:**

The *P1* process definition was copied successfully from one system image to another system image. Either a copy was created or an existing definition was replaced as indicated by *P2* .

System Action:

The process definition is copied.

User Action:

None.

RM710040**ALERT ACTION RECORD MISSING - OBJID: P1****Reason:**

A record defining the action to be taken when an alert is raised is missing.

System Action:

The process is not saved.

User Action:

To recreate the action, enter *P* beside the entry for the GENALERT macro and press F10 (Actions).

RM710041

Missing Action record OBJID: P1 for Process: P2

Reason:

An action for a GENALERT macro is not in the knowledge base. The macro is in a process with the object ID *P2* that is a concatenation of the following:

- Image name
- Image version
- 71 (class number for process definitions)
- Process name

System Action:

The process is copied without the action record.

User Action:

Note the process, and update it to recreate the missing action.

RM800001

PROCEDURE(~P1) INVOKED WITH INVALID KEYWORD ~P2(~P3)

Reason:

The service procedure identified by P1 was invoked with an invalid value for the keyword identified by P2 of P3.

System Action:

Request rejected

User Action:

Correct the keyword value and re-try

RM800002**REQUIRED ICON(~P1) NOT FOUND****Reason:**

The icon identified by P1 was not found on the database

System Action:

Request rejected

User Action:

Determine the correct name or the reason for the object's absence. Correct the error, and retry.

RM800003**INVALID COMMAND****Reason:**

The command entered on the command line was not recognized by the procedure.

System Action:

The command is rejected.

User Action:

Correct the command and retry.

RM800004**'~P1' IS A REQUIRED FIELD****Reason:**

While defining an icon the field identified by P1 was not entered and is a required field.

System Action:

Field highlighted in error.

User Action:

Enter a value for the specified field

RM800005

'~P1' IS NOT A VALID VALUE FOR '~P2'

Reason:

The value identified by P1 is not valid for the field identified by P2

System Action:

Field highlighted in error.

User Action:

Enter a valid value for the specified field

RM800006

'~P1' CANNOT EXCEED '~P2' WHEN '~P3' IS '~P4'

Reason:

The field identified by P1 cannot contain a value greater than P2. Issued in relation to the HEIGHT and WIDTH fields. When issued in relation to HEIGHT the value of P2 will be dependent on the current value of WIDTH (P4) and vice versa.

System Action:

Field highlighted in error.

User Action:

Enter a valid value for the specified field

RM800007

ONLY ONE 'CMD' FIELD CAN BE SPECIFIED PER ICON

Reason:

Only one input (CMD) field may be specified in an icon.

System Action:

Request rejected

User Action:

Only specify one CMD field

RM800008**ICONS MUST BE AT LEAST 16 CHARACTERS WIDE TO INSERT A LABEL****Reason:**

The TXT command was issued against a line which already had a field assigned to it. This means that the text will be interpreted as a LABEL. However, LABELS need an icon to be at least 16 characters wide to be able to be inserted.

System Action:

Request rejected

User Action:

Make icon wider.

RM800009**~P1 OF ICON CANCELLED****Reason:**

Function P1, which was being performed on an icon was cancelled by the user.

System Action:

None

User Action:

None

RM800010**ICON(~P1) ~P2 SUCCESSFULLY****Reason:**

The icon P1 has had action P2 successfully performed upon it.

System Action:

None

User Action:

None

RM800011

THE MINIMUM VALID VALUE FOR '~P1' IS '~P2'

Reason:

This message issues if a value is specified for HEIGHT or WIDTH which is below the permissible minimum.

System Action:

Request rejected

User Action:

Select a value equal to or greater than the minimum (P2)

RM800012

UPDATE IN PROGRESS BY ~P1

Reason:

The required ICON is currently being updated by the user P1.

System Action:

The request is rejected.

User Action:

Try again later.

RM800013

ICON(~P1) ALREADY EXISTS

Reason:

The user has specified an Icon name on an Add or Copy which corresponds to an existing Icon.

System Action:

Request is rejected.

User Action:

Change the name of this Icon and continue.

RM800016**UNABLE TO P1. DEFINITION REQUIRES P2. TERMINAL ALLOWS P3.****Reason:**

An icon panel which requires P2 rows is attempting to be displayed on a terminal which only has a capacity of P3 rows. This situation has most probably arisen by the icon being created on a terminal which supports a larger screen size.

System Action:

Request rejected.

User Action:

Display the panel definition on a terminal large enough to hold it.

RM810001**PROCEDURE(~P1) INVOKED WITH INVALID KEYWORD ~P2(~P3)****Reason:**

The service procedure identified by P1 was invoked with an invalid value for the keyword identified by P2 of P3.

System Action:

Request rejected

User Action:

Correct the keyword value and re-try

RM810002**REQUIRED ICON PANEL(~P1) NOT FOUND****Reason:**

The icon panel definition identified by P1 was not found

System Action:

Request rejected

User Action:

Determine the correct name or the reason for the object's absence. Correct the error, and retry.

RM810003

INVALID COMMAND

Reason:

The command entered on the command line was not recognized by the procedure.

System Action:

The command is rejected.

User Action:

Correct the command and retry.

RM810004

'~P1' IS A REQUIRED FIELD

Reason:

While defining an icon panel definition the field identified by P1 was not entered and is a required field.

System Action:

Field highlighted in error.

User Action:

Enter a value for the specified field

RM810005

'~P1' IS NOT A VALID VALUE FOR '~P2'

Reason:

The value identified by P1 is not valid for the field identified by P2

System Action:

Field highlighted in error.

User Action:

Enter a valid value for the specified field

RM810009**~P1 OF ICON PANEL CANCELLED****Reason:**

Function P1, which was being performed on an icon panel definition was cancelled by the user.

System Action:

None

User Action:

None

RM810010**ICON PANEL(~P1) ~P2****Reason:**

The icon panel P1 has had action P2 successfully performed upon it.

System Action:

None

User Action:

None

RM810011**UNABLE TO PUT ICON AT POSITION(~P1). ~P2****Reason:**

The icon attempting to be placed on the screen will not fit at the row,col combination identified by P1. This may be because it will overlay an existing icon or it will go over the edges of the screen. The reason is contained in P2.

System Action:

Reject request

User Action:

Make the icon smaller or move it to a different position.

RM810012

NO CURRENT ICON AVAILABLE TO PLACE ON SCREEN

Reason:

An attempt was made to use the PUTICON command to place an icon on the screen, however, there was no "current icon". An icon can be selected as the "current icon" by using the PICKICON command.

System Action:

Reject request

User Action:

Select an icon for placement using the PICKICON command.

RM810013

CURSOR MUST BE POSITIONED WITHIN AN ICON FOR COMMAND(~P1)

Reason:

An attempt was made to use a command which requires an icon to identified. To identify an icon the cursor must be placed within the body of the icon. The cursor was detected as having not been within the body of an icon.

System Action:

Reject request

User Action:

Place the cursor over the icon to be actioned.

RM810014

NO ~P1 WAS SELECTED FROM THE LIST

Reason:

Either a PICKICON or PICKGRP command was issued, to display a list of available ICONS or RESOURCE GROUPS but one was not chosen from the list.

System Action:

None

User Action:

None

RM810015**~P1 ICONS HAVE MISSING RESOURCE GROUPS. PANEL WILL NOT BE GENERATED****Reason:**

This is a warning message only. It indicates that P1 icons have been included on the panel without having resource groups attached. Issuing FILE or SAVE immediately will cause the definition to be saved, but no Icon Panel will be generated until all icons have resource groups attached. Resource Groups are attached to icons using the PICKGRP command .

System Action:

None

User Action:

Either issue FILE or SAVE immediately to ignore the warning, or attach icons to the specified boxes and try to SAVE/FILE again.

RM810016**UNABLE TO P1. DEFINITION REQUIRES P2. TERMINAL ALLOWS P3.****Reason:**

An icon panel which requires P2 lines/columns is attempting to be displayed on a terminal which only has a capacity of P3 lines/columns.

System Action:

Request rejected.

User Action:

Display the panel definition on a terminal large enough to hold it.

RM810017

ICON= P1 RESOURCE GROUP= P2

Reason:

This message is issued in response to a QUERY command against an icon on the panel. P1 is the name of the ICON used and P2 is the name of the RESOURCE GROUP attached to it.

System Action:

None.

User Action:

None.

RM810018

ICON PANEL(~P1) ALREADY EXISTS

Reason:

The user has specified an Icon Panel name on an Add or Copy which corresponds to an existing Icon Panel.

System Action:

Request is rejected.

User Action:

Change the name of this Icon Panel and continue.

RM810019**RESOURCE GROUP(~P1) HAS ALREADY BEEN ALLOCATED TO ANOTHER ICON****Reason:**

As a result of a PICKGRP command a Resource Group was selected to be attached to an Icon. However, the selected Resource Group was previously attached to another Icon. Each Resource Group to be monitored may only be attached to ONE Icon per Icon Panel.

System Action:

Request rejected.

User Action:

Select a different Resource Group or delete the Icon to which this Resource Group was previously attached, or attach another Resource Group to it.

RM900101**INVALID KEYWORD VALUE SPECIFIED - KEYWORD(~P1) VALUE(~P2)****Reason:**

An invalid keyword was passed to the service procedure.

System Action:

The request is rejected.

User Action:

Correct the calling procedure to the service procedure and rerun exec.

RM900102**UNABLE TO DETERMINE OBJECT ID PARAMETER****Reason:**

Object ID not found and can not be created because there is not enough information passed to the procedure.

System Action:

The request is rejected.

User Action:

Contact System Administrator.

RM900103

RECORD NOT FOUND

Reason:

The specified record was not found.

System Action:

None.

User Action:

None.

RM900301

INVALID KEYWORD VALUE SPECIFIED - KEYWORD(~P1) VALUE(~P2)

Reason:

An invalid keyword was passed to the service procedure.

System Action:

The request is rejected.

User Action:

Correct the calling procedure to the service procedure and rerun exec.

RM900302

UPDATE IN PROGRESS BY ~P1

Reason:

Update is in progress on this definition by other user.

System Action:

The request is rejected.

User Action:

Try again later.

RM900303**REQUIRED FIELD/S NOT ENTERED****Reason:**

Validation found no entry specified on mandatory field/s.

System Action:

The request is rejected.

User Action:

Specify entry on field/s in error.

RM900304**UNABLE TO DETERMINE OBJECT ID PARAMETER****Reason:**

Object ID not found and can not be created because there is not enough information passed to the procedure.

System Action:

The request is rejected.

User Action:

Contact System Administrator.

RM900305**FIELD PROMPT ENTRY WITH FULL VALUE(~P1) ALREADY EXISTS****Reason:**

Not allowed to have the same full value.

System Action:

The request is rejected.

User Action:

Specify a unique full value.

RM900306

RECORD NOT FOUND

Reason:

The specified record was not found.

System Action:

None.

User Action:

None.

RM900307

FIELD PROMPT ABBREVIATION (P1) ALREADY EXISTS

Reason:

A Field Prompt Definition with the abbreviation entered already exists.

System Action:

The request to file or save the record is rejected.

User Action:

Change the abbreviation of the Field Prompt Definition and attempt to save it again.

RM900308

FIELD PROMPT P1 ALREADY EXISTS

Reason:

A Field Prompt Definition with the *P1* entered already exists.

System Action:

The value is rejected.

User Action:

Change the *P1* of the Field Prompt Definition and try again.

RMAB0001**INVALID KEYWORD VALUE SPECIFIED - KEYWORD(~P1) VALUE(~P2)****Reason:**

An invalid keyword was passed to the service procedure.

System Action:

The request is rejected.

User Action:

Correct the calling procedure to the service procedure and rerun exec.

RMAB0002**NAME(~P1) CLASS(~P2) CREATED - SYSNAME(~P3) VERSION(~P4)****Reason:**

The auto population facility has created the above resource.

System Action:

Informational only.

User Action:

None.

RMAB0003**CREATE FAILED NAME(~P1) CLASS(~P2) - RC(~P3) SYSMMSG(~P4)****Reason:**

The auto population facility has attempted to create a resource definition, but failed.

System Action:

Processing continues.

User Action:

None.

RMAB0004

P1

Reason:

The command processor encountered an error while processing a system command. *P1* indicates the cause of the error.

System Action:

Processing terminates in error.

User Action:

Use *P1* to determine the cause of the error, and rectify the problem.

RMAB0005

NO RESOURCES SELECTED FROM LIST

Reason:

No resources were selected from the Auto Populate resource selection list previously presented.

System Action:

None.

User Action:

None.

RMAB0006

~P1(~P2) DEFINED SUCCESSFULLY

Reason:

The auto population facility has created the above definition.

System Action:

Informational only.

User Action:

None.

RMAB0007**AUTO POPULATION REQUEST COMPLETE****Reason:**

The Auto population request has completed.

System Action:

Informational only.

User Action:

None.

RMAB0008**RESOURCE P1 NOT FOUND IN SYSTEM IMAGE P2 FOR UPDATE.****Reason:**

You were auto-populating the *P2* system image and entered SU beside the *P1* resource. The region cannot find the resource definition after population.

System Action:

The SU action terminates with the error message.

User Action:

Contact your local technical support representative.

RMAB0009**AUTO POPULATE FAILED FOR SYSPLEX RESOURCES - RC(P1) SYMSG(P2)****Reason:**

The Auto Populate Facility tried but failed to create a sysplex resource definition.

System Action:

Processing continues.

User Action:

Contact Technical Support.

RMAB0101

INVALID KEYWORD VALUE SPECIFIED - KEYWORD(~P1) VALUE(~P2)

Reason:

An invalid keyword was passed to the service procedure.

System Action:

The request is rejected.

User Action:

Correct the calling procedure to the service procedure and rerun exec.

RMAB0102

REQUIRED FIELD/S NOT ENTERED

Reason:

Validation found no entry specified on mandatory field/s.

System Action:

The request is rejected.

User Action:

Specify entry on field/s in error.

RMAB0103

RESOURCE WAS NOT PREVIOUSLY SELECTED

Reason:

The Unselect command (U) was entered against a resource in the Auto Populate selection list, but it had not previously been selected and therefore could not be 'unselected'.

System Action:

None.

User Action:

None.

RMAB0104**P1****Reason:**

The command processor encountered an error while processing a system command. *P1* indicates the cause of the error.

System Action:

Processing terminates in error.

User Action:

Use *P1* to determine the cause of the error, and rectify the problem.

RMAB0105**RESOURCE P1 ALREADY EXISTS****Reason:**

A request to select a resource for Auto Population was rejected because the resource is already defined in the selected System Image.

System Action:

None.

User Action:

None.

RMAB0106**EITHER 'S' OR 'U' MUST BE SPECIFIED WITH THE 'ALL' COMMAND****Reason:**

When using the ALL command, *S* or *U* must be used to indicate whether all entries are to be *selected* or *unselected* (for example, ALL S).

System Action:

Command is rejected.

User Action:

Re-issue the command by specifying either ALL S or ALL U as required.

RMAB0107

AUTO POPULATE NOT SUPPORTED FOR P1 CDMGR TYPE

Reason:

The Auto Populate Facility is available to CONNECT:Direct for MVS CDMGR resources only (CDMGR type of JOB or STC).

System Action:

The request is rejected.

User Action:

Specify a CONNECT:Direct file transfer manager of type JOB or STC.

RMAB0108

RESOURCE P1 IS NOT SELECTABLE

Reason:

You were auto-populating a local system image and entered S beside the *P1* resource on the Auto Populate Selection List panel. However, the *P1* resource is already part of an active shared system image, and you cannot add it to the local system image.

System Action:

The region does not select the *P1* resource for auto-population.

User Action:

Determine whether the *P1* resource should be shared and, if required, update the affected system images.

RMAB0109

EITHER 'S','U' OR 'SU' MUST BE SPECIFIED WITH THE 'ALL' COMMAND

Reason:

You entered the ALL command with an invalid operand. The valid commands are as follows: ALL U, ALL S, and ALL SU.

System Action:

The command is rejected.

User Action:

Reissue the command with the correct operand.

RMAB0201**INVALID KEYWORD VALUE SPECIFIED - KEYWORD(P1) VALUE(P2)****Reason:**

An invalid keyword was passed to the service procedure.

System Action:

The request is rejected.

User Action:

Contact Technical Support.

RMAB0202**EITHER 'S','U' OR 'SU' MUST BE SPECIFIED WITH THE 'ALL' COMMAND****Reason:**

You entered the ALL command with an invalid operand. The valid commands are as follows: ALL U, ALL S, and ALL SU.

System Action:

The command is rejected.

User Action:

Reissue the command with the correct operand.

RMAB0203**RESOURCE WAS NOT PREVIOUSLY SELECTED****Reason:**

You entered U beside a resource that has not been selected. You cannot deselect that resource.

System Action:

None.

User Action:

None.

RMAB0204

AT LEAST ONE RESOURCE SHOULD BE SELECTED

Reason:

You must select at least one resource before you press F6 (Action).

System Action:

None.

User Action:

Enter *S* beside the resources you want to define, then press F6 (Action).

RMAB0205

P1

Reason:

The command processor encountered an error while processing a system command. *P1* indicates the cause of the error.

System Action:

Processing terminates in error.

User Action:

Use *P1* to determine the cause of the error, and rectify the problem.

RMAB0206

P1 INOPERATIVE - THIS IS NOT A SYSPLEX ENVIRONMENT

Reason:

The function specified in *P1* is not operative; therefore, your system is not running in a Sysplex environment.

System Action:

The process terminates.

User Action:

This function is not relevant in a non-sysplex environment.

RMAD0101**INVALID KEYWORD VALUE SPECIFIED - KEYWORD(~P1) VALUE(~P2)****Reason:**

An invalid keyword was passed to the service procedure.

System Action:

The request is rejected.

User Action:

Correct the calling procedure to the service procedure and rerun exec.

RMAD0102**DATABASE ~P1 FAILED, RC(~P2)****Reason:**

Request action on the database failed with non zero return code.

System Action:

The request is rejected.

User Action:

Contact System Administrator.

RMAD0103**CANNOT DELETE ACTIVE SYSTEM IMAGE DEFINITION****Reason:**

The active System Image Definition cannot be deleted.

System Action:

The request is rejected.

User Action:

Delete the System Image Definition when it is inactive.

RMAD0104

NO RECORDS ADDED OR FOUND

Reason:

No records of System Definition found in the database.

System Action:

None.

User Action:

None.

RMAD0105

UPDATE IN PROGRESS BY ~P1

Reason:

Update is in progress on this definition by other user.

System Action:

The request is rejected.

User Action:

Try again later.

RMAD0106

NO RECORDS FOUND

Reason:

No records found to be displayed in the selection list.

System Action:

None.

User Action:

None.

RMAD0107**DELETE UNSUCCESSFUL - LAST SYSTEM IMAGE FOR
SERVICEVIEW(~P1)****Reason:**

The System image selected for deleting is the last System Image that points (via APPC LU value) to a ServiceView system and therefore cannot be deleted.

System Action:

The request is rejected.

User Action:

This system image can only be delete if another system image points to this LU. If appropriate create another definition and retry.

RMAD0108**CANNOT DELETE SYSNAME(\$TEMPLAT) VERSION(0001)****Reason:**

The System Image Definition is the template definition base which should not be deleted.

System Action:

The request is rejected.

User Action:

None.

RMAD0109

NO MATCHING SYSTEM IMAGE(P1) STARTS WITH " P2"

Reason:

No system images with names or versions that start with *P2* were found.
P1 is either SYSNAME or VERSION.

System Action:

None.

User Action:

If required, create the system image. You can use any of the following methods to create a system image:

- Use the AutoAssist Express Setup Facility (/RADMIN.AD.E).
- Use the System Images option on the Resource Administration menu (/RADMIN).
- Use the AutoAssist Auto Populate Facility (/RADMIN).

RMAD0110

CANNOT DELETE SYSNAME(\$PROCESS) VERSION(0001)

Reason:

The global process image definition you have attempted to delete is a required component of Automation Services. You are not able to delete this global process image definition. However, you are able to delete other versions of the \$PROCESS global process image definition if you wish.

System Action:

The request is rejected.

User Action:

None.

RMAD0111**CANNOT DELETE SYSNAME(\$SERVICE) VERSION(0001)****Reason:**

The service image definition you have attempted to delete is a required component of Automation Services. You are not able to delete this service image definition. However, you are able to delete other versions of the \$SERVICE image definition if you wish.

System Action:

The request is rejected.

User Action:

None.

RMAD0112**P1 SYSTEM IMAGES FOUND****Reason:**

No system images of the type *P1* were found.

System Action:

None.

User Action:

If required, create the system image. You can use any of the following methods to create a system image:

- Use the AutoAssist Express Setup Facility (/RADMIN.AD.E).
- Use the System Images option on the Resource Administration menu (/RADMIN).
- Use the AutoAssist Auto Populate Facility (/RADMIN).

RMAD0113

SYSTEM LOAD REJECTED, ALREADY IN PROGRESS (P1)

Reason:

A request to load a new system image was rejected because there is already a system load in progress. The current load was started at *P1*.

System Action:

Request rejected.

User Action:

None.

RMAD0114

System load rejected, home system is not supported

Reason:

A request to load a system image was rejected because the home system was not supported by a linked region.

This may be because this is a system image from a region that has subsequently been unlinked.

System Action:

Request is rejected.

User Action:

Where the remote region is no longer linked, log on to that region and load the system image locally.

RMAD2001

INVALID KEYWORD VALUE SPECIFIED - KEYWORD(~P1) VALUE(~P2)

Reason:

An invalid keyword was passed to the service procedure.

System Action:

The request is rejected.

User Action:

Correct the calling procedure to the service procedure and rerun exec.

RMAD2002**' P1' IS NOT A VALID OPTION FOR THE BASE RESOURCE****Reason:**

Action *P1* was issued against the base resource, that is, the resource whose relationships are being displayed or defined. This is not a valid action for this resource.

System Action:

The error is highlighted, and the request is rejected.

User Action:

Use a valid action.

RMAD2003**MAXIMUM P1 RELATIONSHIPS ALREADY DEFINED FOR P2****Reason:**

You tried to create a *P1* relationship with the base resource. However, the *P2* resource already has the maximum number of *P1* relationships. A resource can have a maximum of 25 relationships of each type.

System Action:

The request is rejected.

User Action:

Review the existing *P1* relationships for the *P2* resource.

RMAD2004**THIS RESOURCE IS NOT ELIGIBLE FOR THE SELECTED ACTION****Reason:**

You entered an action that makes no sense for the selected resource (for example, a *PP* action against a resource which is already a primary parent).

System Action:

The request is rejected.

User Action:

Use an action which is applicable to the selected resource.

RMAD2005

UPDATE IN PROGRESS BY ~P1

Reason:

Update is in progress on this definition by other user.

System Action:

The request is rejected.

User Action:

Try again later.

RMAD2006

NO RECORDS FOUND

Reason:

No records exist.

System Action:

None

User Action:

None

RMAD2007

UNABLE TO DETERMINE OBJECT ID PARAMETER

Reason:

Object ID not found and can not be created because there is not enough information passed to the procedure.

System Action:

The request is rejected.

User Action:

Contact System Administrator.

RMAD2008**UNLINK ONLY VALID FOR CURRENT PARENT OR CHILD****Reason:**

The 'Unlink' line command is only valid for a currently linked Parent or Child.

System Action:

The request is rejected.

User Action:

None

RMAD2009**CONNECT INVALID FOR CONNECTED RESOURCE****Reason:**

The 'Connect' Line command is not valid for a currently connected resource. 'Connect' is only valid for Eligible resources.

System Action:

The request is rejected.

User Action:

None

RMAD2010**RESOURCE ALREADY CONNECTED****Reason:**

The 'Connect' Line command is not valid for a currently connected resource. 'Connect' is only valid for Eligible resources.

System Action:

The request is rejected.

User Action:

None

RMAD2011

RELATIONSHIPS UPDATE CANCELLED

Reason:

The user has cancelled the update of the relationships.

System Action:

Relationships are not updated.

User Action:

None

RMAD2012

EXISTING RELATED COMMAND ONLY VALID FOR PARENT OR CHILD

Reason:

The 'Existing Related' line command cannot be performed against the resource the Relationship List is currently presented for.

System Action:

None

User Action:

None

RMAD2014

LIMIT OF P1 PARENTS HAS BEEN REACHED

Reason:

A resource may have a maximum of *P1* parents connected to it. This message indicates that an attempt has been made to connect a parent to a resource which would cause the maximum to be exceeded.

System Action:

Request to connect is rejected.

User Action:

Restructure the hierarchy, possibly by inserting a LOGICAL resource, so that not all the parents are connected directly to the resource in question.

RMAD2015**LOCAL IMAGE MUST HAVE A HOME SYSTEM BEFORE RELATING TO SHARED IMAGE****Reason:**

You tried to specify a relationship between resources in a local system image and a shared system image, but the local image does not have a home system. To specify such a relationship, both resources must have the same home system.

From Version 4.0 onward, a local image must have a home system. The home system nominates the system on which the image can be loaded.

System Action:

The system image definition is displayed for update.

User Action:

Specify a home system for the image, then press F3 (File) to save the updated definition.

RMAD2016**P1 HOMESYS(P2) DOES NOT MATCH P3 HOMESYS(P4)****Reason:**

You tried to relate two resources that have different home systems. Only resources with the same home system can form a relationship.

System Action:

The request is rejected.

User Action:

None.

RMAD2101

INVALID KEYWORD VALUE SPECIFIED - KEYWORD(~P1) VALUE(~P2)

Reason:

An invalid keyword was passed to the service procedure.

System Action:

The request is rejected.

User Action:

Correct the calling procedure to the service procedure and rerun exec.

RMAD2106

NO RECORD FOUND

Reason:

No records exist.

System Action:

None

User Action:

None

RMAD2107

UNABLE TO DETERMINE OBJECT ID PARAMETER

Reason:

Object ID not found and can not be created because there is not enough information passed to the procedure.

System Action:

The request is rejected.

User Action:

Contact System Administrator.

RMAD2112**EXISTING RELATED COMMAND ONLY VALID FOR PARENT OR CHILD****Reason:**

The 'Existing Related' line command cannot be performed against the resource the Relationship List is currently presented for.

System Action:

None

User Action:

None

RMAD3501**INVALID KEYWORD VALUE SPECIFIED - KEYWORD(~P1) VALUE(~P2)****Reason:**

An invalid keyword was passed to the service procedure.

System Action:

The request is rejected.

User Action:

Correct the calling procedure to the service procedure and rerun exec.

RMAD3502**NO USER PROFILE FOUND****Reason:**

No User Profile found in the system.

System Action:

The request is rejected.

User Action:

None.

RMAD3503

USER(P1) IS NOT AUTHORIZED TO MAINTAIN USER PROFILE RECORDS

Reason:

A request to view the User Profile List was rejected because the user did not have UAMS access authority.

System Action:

The request is rejected.

User Action:

None.

RMAD3601

INVALID KEYWORD VALUE SPECIFIED - KEYWORD(~P1) VALUE(~P2)

Reason:

An invalid keyword was passed to the service procedure.

System Action:

The request is rejected.

User Action:

Correct the calling procedure to the service procedure and rerun exec.

RMAD3602

DATABASE ~P1 FAILED, RC(~P2)

Reason:

Request action on the database failed with non zero return code.

System Action:

The request is rejected.

User Action:

Contact System Administrator.

RMAD3603**NO RECORDS ADDED OR FOUND****Reason:**

No records of Filter Definition found in the database.

System Action:

None.

User Action:

None.

RMAD3604**NO RECORDS FOUND****Reason:**

No records found to be displayed in the selection list.

System Action:

None.

User Action:

None.

RMAD3605**FILTER(P1) CANNOT BE DELETED AS IT IS INCLUDED IN P2 SNA GROUP(S)****Reason:**

The Group Filter identified by P1 is currently included as a secondary filter in P2 SNA Groups and may not be deleted as this may affect the Group(s) integrity. The LG option may be used to list the Groups in which a filter is included.

System Action:

Request is disallowed.

User Action:

Use LG to list the affected groups and update them to remove the filter.

RMAD3606

RULESET P1 CANNOT BE DELETED AS IT IS THE ACTIVE RULESET

Reason:

The selected ruleset is currently active. You cannot delete it.

System Action:

The request is disallowed.

User Action:

To enable the ruleset to be deleted, proceed as follows:

1. At a ==> prompt, enter /PARMS to list the customizer parameter groups.
2. Enter F AUTOIDS to find *the* AUTOIDS parameter group.
3. Enter *U* beside the group to display its parameters panel.
4. In the Active Ruleset for File Transfer field, either fill it with blanks or replace the ruleset you want to delete by another ruleset.
5. Press F6 (Action) to unload the active ruleset and possibly load a new ruleset.

The ruleset you want to delete is now unloaded, and you can proceed to delete it.

RMAD3607**RULESET LOAD REQUEST IGNORED. FILE TRANSFER MONITORING INACTIVE.****Reason:**

The Ruleset Load request was not actioned because there is no active file transfer monitoring.

System Action:

The request is ignored.

User Action:

Use Customization Parameters to set up File Transfer Monitoring.

2. Enter F AUTOIDS to find the AUTOIDS parameter group.
 3. Enter *U* beside the group to display its parameters panel.
 4. In the Active Ruleset for File Transfer field, either fill it with blanks or replace the ruleset you want to delete by another ruleset.
 5. Press F6 (Action) to unload the active ruleset and possibly load a new ruleset.
- The ruleset you want to delete is now unloaded, and you can proceed to delete it.

RMAD3608**REQUEST CANCELED BY USER****Reason:**

You canceled your request.

System Action:

None.

User Action:

None.

RMAD3609

LOAD COMMAND ACCEPTED FOR LOAD OF RULESET P1.

Reason:

Your request to load the *P1* file transfer ruleset was accepted.

System Action:

The request will be processed.

User Action:

None.

RMAD3610

FILTER CANNOT BE DELETED AS IT IS USED BY THE MONITORING MENU

Reason:

You cannot delete a filter that is associated with a monitor. For example, you cannot delete the RESOURCEVIEW filter because it is associated with the general resource monitor.

System Action:

The request is denied.

User Action:

None.

RMAD4001

INVALID KEYWORD VALUE SPECIFIED - KEYWORD(~P1) VALUE(~P2)

Reason:

An invalid keyword was passed to the service procedure.

System Action:

RMAD7107**NOT ALLOWED TO ACCESS SYSNAME(\$TEMPLAT) FROM THIS PANEL****Reason:**

Template definitions are special and cannot be accessed from this panel.

System Action:

The request is rejected.

User Action:

Access template definitions from the Template Definition Menu. To access that menu, enter the */RADMIN.T* path at the *==>* prompt.

RMAD8001

SERVICE PROCEDURE ~P1 INVOKED WITH INVALID KEYWORD ~P2(~P3)

Reason:

The service procedure identified by P1 was invoked with an invalid value for the keyword identified by P2 of P3.

System Action:

Request rejected

User Action:

Correct the keyword value and re-try

RMAD8101

SERVICE PROCEDURE ~P1 INVOKED WITH INVALID KEYWORD ~P2(~P3)

Reason:

The service procedure identified by P1 was invoked with an invalid value for the keyword identified by P2 of P3.

System Action:

Request rejected

User Action:

Correct the keyword value and re-try

RMAD8102

Update is not allowed for \$RMDYNAMIC

Reason:

\$RMDYNAMIC is the definition used to generate the default Graphical Monitor screen when multiple products are present in the same region. It displays one icon per product. This definition cannot be updated.

System Action:

Request rejected.

User Action:

None.

RMADAP01**INVALID KEYWORD VALUE SPECIFIED - KEYWORD(P1) VALUE(P2)****Reason:**

An invalid keyword was passed to the procedure \$RMADAPI.

System Action:

The request is rejected.

User Action:

Correct the procedure call to \$RMADAPI.

RMADAP02**P1 NOT AVAILABLE FOR CLASS P2 - P3****Reason:**

The action *P1* is not available for class *P2 - P3*.

System Action:

The request is rejected.

User Action:

None.

RMAM001AT**P1 P2 in P3 requires operator attention****Reason:**

Resource *P2* of type *P1* on system image *P3* has changed to an ATTENTION state.

System Action:

An alert is issued with the severity defined in the \$RM STATECHANGE parameter group for an ATTENTION state.

User Action:

For more information about the cause of the ATTENTION state, use the TL (Transient Log) action to view the Transient Log for the resource.

You can also use the A (Analyze) action to access the resource monitor for the resource. From here you can perform various actions against the resource.

RMAM001DG

P1 P2 in P3 is DEGRADED

Reason:

Resource *P2* of type *P1* on system image *P3* has changed to a DEGRADED state.

System Action:

An alert is issued with the severity defined in the \$RM STATECHANGE parameter group for a DEGRADED state.

User Action:

For more information about the cause of the DEGRADED state, use the TL (Transient Log) action to view the Transient Log for the resource.

You can also use the A (Analyze) action to access the resource monitor for the resource. From here you can perform various actions against the resource.

RMAM001FA

P1 P2 in P3 FAILED

Reason:

Resource *P2* of type *P1* on system image *P3* has changed to a FAILED state.

System Action:

An alert is issued with the severity defined in the \$RM STATECHANGE parameter group for a FAILED state.

User Action:

For more information about the cause of the FAILED state, use the TL (Transient Log) action to view the Transient Log for the resource.

You can also use the A (Analyze) action to access the resource monitor for the resource. From here you can perform various actions against the resource.

RMAM001IN***P1 P2 in P3 failed automation*****Reason:**

Resource *P2* of type *P1* on system image *P3* has changed to an INERROR state.

System Action:

An alert is issued with the severity defined in the \$RM STATECHANGE parameter group for an INERROR state.

User Action:

For more information about the cause of the INERROR state, use the TL (Transient Log) action to view the Transient Log for the resource.

You can also use the A (Analyze) action to access the resource monitor for the resource. From here you can perform various actions against the resource.

RMAM001ME***Monitoring for P1 P2 in P3 incurred an error*****Reason:**

Resource *P2* of type *P1* on system image *P3* has changed to a MONERROR state.

System Action:

An alert is issued with the severity defined in the \$RM STATECHANGE parameter group for a MONERROR state.

User Action:

For more information about the cause of the MONERROR state, use the TL (Transient Log) action to view the Transient Log for the resource.

You can also use the A (Analyze) action to access the resource monitor for the resource. From here you can perform various actions against the resource.

RMAM001MF

Monitoring for *P1 P2* in *P3* failed

Reason:

Resource *P2* of type *P1* on system image *P3* has changed to a MONFAILED state.

System Action:

An alert is issued with the severity defined in the \$RM STATECHANGE parameter group for a MONFAILED state.

User Action:

For more information about the cause of the MONFAILED state, use the TL (Transient Log) action to view the Transient Log for the resource.

You can also use the A (Analyze) action to access the resource monitor for the resource. From here you can perform various actions against the resource.

RMAM001PE

***P1 P2* in *P3* is in a PENDING state**

Reason:

Resource *P2* of type *P1* on system image *P3* has changed to a PENDING state.

System Action:

An alert is issued with the severity defined in the \$RM STATECHANGE parameter group for a PENDING state.

User Action:

For more information about the cause of the PENDING state, use the TL (Transient Log) action to view the Transient Log for the resource.

You can also use the A (Analyze) action to access the resource monitor for the resource. From here you can perform various actions against the resource.

RMAM001UN***P1 P2 in P3 is in an UNKNOWN state*****Reason:**

Resource *P2* of type *P1* on system image *P3* has changed to an UNKNOWN state.

System Action:

An alert is issued with the severity defined in the \$RM STATECHANGE parameter group for an UNKNOWN state.

User Action:

For more information about the cause of the UNKNOWN state, use the TL (Transient Log) action to view the Transient Log for the resource.

You can also use the A (Analyze) action to access the resource monitor for the resource. From here you can perform various actions against the resource.

RMAM00H01***Alert P1 for P2 error P3*****Reason:**

An error occurred generating a State Change Alert for resource *P2*.

P1 has one of the following values:

- INIT: The alert exit procedure is being initialized
- ISSUE: The alert is being issued or updated
- ANNOTATE: The alert is being annotated
- DELETE: The alert is being deleted

P3 contains an error explanation.

System Action:

The action on the alert fails.

User Action:

Investigate the cause of the error. If an alert exit procedure \$RMAM00X is in use, the error message may be from the procedure. If the error is N48C01, a problem occurred with an APPC START of the Alert Monitor API, for example, a disconnected domain.

RMAMAPI01

CALLTYPE= P1 NOT KNOWN

Reason:

The CALLTYPE keyword has the unsupported value, *P1* .

System Action:

The return code is set, and no processing is performed.

User Action:

Contact Technical Support.

RMAMCBP01

P1= P2 IS NOT SUPPORTED BY THIS CALL-BACK PACKAGE

Reason:

The argument, *P1* , has the value, *P2* , which is not supported by this Call-Back package.

System Action:

The return code is set, and processing terminates.

User Action:

Contact Technical Support.

RMAMCBP02

P1 ACTION NOT AVAILABLE FOR THIS ALERT

Reason:

You have selected the *P1* action for an alert, but the resource associated with the alert is not part of an active system image, so the *P1* action is not available.

System Action:

The action terminates.

User Action:

Select another action.

RMAOM001**AOMPROC LOADED AND READY****Reason:**

The AOMPROC is the receiver of messages from the primary message filter. This message indicates that the AOMPROC has been started and is ready to process message traffic.

System Action:

None - message is informational only.

User Action:

None.

RMAOMMA01**++UMA++ : P1****Reason:**

This message is part of the Unmatched Message Alerting (UMA) facility. It is issued when a message matches the Unmatched Message Alerting filter defined in the MSGAWARENESS parameter group.

An unmatched message is a message that does not match any EventView or ResourceView rules.

The message text comprises the message ID followed by ++UMA++, followed by the message ID and message text of the unmatched message. You can customize the text to the right of ++UMA++ through the MSGAWARENESS parameter group (/PARMS).

System Action:

The system writes this message to the Activity Log, raises an alert with this message as the alert description, or issues an EDS event with this message as its text. The option used is specified through the MSGAWARENESS parameter group.

User Action:

Review the captured message. If it is not important, define an EventView rule to suppress it. Conversely, the message may identify a resource under Automation Services control, in which case you may want to define it in the Status Monitor messages for that resource.

RMAOMMA02

Start of *P1* failed. *P2*

Reason:

The Unmatched Message Alerting server procedure, *P1*, failed to start. *P2* is the error message returned from the APPC START command. The message that caused the alert is written after this message.

System Action:

Message processing continues without alerting for this message.

User Action:

Correct the problem highlighted by the error message in *P2*.

RMAOMNX00

MSGBURST SUPPRESSING ==>

Reason:

The message burst protection facility has detected a flood of duplicated unsolicited messages. To avoid damaging automation and the flooding of system consoles, the message burst facility will suppress all further duplicate messages until the rate of arrival drops below the parameters set during region initialization.

System Action:

Duplicates of the message shown after the ==> symbol are suppressed.

User Action:

A message burst is normally an indication of a runaway task. The message burst facility suppresses the symptoms of this problem, but it should still be investigated.

RMAPPC01**INVALID KEYWORD VALUE SPECIFIED - KEYWORD(~P1) VALUE(~P2)****Reason:**

An invalid keyword was passed to the service procedure.

System Action:

The request is rejected.

User Action:

Correct the calling procedure to the service procedure and rerun exec.

RMAPPC02**UNABLE TO DETERMINE OBJECT ID PARAMETER****Reason:**

Object ID not found and can not be created because there is not enough information passed to the procedure.

System Action:

The request is rejected.

User Action:

Contact System Administrator.

RMAPPC03**DATABASE ~P1 ERROR - RC(~P2) SYSMSG(~P3)****Reason:**

An error was encountered while attempting to access the RAM database.

System Action:

Procedure is terminated without successfully establishing APPC requirements.

User Action:

Correct the database error and issue restart.

RMAPPC04

APPC ~P1 ERROR - SYSMSG(~P2)

Reason:

The APPC function was not successfully completed. SYSMSG contains the unexpected message that resulted.

System Action:

Processing is continued.

User Action:

Contact your System Administrator.

RMAPPC05

FLUSHING TRAFFIC MANAGERS FOR REGION P1

Reason:

A region was unlinked and therefore the Traffic Managers are no longer required and are being shut down.

System Action:

The event, data and traffic manager procedures are flushed. Some APPC errors may be displayed on the activity log as the procedures are forcefully terminated.

User Action:

None.

RMAPPC06

LINK ACTIVATION TO P1 FAILED, MSG= P2

Reason:

An attempt to start a link to a remote region failed. The remote region is *P1* and the error message is *P2*.

System Action:

The link activation will continue to be attempted as a background task.

User Action:

The most likely cause of the problem is that the remote region is not available. Check its status. If the link still fails after the remote region becomes available, contact your system administrator.

RMA\$0001***P1* is an invalid sort column****Reason:**

You specified *P1* as a column name on the SORT command; however, the column name is not recognized.

The following are valid sort columns:

- JOBNAME
- STEPNAME
- PROCSTEP
- TASK-CPU
- SRB-CPU
- TOTALCPU
- EXCP
- TYPE
- JOBID
- PROGRAM
- ASID
- SSID
- TIME

System Action:

The sort command is rejected.

User Action:

Specify a valid column name.

RMA\$0002

***P1* is an invalid sort order**

Reason:

You specified *P1* as a sort order on the SORT command; however, the sort order is invalid.

System Action:

The sort command is rejected.

User Action:

Specify a valid sort order. Valid values are A, ASCENDING, D, and DESCENDING. For example, to sort on the JOBNAME column in descending order, then issue the command SORT JOBNAME D.

RMAV0002

STATISTICS TABLE ALLOCATION FAILED - RC(~P1) SYMSG(~P2)

Reason:

The Statistics Handler has attempted to allocate a Table, but the allocation has failed.

System Action:

Processing terminated in error.

User Action:

Contact your System Administrator.

RMAV0003

STATISTICS TABLE ~P1 FAILED - RC(~P2) SYMSG(~P3)

Reason:

The Statistics Handler has attempted the specified action, but the attempt has failed.

System Action:

Processing terminated in error.

User Action:

Contact your System Administrator.

RMAV0101**INVALID KEYWORD VALUE SPECIFIED - KEYWORD(~P1) VALUE(~P2)****Reason:**

An invalid keyword was passed to the service procedure.

System Action:

The request is rejected.

User Action:

Correct the calling procedure to the service procedure and rerun exec.

RMAV0102**P1 FAILED - RC(P2) FDBK(P3) SYSMSG(P4)****Reason:**

As this resource exists on a remote region, an APPC conversation is required to process this statistics request. APPC function *P1* has ended in error. *P2* contains the return code, *P3* the feedback code, and *P4* the message describing the failure.

System Action:

Processing terminated in error.

User Action:

Determine whether the remote system is still available. Contact your system administrator.

RMAV0103**INVALID COMMAND****Reason:**

The command entered on the command line was not recognised by the procedure.

System Action:

The command is rejected.

User Action:

Correct the command and retry.

RMAV0104

UNABLE TO DETERMINE OBJECT ID PARAMETER

Reason:

Object ID not found and can not be created because there is not enough information passed to the procedure.

System Action:

The request is rejected.

User Action:

Contact System Administrator.

RMAV0105

NO STATISTICS AVAILABLE FOR THIS RESOURCE

Reason:

There are currently no statistics available for this resource.

System Action:

The request is rejected.

User Action:

None.

RMAV0106

STATISTICS TABLE IS UNAVAILABLE

Reason:

The Statistics table is not available.

System Action:

The request is rejected.

User Action:

Contact your system administrator.

RMAV0202**P1 FAILED - RC(P2) FDBK(P3) SYSMSG(P4)****Reason:**

As this resource exists on a remote region, an APPC conversation is required to process this statistics request. An APPC function has ended in error.

System Action:

Processing terminated in error.

User Action:

Determine whether the remote system is still available. Contact your system administrator.

RMAV0204**UNABLE TO DETERMINE OBJECT ID PARAMETER****Reason:**

Object ID not found and can not be created because there is not enough information passed to the procedure.

System Action:

The request is rejected.

User Action:

Contact System Administrator.

RMAV0209**UNEXPECTED "WHAT RECEIVED" STATE - STATE(~P1)****Reason:**

Procedure in unexpected APPC "What Received" State.

System Action:

None.

User Action:

Contact System Administrator.

RMAV0301

INVALID KEYWORD VALUE SPECIFIED - KEYWORD(~P1) VALUE(~P2)

Reason:

An invalid keyword was passed to the service procedure.

System Action:

The request is rejected.

User Action:

Correct the calling procedure to the service procedure and rerun exec.

RMAV0302

TABLE ALLOCATION FAILED - RC(~P1) SYMSG(~P2)

Reason:

A temporary table is required to load current statistics table into. The allocation of this table has failed.

System Action:

Processing terminated in error.

User Action:

Contact your System Administrator.

RMAV0303

STATISTICS TABLE ERROR - FDBK(~P1)

Reason:

Vartable error.

System Action:

No further processing.

User Action:

None.

RMAV0304**UNABLE TO DETERMINE OBJECT ID PARAMETER****Reason:**

Object ID not found and can not be created because there is not enough information passed to the procedure.

System Action:

The request is rejected.

User Action:

Contact System Administrator.

RMAV0305**STATISTICS PRINT FUNCTION CANCELLED****Reason:**

You elected not to print statistics.

System Action:

Processing continues.

User Action:

None.

RMAV0401**INVALID KEYWORD VALUE SPECIFIED - KEYWORD(P1) VALUE(P2)****Reason:**

An invalid keyword was passed to the service procedure.

System Action:

The request is rejected.

User Action:

Correct the calling procedure to the service procedure and rerun exec.

RMAV0502

SMF records not written - SMF not enabled

Reason:

ServiceView and ResourceView SMF records will not be written because SMF has not been enabled due to one or both of the following:

- To write SMF records, the SMF Record Identification must have a non-zero value. This value is specified in the Customizer *SMF* parameter group.
- To collect ServiceView and ResourceView SMF records, specify *YES* in the Customizer *SMFDATA* parameter group.

System Action:

The procedure terminates and writes an error message to the system log.

User Action:

Contact your system administrator.

RMAV0601

INVALID KEYWORD VALUE SPECIFIED - KEYWORD(P1) VALUE(P2)

Reason:

An invalid keyword was passed to the service procedure.

System Action:

The request is rejected.

User Action:

Correct the calling procedure to the service procedure and rerun exec.

RMCx to RMSx Messages

RMCA0001

INVALID KEYWORD VALUE SPECIFIED - KEYWORD(P1) VALUE(P2)

Reason:

An invalid keyword was passed to the service procedure.

System Action:

The request is rejected.

User Action:

Correct the calling procedure to the service procedure and rerun exec.

RMCA0101

INVALID KEYWORD VALUE SPECIFIED - KEYWORD(P1) VALUE(P2)

Reason:

An invalid keyword was passed to the service procedure.

System Action:

The request is rejected.

User Action:

Correct the calling procedure to the service procedure and rerun exec.

RMCA0101

INVALID KEYWORD VALUE SPECIFIED - KEYWORD(P1) VALUE(P2)

Reason:

An invalid keyword was passed to the service procedure.

System Action:

The request is rejected.

User Action:

Correct the calling procedure to the service procedure and rerun exec.

RMCLL02

PARAMETERS IN ERROR - NOT IN KEYWORD FORMAT - PARMS(~P1)

Reason:

\$RMCLL has been called with parameters which are not consistent with Keyword format (ie. KEYWORD=<value>).

System Action:

Procedure completed in error.

User Action:

Correct the calling procedure and rerun exec.

RMCLL03

UNABLE TO RESOLVE ACBNAME FOR SYSNAME(P1) VERSION(P2)

Reason:

You issued a command against a resource in the P1 P2 system image. However, the ACB name of the region where the command was to *be* executed could not be resolved. The most likely cause for this is that the selected image is not loaded in any of the linked regions currently.

System Action:

The command is not executed.

User Action:

Ascertain why the remote region's ACB name is not available. Correct the problem, and retry.

RMCALL04

This command is either unrecognized, or is not valid here

Reason:

A command issued from a monitor display cannot be processed due to one of the following reasons:

- The command does not exist.
- The command is recognized, but is not available from this type of monitor.
- The command is recognized, but is not applicable to resources of this class (for line commands only).
- The command was actually a failed attempt to navigate to another part of the product.

System Action:

The command is rejected.

User Action:

Check, correct, and retry the command.

Monitor commands can be entered as follows:

- As primary commands: Enter the command at the Command prompt
- As line commands: Enter the command on the line next to the selected resource

Some monitor commands are common to all resources, others apply only to resources of certain classes or types. Some resource classes support more commands than others.

To see a list of valid commands, enter **?** at the Command prompt, or on the line next to the selected resource. From this list, you can also select the required command.

If you were attempting to navigate to another part of the product you can use one of the following methods (examples are in parentheses):

- Enter a shortcut (/LEVELS or =/LEVELS)
- Enter a combined shortcut and menu option (/BCAST.S or =/BCAST.S)
- Enter a panel path (=H.I.P)

Note: Some shortcuts and options might be displayed but their operation suppressed for the following reasons:

- The shortcut or option requires a product or component that is not configured in this region.

- Access to the shortcut or option is denied because you do not have sufficient authority.

To see a list of all shortcuts and their associated functions, enter a single slash (/) at the Command prompt. Select the desired shortcut from the list by entering S beside it.

RMCALL05

' P1' COMMAND SUBMITTED

Reason:

The command has been submitted successfully.

System Action:

Command is processed.

User Action:

None.

RMCALL06

COMMAND(P1) REQUESTED BY USERID(P2)

Reason:

System Action:

User Action:

RMCALL07

ALERT ISSUED FOR CLASS= P1 NAME= P2 MSG= P3

Reason:

A request by an external application to issue an alert for a resource completed. *P1* is the resource class, *P2* is the resource name and *P3* is the message.

System Action:

None.

User Action:

None.

RMCALL08**INVALID PARMS KEYWORD SPECIFICATION, PARM(P1) VALUE(P2)****Reason:**

The specification for the PARMS keyword was invalid. The parameter P1 was passed with a value P2, however the value is invalid.

System Action:

The request is rejected.

User Action:

Check that the parameter being passed is valid for the service and/or action being requested. Retry the request.

RMCALL09**ALERT SUPPRESSED FOR CLASS= P1 NAME= P2 MSG= P3****Reason:**

A request by an external application to issue an alert for a resource completed, however the message was filtered out because it was not relevant for the resource specified. *P1* is the resource class, *P2* is the resource name and *P3* is the message.

System Action:

None.

User Action:

None.

RMCALL10**NO COMMAND WAS SELECTED FROM THE LIST****Reason:**

A list of possible commands was displayed but you exited from the list without selecting one.

System Action:

None

User Action:

None

RMCALL11

UNABLE TO PERFORM SYSTEM IMAGE PROMPTING - NOT IN FULL-SCREEN MODE

Reason:

System Image Prompting was requested for a command but the command processor was running in an environment which does not permit panels to be displayed.

System Action:

Command is rejected.

User Action:

Re-invoke the command in an environment which supports panel displays, or provide SYSNAME= and VERSION= keywords when invoking the command processor.

RMCALL12

' P1' IS NOT A VALID VALUE FOR ' P2'

Reason:

The value identified by *P1* is not valid for the field identified by *P2*.

System Action:

Field highlighted in error.

User Action:

Enter a valid value for the specified field.

RMCALL13

' P1' COMMAND CANCELLED

Reason:

The command request identified by *P1* has been cancelled.

System Action:

None.

User Action:

None.

RMCALL14**VALID VALUES: " P1" OR " P2"****Reason:**

Only *P1* or *P2* are accepted values.

System Action:

The value is rejected.

User Action:

Enter *P1* or *P2*.

RMCALL15**RESOURCE DOES NOT SATISFY ' P1' COMMAND SCOPE****Reason:**

The command processor has prompted the user to identify the resource to be actioned by the command identified by *P1* but the nominated resource does not match the command's TYPE and/or NAME scope values.

System Action:

The resource name is highlighted in error.

User Action:

Nominate a resource which does match the command's scope.

RMCALL16**NO RESPONSE TO ' P1' COMMAND IN P2 SECONDS****Reason:**

A *P1* command was submitted but no response was received within a *P2* second timeout period.

System Action:

Control is returned to the calling procedure to decide on further processing.

User Action:

Contact your system administrator.

RMEx17

P1 ALREADY REQUESTED AT P2 BY USER P3

Reason:

The requested action, *P1* is rejected because it is already in progress elsewhere. The action was successfully requested at *P2* by user *P3*.

System Action:

The request is rejected.

User Action:

Try again later.

RMEx18

KEYWORD(S) P1 REQUIRED FOR P2 PROCESSING

Reason:

P1 identified one or more keyword parameters, which are required for *P2* processing, that were not passed by the calling process.

System Action:

The procedure sets a return code of '8' and returns processing to the caller.

User Action:

Set a valid value for the defined keywords and retry.

RMEx19

NO SYSTEM WAS SELECTED FROM THE LIST

Reason:

You entered a command beside a resource that belongs to a shared system image. The system affinity list was displayed to enable you to select the system on which you want to execute the command, but you exited the list without making a selection.

System Action:

The command is not executed.

User Action:

If you want to execute the command, select the target system.

RMCALL20**P1 CANCELLED BY USER REQUEST****Reason:**

The requested action *P1* was cancelled at the user's request.

System Action:

None.

User Action:

None.

RMCALL21**' P1' COMMAND PROCESSING TERMINATED****Reason:**

The command processor that was executing the *P1* command against the indicated resource has terminated unexpectedly. This may indicate that the command has abended.

System Action:

None.

User Action:

Check the activity log for possible error messages.

RMCALL22**' P1' COMMAND CANNOT BE ISSUED AGAINST THE LOCAL SYSTEM IMAGE****Reason:**

The command identified by *P1* is not a valid command to be issued against the local system image - it may only *be* issued against a remote system e.g. ACKLNKFAIL.

System Action:

The command is rejected.

User Action:

Re-issue the command against a connected remote system, or do not issue it at all.

RMCALL23

NO P1 WAS SELECTED FROM THE LIST

Reason:

A list of System Images, SNA Domains or SNA Resources (as identified by *P1*) against which a command may be actioned was presented but the user exited without selecting one.

System Action:

Command cancelled.

User Action:

Select a System Image against which to action the command.

RMCALL24

' P1' COMMAND HAS NOT RESPONDED WITHIN TIME LIMIT

Reason:

The command processor, which is executing the command identified by *P1* , has not received any response from the command within 20 seconds and has issued this message and unlocked the keyboard so that subsequent commands may be issued. This may indicate that the command is still in progress or may have ended unsuccessfully. Check the log for any errors.

System Action:

Keyboard is unlocked.

User Action:

Check activity log for possible error messages.

RMCALL25**' P1' COMMAND PROCESSING COMPLETE****Reason:**

The command returns this message when the command procedure has terminated without returning any message. This is the default message to indicate that the command has ended.

System Action:

None.

User Action:

None.

RMCALL26**NETID/DOMAIN COMBINATION IS INVALID****Reason:**

The combination of NETID and DOMAIN which was specified does not relate to a linked SNA Domain.

System Action:

Fields highlighted in error.

User Action:

Enter a valid NETID and DOMAIN combination.

RMCALL27**NETID(P1) DOMAIN(P2) NOT AN ACTIVE SNA DOMAIN****Reason:**

The SNA domain indicated by the NETID and DOMAIN is not currently Active/Available.

System Action:

Procedure completed in error.

User Action:

If the reason is because a remote NetMaster Automation region not being available, rectify and retry the command.

RMCALL28

RESOURCE(P1) IS OF TYPE(P2) NOT TYPE(P3)

Reason:

The resource identified by *P1* is of the type identified by *P2* not the required type as specified by *P3*.

System Action:

Field highlighted in error.

User Action:

Correct and retry.

RMCALL29

REGION P1 PURGED

Reason:

The region specified in *P1* has been purged from the list of linked regions.

System Action:

None.

User Action:

None.

RMCALL30

SUBORDINATE REGION P1 NOT ACCESSIBLE

Reason:

This message is in response to a LOAD command. The system image selected for loading is associated with subordinate region *P1* , but the subordinate region is not currently accessible.

System Action:

The LOAD command is rejected.

User Action:

Determine why the subordinate region is not accessible. It may be inactive, or may be still initializing. You can check the Linked Regions panel for more information on the status of the subordinate region. Enter */LISTREG* to display the panel.

RMCALL31**REMOTE SUBORDINATE REGION P1 NOT ACCESSIBLE FROM THIS REGION****Reason:**

You are in a subordinate region, and you entered a command beside a resource that is active on a system managed by another subordinate region. From a subordinate region, you cannot access another subordinate region. The resource is in a shared system image and is currently managed by the P1 subordinate region.

System Action:

The command is rejected.

User Action:

Where possible, you should use focal point regions to manage the defined resources.

RMCALL32**NO RESOURCE WAS SELECTED FROM THE LIST****Reason:**

A list of possible resources was displayed, but the user exited the list without selecting a resource.

System Action:

None.

User Action:

None.

RMEx33

' P1' COMMAND REJECTED. ALL REMOTE SYSTEMS ARE CONTACTABLE

Reason:

The command identified by P1 (either ALF or ACKLNKFAIL) can be issued only against a remote system with which communication has been lost.

System Action:

The command is rejected.

User Action:

None.

RMEx34

P1 COMMAND INVALID AGAINST RESOURCES FROM A MIGRATION REGION

Reason:

The command identified by P1 is not valid when issued against a resource that is currently running on a region linked in MIGRATION mode.

System Action:

The command is rejected.

User Action:

Issue the required command from a region which is linked as a FOCAL point or from the resource's home region.

RMEx35

REGION P1 NOT ACCESSIBLE

Reason:

This message is in response to a command issued against a remote resource. The region, P1, that owns the resource is not currently accessible.

System Action:

The command is rejected.

User Action:

Determine why the region is not accessible. Enter **/LISTREG** to display the Linked Regions panel for more information about the link to the region.

RMCALL36**P1 FAILED FOR REGION P2 - RC(P3) FDBK(P4)****Reason:**

This message is in response to a command issued against a remote resource. The region, *P2*, that owns the resource is not currently accessible using APPC function *P1*. The APPC request sets return code *P3* with feedback code *P4*.

System Action:

The command is rejected. The APPC error message is written to the activity log.

User Action:

Determine why the region is not accessible. Enter **/LISTREG** to display the Linked Regions panel for more information about the link to the region. Review the activity log message for details of the APPC failure.

RMCCIS01**~p1 PROCEDURE CANNOT BE A NESTED OR STARTED MORE THAN ONCE****Reason:**

THIS IS A LONG RUNNING PROCEDURE THAT CA NONLY HAVE ONE COPY RUNNING AT ANY TIME IN EACH SYSTEM. THIS MESSAGE IS PRODUCED IF AN ATTEMPT IS MADE TO START A SECOND OR SUBSEQUENT COPY OF THE PROC.

System Action:

xx

User Action:

cc

RMCCIS02

ISR ALTER GOT UNEXPECTED RESPONSE (p1)

Reason:

THIS IS A LONG RUNNING PROCEDURE THAT MAINTAINS ISR STATUS FOR CONSOLIDATED CONSOLES. THIS MESSAGE IS PRODUCED IF AN ATTEMPT TO ISSUE AN ISR ALTER COMMAND RECEIVED AN UNEXPECTED RESPONSE

System Action:

THE SYSTEM HAS NOT CHANGED THE ISR DEFINITION AS DESIRED , BUT WILL LEAVE THE OLD VALUE(S) IN PLACE

User Action:

CONTACT YOUR SYSTEMS ADMINISTRATOR

RMCCMC01

SPECIFICATION FAILURE - KEYWORD(~p1) VALUE(~p2)

Reason:

An invalid keyword was passed to the service procedure.

System Action:

The request is rejected.

User Action:

Correct the calling procedure to the service procedure and rerun exec.

RMCCMC02

NO RECORD ADDED OR FOUND

Reason:

No Record added or found for the sysname and version specified

System Action:

The request is rejected.

User Action:

None.

RMCCMC03**UPDATE IN PROGRESS BY ~p1****Reason:**

Update is in progress on this definition by other user.

System Action:

The request is rejected.

User Action:

Try again later.

RMCCMC04**NO MESSAGE PROFILE FOUND****Reason:**

No message profile found to be displayed in the selection list.

System Action:

None.

User Action:

None.

RMCCMC05**PROFILE(~P1) ALREADY ~P2****Reason:**

Profile status already as requested.

System Action:

The request is rejected.

User Action:

None.

RMCCMC06

CONSOLE CONSOLIDATION IS INACTIVE, CANNOT ACTIVATE MESSAGE PROFILES

Reason:

A request to activate the message profiles for console consolidation was rejected because console consolidation is inactive.

System Action:

The request is rejected.

User Action:

If console consolidation is required to be active, then activate it by actioning the CCONSOLIDATN parameter group of Initialization and Customization Services on the Customization Menu. You must set Console Consolidation to ACTIVE and then action the parameter group.

RMCCMM01

SPECIFICATION FAILURE - KEYWORD(~p1) VALUE(~p2)

Reason:

An invalid keyword or value was passed to the service procedure.

System Action:

The request is rejected.

User Action:

Correct the calling procedure to the service procedure and rerun exec.

RMCCMM02

PARAMETERS IN ERROR - NOT IN KEYWORD FORMAT - PARMS(~p1)

Reason:

An invalid value specification format was passed to the service procedure.

System Action:

The request is rejected.

User Action:

Correct the calling procedure to the service procedure and rerun exec.

RMCCMM05**UPDATE IN PROGRESS BY p1****Reason:**

This message profile record is already being edited by the user named in the message.

System Action:

The request is rejected.

User Action:

Correct the calling procedure to the service procedure and rerun exec.

RMCCMN01**INVALID FUNCTION (p1) REQUESTED****Reason:**

An invalid request was made to the menu handler service procedure. This is a system error.

System Action:

Request was rejected.

User Action:

Call Technical Support.

RMCCMN02**(p1)****Reason:**

The console consolidation subsystem interface (AOM) is not active and cannot accept the compiled message profiles.

System Action:

Message profile activation has failed.

User Action:

AOM has either not been started in the region initialization deck, or has been paused/stopped by an authorized person. Determine why AOM is not active, correct the situation, then retry the profile activation.

RMCCMN03

USER P1 NOT AUTHORIZED TO ACCESS MESSAGE CLASSIFICATION SERVICES

Reason:

The user is not authorized to use AOM facilities. The UAMS security profile did not contain authorisation for P1 to use AOM services. AOM is the Automation Services subsystem interface.

System Action:

Access denied.

User Action:

Contact the appropriate person to grant access (in UAMS) to AOM services.

RMCCOC01

p1 PROCEDURE CANNOT BE A NESTED PROCEDURE

Reason:

The procedure named in the above message cannot be executed in-line. It must be executed as an asynchronous process. This is a system error.

System Action:

Action rejected.

User Action:

Call Technical Support.

RMCCOC02

CONSOLIDATED MESSAGE DELIVERY SERVICE IS ALREADY ACTIVE

Reason:

Consolidate message delivery is already active for this console.

System Action:

Duplicate activation request is ignored.

User Action:

If you are not receiving messages use the PROFILE command to check that UNSOL=YES AOMMSG=YES MSG=YES and MONMSG=YES. If any of these are not set as described, issue the below command with the console window. PR AOMMSG=Y UNSOL=Y MONMSG=Y MSG=Y

RMCCOC03**USER PROFILE IS NOT SUITABLE FOR CONSOLIDATED CONSOLE SERVICES****Reason:**

The users UAMS profile prevents activation of Consolidated Message Services.
1. The user does not have access to AOM 2. The field AOMMSG is set to NO - should be set to YES 3. The ROUTCDE field set to NONE or is restricted - should be set to ALL

System Action:

Consolidated Message Services is not initialized for this user environment.

User Action:

Correct the users UAMS definition and try again.

RMCCOC04**CONSOLIDATE MESSAGE DELIVERY NOT SUPPORTED FOR THIS ENVIRONMENT****Reason:**

The Consolidate Message Delivery Service could not be initialized because the desired console environmental profile could not be set.

System Action:

Message delivery not activated.

User Action:

Check the users automation profile and UAMS profile.

RMCCOC05**THE DEFAULT PROFILE FOR OCS ENVIRONMENT NOT AVAILABLE (RC: p1)****Reason:**

The Initial OCS environment PROFILE attributes not available.

System Action:

Message delivery not initialized.

User Action:

Check the users automation and UAMS profiles.

RMCCOC06

CONSOLIDATED MESSAGE DELIVERY IS PENDING (P1=NO)

Reason:

Consolidate message delivery is pending because the profile setting *P1* must be set to YES.

System Action:

None. Messages will be received when UNSOL=YES and AOMMSG=YES and one or more Message Profiles have been enabled (ie ROUTCDE= is set to one or more route code values that match defined and activated message profiles).

User Action:

Use the PROFILE command to set the parameter identified by *P1* to YES or use the PROFILE CC command to enable message flow from a full screen panel.

RMCCOC07

CONSOLIDATED MESSAGE DELIVERY IS WAITING FOR MESSAGE PROFILE(S) TO BE EN ABLED

Reason:

Consolidate message delivery cannot deliver any messages until you have enabled one or more Message Profiles.

System Action:

None. Messages will not be delivered until one or more message profiles have been enabled.

User Action:

Use the PROFILE CC command to enable the profiles via full screen panels. You can change your User Profile record to default the enabled message profiles.

You can also use the PROFILE command to set the ROUTCDE parameter to include all the route codes associated with all the message profiles you wish enabled.

RMCCOC11**CONSOLIDATED MESSAGE DELIVERY SERVICES HAS BEEN ACTIVATED****Reason:**

Message delivery has been activated.

System Action:

Message delivery activated.

User Action:

None.

RMCCOC12**CONSOLIDATED MESSAGE FLOW TO THIS CONSOLE HAS BEEN p1****Reason:**

Message flow has be enabled or disabled as requested.

System Action:

As indicated.

User Action:

None.

RMCCOC13**THE CONSOLIDATED MESSAGE DELIVERY MANAGER IS NOT ACTIVE****Reason:**

The Consolidated Message delivery manager is not active in this system.

System Action:

The CCON command is not effective.

User Action:

Check the CCONSOLIDATN parameter group to ensure that the value of the Console Consolidation field is ACTIVE. Update the field if required.

If console consolidation is active, check the log for messages that indicate why console consolidation has failed. Review those messages to determine the cause.

RMCCOC15

MESSAGE DELIVERY STATUS IS P1 - ISR STATUS IS P2

Reason:

This message gives the status of both the ability of this console to receive consolidated messages and of the message Inter System Routing (ISR) manager. If ISR is disabled then you will receive messages from the local MVS region only.

System Action:

None.

User Action:

None.

RMCCOC17

CURRENTLY ACTIVE MESSAGE RECEIPT PROFILES (p1)

Reason:

This console is profiled to receive messages delivered by the indicated Message Classification profile id numbers. Refer to the EventView Message Classification Profile menu for more detail on the profiles.

System Action:

None.

User Action:

None.

RMCCOC19

CONSOLIDATED MESSAGE DELIVERY SERVICES HAS BEEN INACTIVATED

Reason:

Consolidated Message delivery to this console has been switched off.

System Action:

None.

User Action:

None.

RMCCOC20**CONSOLIDATED MESSAGE DELIVERY SERVICES IS NOT ACTIVE****Reason:**

Consolidated Message delivery to this console was never switched on.

System Action:

None.

User Action:

None.

RMCCOC21**CONSOLE CONSOLIDATION IS INACTIVE****Reason:**

Console consolidation is not active. This is a global setting, and no message profiles are effective.

System Action:

The CCON command is not effective.

User Action:

Enter the **/PARMS** panel shortcut, and update the CCONSOLIDATN parameter group to set the Console Consolidation field to ACTIVE.

RMCCOM01**SPECIFICATION FAILURE - KEYWORD(~p1) VALUE(~p2)****Reason:**

An invalid keyword or value was passed to the service procedure.

System Action:

The request is rejected.

User Action:

Correct the calling procedure to the service procedure and rerun exec.

RMCCOM02

NO RECORDS FOUND

Reason:

No records found to be displayed in the selection list.

System Action:

None.

User Action:

None.

RMCCOM03

USERID(~p1) NOT AUTHORIZED FOR RECEIVING AOM MESSAGE

Reason:

User access rejected by security procedure.

System Action:

None.

User Action:

None.

RMCCOM04

CONSOLIDATED MESSAGE FLOW ~P1

Reason:

User change its profile to receive or not to receive aom message.

System Action:

None.

User Action:

None.

RMCCOM05**NOT AUTHORIZED TO RECEIVE MESSAGE OF ROUTCDE(~p1)****Reason:**

UAMS prevent user of receiving messages from rout code P1 .

System Action:

None.

User Action:

None.

RMCCOM06**PRIVATE MESSAGE PROFILE CHANGED****Reason:**

A PROFILE command has been issued to change the consolidated message flow attributes of the OCS environment.

System Action:

None.

User Action:

None.

RMCCOM07**ROUTCDE ALREADY ~p1****Reason:**

The process requested is not going to change anything.

System Action:

The request is rejected.

User Action:

None.

RMCCOM08

CONSOLE CONSOLIDATION SUPPORTS ONLY ROUTE CODES (p1)

Reason:

The route code string you have specified contains unsupported routing codes.

System Action:

The request is rejected.

User Action:

None.

RMCCOM09

CONTROL OF CONSOLE CONSOLIDATION SERVICES NOT AVAILABLE FOR THIS ENV.

Reason:

The program was not able to locate a \$RMCCOCS Ncl procedure in this environment to be able to pick up the current msg flow control parameters.

System Action:

The request is rejected.

User Action:

None.

RMCCOM10

LIST SORTED BY P1

Reason:

The list has been sorted according to the value in *P1*. This can be either Identification Number or Profile Name. The LstSort command will toggle between the two.

System Action:

None.

User Action:

None.

RMCCST00**ALL MESSAGE CONSOLIDATION PROFILES NOW ACTIVE****Reason:**

All console message consolidation profiles with STATUS=ACTIVE have now been loaded in all linked regions and are actively filtering messages on all systems.

System Action:

Profile activation functions are complete.

User Action:

None.

RMCCST01**SPECIFICATION FAILURE - KEYWORD(~p1) VALUE(~p2)****Reason:**

An invalid keyword or value was passed to the service procedure.

System Action:

The request is rejected.

User Action:

Correct the calling procedure to the service procedure and rerun exec.

RMCCST02**(p1)****Reason:**

The console consolidation subsystem interface (AOM) is not active and cannot accept the compiled message profiles.

System Action:

Message profile activation has failed.

User Action:

AOM has either not been started in the region initialization deck, or has been paused/stopped by an authorized person. Determine why AOM is not active, correct the situation, then retry the profile activation.

RMCCST03

USER P1 NOT AUTHORIZED TO ACCESS MESSAGE CLASSIFICATION SERVICES

Reason:

The user is not authorized to use AOM facilities. The UAMS security profile did not contain authorization for P1 to use AOM services. AOM is the Automation Services subsystem interface.

System Action:

Access is denied.

User Action:

Contact the appropriate person to grant access (in UAMS) to AOM services.

RMCCST05

LOCK FOR P1 DENIED, RC= P2 ZFDBK= P3

Reason:

The request to obtain exclusive control for the resource *P1* was denied. The return code from the lock was *P2* and the feed back code was *P3*. This error indicates that another process or user is accessing the resource.

System Action:

Processing terminates.

User Action:

Retry the action later.

RMCCST06**MAXIMUM NUMBER OF GBL\$RMC VARIABLES REACHED, MAXIMUM IS P1****Reason:**

Console consolidation message profiles have used the maximum number (*P1*) of global variables that the profiles can use.

System Action:

Processing terminates.

User Action:

Reduce the number and/or complexity of the message profiles, and retry the request.

RMCCST07**THERE ARE NO MESSAGE PROFILES WITH A STATUS OF ACTIVE****Reason:**

No STATUS=ACTIVE message consolidation profiles were found.

System Action:

Message consolidation profile activation abandoned

User Action:

Set the desired message profiles to STATUS=ACTIVE and then retry the profile compile

RMCCST08

AOM COMMAND RESPONSE TIMEOUT

Reason:

The Console Consolidation Subsystem Interface (AOM) has not responded to the profile activation request in the allotted time. This is possibly due to slow response times.

System Action:

Activation in progress

User Action:

Determine the state of AOM. If active and functioning normally then the profile activation will eventually complete. If AOM is not OK then correct the problem and retry the profile activation.

RMCCST09

SYSTEM IDENTIFICATION NAME NOT AVAILABLE

Reason:

Failure accessing RAM initialization parameters.

System Action:

Activation in progress

User Action:

Determine the state of AOM. If active and functioning normally, the profile activation will eventually complete. If AOM is not OK, correct the problem and retry the profile activation.

RMCCST10

CONSOLE CONSOLIDATION MESSAGE PROFILES LOADED INTO GLOBALS

Reason:

All console consolidation message profiles with STATUS=ACTIVE have now been loaded into global variables and will be active when the screening table is next compiled.

System Action:

None.

User Action:

None.

RMCCST11

CONSOLE CONSOLIDATION PROFILES TOO LARGE (BY P1 BYTES)

Reason:

There is insufficient storage to load all the active console consolidation profiles.

System Action:

The profiles are not loaded.

User Action:

Reduce the amount of storage required by the profiles by: * inactivating unused profiles or * reducing the size (complexity) of the active profiles. Retry the activate operation.

RMCCDK01

INVALID KEYWORD VALUE SPECIFIED, KEYWORD= P1 VALUE=" P2"

Reason:

An invalid keyword value was passed. The keyword is P1 and the invalid value is P2.

System Action:

The request is rejected.

User Action:

Correct the invalid value and retry the request.

RMCDK02

KEYWORD P1 IS ALREADY REFERENCED

Reason:

The keyword *P1* is already referenced by the displayed date.

System Action:

The request is rejected.

User Action:

None.

RMCDK03

KEYWORD P1 IS NOT REFERENCED

Reason:

The keyword *P1* is not referenced by the date displayed.

System Action:

The request is rejected.

User Action:

None.

RMCDM001

INVALID KEYWORD VALUE SPECIFIED, KEYWORD= P1 VALUE=" P2"

Reason:

An invalid keyword value was passed. The keyword is P1 and the invalid value is P2.

System Action:

The request is rejected.

User Action:

Correct the invalid value and retry the request.

RMCDM002**CALENDAR P1 DELETED****Reason:**

The calendar *P1* was successfully deleted.

System Action:

None.

User Action:

None.

RMCDM101**INVALID KEYWORD VALUE SPECIFIED, KEYWORD= P1 VALUE=" P2"****Reason:**

An invalid keyword value was passed. The keyword is P1 and the invalid value is P2.

System Action:

The request is rejected.

User Action:

Correct the invalid value and retry the request.

RMCDM102**REQUIRED FIELD(S) OMITTED****Reason:**

One or more required fields were not entered.

System Action:

Field(s) set in error.

User Action:

Enter values for the omitted field(s).

RMCDM103

RECORD ALREADY BEING UPDATED BY P1

Reason:

The selected record is already being updated by user *P1*.

System Action:

Request rejected.

User Action:

Try later.

RMCDMC01

INVALID KEYWORD VALUE SPECIFIED, KEYWORD= P1 VALUE=" P2"

Reason:

An invalid keyword value was passed. The keyword is P1 and the invalid value is P2.

System Action:

The request is rejected.

User Action:

Correct the invalid value and retry the request.

RMCDMT01

INVALID KEYWORD VALUE SPECIFIED, KEYWORD= P1 VALUE=" P2"

Reason:

An invalid keyword value was passed. The keyword is P1 and the invalid value is P2.

System Action:

The request is rejected.

User Action:

Correct the invalid value and retry the request.

RMCXYT01**INVALID KEYWORD VALUE SPECIFIED, KEYWORD= P1 VALUE=" P2"****Reason:**

An invalid keyword value was passed. The keyword is P1 and the invalid value is P2.

System Action:

The request is rejected.

User Action:

Correct the invalid value and retry the request.

RMCLOG01**P1****Reason:**

This message forms part of the returned messages on usage of the \$RMCLOG procedure.

System Action:

None.

User Action:

The message is informational.

RMCLOG02**RESOURCE NAME NOT SPECIFIED, < P1> TERMINATING****Reason:**

A Resource has not been specified. Specify the name of a resource using the keyword NAME and

System Action:

None.

User Action:

Retry the command with the requested parameter.

RMCL0G03

GLOBAL LOG VARIABLE NOT FOUND, < P1> TERMINATING

Reason:

The Global Log Variable which contains the names of all the resource variables could not be located.

System Action:

None.

User Action:

Please contact your local support representative

RMCL0G04

NO VARIABLE FOUND FOR RSC P1, < P2> TERMINATING

Reason:

No Log variable could be found for the resource identified by *P1* . The procedure issuing the message is identified by *P2* .

System Action:

None.

User Action:

Ensure the resource definition has a log table size greater than 0 specified. If this is the case, please contact your local support representative.

RMCL0G05

LOG FOR RESOURCE < P1> IS EMPTY

Reason:

The resource log for the resource identified by *P1* is empty.

System Action:

None.

User Action:

None.

RMCLOG06**P1 P2****Reason:**

This message forms part of the returned messages extracted from the resources log. The timestamp of the record is identified by *P1* and the text is identified by *P2* .

System Action:

None.

User Action:

The message is informational.

RMCLOG07

==> NCLID < P1> NCLPROC < P2> ATTR < P3>

Reason:

This message forms part of the returned messages extracted from the resources log. The NCLID of the procedure writing the message is identified by *P1* . The name of the procedure writing the message is identified by *P2* and the assigned attribute for the message is identified by *P3* .

System Action:

None.

User Action:

The message is informational.

RMCM0101

NO OUTSTANDING WTOR FOUND FOR P1

Reason:

A display of outstanding WTORS has been requested for resource *P1*. However, there are no outstanding WTORS for this resource.

System Action:

None.

User Action:

None.

RMCM0102

P1 IS NOT ACTIVE

Reason:

A request was made to display outstanding WTORs for resource P1, but resource P1 is not active.

System Action:

Request is rejected.

User Action:

None.

RMCM0103

WAIT PERIOD (P1) EXPIRED

Reason:

While trying to identify outstanding WTORs for a resource, the command has timed out.

System Action:

None

User Action:

None

RMCM0201

THE (P1) COMMAND IS NOT SUPPORTED ON (P2)

Reason:

The command *P1* is not available on the current operating system (*P2*).

System Action:

No command was issued, no response will be returned.

User Action:

None.

RMCMD023**WAIT PERIOD (P1) EXPIRED****Reason:**

While trying to issue the requested command for a resource, the command has timed out.

System Action:

None

User Action:

None

RMCMD002**CONSOLE SHORTAGE PROCESSING ENTERED - COMMAND P1****Reason:**

An attempt to acquire a system console to issue a system command failed because there were no free consoles.

System Action:

The command processor will attempt to acquire a system console again in a short period of time. If successful, the requested command will be issued.

User Action:

None.

RMCMMD003

RETRY LIMIT OF *P1* EXCEEDED FOR COMMAND *P2*

Reason:

The requested command was submitted to a system console a number of times but was rejected each time because a required resource is unavailable. The maximum number of retries (as defined in the System Initialization Parameters) was exceeded and so the command failed.

System Action:

The command is not processed.

User Action:

Possible reasons for command rejection are:

- N86505 Unable to acquire a temporary console
- N86518 Unable to acquire the master console
- N86519 Storage Shortage

Wait a while for the resource to become available and retry.

RMCMMD004

DELAYING *P1* SECONDS BEFORE ATTEMPTING TO RE-ISSUE COMMAND *P2*

Reason:

The requested system command was submitted but a required resource was not available. The command processor will wait the specified number of seconds (as defined in the System Initialisation Parameters) before retrying.

System Action:

The command will be re-submitted after the specified number of seconds.

User Action:

None.

RMCMD005**< P1> COMMAND P2 FAILED****Reason:**

The requested command failed because the syntax of the request passed to the command processor was invalid.

System Action:

The command is rejected.

User Action:

Correct the command syntax and retry.

RMCMD006**END OF RESPONSES****Reason:**

All response messages for an issued system command have been processed by the command processor.

System Action:

None.

User Action:

None.

RMCMD01**REQUEST REJECTED, RESOURCE P1 IS IN AN INVALID STATE (P2)****Reason:**

The command cannot be issued against a resource that is in a Failed or Inactive state. The resource being actioned was P1 and its state at the time of the request was P2.

System Action:

Request is rejected.

User Action:

Activate the resource and then try again.

RMCMMD02

OPERATING SYSTEM VERSION IS *P1* AND *P2* IS NEEDED

Reason:

The command cannot be issued because the current operating system version is *P1* and the command first became available at version *P2*.

System Action:

The command is not issued.

User Action:

None.

RMCMMD031

P1 INVOKED WITH INVALID PARAMS(*P2*)

Reason:

An invalid call was made to the named module.

System Action:

The call is rejected.

User Action:

Report problem to product support.

RMCMMD032

INVOKED WITH INVALID PARM(*P1*) VALUE(*P2*)

Reason:

An invalid call was made to the named module.

System Action:

The call is rejected.

User Action:

Report problem to product support.

RMCMD033****** COMMAND CACHE BUILD FAILURE **** - BLD TYPE= P1****Reason:**

Command cache build was attempted for the command type listed. However, it failed to complete successfully.

System Action:

Command caching for command type shown will be bypassed. This may cause some performance and throughput degradation, but will not affect automation or monitoring.

User Action:

Report problem to product support.

RMCMD01**REGISTERED FOR MSGID(P1) FROM JOBNAME(P2)****Reason:**

The command processor has registered to receive unsolicited messages with a message id of P1 emanating from the job P2.

System Action:

None.

User Action:

None.

RMCMD02**REGISTERED FOR MSGID(P1)****Reason:**

The command processor has registered to receive unsolicited messages with a message id of P1 irrespective of which job generates them.

System Action:

None.

User Action:

None.

RMCMDE03

CONSOLE ACQUIRED. COMMAND(P1) ISSUED

Reason:

The command processor has acquired a system console and issued the command P1.

System Action:

None.

User Action:

None.

RMCMDE04

MATCHED ON MSGID(P1)

Reason:

The command processor has matched the message preceding this one on message id.

System Action:

None.

User Action:

None.

RMCMDE05

MATCHED ON MESSAGE TEXT(P1)

Reason:

The command processor has matched the message preceding this one on elements of its text identified by P1.

System Action:

None.

User Action:

None.

RMCMD06**PASSED EXTENDED FILTERING****Reason:**

The command processor has matched the message preceding this one on the basis of the extended filtering parameters passed on entry.

System Action:

None.

User Action:

None.

RMCMD07**WAIT PERIOD (P1) EXPIRED****Reason:**

The command processor has been unable to match any of the passed message criteria and has not received any further messages before the wait period, P1, expired.

System Action:

None.

User Action:

None.

RMCMDRG01**COMMAND RESPONSE TIMEOUT****Reason:**

Expected command response was not received within the allotted time. This may be due to slow response times. Another cause is that the program to which a command was issued has not responded with a solicited message.

System Action:

The wait for command responses is terminated.

User Action:

RMCSX is a registered trademark of IBM Corporation. All other trademarks are the property of their respective owners.

RMCMDRG02

Command response queue congestion

Reason:

Expected command responses not received because the response queue was congested with unprocessed messages. The number of unprocessed messages exceeded the limit set by the NMIQLIM parameter.

System Action:

Command response process terminates with relevant return code.

User Action:

Investigate why so many messages are queued.

RMCO0001

INVALID KEYWORD VALUE SPECIFIED - KEYWORD(~P1) VALUE(~P2)

Reason:

An invalid keyword was passed to the service procedure.

System Action:

The request is rejected.

User Action:

Correct the calling procedure to the service procedure and rerun exec.

RMCO0002**NO P1 SYSTEM IMAGES FOUND****Reason:**

A command was issued, but there were no ACTIVE/LINKED system images found against which the command could be actioned.

System Action:

The command is rejected.

User Action:

If this message is issued in response to an 'ADD' command entered on the resource monitor, it means that no system images are currently loaded on this system or any active linked system. Do one of the following:

- If system images exist, load one by entering LOAD at the ==> prompt.
- If no system images have been defined, you can define one by entering /RADMIN at the ==> prompt and selecting option I. Once you have defined a system image, load it as described above.

RMCO0003**ACBNAME(P1) COULD NOT BE CONTACTED****Reason:**

The selected region cannot be contacted. *P1* displays the ACB name of the region.

System Action:

The request is rejected.

User Action:

Select a region that is available.

RMCO0101

INVALID KEYWORD VALUE SPECIFIED - KEYWORD(~P1) VALUE(~P2)

Reason:

An invalid keyword was passed to the service procedure.

System Action:

The request is rejected.

User Action:

Correct the calling procedure to the service procedure and rerun exec.

RMCO0106

NO RECORDS FOUND

Reason:

No records found to be displayed in the selection list.

System Action:

None.

User Action:

None.

RMCO0301

DISPLAY COMMAND/PROCESS NOT DEFINED FOR RESOURCE P1

Reason:

A display command was requested for resource *P1* but the resource definition does not define a display command nor a display process. The resource cannot be displayed.

System Action:

The request is rejected.

User Action:

Define a display command or display process for the resource.

RMCONF01**INVALID KEYWORD VALUE SPECIFIED - KEYWORD(P1) VALUE(P2)****Reason:**

An invalid keyword was passed to the user confirmation procedure.

System Action:

The user confirmation procedure terminates with RC=8.

User Action:

Contact your local support representative.

RMCONF02**INVALID COMMAND****Reason:**

The command that was specified on the command line was invalid.

System Action:

The command is rejected.

User Action:

Enter a valid command and retry.

RMCONF03**FUNCTION KEY P1 IS NOT ACTIVE IN THIS WINDOW****Reason:**

Function key *P1* was pressed and it has no action assigned to it.

System Action:

None.

User Action:

None.

RMCONF04

P1 MUST BE ENTERED

Reason:

No value was supplied for a mandatory field on the confirmation panel.

System Action:

The field is highlighted in error and the confirmation panel is redisplayed.

User Action:

Enter a valid value in the field or press the Exit key to cancel the request.

RMCONF05

SYSTEM IMAGE (P1. P2) ALREADY EXISTS

Reason:

The nominated system image has already been defined or is the 'active' system image. A new system image must be used for the Express Set Up facility.

System Action:

The System Name and Version fields are highlighted in error and the confirmation panel is redisplayed.

User Action:

Choose another system name/version combination and retry or press the Exit key to cancel the request.

RMCONF06

P1 IS INVALID

Reason:

An invalid value was supplied for the nominated field.

System Action:

The field is highlighted in error and the confirmation panel is redisplayed.

User Action:

Enter a valid value in the field or press the Exit key to cancel the request.

RMCONF07**P1 IS INVALID - IT IS A RESERVED SYSTEM IMAGE NAME.****Reason:**

The system image name that you supplied is a reserved system image name and cannot be specified.

System Action:

The field is highlighted in error and the confirmation panel is redisplayed.

User Action:

Enter a valid value in the field or press the Exit key to cancel the request.

RMCONS01**INVALID CALL TO \$RMCONS - PARMs(~P1)****Reason:**

An invalid keyword was passed to the service procedure.

System Action:

The request is rejected.

User Action:

Correct the calling procedure to the service procedure and rerun exec.

RMCONS02**RESOURCE ~P1 NOT FOUND IN STATUS TABLE****Reason:**

The requested resource is not present in the Status Table.

System Action:

Processing terminates in error.

User Action:

Correct and retry.

RMCONS03

~P1 OF ~P2 REFUSED - RESOURCE STATUS(~P3)

Reason:

The command issued against this resource is invalid given the physical status of the resource.

System Action:

No further processing.

User Action:

None.

RMCONS04

P1 OF P2 REFUSED - NOT IN MANUAL OR UNATTENDED MODE

Reason:

The command issued against this resource is invalid unless the resource is in MANUAL or UNATTENDED mode.

System Action:

No further processing.

User Action:

Place resource in MANUAL or UNATTENDED mode and retry.

RMCONS05

LOG RESET BY USER(~P1)

Reason:

The Log has been successfully reset.

System Action:

None.

User Action:

None.

RMCONS07**P1 COMMAND ACCEPTED****Reason:**

The issued command has been accepted.

System Action:

None.

User Action:

None.

RMCONS08**RESOURCE ~P1 - ~P2 SET TO ~P3 BY ~P4****Reason:**

The user (P4) has successfully set the field P2, for Resource P1, to the value P3.

System Action:

None.

User Action:

None.

RMCONS09**RAM STATUS OF RESOURCE ~P1 REQUESTED****Reason:**

A status request has been issued.

System Action:

None.

User Action:

None.

RMCONS10

P1 REQUEST FOR P2 BEING ACTIONED

Reason:

The request has been accepted.

System Action:

Processing continues.

User Action:

None.

RMCONS11

DELETE REQUEST NOT ACTIONED - RESOURCE IS NOT DYNAMICALLY DEFINED

Reason:

This request is only valid for dynamically defined resources.

System Action:

Request rejected.

User Action:

None.

RMCONS12

INVALID KEYWORD VALUE SPECIFIED - KEYWORD(~P1) VALUE(~P2)

Reason:

An invalid keyword was passed to the service procedure.

System Action:

The request is rejected.

User Action:

Correct the calling procedure to the service procedure and rerun exec.

RMCONS13**GLOBAL MODE PRESENTLY SET TO MODE(~P1)****Reason:**

The Global Mode is already set to the request mode.

System Action:

The request is rejected.

User Action:

None.

RMCONS14**~P1 REQUEST FOR SYSNAME(~P2) VERSION(~P3) CANCELLED****Reason:**

The mention request has been cancelled.

System Action:

None.

User Action:

None.

RMCONS15**VALID VALUES: "CONFIRM" OR "CANCEL"****Reason:**

Only CONFIRM or CANCEL accepted.

System Action:

The value is rejected.

User Action:

Enter CONFIRM or CANCEL.

RMCONS16

'~P1' IS NOT A VALID VALUE FOR '~P2'

Reason:

The value identified by P1 is not valid for the field identified by P2

System Action:

Field highlighted in error.

User Action:

Enter a valid value for the specified field

RMCONS17

'~P1' COMMAND CANCELLED

Reason:

The command request identified by P1 has been cancelled.

System Action:

None.

User Action:

None.

RMCONS18

' P1' OF P2 REFUSED - P3

Reason:

The command identified by P1 requested against the resource identified by P2 was rejected for the reason identified by P3.

System Action:

Command rejected.

User Action:

None.

RMCONS19**NOT LICENSED FOR AUTOMATED MODE****Reason:**

This region is licensed as a SOLVE:Operations for IT/Operations or OpenView agent only and cannot be run in automated mode.

System Action:

The request is rejected.

User Action:

If you require a full license, contact Technical Support.

RMCONS20**QLOAD NOT SUPPORTED FROM THIS ENVIRONMENT****Reason:**

The QLOAD command is not supported in full-screen mode. The command is designed for use from a system console or remotely-attached workstation. It returns a line-by-line summary of the active local system image and automation statuses. The information returned is similar to that provided on the confirmation panel when you issue a LOAD command interactively.

System Action:

The command is rejected.

User Action:

None.

RMCONS21**ACKLNKFAIL REJECTED - LINK TO P1 IS ACTIVE****Reason:**

You issued an ACKLNKFAIL command for the *P1* region while the link to that region is still active.

System Action:

The command is rejected.

User Action:

None.

RMCONS22

P1 COMMAND ISSUED FOR P2 ON P3

Reason:

The message indicates that the *P1* command was issued for the *P2* resource. *P3* is as follows:

If the number of systems on which the command was issued is *one* then the value of *P3* is the *name of the region on that system*.

If the number of systems on which the command was issued is *more than one* then the value of *P3* is the *number of systems*.

For a resource in a shared system image (if supported), *P3* can be greater than 1, which means that the command was issued on all the systems with which the resource has affinity.

System Action:

None.

User Action:

None.

RMCONS23

P1 is already P2 for resource P3

Reason:

A command has been issued against resource *P3* ; however, the attribute *P1* which the command is attempting to set is already in the state described by *P2*.

System Action:

The command is rejected.

User Action:

None

RMCONS24**P1 request for P2 is being actioned****Reason:**

A command to perform the action described by *P1* has been entered for resource *P2* . The command has been accepted and is being actioned.

System Action:

None

User Action:

None

RMCONS25**ACKLNKFAIL REJECTED - INVALID AGAINST A SHARED SYSTEM IMAGE****Reason:**

You issued an ACKLNKFAIL (ALF) command against a resource in a SHARED system image. This is not allowed because SHARED images receive information from multiple regions.

System Action:

The command is rejected.

User Action:

None.

RMCP0001**INVALID KEYWORD VALUE SPECIFIED - KEYWORD(~P1) VALUE(~P2)****Reason:**

An invalid keyword was passed to the service procedure.

System Action:

The request is rejected.

User Action:

Correct the calling procedure to the service procedure and rerun exec.

RMCP0003

COMMAND PROCESSOR FOR ~P1 STARTED

Reason:

The Command Process has been started for the mentioned resource.

System Action:

Audit Message only.

User Action:

None.

RMCP0004

COMMAND PROCESSOR FOR P1 ENDED RC(P2) SYMSG(P3)

Reason:

The Command Processor has ended for the mentioned resource.

System Action:

Audit Message only.

User Action:

None.

RMCP0005

INITIATING FORCE INACTIVATION REQUEST FOR ~P1

Reason:

The Command Processor initiated force inactivation processing.

System Action:

Informational only.

User Action:

None.

RMCP0006**PROCESSING P2 REQUEST FOR P1****Reason:**

The Command Processor is processing a START/STOP/FORCE request for the mentioned resource.
Informational only.

System Action:

Processing continues.

User Action:

None.

RMCP0007**SYSTEM COMMAND P2 ISSUED FOR P1****Reason:**

The Command Processor has issued a System Command for the mentioned resource.

System Action:

Audit message only.

User Action:

None.

RMCP0010**TIMEOUT REACHED WITHOUT SUCCESS FOR P1****Reason:**

The Command Processor has been unsuccessful in processing the request.

System Action:

Informational only.

User Action:

None.

RMCP0011

REQUEST SUCCESSFUL - ~P1 IN DESIRED STATE

Reason:

The Command Processor has been successful in processing the request.

System Action:

Audit message only.

User Action:

None.

RMCP0012

RECEIVED UNSOLICITED MONITOR MESSAGE FOR ~P1 INDICATING STATUS OF ~P2

Reason:

The Command Processor has been notified of a resource status change.

System Action:

Audit message only.

User Action:

None.

RMCP0013

STATUS TABLE API ERROR - RC(P1) SYSMSG(P2)

Reason:

The call to the Status Table API failed.

System Action:

Audit Message only.

User Action:

None.

RMCP0014**P1 ACTUAL STATE SET TO P2****Reason:**

The Command Processor has set the Actual state.

System Action:

None.

User Action:

None.

RMCP0015**EXECUTING PROCESS ' P2' FOR P1****Reason:**

The Command Processor executed the defined process for this resource.

System Action:

Informational only.

User Action:

None.

RMCP0016**P1 MODE OVERRIDE SET TO P2****Reason:**

The Command Processor has set the Mode Override.

System Action:

None.

User Action:

None.

RMCP0017

PROCESS ~P1 COMPLETED FOR ~P2 - RC(~P3) SYSMSG(~P4)

Reason:

The executed process has completed with the following retcode and sysmsg.

System Action:

Informational only.

User Action:

None.

RMCP0019

CAN'T DETERMINE OBJECT IDENTIFIER FROM PARAMETERS

Reason:

Object ID not found and cannot be created because there is not enough information passed to the procedure.

System Action:

The request is rejected.

User Action:

Contact system administrator.

RMCP0021

~P1 DISPLAY PROCESSOR REQUEST INITIATED

Reason:

The Command Processor has requested the Display Processor to determine the status of the resource.

System Action:

Display processor is initiated for this resource.

User Action:

None.

RMCP0022

P1 DISPLAY PROCESSOR REQUEST COMPLETE - STATUS(P2) P3 P4

Reason:

The Display Processor has completed.
Informational only

System Action:

None.

User Action:

None.

RMCP0023

~P1 ~P2 STATUS ACCEPTED - RETURN CODE SET TO 0

Reason:

The monitor message status has been accepted by the Command Processor.

System Action:

No further processing.

User Action:

None.

RMCP0024

~P1 COMMAND/STATUS CONFLICT - ATTEMPT ABORTED

Reason:

The Command Processor has determined that the resource is in a status that is contradictory to the command issued. eg. The resource was STARTED and the STATUS changed to INACTIVE.

System Action:

No further processing, Automation failed.

User Action:

Verify message definitions are corrected for this resource. Check Log details.

RMCP0025

~P1 LOGICAL RESOURCE - DESIRED STATE ASSUMED

Reason:

If a resource is defined as type LOGICAL the Command Processor will issue START/STOP/FORCE commands, but will then assumed that they have worked.

System Action:

Audit message only.

User Action:

None.

RMCP0026

P1 MODE OVERRIDDEN TO P2 - OPERATOR ACTION REQUIRED

Reason:

The Desired State Engine has changed the resource's operation mode to Manual because the resource was in Automated mode but the required automation command had not been defined in the resource definition.

System Action:

The resource operational mode was changed from Automated to Manual as no further automation was possible because of the missing command.

User Action:

The operator must manually issue the required command. Notify the sites Operations Analyst to define the required command or permanently place the resource in Manual mode.

RMCP0027

~P1

Reason:

Solicited Message received by the Command Processor.

System Action:

Informational only.

User Action:

None.

RMCP0028**~P1****Reason:**

Unexpected Response received when attempting to issue command.

System Action:

No further processing.

User Action:

Contact System Administrator.

RMCP0029**P1 TIMEOUT STATUS ASSUMED - STATUS(P2)****Reason:**

The request has timeout, the Command Processor has therefore set the status to the Timeout Status indicated on the Resource definition

System Action:

Informational only.

User Action:

None.

RMCP0030**PROCESS RETURN CODE INDICATES TIMEOUT PARAMETERS ARE
TAKEN INTO ACCOUNT****Reason:**

A return code of 99 was received from a process. A return code of 99 indicates that the process timed out.

System Action:

Informational only.

User Action:

None.

RMCP0031

EXECUTING PROCESS (P2) FOR P1

Reason:

The Command Processor executed the defined process for this resource.

System Action:

Informational only.

User Action:

None.

RMCP0032

PROCESS ERROR (P1)

Reason:

An error occurred executing a process. Error message is returned in *P1*.

System Action:

Informational only.

User Action:

None.

RMCP0033

' P1' PROCESSING TERMINATING - ' P2' PROCESSING IN PROGRESS

Reason:

The processing for command type P1 has been abandoned because it was detected that processing for command type P2 was already in progress. Use of the RES command will flush any current command processing.

System Action:

Command processing terminated.

User Action:

Wait until current command completes before re-submitting the failed command or use the RES command to flush any currently executing commands.

RMCP0034

EXCEEDED RETRY LIMIT OF P1 WITHIN PERIOD OF P2

Reason:

Activation processing for a resource has been attempted more than *P1* times within the period defined by *P2*.

System Action:

The resource is placed in a FAILED state, and any system command or process specified in the resource definition is executed.

User Action:

None.

RMCP0035

ISSUING COMMAND " P1" FOR P2

Reason:

The Command Processor will issue the command identified by *P1* for the resource identified by *P2*.

System Action:

Informational only.

User Action:

None.

RMCP0036

PROCESS P1 UNSUCCESSFUL BUT RESOURCE ALREADY IN REQUIRED STATE (P2)

Reason:

The activation or inactivation process **P1** returned a code indicating that the process was unsuccessful. However, while the process was running, the resource has reached its required state **P2** (possibly due to events outside the control of the process).

System Action:

The process return code is ignored.

User Action:

None.

RMCT0001

INVALID KEYWORD VALUE SPECIFIED - KEYWORD(~P1) VALUE(~P2)

Reason:

An invalid keyword was passed to the service procedure.

System Action:

The request is rejected.

User Action:

Correct the calling procedure to the service procedure and rerun exec.

RMCT0002

~P1 FAILED - RC(~P2) FDBK(~P3) SYMSG(~P4)

Reason:

A Command Traffic Manager requires the establishment of an APPC conversation. An APPC function has ended in error.

System Action:

Processing terminated in error.

User Action:

Determine whether the remote system is still available. Contact your System Administrator.

RMCT0003

UNEXPECTED "WHAT RECEIVED" STATE - STATE(~P1)

Reason:

Procedure in unexpected APPC "What Received" State.

System Action:

None.

User Action:

Contact System Administrator.

RMCT0102**~P1 FAILED - RC(~P2) FDBK(~P3) SYMSG(~P4)****Reason:**

A Command Traffic Manager requires the establishment of an APPC conversation. An APPC function has ended in error.

System Action:

Processing terminated in error.

User Action:

Determine whether the remote system is still available. Contact your System Administrator.

RMCT0107**TRANSACTION NOT CONFIRMED - SYMSG(~P1)****Reason:**

The remote conversation partner has indicated that the last transaction was processed in error.

System Action:

The transaction record is left on the staging file.

User Action:

Contact System Administrator.

RMDB0001**INVALID KEYWORD VALUE SPECIFIED - KEYWORD(~P1) VALUE(~P2)****Reason:**

An invalid keyword was passed to the service procedure.

System Action:

The request is rejected.

User Action:

Correct the calling procedure to the service procedure and rerun exec.

RMDB0002

DATABASE STILL HAS ~P1 ACTIVE USERS

Reason:

The Database still has active users.

System Action:

The request is rejected.

User Action:

Display active users via: SH NDBUSER SH UDBUSERS Clear active users.

RMDB0003

DATABASES (P1) RESET

Reason:

The listed databases have been successfully cleared.

System Action:

None.

User Action:

None.

RMDB0004

DATABASE ERROR - DB(~P1) RC(~P2) SYMSG(~P3)

Reason:

A database error has occurred.

System Action:

Procedure terminates in error.

User Action:

Contact your system administrator.

RMDB0005**NO DATABASES SELECTED****Reason:**

No databases were selected from the list.

System Action:

None.

User Action:

None.

RMDB0006**RESET OF DATABASE(~P1) CANCELLED****Reason:**

The user has cancelled when asked to confirm the reset of this database.

System Action:

None.

User Action:

None.

RMDB0101**Invalid keyword value specified, KEYWORD= P1 VALUE= P2****Reason:**

The call to the RAMDB Utilities procedure \$RMDB01M failed during request processing because it was passed an invalid keyword value. The keyword was *P1* and the invalid value was *P2* .

System Action:

The request is rejected and procedure \$RMDB01M terminates. Control is returned to the procedure that called \$RMDB01M.

User Action:

Contact your System Administrator.

RMDB0102

No components selected for export processing

Reason:

You have elected to perform export processing but have not selected any components from the list presented.

System Action:

None.

User Action:

None.

RMDB0103

Import rejected - the import dataset is not in the correct format

Reason:

The data set from which you are importing data is not in the correct format. The data must be in the format OBJECT=objid, or Database Field Name = Value.

System Action:

The request is rejected.

User Action:

Ensure that the correct data set is specified for the import operation. The data must be created from an export using the RAMDB Utilities menu option.

RMDB0104

Import rejected - invalid for active system image

Reason:

You cannot import records to the active system image.

System Action:

The request is rejected.

User Action:

Ensure that the records you are trying to import do not belong to the currently active system image.

RMDB0105**Import rejected - invalid for active file transfer ruleset****Reason:**

An import of a file transfer ruleset has been rejected. The file transfer ruleset being imported has the same name as the active file transfer ruleset.

System Action:

The request is rejected.

User Action:

Ensure that the file transfer ruleset being imported is not the active file transfer ruleset.

RMDB0106**Import rejected - cannot import Services to a subordinate region****Reason:**

Services cannot be imported to a subordinate region because this region does not support services.

System Action:

The request is rejected.

User Action:

None.

RMDB0107**Import rejected - this region only accepts system name P1****Reason:**

The RAMDB import attempted to import a system image that is not supported. This system is a subordinate region and is restricted to system name *P1*.

System Action:

The request is rejected.

User Action:

Perform the import on a focal region.

RMDB0108

P1

Reason:

This is the summary report for the RAMDB Import Utility.

System Action:

None.

User Action:

None.

RMDB0109

P1 failed for file P2 Error P3

Reason:

The file operation specified by *P1* failed on file *P2* and the error is contained in *P3*.

System Action:

The file operation failed.

User Action:

Refer to the error message found in *P3* for more information about the cause of the error.

RMDB0110

Import rejected - invalid for active EventView Ruleset

Reason:

An import of an EventView ruleset has been rejected. The EventView ruleset being imported has the same name as the active EventView ruleset.

System Action:

The request is rejected.

User Action:

Ensure that the EventView ruleset being imported is not the active EventView ruleset.

RMDB0111**Request canceled by user****Reason:**

You have canceled a database import request.

System Action:

The request is canceled.

User Action:

None.

RMDB0112**Database P1 Error - DB(P2) RC(P3) SYSMSG(P4)****Reason:**

The database function has ended in error. P1 is the function being performed, P2 is the name of the database, P3 is the system return code, and P4 is the system error message.

System Action:

The current processing terminates in error.

User Action:

Check the status of the NDB database using the SH ALLOC command.

RMDB0113

Import rejected - the export was not performed on the same level

Reason:

The data you are attempting to import was exported from a NetMaster system on a different release level. This is not allowed as RAMDB formats can change between releases.

System Action:

The request is rejected.

User Action:

You can only import the data to a system that has the same base level of software as the system that performed the export. If you browse the data set, the first record will show you the level of the NetMaster base where the export was performed. This must match the base level of the NetMaster system where you are attempting to perform the import. Use the CMD command at the ==> prompt at the top of your screen and the STATUS command to determine the level of your NetMaster system.

RMDB0201

No records found to export from component(P1)

Reason:

You chose to perform export processing but no records were found in the database that match the component selected, identified by *P1*.

System Action:

None.

User Action:

None.

RMDB0202**Export commenced for component(*P1*) to *P2*****Reason:**

The RAMDB Export Utility has started to write the selected records to the data set specified by *P1*. The records being written belong to the component identified by *P2*.

System Action:

None.

User Action:

None.

RMDB0203**Database *P1* Error - DB(*P2*) RC(*P3*) SYSMSG(*P4*)****Reason:**

The database function has ended in error. *P1* is the function being performed, *P2* is the name of the database, *P3* is the system return code, and *P4* is the system error message.

System Action:

The current processing terminates in error.

User Action:

Check the status of the NDB database using the SH ALLOC command.

RMDB0204**P1****Reason:**

This is the summary report for the RAMDB Export Utility.

System Action:

None.

User Action:

None.

RMDB0205

P1 failed for file P2 Error P3

Reason:

The file operation specified by P1 failed on file P2 and the error is contained in P3.

System Action:

The file operation failed.

User Action:

The abend code indicates a system level error, correct the cause of the error and retry the request.

RMDB0401

INVALID KEYWORD VALUE SPECIFIED FOR KEYWORD ~P1 VALUE=~P2

Reason:

An invalid keyword value was passed to the Database Maintenance routine. The keyword was P1 and the invalid value was P2 .

System Action:

Request is rejected.

User Action:

Correct the keywords value and retry the request.

RMDB0402

~P1 KEYWORD REQUIRED IF ~P2 KEYWORD SPECIFIED

Reason:

The keyword P1 must also be specified if keyword P2 is specified.

System Action:

Request is rejected.

User Action:

Correct the parameters and retry the request.

RMDB0403**DDNAME P1 ALREADY ALLOCATED TO P2****Reason:**

The fix application process could not allocate the specified data set because the specified DDname was already allocated to another data set. The specified DDname was *P1* and the already allocated data set name is *P2* .

System Action:

Allocation of the data set terminates.

User Action:

Specify another DDname or the already allocated data set name.

RMDB0404**P1 ALREADY OPENED WITH FILE ID P2****Reason:**

The fix application process could not open the specified data set because the specified name was already opened with another File ID. The specified name was *P1* and the already in use file ID is *P2* .

System Action:

Request is rejected.

User Action:

Specify another name.

RMDB0405**INVALID NDB STATUS FOR NDB ~P1, DDNAME ~P2, STATUS IS ~P3****Reason:**

The fix application process could not continue as the specified database was in an invalid NDB state. The NDB file ID is *P1* and the DDname specified was *P2* and the current status of the NDB is *P3* .

System Action:

Request is rejected.

User Action:

Retry the request when the database's current status is ACTIVE.

RMDB0406

DATASET= KEYWORD CANNOT BE SPECIFIED IF DDNAME= KEYWORD IS SPECIFIED

Reason:

The DDNAME= and the DATASET= keyword are mutually exclusive parameters.

System Action:

Request is rejected.

User Action:

Correct the parameters and retry the request.

RMDB0407

FIX SYNTAX ERROR AT LINE ~P1 EXPECTED "~P2" FOUND "~P3"

Reason:

The Database application utility encountered a syntax error with the fix that was being applied. The expected data was P2 however P3 was found. The line on which the error was detected is P1 .

System Action:

Fix is rejected.

User Action:

Correct the fix and reapply.

RMDB0408

Internal message queue overflow

Reason:

The database application utility encountered a queue problem. The size of the fix exceeds the total number of messages allowed for the internal dependent command environment queue.

System Action:

The fix is rejected.

User Action:

Contact Technical Support.

RMDB0409**EMPTY FIX FILE****Reason:**

The Database application utility could not continue because the fix file is empty.

System Action:

Fix is rejected.

User Action:

Specify a fix file that contains a real database fix.

RMDB0410**UNEXPECTED END OF FILE BEFORE FIX WAS PROCESSED****Reason:**

The Database application utility could not continue because the fix file was incomplete.

System Action:

Fix is rejected.

User Action:

Correct the fix file, ensuring the fix is complete.

RMDB0411**ATTRIBUTE VALUE FOR ~P1 IS TOO LARGE AT LINE ~P2****Reason:**

The Database application utility could not continue because the fix contained an attribute value assertion that exceeded the maximum of 256.

System Action:

Fix is rejected.

User Action:

Correct the fix file, ensuring all attribute values are not greater than 256 bytes.

RMDB0412

INVALID COMMAND ~P1

Reason:

The command P1 is invalid.

System Action:

Command field is set in error.

User Action:

Enter a valid command.

RMDB0413

REQUEST CANCELLED

Reason:

A request to apply a database fix was cancelled by the user.

System Action:

None.

User Action:

None.

RMDB0414

APPLY ACTION ~P1 REQUIRES OBJECT "~P2" IN TARGET DATABASE

Reason:

A request to apply a database fix encountered an error. The fix specified an action of P1 , which requires the object being on the target database, however the object was not found.

System Action:

Fix will be rejected, unless FORCE=YES is specified.

User Action:

Determine why the object was not on the target database.

RMDB0415**APPLY ACTION ~P1 CREATES OBJECT "~P2" HOWEVER OBJECT ALREADY EXISTS****Reason:**

A request to apply a database fix encountered an error. The fix specified an action of P1 , which requires the object not being on the target database, however the object was on the database.

System Action:

Fix will be rejected, unless FORCE=YES is specified.

User Action:

Determine why the object was on the target database.

RMDB0416**APPLY ACTION ~P1 HAS FOUND THAT THE TARGET OBJECT'S STATS INDICATE THAT THE OBJECT HAS BEEN MODIFIED. APPLYING THE FIX WILL REGRESS THE MODIFIC ATIONS MADE.OBJECT=~P2"****Reason:**

A request to apply a database fix encountered an error. The fix was performing the action P1 against the object P2 . Comparisson of the target objects status indicates that the object was modified and is not equal to the distributed object. Applying the fix will regress any of the changes made to the target object.

System Action:

Fix will be rejected, unless FORCE=YES is specified.

User Action:

Determine why the object was modified.

RMDB0417

**APPLY ACTION ~P1 WOULD NOT BE PERFORMED FOR OBJECT "~P2",
PREVIOUS LEVEL IS ~P3**

Reason:

A request to apply a database fix encountered an error. The fix specified the action P1 be applied to the object P2 , however due to previous errors the action would not be performed. This is an apply check error. P3 is the created user ID for the object and would normally contain the version or last fix number for the object.

System Action:

Fix will be rejected, unless FORCE=YES is specified.

User Action:

Refer to previous errors for this object.

RMDB0418

**APPLY ACTION ~P1 WOULD BE PERFORMED FOR OBJECT "~P2",
PREVIOUS LEVEL IS ~P3**

Reason:

A request to apply a database fix has successfully completed the CHECK phase for the action P1 against the object P2 . The previous level for the object is P3 .

System Action:

None.

User Action:

None.

RMDB0419**APPLY PROCESSING TERMINATED DUE TO PREVIOUS ERRORS****Reason:**

A request to apply a database fix failed.

System Action:

Apply terminates.

User Action:

Check the associated error messages.

RMDB0420**APPLY ACTION ~P1 ERROR. RECEIVED RC=~P2 FOR OBJECT="~P3"****Reason:**

A request to apply a database fix failed. A previous message indicates the error. The action being performed was P1 , the database return code received was P2 and the object being actioned was P4 .

System Action:

None.

User Action:

Check the associated error messages.

RMDB0421**APPLY ACTION ~P1 WAS SUCCESSFULL FOR OBJECT "~P2"****Reason:**

A request to apply a database fix has successfully completed the action P1 for the object P2 .

System Action:

None.

User Action:

None.

RMDB0422

APPLY PROCESSING COMPLETED. CHECK HAD ~P1, APPLY ~P2

Reason:

A request to apply a database fix has completed. The check phase had P1 (Either ERRORS or NO ERRORS if all was successfully completed). The apply phase either HAD ERRORS, was NOT PERFORMED or WAS SUCCESSFUL as indicated by P2 .

System Action:

None.

User Action:

None.

RMDB0423

APPLY CHECK PROCESSING COMPLETED

Reason:

A request for an Apply Check of a database fix has completed.

System Action:

None.

User Action:

See previous messages.

RMDB0424

APPLY PROCESSING CONTINUING AFTER ERRORS BECAUSE OF FORCE OPTION

Reason:

A request for an apply of a database fix has encountered errors however because the FORCE option was specified the apply process will continue with the next object and action.

System Action:

None.

User Action:

See previous messages.

RMDB0425**APPLY WILL USE DATABASE FILE ID ~P1****Reason:**

A request for an apply of a database fix specified the database file ID P1 .

System Action:

None.

User Action:

None.

RMDB0426**FIX SYNTAX ERROR AT LINE ~P1, INVALID HEX STRING FOUND****Reason:**

The Database application utility encountered a syntax error with the fix that was being applied. The expected data was a hex string with an even number of characters, however an invalid hex string was found.

System Action:

Fix is rejected.

User Action:

Correct the fix and reapply.

RMDB0427**ATTRIBUTE ~P1 BEING DELETED, OLD VALUE="~P2"****Reason:**

When the fix is applied to the target database then the attribute P1 will be deleted. The current value of the attribute is P2 . A previous message identifies the object.

System Action:

None.

User Action:

None.

RMDB0428

ATTRIBUTE ~P1 BEING CREATED, NEW VALUE=~P2"

Reason:

When the fix is applied to the target database then the attribute P1 will be created. The value of the attribute will be P2 . A previous message identifies the object.

System Action:

None.

User Action:

None.

RMDB0429

ATTRIBUTE ~P1 BEING UPDATED, NEW AND OLD VALUES:

Reason:

When the fix is applied to the target database then the attribute P1 will be updated. The previous and new values for the attribute will be described in the following RMDB0431 messages.

System Action:

None.

User Action:

None.

RMDB0430

(CONT.) "~P1"

Reason:

This is a continuation message for displaying the value of an attribute. See the previous message for more information.

System Action:

None.

User Action:

None.

RMDB0431**~P1: "~P2"****Reason:**

This message displays the OLD or NEW value of an attribute being updated as specified in the previous message. P1 is either "OLD" to indicate the display of an attributes previous value, or "NEW" to indicate its new value. P2 is the actual value.

System Action:

None.

User Action:

None.

RMDB0432**DIFFERENCE DISPLAY OF OBJECT ~P1; ~P2 ATTRIBUTE(S) WOULD BE ALTERED AS F OLLOWS:****Reason:**

When the fix is applied to the target database then the object P1 will be modified as described by subsequent messages. P2 is the number of attributes that will be altered. This is a heading message for a difference display for an object that will be updated.

System Action:

None.

User Action:

None.

RMDB0433

ACTION ~P1 IGNORED FOR OBJECT ~P2, OBJECT DOES NOT EXIST

Reason:

A request to perform the action P1 for object P2 will be ignored because the object does not exist in the target database.

System Action:

None.

User Action:

None.

RMDB0434

ACTION ~P1 CHANGED TO SET FOR OBJECT ~P2, OBJECT ALREADY EXISTS

Reason:

A request to perform the action P1 for object P2 will be changed to action SET because the object already exists in the target database.

System Action:

None.

User Action:

None.

RMDB0435

ACTION ~P1 CHANGED TO CREATE FOR OBJECT ~P2, OBJECT DOES NOT EXIST

Reason:

A request to perform the action P1 for object P2 will be changed to action CREATE because the object does not exist in the target database.

System Action:

None.

User Action:

None.

RMDB0436**ACTION ~P1 DOES NOT CHANGE ANY ATTRIBUTES OF OBJECT ~P2****Reason:**

A request to perform the action P1 for object P2 will not result in any attributes being changed in the target database, because the target database's object is identical to that specified in the fix.

System Action:

None.

User Action:

None.

RMDB0437**FIX ~P1 DOES NOT EXIST IN DDNAME ~P2****Reason:**

A request to apply or restore the fix P2 failed because the DDNAME P2 did not contain the member name P1, which should contain the fix source.

System Action:

The request is rejected.

User Action:

Ensure the dataset allocated to DDNAME P2 contains the member P1 and retry the request.

RMDB0438**RESTORE FROM ACTION DELETE IGNORED BECAUSE OBJECT ~P1 DID NOT EXIST IN DISTRIBUTION DATABASE****Reason:**

A request to restore the delete action for object P1 was ignored because the object does not exist in the distribution database.

System Action:

None.

User Action:

None.

RMDB0439

RESTORE FAILED, ACTION ~P1 REVERSED BY ACTION ~P2 WHICH RECEIVED RC=~P3 FOR OBJECT ~P4 AGAINST TARGET DATABASE

Reason:

A request to restore from action P1 was attempted by invoking action P2 . However the action received an error from the database manager. The return code was P3 and the object of the action was P4 .

System Action:

Restore for the object fails. Processing continues for the next object in the fix.

User Action:

Determine the reason for the database error and retry the restore.

RMDB0440

RESTORE OF OBJECT ~P1 FAILED, GET FROM DISTRIBUTION DATABASE RETURNED RC =~P2

Reason:

A request to restore object P1 failed because the object get from the distribution database failed. The return code was P2 .

System Action:

Restore for the object fails. Processing continues for the next object in the fix.

User Action:

Determine the reason for the database error and retry the restore.

RMDB0441**RESTORE SUCCESSFUL, ACTION ~P1 REVERSED BY ACTION ~P2 FOR OBJECT ~P3 AGA INST TARGET DATABASE****Reason:**

A request to restore object P3 from action P1 was performed by invoking action P2 against the target database. The action was successful and the object was successfully restored.

System Action:

None.

User Action:

None.

RMDB0442**RESTORE FROM ACTION CREATE WILL BE SET BECAUSE OBJECT ~P1 EXISTED IN DIS TRIBUTION DATABASE****Reason:**

A request to restore the create action for object P1 was set instead of delete because the object existed in the distribution database.

System Action:

None.

User Action:

None.

RMDB0443

**OBJECT IS ~P1 LAST UPDATED STATS ARE: USER=~P2 DATE=~P3
TIME=~P4 NMDID=~ P5**

Reason:

The fix was attempting to modify object P1 however the object's stats indicate that it had been modified since distribution or the last fix applied. This is an apply CHECK error. The stats P2, P3, P4 and P5 are last updating User ID, the Date, Time and Domain ID of the update respectively.

System Action:

The fix fails the apply CHECK phase.

User Action:

Determine the reason the object was modified and use the FORCE=YES keyword to force the apply the fix. Then redo the customisations if necessary.

RMDB0444

RESTORE PROCESSING COMPLETED SUCCESSFULLY

Reason:

The fix was successfully restored. See previous messages for further details.

System Action:

None.

User Action:

None.

RMDB0445

RESTORE PROCESSING COMPLETED, ERRORS OCCURRED

Reason:

The restore processing has completed, however errors has occurred. See previous messages for details of the errors.

System Action:

None.

User Action:

None.

RMDB0446**DIFFERENCE DISPLAY FOLLOWING (ATTRIBUTES OF THE TARGET DATABASE THAT WILL BE CHANGED BY THIS FIX)****Reason:**

When the fix is applied to the target database and the DIFF=YES keyword is specified then this message is displayed as the title for the difference display.

System Action:

None.

User Action:

None.

RMDB0447**RESTORE FROM ACTION SET WILL BE DELETED BECAUSE OBJECT ~P1 DID NOT EXIST IN DISTRIBUTION DATABASE****Reason:**

A request to restore the set action for object P1 was deleted instead of set because the object did not exist in the distribution database.

System Action:

None.

User Action:

None.

RMDBAD01**FILE P1 ERROR - FILE(P2) RC(P3) MSG(P4)****Reason:**

An error was encountered when attempting to access file. *P1* is the operation being performed, *P2* is the ID of the file, *P3* is the return code and *P4* is the message set by the file verb.

System Action:

Database synchronisation terminates.

User Action:

Contact the system administrator.

RMDBAD02

CANNOT DELETE TASK RECORD FOR TASK P1 - STATUS IS P2

Reason:

A request to delete a task record was rejected because the task is still in progress. *P1* is the task number and *P2* is the current status of the task.

System Action:

None.

User Action:

Task records can only be deleted after the task has completed. Wait until the task has a status of ENDED or FAILED before attempting to delete the record.

RMDBAD03

TASK RECORD FOR TASK P1 DELETED

Reason:

A request to delete a task record was successfully processed.

System Action:

None.

User Action:

None.

RMDBAD04

NO LOG RECORDS FOR TASK (P1)

Reason:

The task identified by *P1* has not generated any log records.

System Action:

None.

User Action:

None.

RMDBAD05**TASK (P1) LOG NOT AVAILABLE DUE TO SYSTEM RESTART****Reason:**

The log for the task identified by *P1* no longer exists because the log is not preserved across system restarts and the system has been restarted after the task was started.

System Action:

None.

User Action:

Check the messages in the activity log for the time when the task was running.

RMDBAPI01**SYNTAX ERROR: P1****Reason:**

A call Syntax Error has been detected while processing a RAMDB Maintenance request. *P1* contains the details of the error.

System Action:

The request is rejected.

User Action:

Correct the API Call request and re-submit.

RMDBAPI02**P1 EXCEEDS MAXIMUM LENGTH P2.****Reason:**

The value given by the field *P1* exceeds the maximum length allowable, *P2*, for that variable. *P3* names the Field.

System Action:

The request is rejected.

User Action:

Reduce the length of the value to less than or equal to the value indicated by *P2*.

RMDBAPI03

INVALID PARAMETERS DETECTED FOR CLASS P1: P2

Reason:

The parameter(s) indicated by *P2* are invalid when class is *P1*.

System Action:

The request is rejected.

User Action:

Remove the *P1* parameter or change the class. Then retry.

RMDBAPI04

ACBNAME IS AN INVALID PARAMETER FOR ALL CLASSES EXCEPT 02 (STC), 09 (CDMON) and 22 (FTSMGR)

Reason:

The ACPNAME parameter is invalid for all classes except 02 (STC), 09 (CDMON) and 22 (FTSMGR).

System Action:

The request is rejected.

User Action:

Remove the ACPNAME parameter or change the class. Then retry.

RMDBAPI05

P1 IS AN INVALID PARAMETER UNLESS CLASS IS 09 (CDMON) OR 26 (FTPMON)

Reason:

The parameter indicated by *P1* is invalid unless class is 09, which is CDMON class, or class is 26, which is the FTPMON class.

System Action:

The request is rejected.

User Action:

Remove the *P1* parameter or change the class. Then retry.

RMDBAPI06**VOLUME IS AN INVALID PARAMETER FOR ALL CLASSES EXCEPT 16 (DASD)****Reason:**

The VOLUME parameter is invalid for all classes except 06 (DASD).

System Action:

The request is rejected.

User Action:

Remove the VOLUME parameter or change the class. Then retry.

RMDBAPI07**SCHEDULE IS AN INVALID PARAMETER FOR CLASSES 09(CDMON), 23(FTSMON), 24(FTSCHED) AND 26(FTPMON)****Reason:**

The SCHEDULE parameter is invalid for classes 09(CDMON), 23(FTSMON), 24(FTSCHED) AND 26(FTPMON).

System Action:

The request is rejected.

User Action:

Remove the SCHEDULE parameter or change the class. Then retry.

RMDBAPI08**THE SCHEDULE REQUIRES AT LEAST ONE SCHEDULE ENTRY****Reason:**

The SCHEDULE must contain at least one entry consisting of a schedule criteria, start time, pre-processing period, processing period, and post-processing period. Other criteria fields are optional.

System Action:

The request is rejected.

User Action:

Correct the SCHEDULE request by adding a schedule entry which contains at least the required parameters and retry.

RMDBAPI09

THE SCHEDULE MAXIMUM FILE SIZE MUST BE GREATER THAN THE MINIMUM FILE SIZE.

Reason:

The maximum file size (in bytes) is less than the minimum file size (in bytes).

System Action:

The request is rejected.

User Action:

Correct the SCHEDULE request making the maximum file size greater than the minimum or the minimum less than the maximum.

RMDBAPI10

SCHEDULE ENTRIES ARE ONLY VALID FOR FTSCHED (CLASS 24) REQUESTS

Reason:

Schedule entries have been supplied in a request that is not class 24.

System Action:

The request is rejected.

User Action:

Either remove the schedule entries or change the class to 24 for a schedule request and retry.

RMDBAPI11

P1 EXCEEDS MAXIMUM VALUE P2

Reason:

The value presented in *P1* exceeds the maximum value allowable, *P2*, for that variable.

System Action:

The request is rejected.

User Action:

Reduce the value to less than or equal to the value indicated by *P2*.

RMDBAPI12**P1 VALUE ' P2' INVALID FOR CLASS P3****Reason:**

The parameter value *P2* for Field *P1* is invalid for the class *P3* specified.

System Action:

The request is rejected.

User Action:

Specify a valid value in field *P1* and retry.

RMDBAPI13**INVALID CLASS SPECIFIED****Reason:**

An invalid class has been specified in the request. If this is a System Image Create then Class is not a valid field. If it is a Resource Create request then the Class value specified is not a valid resource class.

System Action:

The request is rejected.

User Action:

Specify a valid class value or remove and retry.

RMDBAPI14**P1 IS A REQUIRED PARAMETER****Reason:**

The parameter *P1* is required for this request.

System Action:

The request is rejected.

User Action:

Add the required field *P1* to the request and retry.

RMDBAPI15

' P1' IS AN INVALID VALUE FOR P2

Reason:

The value *P1* is an invalid value for the field *P2*.

System Action:

The request is rejected.

User Action:

Correct the value for the field and retry.

RMDBAPI16

P1 IS AN INVALID PARAMETER WHEN TYPE IS P2

Reason:

The parameter indicated by *P1* is invalid when type is *P2*.

System Action:

The request is rejected.

User Action:

Remove the *P1* parameter or change the type *P2* and retry.

RMDBAPI17

VALID VALUES FOR QTYPE ARE 'EXEC', 'HOLD', 'TIMER' OR 'WAIT'

Reason:

An invalid value was specified for QTYPE. Valid values are 'EXIT', 'HOLD', 'TIMER' or 'WAIT'.

System Action:

The request is rejected.

User Action:

Correct the value and retry.

RMDBAPI18

VALID VALUES FOR QUEUE STATUS ARE 'H', 'HC', 'HE', 'HI', 'HO', 'HP', 'HR', 'HS', 'R', 'RA', 'RETRY', 'RH', or 'WS'

Reason:

An invalid value was specified for the Queue Status. Valid values are 'H', 'HC', 'HE', 'HI', 'HO', 'HP', 'HR', 'HS', 'R', 'RA', 'RETRY', 'RH', or 'WS'.

System Action:

The request is rejected.

User Action:

Correct the value and retry.

RMDBAPI19

FIELD P1 CONTAINS AN INVALID TIME FORMAT

Reason:

Time must be in HH.MM.SS format.

System Action:

Request is rejected.

User Action:

Respecify value and retry.

RMDBAPI20

FIELD P1 MUST BE NUMERIC IN RANGE P2 TO P3

Reason:

The field indicated by *P1* must contain a number in the range specified.

System Action:

Request is rejected.

User Action:

Respecify value and retry.

RMDBAPI21

REQUIRED FORCE INACTIVATION FIELDS HAVE BEEN OMITTED

Reason:

When the parameter Force Termination is 'YES' then either a Force Inactivation Command or Process must be specified.

System Action:

The request is rejected.

User Action:

Add the required field to the request and retry.

RMDBAPI22

NO RECORDS MATCH FOR LIST P1 REQUEST

Reason:

No records were found to match a List *P1* request.

System Action:

None.

User Action:

Information only.

RMDBAPI23

THE 'SET' COMMAND IS ONLY VALID FOR SYSTEM IMAGE UPDATE REQUESTS

Reason:

An update request was made, using the 'SET' option, for other than a System Image record. Only System Image records may be updated using 'SET'.

System Action:

The request is rejected.

User Action:

Information only.

RMDBAPI24

PARAMETER P1 IS IN ERROR. P2

Reason:

The Parameter indicated by *P1* is in error. The reason for the error is indicated by *P2*.

System Action:

The request is rejected.

User Action:

Correct the parameter and retry.

RMDBAPI25

REQUIRED FIELDS HAVE BEEN OMITTED

Reason:

Required fields to create a file transfer schedule have been omitted. The syntax for a Create Schedule request is:

\$RMDBAPI SERVICE=CREATE (required)

SYSTEM=xxxxxxx (required)

VERSION=IIII (required)

CLASS=24 (required)

NAME=xxxxxxxxxxxxxxxxxxxx (required)

SDESC=xxxxxxxxxxxxxxxxxxxx (required)

CRITn=xxxxxxxxxxx (required, where n=1-97)

TIMEEn=hh.mm (required, where n=1-97)

PREPn=hh.mm (required, where n=1-97)

PROCN=hh.mm (required, where n=1-97)

POSTn=hh.mm (required, where n=1-97)

LONGn=hh.mm (optional, where n=1-97)

FILEn=xxxxxxxxxxxxxxxxxxxx (required, where n=1-97)

TYPEEn=SRC/TGT/ID (required, where n=1-97)

FNUMn=III (required, where n=1- 97) SRCn=xxxxxxxxxxxxxxxx (optional, where n=1-97)

TGTn=xxxxxxxxxxxxxxxx (optional, where n=1-97)

MINn=IIIIIIII (optional, where n=1-97)

MAXn=IIIIIIII (optional, where n=1-97)

System Action:

The request is rejected.

User Action:

Correct the request providing all required parameters, and retry.

RMDBAPI26

P1 SERVICE COMPLETED SUCCESSFULLY

Reason:

The service *P1* was performed successfully.

System Action:

None.

User Action:

None.

RMDBAPI27

SYSTEM IMAGE (P1 P2) DOES NOT EXIST. RESOURCE CREATION REQUEST FAILS.

Reason:

The System Image described by **P1** (Image name) **P2** (Version) does not currently exist.

System Action:

The Resource Create request is not performed.

User Action:

Either specify a different System Image or Create the given image prior to the Resource Create request.

RMDBAPI28

LUNAME IS AN INVALID PARAMETER FOR ALL CLASSES EXCEPT 14 (JES LINE)

Reason:

The VOLUME parameter is invalid for all classes except 14 (JES LINE).

System Action:

The request is rejected.

User Action:

Remove the LUNAME parameter or change the class. Then retry.

RMDBAPI29**THE NUMBER OF ALERT ACTIONS SPECIFIED EXCEEDS THE MAXIMUM STORAGE SIZE AVAILABLE FOR ALERT ACTIONS.****Reason:**

You attempted to create a file transfer rule with alert automated actions, but the total storage size required to store the actions has exceeded that which is available for them.

System Action:

The request is rejected.

User Action:

Reduce the number of actions in the request.

RMDBAPI30**THE RESOURCE SELECTED FOR DELETION P1, CANNOT BE DELETED WHILE IT IS THE OWNER OF P2 RESOURCES****Reason:**

You have attempted to delete the resource manager, *P1*, that currently is the owner of *P2* resources. Because the deletion of a manager without prior removal of the dependent resources may lead to unexpected behavior by those owned resources, the request is rejected.

System Action:

The request is rejected.

User Action:

Delete the dependent resources before you delete the manager.

RMDBAPI31

CLASS P1 NOT LICENSED

Reason:

The class of resource for which the request is made, *P1* , is not licensed for the region in which the request was made.

System Action:

The request is rejected.

User Action:

To create a resource of the *P1* class, do one of the following:

- Use a region that is licensed for the class.
- Set up the region again with the correct license.

RMDBAPI32

RSNAME P1 ALREADY EXISTS

Reason:

An attempt to create a new File Transfer Ruleset has failed because the Ruleset (*P1*) already exists.

System Action:

The request is rejected.

User Action:

Check the RSNAME.

RMDBAPI33

PARAMETER FIELD P1 IS INVALID

Reason:

The parameter field indicated by *P1* is invalid for this request. The field name may be incorrect or the field is not relevant to the request being made.

System Action:

The request is rejected.

User Action:

Correct the request, providing only relevant parameters, and retry.

RMDBAPI34**SYNTAX ERROR: PARAMETER LIST INVALID. MUST BE IN KEYWORD FORMAT****Reason:**

The parameter list provided is not in Keyword format. That is parameters that are being passed in the request are not listed in the format 'Keyword'='Value'.

System Action:

The request is rejected.

User Action:

Check the parameter list. Blank spaces within Values may be interpreted as Keywords when 'EXEC' is used to initiate the request or when the value is incorrectly quoted. Beware the following when using &CALL or EXEC:

- 1)Field values should NOT be enclosed in quotes
- 2)If using EXEC, then if any field value contains embedded blanks, your calling NCL procedure must use &CONTROL NOVARSEG and the value must be coded as a variable. For instance - &CONTROL NOVARSEG &DCMD = &STR D J,STC1 EXEC \$RMDBAPI SERVICE=CREATE.....DISPCMD=&DCMD ... If you are invoking \$RMDBAPI to run as a separate process you must pass the field values via keyword parameters on the command and any value containing embedded blanks should be enclosed in quotes.

RMDBAPI35**CLASS(P1) CAN ONLY HAVE ONE DEFINITION****Reason:**

Only one definition can be defined to the system for each of the following classes: SPOOL, JES, EE, and CSM.

System Action:

None.

User Action:

None.

RMDBDY02

Update in progress by P1

Reason:

The definition you tried to delete was being updated by another user, *P1* .

System Action:

The request is rejected.

User Action:

Retry later.

RMDBDY03

Delete cancelled

Reason:

Deletion of a resource, that has owned resources, was cancelled by the user.

System Action:

None.

User Action:

None.

RMDBDY04

Value not selected from list

Reason:

You exited a list without making a selection.

System Action:

None.

User Action:

None.

RMDBDY05

Class(P1) can only have one definition

Reason:

Only one definition can be defined to the system for each of the following classes: SPOOL, JES, EE, and CSM. A definition for the class indicated (P1) already exists.

System Action:

None.

User Action:

The resource may be suppressed from the Status Monitor display if the monitoring status for the resource is OFF.

Do the following to confirm that a resource in the class indicated exists:

1. Use the /RADMIN.R shortcut to display the ResourceView : Resource Definition panel.
2. Select the appropriate class. The resource list for the class is displayed.
3. To change the monitoring status, update (U) the resource. The list of panels is displayed
4. Select the first panel in the list, (resource type) General Description.
5. Update the Monitoring Activity field to the desired value.
6. Press F3 (File) to file the change.

RMDBEX01

UNABLE TO DETERMINE OBJECT ID PARAMETER

Reason:

Object ID not found and can not be created because there is not enough information passed to the procedure.

System Action:

The request is rejected.

User Action:

Contact your system administrator.

RMDBMS00

OBJID=" P1" P2 ON P3 AT P4 BY P5 P6

Reason:

The database record identified by object ID *P1* had the action *P2* issued against it on date *P3* at time *P4* by user *P5*. If the update was originally done on a remote system, then *P6* is additional information about when the update was done on the remote system in remote system time.

System Action:

None.

User Action:

None.

RMDBMS01

INVALID CALL TO PROCNAME \$RMDBMS PARMS=< p1>

Reason:

An internal RAMDB call has failed due to an invalid call syntax or a non-existent function request.

System Action:

Processing is terminated.

User Action:

Contact Technical Support.

RMDBMS02

NDB ERROR ON p1 DBRC= p2 ERROR=(p3)

Reason:

There was an NDB error on the specified database.

System Action:

None.

User Action:

For information about the DBRC and ERROR fields, enter \$INFO on the command line and select *NDB Error Codes*.

RMDBMS03**NDB WARNING ON p1 DBRC= p2 ERROR=(p3)****Reason:**

There was an NDB warning on the specified database.

System Action:

None.

User Action:

For information about the DBRC and ERROR fields, enter \$INFO on the command line and select *NDB Error Codes*.

RAMDBMS04

RECORD(resource-name) NOT FOUND

Reason:

An object with the specified name was not found in the currently active system image, and is therefore unknown to monitoring on this region.

A system image is a collection of the definitions of all objects required for a NetMaster or SOLVE region to perform monitoring.

Most objects are resources (for example, names of your devices, tasks, and nodes) but objects can also include commands, profiles, filters, and icons.

Multiple system images, identified by different system image names, can be defined for different purposes; however, only one is loaded/active at any time.

System images are stored in the RAMDB VSAM file (referred to in some documentation as the knowledge base).

The system image that is currently active on this region does not contain a definition for this resource name.

System Action:

None. The requested action cannot be performed.

User Action:

A common cause of this message is requesting a diagnostic function on a resource that isn't known. Check for the correct resource name.

If you are typing the name of this resource into a name input field (for example, the Stack Name, Address Space Name, or network device name) check that you have not mistyped the name.

With most name input fields, you can enter ? to display a selection list of names known by the active system image, for example: Stack Name ...+ ?

If you are sure that this is the correct resource name, then check for the correct system image.

Look at this region's monitors to see the active system image and its resources. Use options /RMON, or if using NetMaster for TCP/IP, /IPMON or /IPNODE.

The system image name is at the top right, and consists of a system name and version number, for example, SYS1-0001 or PROD-0004.

Check with whoever set up this region that this is the right system image name. Some possible problems might be:

- The region loaded the wrong system image at startup
- The region tried to load the correct system image, but failed
- There is no correct system image, Express Setup failed

If this currently active system image is the correct one, then this resource name needs to be added to this system image.

RMDBMS05

AN INVALID FIELD NAME WAS ENCOUNTERED

Reason:

An Invalid Field name has been defined.

System Action:

None.

User Action:

Refer to SERVICE/VIEW Technical Support.

RMDBMS06

NO RECORDS FOUND FOR SPECIFIED SCAN CRITERIA

Reason:

No Records were found for the specified Search Criteria.

System Action:

None.

User Action:

Verify that you have specified the correct criteria - eg - a valid SYSNAME and VERSION Combination.

RMDBMS07

SCAN TERMINATED RC: P1 P2 LIMIT EXCEEDED ON P3

Reason:

The limits for an NDB scan were reached or exceeded.

System Action:

The request ends with an error, and no records are returned.

User Action:

You can raise the NDB scan limits by modifying the *NDBLIMITS* region initialization parameters group.

RMDBMS08

COPY REQUEST INVALID - SOURCE AND TARGET ARE THE SAME

Reason:

You cannot copy the source onto itself.

System Action:

The request fails.

User Action:

Change the copy target.

RMDBMS09

MERGE REQUEST CANCELLED

Reason:

The option to merge two system images was cancelled at the user's request.

System Action:

Merge does not proceed.

User Action:

None.

RMDBMS10

RECORD ALREADY EXISTS

Reason:

The record you are trying to add already exists.

System Action:

The request fails.

User Action:

Delete the existing record, or change the name of the one you are trying to add.

Note: If the region supports local, shared, and sysplex system images, the name must be unique across all image types.

RMDBMS11**CLASS(P1) IS NOT SUPPORTED BY THIS VERSION OF THE PRODUCT****Reason:**

The class identified by P1 is not supported by the version installed on this system. The most likely scenario is *that* this region is linked to a region that is at a later version and contains resource classes not known by this region.

System Action:

The request is rejected.

User Action:

Perform the desired request in a region that recognizes this resource class. It is recommended that all monitoring be performed from the latest version of the product as it will be aware of all resource classes.

RMDBMS12**STAGING FILE ERROR, OBJID(P1) MSG(P2)****Reason:**

An error was encountered when attempting to write to the staging file. *P1* is the ID of the object that was being processed and *P2* is the message set by the staging file maintenance procedure.

System Action:

The database record will not be updated on any linked systems. Processing continues.

User Action:

Determine the cause of the error from the staging file maintenance procedure message and re-update the record in error in order to cause the changes to be transmitted to any linked regions.

RMDBMS13

SERIOUS NDB ERROR ON p1 DBRC= p2 ERROR=(p3)

Reason:

There was an NDB error on the specified database.

System Action:

The request fails.

User Action:

For information about the DBRC and ERROR fields, enter \$INFO on the command line and select *NDB Error Codes*.

RMDBMS15

SYSTEM IMAGE p1 IN PROGRESS

Reason:

A System Image Copy/Delete is underway.

System Action:

None.

User Action:

None.

RMDBMS16

REQUEST NOT PROCESSED - DATABASE IS LOCKED

Reason:

A request to the Database manager has been rejected due to the database being locked.

System Action:

Call is rejected.

User Action:

Contact your Systems Administrator.

RMDBMS17

RAMDB ERROR, P1 P2 AT P3 ON P4

Reason:

A serious error has occurred on the RAMDB. *P1* is the NCLID, *P2* is the name of the procedure, *P3* is the time and *P4* is the date.

System Action:

None.

User Action:

None.

RMDBMS18

P1

Reason:

This message is part of a block of messages detailing a severe database error. These messages show the values of various system and local variables for debugging purposes. *P1* is the description of the NDBRC and NDBERRI values.

System Action:

Processing terminates.

User Action:

Save the information, and contact Technical Support.

RMDBMS19

P1 WERE PROCESSED BEFORE THE ERROR

Reason:

This message is part of a block of messages detailing a severe database error. These messages show the values of various system and local variables for debugging purposes. *P1* is number of records processed before the error occurred.

System Action:

Processing terminates.

User Action:

Save the information, and contact Technical Support.

RMDBMS20

P1 WAS INVOKED WITH THE FOLLOWING PARAMETERS:

Reason:

This message is part of a block of messages detailing a severe database error. These messages show the values of various system and local variables for debugging purposes. *P1* is name of the database access module, and the next message shows the parameters with which the module was invoked.

System Action:

Processing terminates.

User Action:

Save the information, and contact Technical Support.

RMDBMS21

P1

Reason:

This message is part of a block of messages detailing a severe database error. These messages show the values of various system and local variables for debugging purposes. *P1* displays the parameters with which the database access module was invoked.

System Action:

Processing terminates.

User Action:

Save the information, and contact Technical Support.

RMDBMS22**REQUEST NOT PROCESSED - A VARIABLE NAME MUST BE PROVIDED****Reason:**

The Database Manager was called with a request to build a sequence which requires the use of a variable and no variable name was supplied via the LISTVTAB keyword. Use the LISTVTSC keyword to identify the SCOPE of the VARIABLE.

System Action:

Call is rejected.

User Action:

Use the LISTVTAB and LISTVTSC keywords to identify the NAME and SCOPE of the VARIABLE to be used.

RMDBMS23**ACTION P1 REJECTED, IMAGE LOADED ON LINKED SYSTEM, SYSTEM=P2****Reason:**

The Database Manager was called with action P1 and system image P2 , however the action is not allowed for system images of *linked* regions.

System Action:

Call is rejected.

User Action:

You can perform this action only on the locally loaded system image or a system image that is NOT loaded on any other system.

RMDBMS24

RESOURCE (*P1*) ALREADY DEFINED IN CLASS *P2*

Reason:

The resource *P1* cannot be added since the same name exists in class *P2*.

System Action:

Call is rejected.

User Action:

Provide a different resource name, if possible.

If one of the resources is class ASMON then, if possible, delete it and add it again with the Is Name Generic? field set to YES. You should then be able to add the other resource with the same name.

RMDBMS25

REQUEST NOT PROCESSED - NO SYSTEM IMAGE NAMES SUPPLIED

Reason:

A request to the Database manager has been rejected because required information was not supplied with the request.

System Action:

Call is rejected.

User Action:

Contact your Systems Administrator.

RMDBMS26

REQUEST TO DELETE LOCAL LINK RECORD IGNORED

Reason:

A request to delete the Link Definition record for the local region from the database was ignored. This record should never be deleted.

System Action:

None.

User Action:

None.

RMDBMS27**DATA SAMPLING ATTRIBUTE IN USE IN *P1* RESOURCE(S)****Reason:**

You have attempted to delete a data sampling attribute, but it is currently in use in *P1* resources.

Subsequent RMDBMS27 messages follow, listing the object ids of the affected resources.

System Action:

The data sampling attribute is not deleted.

User Action:

Update each of the affected resources to remove the attribute and then retry deleting the attribute.

RMDBMS28**MASS UPDATE OF *P1* IN PROGRESS****Reason:**

A mass update of resources and services (*P1*) is in progress.

System Action:

None.

User Action:

None.

RMDBMS29**MASS UPDATE OF *P1* ENDED: *P2* OF *P3* RECORDS UPDATED****Reason:**

The mass update of resources and services (*P1*) has ended. The number of records (*P2*) of the total (*P3*) is indicated.

System Action:

None.

User Action:

If the number of updated records is less than the total, review the activity log to identify the records that were not updated and the error reason.

RMDBMS30

NO RECORDS QUALIFY FOR UPDATE

Reason:

You attempted to update multiple records with a new value; however, no records qualify for one of the following reasons:

- No match was found for the selection criteria provided
- All matching records already use the nominated new value

System Action:

None.

User Action:

Check the validity of the selection criteria and retry.

RMDF1001

P1 applies to user-defined attributes only

Reason:

An attempt was made to perform the action *P1* against a protected and distributed attribute. The Copy, Update, and Delete actions only apply to user-defined attributes.

System Action:

The action is not performed.

User Action:

Try another action or select a user-defined attribute for this action. User-defined attributes are displayed in turquoise at the top of the selection list.

RMDF1002**Delete rejected. Attribute P1 in use by P2 resource(s)****Reason:**

A delete request was specified for attribute *P1* which is selected for monitoring in *P2* resources. The count includes resources found in all system images.

System Action:

The delete request is rejected.

User Action:

Ensure that no resource uses these attribute for monitoring.

RMDF1003**No attributes found for filter(P1)****Reason:**

A request was made to list attributes which pass a particular filter criterion but none were found.

System Action:

None.

User Action:

If this is not the desired result, then check the filter.

RMDF1004**Attribute list display has been reset to FILTER(NONE)****Reason:**

The monitor attribute list display has been refreshed with no filters applied.

System Action:

None.

User Action:

None.

RMDF1005

Usage: `FILTER` `[? | class | attrname [*Û | **MULT** | NONE | * Û]`

Reason:

A request was made to list the FILTER command options. The command has the following options:

1. FILTER `?` - shows the list of FILTER command options.
2. FILTER *class* - view all attributes associated with a resource class (e.g., FILTER CIP).
3. FILTER *attrname* `[*Û]` - view all attributes according to a particular name. Optionally, the wildcard `'*'` lists all attributes beginning with *attrname*. (e.g., FILTER ifInBytes displays an attribute whose name equals ifInBytes. FILTER Channel* lists all attributes whose name begins with Channel.)
4. FILTER `**MULT**` - view all attributes associated with multiple resource classes.
5. FILTER - disables filtering FILTER *NONE* FILTER `*`

System Action:

None.

User Action:

None.

RMDF1006

Attribute successfully deleted.

Reason:

The selected attribute has been deleted successfully.

System Action:

The list is refreshed.

User Action:

None.

RMDF1101**Exclude rejected. Attribute P1 in use by P2 resource(s)****Reason:**

An exclude class request was specified for attribute *P1* which is selected for monitoring in *P2* resources. The count includes resources found in all system images.

System Action:

The exclude class request is rejected.

User Action:

Ensure that no resource uses these attribute for monitoring.

RMDF1102**No associated resource class****Reason:**

A request was made to list the resource classes associated with the selected monitoring attribute but none were found.

System Action:

None.

User Action:

None.

RMDF1201**Invalid value for P1. Must be P2****Reason:**

An invalid value has been entered in field *P1* . Correct values for this field are described in *P2* .

System Action:

The value is rejected.

User Action:

Correct the value.

RMDF1202

Attribute P1 already exists

Reason:

An attempt was made to add either a new attribute with the same name, or an attribute that has the same first 18 characters of a pre-existing user attribute.

System Action:

The attribute is not added.

User Action:

Change the attribute name and try again.

RMDF1203

Attribute P1 has been successfully stored

Reason:

An attribute was successfully stored in the RAMDB

System Action:

The attribute is added to the RAMDB.

User Action:

None.

RMDF1204

Only ENUMERATED attributes can be defined for enumerated MIB objects

Reason:

An attempt was made to define an attribute with an attribute type other than ENUMERATED from a MIB object that happens to be enumerated.

System Action:

The attribute type is rejected.

User Action:

Change the attribute type to ENUMERATED.

RMDF1205**Attribute already exists as a reserved system attribute****Reason:**

An attempt was made to add a new attribute that has the same name or the same first 18 characters of a reserved system attribute.

System Action:

The attribute is not added.

User Action:

Change the attribute name and try again.

RMDF1206**Failure accessing RAMDB RC(P1)****Reason:**

An attempt to access RAMDB failed with a return code *P1* .

System Action:

The attribute is not added.

User Action:

Contact the system administrator.

RMDF1207**Incomplete MIBinsight details for MIB P1****Reason:**

A request to save a monitoring attribute definition has failed because the MIBinsight details for MIB *P1* was not provided.

System Action:

The request is rejected.

User Action:

Press PF10(MibAttr) to complete the MIBinsight details for the selected MIB or erase the *MIB Name* field before saving the definition.

RMDF1208

Invalid Qualifier Filter : No MIB Qualifier

Reason:

A qualifier filter value has been incorrectly specified. This occurred because of one of the following reasons:

* No MIB object was selected * No MIB qualifier object was selected * The selected MIB object is not part of a MIB table definition and cannot be qualified.

System Action:

The invalid field is highlighted.

User Action:

To select a MIB object, either provide a *MIB Name* , or press PF10(MibAttr) to select a MIB from the MIBinsight list of loaded MIBs, and scroll through the MIB definition to select the object you want to sample. For you to be able to specify a qualifier object, the the object must be part of a MIB table.

To nominate a MIB object qualifier, press PF11(MibQual) and select the MIB object whose values you want to use to qualify this attribute.

NOTE: The PF11(MibQual) is only available for MIB objects that are part of a MIB table definition.

RMDF1209

Invalid Attribute Name

Reason:

The Attribute Name can consist only of non-blank alphanumeric characters and the following characters:

() - parenthesis - - hyphen / - forward slash % - percent sign

System Action:

The field in error is highlighted.

User Action:

Correct the name.

RMDF1210**Attribute type conflicts with MIB object syntax****Reason:**

An attempt was made to define an attribute with an attribute type which is not inline with the MIB object syntax. When the MIB object syntax is 'Gauge' or 'Gauge32' you can only define a GAUGE attribute, and when the MIB syntax is 'Counter' or 'Counter64' you can only define a COUNTER attribute.

System Action:

The attribute type is rejected.

User Action:

Change the attribute type to a value of GAUGE or COUNTER.

RMDF1211**No object selected****Reason:**

No selection was made from the MIBinsight Structure Viewer.

System Action:

None.

User Action:

None.

RMDFAP01**INITIALIZATION FOR RESOURCE SAMPLING IN PROGRESS****Reason:**

Data sampling initialization is in progress for this resource.

System Action:

No further processing.

User Action:

Retry later.

R MDFAP02

Start of monitoring activity for P1 failed.

Reason:

During the initialization of the *P1* monitor, the request to start monitoring has failed.

System Action:

None.

User Action:

The message preceding this message indicates the cause of the failure.

R MDFAP03

Change to attribute P1 takes effect on the next sampling interval for (P2) resources.

Reason:

The change to monitoring attribute P1 will take effect on the next sampling interval for P2 resources.

System Action:

None.

User Action:

None.

R MDFAP04

EE monitoring failed - system initialization at PRE-INIT phase

Reason:

System initialization has been stalled at the PRE-INIT phase which has resulted in EE monitoring failure.

System Action:

Monitoring will be attempted for the EE resource with a degraded status.

User Action:

Review the activity log to determine the reason why initialization is being stalled in the PRE-INIT phase. In this phase, all VTAM commands are rejected.

RMDH0001**INVALID KEYWORD PARAMETER VALUE, KEYWORD= P1 VALUE= P2****Reason:**

The keyword parameter P1 was either not specified or an invalid value was specified. P2 is the invalid value.

System Action:

Request is rejected.

User Action:

Correct the call parameters and retry.

RMDH0002**NO DATA TO DISPLAY****Reason:**

No data was found for display in the diagram.

System Action:

The Diagram Display call is terminated.

User Action:

None.

RMDH0003**INVALID COMMAND****Reason:**

The command entered on the command line was not recognized by the Diagram Handler.

System Action:

The command is rejected.

User Action:

Correct the command and retry.

RMDH0004

INVALID OPTION

Reason:

The select option specified was invalid.

System Action:

The cursor is placed in the field in error and the field is highlighted.

User Action:

Correct the selection option and retry. Valid may be displayed on the fourth line of the window, otherwise use help to display the valid options.

RMDH0005

INVALID VARIABLE FROM SPROC= P1 VAR= P2 VALUE= P3

Reason:

The service procedure *P1* passed an invalid value for a variable required for generating a diagram. The service procedure's name is *P1* and the variable incorrectly set is *P2* . *P3* is the invalid value that was set.

System Action:

Processing is terminated.

User Action:

Correct the variable assignments in the service procedure *P1* and retry the request.

RMDH0006

PRESS ENTER TO CONFIRM SELECTION OR PRESS CANCEL

Reason:

This is a prompt message which is displayed to allow the user to verify that the selected actions are correct before they are carried out.

System Action:

None.

User Action:

Press the ENTER key to execute the highlighted selections, or press the CANCEL function key to cancel the requested actions.

RMDH0007**PRINT REQUEST P1 SENT TO PRINTER P2****Reason:**

This is an informational message indicating that a print request has successfully been sent to the requested printer. The print request number is *P1* and the printer is *P2* .

System Action:

None.

User Action:

None.

RMDH0008**STRING " P1" NOT FOUND****Reason:**

The search string *P1* was not found.

System Action:

None.

User Action:

None.

RMDH0009**FIND STRING NOT SPECIFIED****Reason:**

A find command was issued and no character string was specified as the find argument and no previous find has been issued. The find command can be specified without a character string, but only if a previous find has been specified with a character string.

System Action:

The command is rejected.

User Action:

Re-enter the command specifying a valid character string.

RMDH0010

COMPLEXITY LIMIT EXCEEDED, HIERARCHY EXCEEDS MAXIMUM DEPTH OF 245

Reason:

The hierarchical depth of the diagram to be constructed exceeds the maximum allowed. The maximum is 245.

System Action:

Processing terminates.

User Action:

None.

RMDH0011

CIRCULAR HIERARCHY DETECTED. P1 IS PARENT OF P2

Reason:

The hierarchical structure being diagrammatically represented is invalid. It contains at least one set of circular relationships. The child entity *P1* is the parent of *P2* and *P2* is either the parent of *P1* or is a grand parent, great grand parent, great great grand parent ... of *P1*.

For example, A is a parent of B, B is a parent of C, C is a parent of D and D is a parent of A.

System Action:

Processing terminates.

User Action:

Correct the entity relationships so that there are no circular relationships.

RMDM0001**\$RMDM00S INVOKED WITH INVALID PARAMETERS: P1****Reason:**

Procedure \$RMDM00S was invoked with invalid parameters.
P1 identifies the invalid parameters.

System Action:

Processing is terminated.

User Action:

Correct the parameters in the calling procedure and rerun the exec.

RMDM0002**DSM FOR P1 STARTED BY P2****Reason:**

The Desired State Manager for the resource *P1* has been started by the initiating process *P2*.

System Action:

None

User Action:

None

RMDM0003**DESIRED STATE MGR FOR P1 ENDED****Reason:**

The Desired State Manager for resource identified by *P1* has ended.

System Action:

None.

User Action:

None.

RMDM0004

DATABASE GET FOR P1 OF P2 FAILED

Reason:

A database read for the record identified by *P1*, which is a relative of *P2* has failed.

System Action:

Processing is terminated.

User Action:

Ensure the correct database record is entered.

RMDM0005

DESIRED STATE MGR FOR P1 IN PROGRESS - TERMINATING THIS ONE.

Reason:

The Desired State Manager attempted to start a process for *P1* but there was already a request in progress. This request will be terminated.

System Action:

The request is rejected.

User Action:

Wait for the current process to complete before entering request.

RMDM0006

RESOURCE P1 IN P2 MODE - NO AUTOMATION ACTION TAKEN

Reason:

The resource *P1* is in the automation mode identified by *P2*. No automation action will be taken because of the automation mode.

System Action:

The request will be rejected.

User Action:

Review the automation mode.

RMDM0007**P1 DES(P2) ACT(P3) MODE(P4) AUTO(P5)****Reason:**

P1 is the resource, its desired state is *P2*, its actual state is *P3*, its automation mode is *P4* and its automation status is *P5*.

System Action:

None.

User Action:

None.

RMDM0008**REQUESTING P1 OF P2****Reason:**

The action specified by *P1* has been requested of resource *P2*.

System Action:

None.

User Action:

None.

RMDM0009**INITIATING STATUS INQUIRY FOR P1****Reason:**

The resource display processor has been started for resource *P1* and the actual state of the resource will be determined.

System Action:

None.

User Action:

None.

RMDM0011

RESOURCE P1 HAS P2 OF P3

Reason:

The Desired State Manager has been started for resource *P1*. *P2* identifies the nature of the relationship to *P3*.

System Action:

None.

User Action:

None.

RMDM0012

RESOURCE P1 NOT FOUND IN STATUS TABLE - MAY BE IN MODE:OFF

Reason:

The resource *P1* is not found in the status table as the mode may be specified as off.

System Action:

None.

User Action:

None.

RMDM0013

STATUS INQUIRY COMPLETED RC: P1 RETURNED STATUS: P2

Reason:

The status inquiry completed with return code *P1* and has an actual status of *P2*.

System Action:

None.

User Action:

None.

RMDM0014**P1 HAS NO P2****Reason:**

The resource *P1* has no *P2* relationship.

System Action:

None.

User Action:

None.

RMDM0015**P1 IS IN DESIRED STATE P2 - CHECKING P3****Reason:**

Resource *P1* is in the desired state of *P2*. The Desired State Manager will now check its *P3*.

System Action:

None.

User Action:

None.

RMDM0016**P1 REQUEST COMPLETED RC: P2 MSG: P3****Reason:**

Command of *P1* has been completed with return code *P2* and system message *P3*.

System Action:

None.

User Action:

None.

RMDM0018

P1 AUTOMATION STATE FAILED - AUTOMATION BYPASSED

Reason:

Automation has failed for resource *P1* and automation has been bypassed.

System Action:

Resource automation state is flagged as failed.

User Action:

Review resource to determine reason for failure.

RMDM0019

P1 HAS P2 OF P3 IN STATE: P4

Reason:

The resource *P1* has a relationship of *P2* to *P3* in state *P4*.

System Action:

None.

User Action:

None.

RMDM0020

P1 HAS CHANGED TO DESIRED=(P2) PHYSICAL=(P3)

Reason:

Resource *P1* has changed to desired state *P2* and physical state *P3*.

System Action:

None.

User Action:

None.

RMDM0021**P1 AUTOMATION STATE SET TO 'FAILED'****Reason:**

Resource *P1* has had its automation state set to failed.

System Action:

The automation status is flagged as failed.

User Action:

Review resource to determine cause of failure.

RMDM0022**P1 NOT BROUGHT P2. P3 P4 NOT P5****Reason:**

Resource *P1* has not been set to *P2* which is either active or inactive. *P3* identifies the number of resources, *P4* identifies the nature of the resources relationship with *P1* and *P5* identifies the state of the resources which is either active or inactive.

System Action:

Processing is terminated.

User Action:

Ensure resources specified are either activated or inactivated as required.

RMDM0023**P1 FOR P2 IN PROGRESS: P3****Reason:**

P1 for resource *P2* is in progress. The desire state lock text is *P3*.

System Action:

None.

User Action:

None.

RMDM0024

STARTING DESIRED STATE MGR FOR P1

Reason:

The Desired State Manager is starting for resource *P1*.

System Action:

None.

User Action:

None.

RMDM0025

SCHEDULE OF P1 HAS SET P2 TO DESIRED INACTIVE

Reason:

The schedule of resource *P1* has set resource *P2* to the desired state of inactive.

System Action:

None.

User Action:

None.

RMDM0027

SCHEDULE STATE OVERRIDE FLAG FOUND SET BY P1

Reason:

The schedule state override flag has been set by *P1*. A check will be made to ensure that *P1* still requires the resource to be overridden.

System Action:

None.

User Action:

None.

RMDM0028**SCHEDULE STATE OVERRIDE FLAG RESET - P1 NOW IN DESIRED STATE ACTIVE****Reason:**

The schedule state override flag has been reset as resource P1 is already in a desired state of active.

System Action:

None.

User Action:

None.

RMDM0031**DESIRED STATE OVERRIDE SET BY P1 NOT RESET****Reason:**

The desired state override flag set by resource *P1* is still in place and does not require to be reset.

System Action:

None.

User Action:

None.

RMDM0033

STARTED P1 DESIRED STATE MANAGERS. ENTERING P2 SECOND LATENCY PERIOD

Reason:

A desired state manager has started **P1** desired state managers for related resources and will now enter a latency period of no longer than **P2** seconds. The latency period will end before **P2** seconds if a state change event occurs for the resource or if all the started desired state managers complete processing.

System Action:

None.

User Action:

None.

RMDM0034

LATENCY PERIOD ENDED. P1

Reason:

The latency period ended because of one of the following:

- All the started desired state managers ended.
- The latency period expired.

System Action:

None.

User Action:

None.

RMDM0035**STATE CHANGE RECEIVED FOR (P1) DURING LATENCY PERIOD****Reason:**

A state change was received for resource *P1* during the latency period while waiting for an event.

System Action:

None.

User Action:

None.

RMDM0036**TREE-INACT OF P1 HAS SET P2 TO DESIRED INACTIVE****Reason:**

A tree-inact of resource *P1* has set resource *P2* to a desired state of inactive.

System Action:

None.

User Action:

None.

RMDM0037**ENTERING P1 WAIT PERIOD****Reason:**

Entering wait period for resource *P1* to either become active or inactive.

System Action:

None.

User Action:

None.

RMCM0038

ARM RESTART FAILED - START COMMAND WILL BE ISSUED

Reason:

The desired state manager detected that ARM recovery for a resource has failed. The region will try to restart the resource.

System Action:

The region tries to restart the resource.

User Action:

None.

RMCM0039

P1 IS NOT ELIGIBLE TO BE STARTED AUTOMATICALLY ON P2

Reason:

The home system of the *P1* resource is not *P2*. During automation, the Desired State Manager can start a resource only on the home system of the resource.

System Action:

Processing is canceled.

User Action:

If you want the *P1* resource to be able to start on the *P2* system during automation, specify *P2* as the home system of the resource.

RMCM0040

P1 IS CURRENTLY RUNNING ON P2

Reason:

The Desired State Manager tried to shut down the *P1* resource, but the resource is currently running on another system, *P2*.

System Action:

Processing is canceled.

User Action:

None.

RMDP0001**INVALID KEYWORD VALUE SPECIFIED - KEYWORD(~P1) VALUE(~P2)****Reason:**

An invalid keyword was passed to the service procedure.

System Action:

The request is rejected.

User Action:

Correct the calling procedure to the service procedure and rerun exec.

RMDP0002**~P1 HAS NO DISPLAY COMMAND OR PROCESS****Reason:**

The Resource mention doesn't have either a Display Command or Display Process defined for it in it's RAM Database definition.

System Action:

Audit message only.

User Action:

None.

RMDP0003**DISPLAY PROCESSOR FOR ~P1 STARTED****Reason:**

The Display Process has been started for the mentioned resource.

System Action:

Audit Message only.

User Action:

None.

RMDP0004

DISPLAY PROCESSOR FOR ~P1 ENDED

Reason:

The Display Processor has ended for the mentioned resource.

System Action:

Audit Message only.

User Action:

None.

RMDP0005

DISPLAY PROCESSOR CALLED FOR ~P1 TO ~P2 ACTUAL STATE

Reason:

The Display Processor has been called to GET/SET the Actual state.

System Action:

Audit message only.

User Action:

None.

RMDP0006

ACTUAL STATE OF ~P1 DETERMINED TO BE ~P2

Reason:

The Display Processor has determined the Actual State to be as mentioned.

System Action:

Informational only.

User Action:

None.

RMDP0007**COMMAND P1 ISSUED FOR P2****Reason:**

The Display Processor has issued a command identified by *P1* for the resource. This is an audit message.

System Action:

Processing continues.

User Action:

None.

RMDP0008**DISPLAY PROCESSOR CALLED TO GET ~P1 FOR ~P2****Reason:**

The Display Processor has been called to determine the JOBID or ASID for a resource.

System Action:

Informational only.

User Action:

None.

RMDP0009**~P1 ~P2(~P3)****Reason:**

Results of ASID or JOBID request.

System Action:

Informational only.

User Action:

None.

RMDP0014

~P1 ACTUAL STATE SET TO ~P2

Reason:

The Display Processor has set the Actual State to that mentioned.

System Action:

None.

User Action:

None.

RMDP0015

EXECUTING DISPLAY PROCESS P1 FOR P2

Reason:

The Display Processor executed the defined process for this resource.

System Action:

Informational only.

User Action:

None.

RMDP0017

PROCESS ~P1 COMPLETED FOR ~P2 - RC(~P3) SYMSG(~P4)

Reason:

The executed process has completed with the following retcode and sysmsg.

System Action:

Informational only.

User Action:

None.

RMDP0018**~P1 HAS A DISPLAY PROCESSOR ALREADY ACTIVE(~P1)****Reason:**

A Display Processor is already in progress for this resource.

System Action:

No further processing.

User Action:

None.

RMDP0019**UNABLE TO DETERMINE OBJECT ID PARAMETER****Reason:**

Object ID not found and can not be created because there is not enough information passed to the procedure.

System Action:

The request is rejected.

User Action:

Contact System Administrator.

RMDP0020**~P1 DISPLAY TABLE ~P2 ERROR - RC(~P3) SYSMSG(~P4)****Reason:**

A Display Table vartable error has occurred.

System Action:

Procedure terminates in error.

User Action:

Contact System Administrator.

RMDP0021

~P1

Reason:

Solicited Message received by the Display Processor.

System Action:

Informational only.

User Action:

None.

RMDP0022

P1 IS NOT ELIGIBLE TO RUN ON P2

Reason:

The region tries to start the display processor for the *P1* resource, but the resource is defined as not eligible to run on this system. The eligibility of a resource to run on a system is determined by the system affinity specified in the resource definition.

System Action:

Processing is canceled.

User Action:

If you want to indicate that the *P1* resource can run on the *P2* system, update the system affinity in the resource definition.

RMDP0023

P1 IS CURRENTLY RUNNING ON P2

Reason:

The region tries to start the display processor for the *P1* resource, but the resource is currently running on another system, *P2* .

System Action:

Processing is canceled.

User Action:

None.

RMDP01S**LINK P1 OF TYPE P2 HAS STATUS P3****Reason:**

This message is issued by the display process for Link Resources.

P1 is the name of the link.

P2 is the type of link (DATA, EVENT, and so on).

P3 is the link status.

System Action:

None.

User Action:

None.

RMDP0201**INVALID KEYWORD VALUE SPECIFIED - KEYWORD(~P1) VALUE(~P2)****Reason:**

An invalid keyword was passed to the service procedure.

System Action:

The request is rejected.

User Action:

Correct the calling procedure to the service procedure and rerun exec.

RMDS0101**INVALID KEYWORD VALUE SPECIFIED - KEYWORD(~P1) VALUE(~P2)****Reason:**

An invalid keyword was passed to the service procedure.

System Action:

The request is rejected.

User Action:

Correct the calling procedure to the service procedure and rerun exec.

RMDS0301

INVALID CALL TO P1 < P2>

Reason:

An invalid keyword was passed to the service procedure.

System Action:

The request is rejected.

User Action:

Correct the calling procedure to the service procedure and rerun exec.

RMDS0302

P1 INITIATED SYSTEM(P2) VERSION(P3)

Reason:

The message indicates that the action indicated by *P1* has been taken for the system and version identified by *P2* and *P3* .

System Action:

The message is written to the log.

User Action:

None; the message is informational only.

RMDS0303

P1 P2 IS AN ORPHAN. STARTING DESIRED STATE MANAGER.

Reason:

The resource identified by class name *P1* and name *P2* has no parents. A desired state manager has been started for this resource.

System Action:

A desired state manager is started for the resource.

User Action:

The message is informational only.

RMDS0304**P1 P2 HAS NO CHILDREN. STARTING DESIRED STATE MANAGER.****Reason:**

The resource identified by class name *P1* and name *P2* has no children. A desired state manager has been started for this resource.

System Action:

A desired state manager is started for the resource.

User Action:

The message is informational only.

RMDS0305**INITIATING P1 EXIT(P2)****Reason:**

The exit identified by *P2* for action identified by *P1* has been initiated.

System Action:

Control is passed to the exit identified.

User Action:

The message is informational only.

RMDS0306**P1 EXIT RC(P2) MSG(P3)****Reason:**

The action identified by *P1* completed with return code *P2* and returned message *P3* .

System Action:

Control is returned to desired state processor.

User Action:

The message is informational only.

RMDS0308

INVALID PARAMETERS - NO GLOBAL MODE PASSED TO PROCEDURE

Reason:

A Global Mode value was not passed to the procedure.

System Action:

Processing is terminated.

User Action:

Ensure the procedure is being called with the correct parameters.

RMDS0310

P1 ACTUAL STATE UNKNOWN.

Reason:

The actual state of the resource identified by *P1* is unknown.

System Action:

A desired state manager is started for the resource.

User Action:

The message is informational only.

RMDS0311

P1 NOT PROCESSED DUE TO NON-ZERO RETURN CODE FROM P1 EXIT P2

Reason:

The action identified by P1 was not performed due to a non-zero return code from the exit P2 .

System Action:

Processing for the action identified is discontinued.

User Action:

Check the reasons for the non-zero return code and retry the action.

RMDS0312**SHUTDOWN IN PROGRESS - DESIRED STATE OF P1 SET TO
<INACTIVE>****Reason:**

The desired state for resource P1 has been set to inactive in response to a shutdown request.

System Action:

Processing continues.

User Action:

The message is informational only.

RMDS0313**NOT LICENSED FOR AUTOMATED MODE****Reason:**

This region is licensed as a SOLVE:Operations for IT/Operations or OpenView agent only and cannot be run in automated mode.

System Action:

The request is rejected.

User Action:

If you require a full license, contact Technical Support.

RMDT0002**~P1 FAILED - RC(~P2) FDBK(~P3) SYMSG(~P4)****Reason:**

A Database Event Manager requires the establishment of an APPC conversation. An APPC function has ended in error.

System Action:

Processing terminated in error.

User Action:

Determine whether the remote system is still available. Contact your System Administrator.

RMDT0004

**DATABASE ~P1 ERROR - DB(~P2) OBJID(~P3) RC(~P4) FDBK(~P5)
SYSMSG(~P6)**

Reason:

The database function has ended in error.

System Action:

Return code 0,4 processing continues. Return code greater than 4 processing terminates in error.

User Action:

Contact System Administrator.

RMDT0007

INVALID TRANSACTION CHAINING FOR OBJID(P1)

Reason:

An invalid sequence of chained records has been received in a transaction.

System Action:

This transaction is not processed any further.

User Action:

Contact System Administrator.

RMDT0008

INVALID TRANSACTION TYPE - TYPE(~P1)

Reason:

A staging file record has been read which has an invalid transaction type specified.

System Action:

This transaction is not processed any further.

User Action:

Contact System Administrator.

RMDT0009**INVALID TRANSACTION ACCESS METHOD - ACCESS(~P1)****Reason:**

A staging file record has been read which has an invalid access method specified.

System Action:

This transaction is not processed any further.

User Action:

Contact System Administrator.

RMDT0010**REMOTE SYSTEM ERROR - SYSMSG(~P1)****Reason:**

An error has been encountered by the remote APPC conversation partner.

System Action:

Processing continues.

User Action:

Contact System Administrator.

RMDT0012**SYSTEM REGISTRATION FAILED - RC(~P1) SYSMSG(~P2)****Reason:**

Registration Table error encountered.

System Action:

Procedure terminates in error.

User Action:

Contact System Administrator.

RMDT0017

REC(P1) OBJID(P2) TRANTYPE(P3) ACCESS(P4) NMDID(P5)

Reason:

A link manager received data from its remote partner.

System Action:

None.

User Action:

This message is written to a link manager's transient log when 'Log Internal Audit Trail' is set to YES in the resource definition and can be used to aid in link problem diagnosis.

RMDT0101

P1 DATABASE BLOCKED

Reason:

The database is blocked. This database is isolated from all remote regions.

System Action:

The database event manager will terminate.

User Action:

None.

RMDT0102

P1 FAILED - RC(P2) FDBK(P3) SYSMSG(P4)

Reason:

A Database Event Manager requires the establishment of an APPC conversation. An APPC function has ended in error.

System Action:

Processing terminated in error.

User Action:

Determine whether the link to the remote system has failed. If the link has failed, the region will try to recover the link. Otherwise, contact Technical Support.

RMDT0104**DATABASE ~P1 ERROR - DB(~P2) OBJID(~P3) RC(~P4) FDBK(~P5)
SYSMSG(~P6)****Reason:**

The database function has ended in error.

System Action:

Return code 0,4 processing continues. Return code greater than 4 processing terminates in error.

User Action:

Contact System Administrator.

RMDT0105**STAGING FILE ~P1 ERROR - RC(~P2) SYSMSG(~P3)****Reason:**

A staging file function has terminated in error.

System Action:

Processing terminates in error.

User Action:

Contact System Administrator.

RMDT0106**INVALID TRANSACTION ON STAGING FILE - TRANTYPE(~P1)
OBJID(~P2) ACCESS(~P3)****Reason:**

A staging file record has been read which is invalid.

System Action:

This transaction is not processed any further.

User Action:

Contact System Administrator.

RMDT0107

TRANSACTION NOT CONFIRMED - SYSMSG(~P1)

Reason:

The remote conversation partner has indicated that the last transaction was processed in error.

System Action:

The transaction record is left on the staging file.

User Action:

Contact System Administrator.

RMDT0108

STAGING FILE ~P1 ERROR - LINK(~P2) OBJID(~P3) RC(~P4) SYSMSG(~P5)

Reason:

A staging file function has terminated in error.

System Action:

Processing terminates in error.

User Action:

Contact System Administrator.

RMDT0109**TRANSACTION FAILED - OBJECT(P1) ZMDORC(P2) ZMDOFDBK(P3)****Reason:**

The P1 object could not be formatted for transmission. The most likely cause is if a definition exceeds the maximum transmittable size of 32 KB, as indicated by ZMDORC(8) and ZMDOFDBK(2).

System Action:

The transaction fails. The object is not updated on the remote region's database.

User Action:

For ZMDORC=8 and ZMDOFDBK=8, update the *P1* definition to reduce its size. Once the record is small enough, the remote database's copy will be updated automatically. For any other return code/feedback, contact your systems administrator.

RMDT0110**TRANSACTION FAILED - SYSMMSG(P2)****Reason:**

A failure occurred processing a transaction for transmission to a linked region. The failure reason is described in the sysmsg *P2*.

System Action:

The transaction fails. The object is not updated on the remote region's database.

User Action:

Contact your systems administrator.

RMED0001

CHARACTER NOT ELIGIBLE

Reason:

The 'HEX ATTR' option has been selected with the cursor positioned on a special character such as a DBCS shift character. This character is not eligible for display/alter.

System Action:

None.

User Action:

Position the cursor elsewhere and retry.

RMED0002

CURSOR MUST BE WITHIN TEXT

Reason:

The 'HEX ATTR' edit option has been selected, but the cursor is not positioned within the body of the text.

System Action:

None.

User Action:

Position the cursor within the body of the text and retry.

RMENFPL01

ARM POLICY STOPPED, ARM COEXISTENCE DISABLED.

Reason:

The automatic restart manager (ARM) policy has become inactive, and the region takes control of the monitored resources that are registered to ARM. The region relinquishes control back to ARM when the ARM policy becomes active again.

System Action:

The region takes control of the monitored resources that are registered to ARM.

User Action:

None.

RMENFRC00**ENF EVENTS RECEIVER INVOKED WITHOUT REQUIRED KEYWORD(S)
P1****Reason:**

The ENF events receiver procedure was invoked without the required keyword, P1 .

System Action:

The request is rejected. The procedure ends with return code 8.

User Action:

Contact your local support representative.

RMENFRC01**ENF EVENTS RECEIVER - P1 - EPS REQUEST REJECTED (RC= P2
ERRNO= P3) REAS ON: P4****Reason:**

The events receiver failed when issuing an EPS request. The failure is identified by the following:

- Type of EPS request, **P1**
- Return code, **P2** (&RETCODE)
- Error number, **P3** (&ERRNO)
- Reason, **P4** (for example, EPS UNAVAILABLE)

A possible cause is data corruption.

System Action:

The event is discarded, and processing continues. The ENF events receiver will attempt recovery.

User Action:

Contact your local support representative.

RMENFRC02

RESOURCE P1 P2 TO ARM

Reason:

The *P1* resource was registered to or deregistered from the automatic restart manager, as indicated by *P2* .

System Action:

None.

User Action:

None.

RMENFRC03

**MDO ASSIGN FAILED: RC= P1 FDBK= P2 MAP= P3 COMPONENT= P4
TAG= P5 TYPE= P 6****Reason:**

The ENF events receiver failed due to an MDO error. The failure is identified by the following:

- The statement type, ASSIGN - The MDO return code, **P1** (&ZMDORC)
- The MDO feedback code, **P2** (&ZDMOFDBK)
- The map name, **P3** (&ZMDOMAP)
- The full map component name, **P4** (&ZMDONAME)
- The map component tag value, **P5** (&ZMDOTAG)
- The ASN.1 type of the component, **P6** (&ZMDOTYPE)

This failure indicates one of the following causes:

- An invalid record has been received.
- There is a mismatch between the ASN.1 map and the record.

System Action:

The procedure terminates.

User Action:

Contact your local support representative.

RMENFRC06**ENF EVENTS EPS RECEIVER ACTIVE, EPS RECEIVER ID: P1****Reason:**

The ENF events receiver procedure is ready to receive ENF events by using EPS services. The associated EPS receiver ID is *P1* .

System Action:

The region is ready for ENF events processing. If required, the product specific events handler will be started when the first event is received.

User Action:

None.

RMENFRC08**ENF EVENTS RECEIVER WILL ATTEMPT EPS RECONNECTION EVERY 30 SECONDS****Reason:**

Recovery is attempted after an EPS request failure (see RMENFRC01).

System Action:

Reconnection to EPS is attempted.

User Action:

None.

RMENFRC09**ENF EVENTS RECEIVER WAITING FOR EPS SERVICES AVAILABILITY****Reason:**

The required EPS services are currently unavailable. Events monitoring will resume as soon as EPS services are restored.
This message follows the RMENFRC01 message.

System Action:

The region waits for EPS to become available.

User Action:

Ensure that an SSI region is currently active with its event processor enabled. From any panel, enter /PARMS and check the SSI parameter group. Ensure that the Sub- System Interface ID *field* contains the correct ID.

RMENFRC10

ENF EVENTS RECEIVER TERMINATED - EPS SERVICES UNUSABLE

Reason:

An unrecoverable error occurred during an EPS request (see message RMENFRC01). Monitoring of ENF events has stopped.

System Action:

The ENF events receiver is terminated.

User Action:

Contact your local support representative.

RMET0001

P1 DATABASE BLOCKED

Reason:

The database is blocked. This database is isolated from all remote regions.

System Action:

The database event manager will terminate.

User Action:

None.

RMET0002

~P1 FAILED - RC(~P2) FDBK(~P3) SYMSG(~P4)

Reason:

A Unsolicited Event Manager requires the establishment of an APPC conversation. An APPC function has ended in error.

System Action:

Processing terminated in error.

User Action:

Determine whether the remote system is still available. Contact your System Administrator.

RMET0003**UNEXPECTED "WHAT RECEIVED" STATE - STATE(~P1)****Reason:**

Procedure in unexpected APPC "What Received" State.

System Action:

None.

User Action:

Contact System Administrator.

RMET0008**INVALID TRANSACTION TYPE - TYPE(P1) DATA(P2)****Reason:**

The transaction request from remote conversation partner is not recognized.

System Action:

This transaction is not processed any further.

User Action:

Contact your system administrator.

RMET0010**STATUS TABLE P1 FAILED - SYSTEM(P2) VERSION(P3) RC(P4)
SYSMSG(P5)****Reason:**

The status table function has ended in error.

System Action:

Processing continues.

User Action:

Contact Technical Support.

RMET0011

STATUS TABLE ~P1 FAILED - OBJID(~P2) RC(~P3) SYMSG(~P4)

Reason:

The status table function has ended in error.

System Action:

Processing continues.

User Action:

Contact System Administrator.

RMET0012

SYSTEM REGISTRATION FAILED - RC(~P1) SYMSG(~P2)

Reason:

Registration Table error encountered.

System Action:

Procedure terminates in error.

User Action:

Contact System Administrator.

RMET0013

REMOTE SYSTEM IMAGE CONFLICT - LINK(P1) SYSTEM(P2) VERSION(P3)

Reason:

Duplicate active images in remote regions.

System Action:

Processing terminates in error.

User Action:

Contact your system administrator.

RMET0014**REMOTE DATABASE CORRELATOR ID MISMATCH****Reason:**

The RAM Database correlator id doesn't match with the remote RAM Database correlator id. This is a requirement for two systems to transfer database traffic.

System Action:

The Database Event Manager will terminate.

User Action:

None.

RMET0015**P1 DATABASE DOESN'T HAVE A CORRELATOR****Reason:**

The RAM Database doesn't have a Database Information Record defined. Therefore no correlator id checking can be performed.

System Action:

The Database Event Manager will terminate.

User Action:

The database has not been initialized correctly. Contact your System Administrator.

RMET0017**REC(P1) TRANTYPE(P2) PARMS(P3)****Reason:**

A link manager received data from its remote partner.

System Action:

None.

User Action:

This message is written to a link manager's transient log when 'Log Internal Audit Trail' is set to YES in the resource definition and can be used to aid in link problem diagnosis.

RMET0102

P1 FAILED - RC(P2) FDBK(P3) SYSMSG(P4)

Reason:

A Unsolicited Event Manager requires the establishment of an APPC conversation. An APPC function has ended in error.

System Action:

Processing terminated in error.

User Action:

Determine whether the link to the remote system has failed. If the link has failed, the region will try to recover the link. Otherwise, contact Technical Support.

RMEV0002

Event Handler P1 P2 initialized

Reason:

The Event Handler task was successfully started.

System Action:

Reason:

The display processor is being invoked to determine the current status of a resource.

System Action:

None.

User Action:

This message is informational only.

RMEV0012**##WARNING## - P1 not found in status table****Reason:**

An event was received for a resource but the resource definition was not present in the status table.

System Action:

The event is not processed.

User Action:

Contact Technical Support.

RMEV0014**Event Handler already running****Reason:**

The Event Handler procedure was started, but another copy of the procedure was already running.

System Action:

The new copy of the procedure terminates.

User Action:

None.

RMEV0015**##WARNING## ' P1' event detected****Reason:**

An event was received by the Event Handler that will prevent further monitoring of resources.

System Action:

Monitoring of resources will cease until the problem has been rectified.

User Action:

Determine the cause of the error from the messages following this one in the activity log.

RMEV0016

Event Handler in idle mode due to P1

Reason:

The Event Handler is temporarily not monitoring the status of resources. This mode is entered when a large number of resources are changing status simultaneously such as during a System Image load. *P1* indicates the reason that the Event Handler entered 'idle' mode.

System Action:

Monitoring of resource status ceases until the condition causing the monitor to go into 'idle' mode has completed.

User Action:

Most conditions which cause the Event Handler to be placed in idle mode will resolve themselves without user intervention, however some do require user action. If *P1* is:

RAMDB SHORT OF STORAGE issue the STARTSYS command once sufficient storage is available. If this is not possible the region will need to be restarted.
AOM MESSAGE QUEUE OVERFLOW issue the AOMRECOVER command once message traffic has subsided.

RMEV0020

P1

Reason:

This message follows message EV0015 and indicates the nature of the problem.

System Action:

None.

User Action:

None.

RMEV0021

AOM message overflow was detected. Event Handler placed in idle mode.

Reason:

The Event Handler has detected an AOM Message Queue Overflow condition and has gone into idle mode, to prevent unnecessary processing of events. This message will be followed by others outlining the action taken to attempt to rectify this situation.

System Action:

Event Handler placed in idle mode.

User Action:

None.

RMEV0022

Messages have been lost. RSC states may not be determined accurately.

Reason:

This message follows RMEV0021 and indicates that resource states may not be accurately represented because messages have been lost which may have indicated a change in a resource's state.

System Action:

None.

User Action:

None.

RMEV0023

**Queues currently at maximums. AOMGQSZ= P1 AOMPQSZ= P2
AOMPQLIM= P3.**

Reason:

This message follows RMEV0022 and indicates that no corrective action could be taken to alleviate an AOM message overflow situation because the queue size limits were already set to their respective maximums.

P1, P2 and P3 show the values of, respectively, the Global Queue Size, the Private Queue *Size* and the Private Queue Limit.

System Action:

None.

User Action:

None.

RMEV0024

All RSCs set to UNKNOWN. Use AOMRECOVER when message traffic subsides.

Reason:

This message follows message RMEV0023. Due to an AOM message overflow, all resources have been set to an UNKNOWN state. The second part of the message suggests you use the AOMRECOVER command when the message traffic that caused the overflow has abated.

System Action:

Set all resources to UNKNOWN.

User Action:

Wait for message traffic to subside and then issue an AOMRECOVER command.

RMEV0025

AOM has been stopped. Queue limits have been set to maximum levels.

Reason:

This message follows RMEV0021 and indicates the steps taken to try to alleviate an AOM message overflow situation. This message informs the user that AOM has been stopped and the queue limits set to their respective maximums.

System Action:

Stop AOM and set queue limits to maximum levels.

User Action:

Review queue limits in preparation for the next start of the Automation region.

RMEV0026

AOMGQSZ: P1 TO P2. AOMPQSZ: P3 TO P4. AOMPQLIM: P5 TO P6.

Reason:

This message follows RMEV0025 and shows which queue values were set. Only those queue limits which were changed are displayed and the display shows what the value was and what it was changed to. These values are contained in P1 and P2 , P3 and P4 , P5 and P6 respectively.

System Action:

None.

User Action:

None.

RMEV0027

STARTSYS will be issued against P1 when AOM re-starts

Reason:

This message follows RMEV0026 and informs the user that when AOM re-starts, after having been stopped to adjust queue limits, a STARTSYS will be issued against the active system image, identified by *P1* which should result in a resumption of normal processing.

System Action:

None.

User Action:

None.

RMEV0028

Short on storage condition detected on P1 for NDB(RAMDB)

Reason:

The Event Handler has detected a Short of Storage condition for the RAMDB on the region identified by *P1* . Event Handler has gone into idle mode, to prevent unnecessary processing of events.

System Action:

Event Handler placed into IDLE mode.

User Action:

Attempt to determine if the problem is a short-term or long-term one, as this will help to decide if the region needs to be re-started or not. If the problem is short-term, issuing a STARTSYS command should allow processing to continue.

RMEV0029**Event Handler placed into IDLE mode and all resources in UNKNOWN state****Reason:**

This message outlines the action taken by the region upon detection of a Short of Storage condition. The Event Handler is placed into IDLE mode, and all resource states are set to UNKNOWN.

System Action:

None.

User Action:

Attempt to determine if the problem is a short-term or long-term one, because this will help to decide if the region needs to be restarted or not. If the problem is short-term, issuing a STARTSYS command should allow processing to continue.

RMEV0030**Issue the 'STARTSYS' command when storage is available****Reason:**

This message indicates the suggested course of action if the storage problem detected previously is deemed to be of a short-term nature.

System Action:

Informational Only.

User Action:

Issue STARTSYS when more storage is available.

RMEV0031

If this problem persists re-start P1 with more storage

Reason:

If the storage problem is deemed to be a long-term one then the region identified by *P1* should be re-started with a larger allocation of storage.

System Action:

Informational Only.

User Action:

Re-start the nominated region with more storage.

RMEV0032

Consider setting \$RM AOMQUEUES parameter group to default

Reason:

This message appears along with RMEV0021 indicating an AOM Message Queue Overflow has occurred. The RMEV0032 message is issued if the \$RM AOMQUEUES parameter group is not using the default. The default offers the best chance of avoiding these overflow problems by having queues sizes set to maximum and using AOM Cross Memory Services.

System Action:

None.

User Action:

To best avoid the AOM Message Queue overflow problem in future use the default for the \$RM AOMQUEUES parameter group. The SD command can be used against the parameter group to set default. Default uses the max queue sizes and AOM Cross Memory Services. It comes into effect at startup.

RMEV2501**Event receiver= P1 stop failed - not active****Reason:**

A request to stop an event receiver for the receiver ID identified by *P1* has failed because there is no active Event Receiver process for the same receiver ID on this system.

System Action:

The request is ignored.

User Action:

None.

RMEV2503**Event receiver= P1 stopped****Reason:**

An event receiver for the receiver ID identified by *P1* has stopped.

System Action:

The event receiver is inactive.

User Action:

None.

RMEV2504

Event receiver ID= P1, type= P2 is P3

Reason:

Shows the status (*P3*) of the event receiver ID (*P1*) for event type (*P2*).
The status is one of the following:

ACTIVE - The receiver is active.

INACTIVE - The receiver is inactive.

RETRYING - The define for the receiver failed but is being retried. Messages RMEV2509 and RMEV2510 were written to the activity log when the define was last tried and failed. These messages give the reason for the failure.

INITIALIZING - The receiver is being defined.

System Action:

None.

User Action:

None.

RMEV2505

Define retry for event receiver= P1 cancelled

Reason:

The define process for the event receiver whose receiver ID is *P1* failed to start and the system entered a retry process. A request to stop the event receiver, and so cancel the retry process, has completed successfully.

System Action:

The event receiver is not defined and events will not be received.

User Action:

If you want to receive events, you must restart the event receiver.

RMEV2506

Event receiver= P1 for type= P2 started. NCLID= P3

Reason:

The event receiver for the receiver ID (*P1*) and event type (*P2*) has started, using NCL process ID *P3* .

System Action:

The event receiver processes events of the specified type.

User Action:

None.

RMEV2507

EPS connection for ID=*P1* refused:

Reason:

The event receiver for the EPS receiver ID *P1* did not connect to the SOLVE SubSystem Interface (SSI). The reason that the connection was refused follows in message RMEV2508.

System Action:

The event receiver cannot receive events.

User Action:

See the refusal reason in message RMEV2508, which accompanies this message on the log. The most likely causes are:

- The SOLVE SSI is inactive or does not support EPS. Ensure that EPS is correctly configured by including the following parameters:
XMEM=YES
XAPI=YES
XEVT=YES
For information about how to set up the SOLVE SSI, see the *Installation Guide*.
- The region has not connected to the correct SSI or it is not active. Issue the STATUS command and check the output for message N98601, which indicates the current status and subsystem ID. If there is no SSID, use the SYSPARM SSID command to connect to the SOLVE SSI.

RMEV2508

P1

Reason:

This message accompanies message RMEV2507 when an EPS connection is refused. The refusal reason (*P1*) is shown and will be either:

- Another message number - REFUSAL REASON UNAVAILABLE

System Action:

The event receiver will not receive events.

User Action:

Check the refusal reason:

- Refer to the description of the message in the reason. Also refer to the user actions described for message RMEV2507.
- *REFUSAL REASON UNAVAILABLE* indicates an internal error. (1) Check SupportConnect to ensure that any APARs that relate to EPS are installed. (2) Perform the user actions described for message RMEV2507. (3) If the problem is not resolved, contact Technical Support.

RMEV2509**Event receiver=*P1* failed - see Log****Reason:**

An event receiver for the *P1* receiver ID has failed. The failure reason is detailed in message RMEV2510, which is written to the activity log with this message.

System Action:

Message RMEV2510 includes the type of EPS operation that failed, which can be *one* of the following:

CONNECT

Indicates that the event receiver is not defined and events are not received. The system is suspended for a time and then try to define the receiver again.

RECEIVE

Indicates that the EPS connection is closed and the process is suspended for 15 seconds during which time events are not received. After this interval, the event receiver tries to connect to the SSI and any further errors are shown as per CONNECT.

CLOSE

Indicates that the event receiver is terminated.

User Action:

Review the messages on the activity log. Message RMEV2510 includes the failure reason and the type of EPS operation that failed.

List this region's configuration details (/IPTEST), and investigate any errors.

Use the feedback reason to determine why the event receiver failed:

39 EPS event support unavailable**70 EPS event support unavailable**

Indicate that the SSI (to which this region is connected), does not provide EPS event support. Either:

- the SSI does not provide this function, or
- the SSI is connected to other SSIs in the same LPAR and none of them provide the support.

This usually indicates that you have not connected this region to a correct SSI.

EPS event support is provided by the XEVNT=YES (SSI) parameter.

81 SSI connection lost

Indicates that the connection to the SSI has been lost. This may occur if the SSI started task is terminated, or the region is disconnected from the SSI because the SSID parameter has been reset.

Use the SHOW SYSPARM=SSID command to determine the SSID value. Ensure that the correct SSID is specified and that the SSI started task is active. Use the SSI STATUS command to verify the status of the SSI started task.

Use the EPS operation type to determine the options available:

CONNECT or RECEIVE

The event receiver, suspended in retry mode, may be canceled by stopping the receiver.

CLOSE

The event receiver may be restarted.

Important! Stopping or restarting the receiver should only be done under guidance from your system administrator or Technical Support.

RMEV2510

EPS type= P1 FDBK= P2 reason= P3

Reason:

This message follows message RMEV2509 and provides the EPS operation type (P1), failure code (P2) and reason (P3).

System Action:

Refer to message RMEV2509.

User Action:

Refer to message RMEV2509.

RMEV2511**Abend in event receiver procedure P1****Reason:**

Procedure (*P1*), used to process EPS events, has abended.
This message is followed by additional messages that provide:
* error diagnostic information * a dump of the event received

System Action:

The event is ignored. Processing continues with the next event.

User Action:

Contact Technical Support. Provide the complete set of RMEV25* messages from the activity log.

RMEV2512**Abend text: P1****Reason:**

This message is part of a group of messages which start with RMEV2511. This specific message provides the error description.

System Action:

Refer to message RMEV2511.

User Action:

Refer to message RMEV2511.

RMEV2513

Abend details: line= P1 cond= P2 stmt= P3 keyword= P4 name= P5
var= P6

Reason:

This message is part of a group of messages which start with RMEV2511. This specific message provides the following error details:

LINE= P1 - the line number in the source code

COND= P2 - the error condition

STMT= P3 - the *statement* name (verb name)

KEYWORD= P4 - the keyword name (operand name)

NAME= P5 - the name specification

VAR= P6 - the variable name causing the error

System Action:

Refer to message RMEV2511.

User Action:

Refer to message RMEV2511.

RMEV2514**Error in event record: P1****Reason:**

An End Point Services (EPS) event receiver has received an event that contains invalid data. A description of the field and invalid data is provided (P1).

System Action:

The system writes this message to the Activity Log, then dumps the invalid event. The system assumes a default value depending on the field that is in error. For example, the current date is assumed when a date field is invalid.

Note: Successive events that have the same error reason (P1) are not logged but do have a default value assumed.

User Action:

This message is provided for diagnostic purposes only. Use the event dump to identify the specific external event data, such as an SMF record.

Note: The event data is prefixed by EPS data - the external event data is the last part of the dump.

The invalid field and data (P1) should be used to identify the specific field that has an error. Use this information, together with the entire external event data, to identify the source of the data and correct the data at the source.

RMEV2591**Dump of EPS Event Data: Class=~P1 RcvID=~P2****Reason:**

This message appears before a dump of received event data starts.

Normally, it follows message RMEV2514 and is followed by the hexadecimal and character dump of the data.

P1 is the class of the event.

P2 is the receiver name of the event.

System Action:

None.

User Action:

See message RMEV2514.

RMEV2592

offset | characters | hexadecimal |

Reason:

This message follows message RMEV2591 and accompanies each line of the data dump. Each line contains up to 16 bytes of data:

- offset is the hexadecimal data line offset from the start of the data.
- characters is the printable representation of the data line.
- hexadecimal is the hexadecimal representation of the data line.

System Action:

None.

User Action:

None.

RMEV2593

End of Event Data

Reason:

This message is the last message and follows the dump of received event data.

System Action:

None.

User Action:

None.

RMEXPR01**INVALID KEYWORD VALUE SPECIFIED - KEYWORD(P1) VALUE(P2)****Reason:**

An invalid keyword value was passed to the the Express Setup facility procedure.

System Action:

The request is rejected.

User Action:

Correct the call parameters and retry.

RMEXPR02**INVALID RECORD FORMAT - RECTYPE(P1) FIELD(P2) VALUE(P3) LINE(P4) REASON(P5)****Reason:**

An input record in the Control Member for the Express Setup facility was not valid.

System Action:

The record is rejected and processing continues.

User Action:

Either correct the input record and rerun the Express Setup facility or define the resource or resources manually.

RMEXPR03**CREATE FAILED NAME(P1) CLASS(P2) - RC(P3) MSG(P4)****Reason:**

The Express Setup facility encountered an error when attempting to create a resource definition.

System Action:

Processing continues.

User Action:

Determine the cause of the error from the return code and MSG and take appropriate action. Create the resource manually using the Resource Definition maintenance facility if required.

RMEXPR04

P1

Reason:

The command processor encountered an error when attempting to issue a system command. The second word in the message is the ID of the message set by the command processor.

System Action:

No resource definitions are generated from the results of the command. Processing continues.

User Action:

Correct the command in the Express Setup input file and rerun Express Setup if necessary. Refer to the message definition for the message set by the command processor for more information.

RMEXPR05

IP node discovery has reached the maximum nodes limit (P1)

Reason:

This message indicates that the IP node discovery phase of express setup has reached the maximum number of nodes as set in the control member. The maximum number used was *P1*.

System Action:

IP node discovery stops and express setup continues.

User Action:

If you would like to increase the maximum number of IP nodes discovered, then update the control member used, specifying a larger value for the argument MAXNODES and rerun the express setup.

RMEXPR06**P1(P2) DEFINED SUCCESSFULLY****Reason:**

A database record was created by the Express Setup facility. *P1* is the record type and *P2* is the name of the record.

System Action:

None.

User Action:

None.

RMEXPR07**EXPRESS SETUP P1****Reason:**

The Express Setup facility has completed setting up resource definitions. *P1* is one of the following:

COMPLETED SUCCESSFULLY - all control records processed successfully

COMPLETED WITH WARNINGS - all records processed but some warnings were issued. See the Express Setup log.

COMPLETED WITH ERRORS - all records processed but some errors were encountered. See the Express Setup log. *FAILED* - because of a fatal error, not all records processed. See the Express Setup log.

System Action:

None.

User Action:

If the message indicates that Express Setup has failed or errors occurred, review messages in the Express Setup Task Log, in the log for the specific express setup task, and in the activity log to determine the cause of failure.

RMEXPR08

IP node discovery maximum duration exceeded (*p1* minutes). Discovery incomplete

Reason:

The IP node discovery phase of Express Setup has reached the maximum duration set in the control member. The duration used was *p1* minutes.

System Action:

IP node discovery stops, and Express Setup continues.

User Action:

To extend the duration of the discovery, update the control member used. Specify a larger value for the MAXDUR argument, and rerun the Express Setup.

RMEXPR09

FILE P1 ERROR - RC(P3) FDBK(P4)

Reason:

The Express Setup facility encountered an error when attempting to access the work file. The type of access attempted was *P1*, the file return code was *P3* and the VSAM feedback code was *P4* .

System Action:

The Express Setup facility terminates.

User Action:

Determine the cause of the error from the return and feedback codes, correct and rerun the Express Setup procedure.

RMEXPR10**NO CONTROL RECORDS IN INPUT FILE - MEMBER(P1)****Reason:**

The Express Setup procedure terminated because no records were found in the control file. *P1* is the command library member which was nominated as the control file.

System Action:

The Express Setup procedure terminates.

User Action:

Specify a valid control information member name and make sure the member is in a PDS which is in the command library of the invoking user, then rerun the Express Setup procedure.

RMEXPR11**CLASS NOT SPECIFIED FOR COMMAND****Reason:**

A 'C' (command) type control record was encountered in the control file for the Express Setup facility, but the class attribute (\$RM00CLASS) was not set before the command record.

System Action:

The control record is rejected and processing continues.

User Action:

Correct the control file so that the \$RM00CLASS field is set before each command record and rerun the Express Setup facility.

RMEXPR12

MISSING FIELD FOR ADD REQUEST - CLASS(P1) NAME(P3)

Reason:

The Express Setup facility rejected a request to add a resource definition to the database because either the class or type field was not assigned a value.

System Action:

The add request is rejected and processing continues.

User Action:

Correct the control records which are used to generate the resource and rerun the Express Setup facility or add the resource definition manually.

RMEXPR14

INTERNAL LOCK ERROR - TYPE(P1) RC(P2) FDBK(P3)

Reason:

An internal lock failed. *P1* is the lock action that was attempted, *P2* is the return code and *P3* feedback code.

System Action:

The express set up request fails.

User Action:

Contact your Systems Administrator.

RMEXPR15

FILE P1 ERROR - FILE(P2) RC(P3) MSG(P4)

Reason:

An error was encountered when attempting to access file. *P1* is the operation being performed, *P2* is the ID of the file, *P3* is the return code and *P4* is the message set by the file verb.

System Action:

Express Setup terminates.

User Action:

Determine the cause of the error from the return code and message, correct the problem and rerun the Express Setup facility.

RMEXPR16**PROCESSING ALL P1 RESOURCES****Reason:**

The Express Setup Facility is currently finding all active *P1* class resources on the system and creating resource definitions for them in the knowledge base.

System Action:

None.

User Action:

None.

RMEXPR17**PROCESSING P1 RESOURCE P2****Reason:**

The Express Setup Facility is currently creating a resource definition in the knowledge base for a *P1* class resource named *P2* .

System Action:

None.

User Action:

None.

RMEXPR18**REGION IS NOT LICENSED FOR MANAGING RESOURCES THAT EXPRESS SETUP CREATES****Reason:**

A request to invoke the Express Setup Facility was rejected because the region is not licensed for any of the resource types that express setup creates.

System Action:

The Express Setup request is rejected.

User Action:

None.

RMEXPR19

SYSTEM IMAGE (P1. P2) ALREADY EXISTS

Reason:

A request to invoke the Express Setup facility was rejected because the system image to be created has already been defined.

System Action:

The Express Setup request is rejected.

User Action:

Resubmit the request specifying a system name and/or version which does not already exist.

RMEXPR20

LOADING SYSTEM IMAGE (P1. P2)

Reason:

Express Setup has completed and is now loading the newly created system image as the active image.

System Action:

None.

User Action:

None.

RMEXPR21

EXPRESS SETUP IS USING PROCEDURE LIBRARY P1

Reason:

The indicated procedure library was either specified in the Express Setup control file or defaulted as a procedure library to be searched in order to identify started task types.

System Action:

None.

User Action:

None.

RMEXPR22**TEMPLATE SYSTEM IMAGE VERSION (P1) DOES NOT EXIST****Reason:**

The indicated Template System image version does not exist in the RAMDB. Express Setup is not able to create resources without a valid Template System Image version.

System Action:

Express setup fails.

User Action:

Update the Customizer parameter member OPSYSIDS with a valid Template System Image version.

RMEXPR23**P1****Reason:**

This message contains an error message returned by a procedure that Express Setup has invoked to perform a service needed for setup.

System Action:

The message is written to the log and processing continues.

User Action:

Check the message *P1* and any related messages in the log to determine if any action is required.

RMEXPR24

Node discovery of *P1* nodes took *P2* hrs *P3* mins and *P4* secs

Reason:

This informational message shows the duration of node discovery by Express Setup. The duration can be affected by the HOPS and SNMPWAIT arguments in the Express Setup control member.

P1 nodes were discovered during the node discovery. In the next phase, the discovered nodes are compared to the NODETYPES or CIPTYPES filter criteria in the control member. Nodes matching the criteria are added as resources of class IPNODE or CIP.

System Action:

The message is written to the log, and processing continues.

User Action:

None.

RMEXPR25

TCP/IP sockets interface is not active

Reason:

During Express Setup processing, the TCP/IP sockets interface terminated or never started.

System Action:

Processing is ignored for the current resource and continues to the next available resource. This results in a system image that may not contain all of the resources that are currently in the network.

User Action:

Ensure that the TCP/IP sockets interface is active. Perform the following steps:

1. Review the SOCKETS Parameter group (/PARMS). Verify that all of the details are correct and then press F6 (Action).
2. If actioning the group fails, verify that the associated stack address space is available and is completely initialized. Retry actioning the parameter group.
3. Rerun Express Setup if needed.

RMEXPR26**No response from stack *P1* for command : *P2*****Reason:**

Express Setup did not get a response from the IP stack *P1* for the *P2* command. The information contained in the response is needed to create the resource definition.

System Action:

Processing is ignored for this resource and continues to the next available resource. This results in a system image that may not contain all the resources currently in the network.

User Action:

List this region's configuration details (/IPTEST), and investigate any errors.

RMEXPR27**Starting node search from address *P1*****Reason:**

The IP discovery is now searching for nodes starting from the interface address *P1*.

System Action:

None.

User Action:

This is an informational message indicating what IP node discovery is currently doing.

RMEXPR28**IP node discovery starting.****Reason:**

The IP discovery process is now starting.

System Action:

None.

User Action:

This is an informational message indicating what IP node discovery is currently doing.

RMEXPR29

Getting route table for address *P1* hop *P2* of *P3*

Reason:

IP discovery is now retrieving the routing table for address *P1*. This table is used to determine the adjacent networks and hosts. *P2* is the current hop count represented by this level of discovery and *P3* is the hop limit set for this Express Setup discovery.

System Action:

None.

User Action:

This is an informational message indicating what IP node discovery is currently doing.

RMEXPR30

Processing RT: *P1*, *P2* <-> *P3*

Reason:

TCP/IP discovery is processing the routing table entry with first hop *P1* and address *P2* with subnet mask *P3*.

System Action:

None.

User Action:

This is an informational message indicating what TCP/IP node discovery is currently doing.

RMEXPR31**Discovering local interfaces for P1 stack P2****Reason:**

IP discovery is now searching for the local interfaces for the TCP/IP stack of type *P1* called *P2*.

System Action:

None.

User Action:

This is an informational message indicating what IP node discovery is currently doing.

RMEXPR32**Validating P1 stack P2****Reason:**

IP discovery is validating a potential *P1* type TCP/IP stack called *P2*.

System Action:

None.

User Action:

This is an informational message indicating what IP node discovery is currently doing.

RMEXPR33**Class P1 (P2) not licensed for this region****Reason:**

The resource class *P1* is not available for use by this region.

System Action:

The resource class is ignored and processing continues to the next entry in the control file.

User Action:

To avoid generating this warning message, remove resource class entries in the control file that are not licensed for this region.

RMEXPR34

Bypassed system image loading due to failed Express Setup

Reason:

A request to load the newly created system image has been bypassed due to failures during Express Setup.

System Action:

Processing continues.

User Action:

Review messages in the Express Setup Task Log, in the log for the specific express setup task, and in the activity log to determine the cause of failure.

RMEXPR35

TCP/IP sockets interface is now active

Reason:

During Express Setup processing, the TCP/IP sockets interface became available.

System Action:

Processing continues.

User Action:

It may be necessary to rerun Express Setup to ensure that all resources in the network are defined correctly.

RMEXPR36

NETSTAT Interface is now available.

Reason:

During Express Setup processing, the NETSTAT interface became available.

System Action:

Processing continues.

User Action:

It may be necessary to rerun Express Setup to ensure that all resources in the network are correctly defined.

RMEXPR37**NETSTAT Interface not available : *P1* discovery bypassed****Reason:**

Express Setup did not receive a response from the NETSTAT interface. The information contained in the response is needed for *P1* discovery processing.

System Action:

Processing is ignored for the current resource and continues to the next available resource. This results in a system image that may not contain all the resources that are currently in the network.

User Action:

List this region's configuration details (/IPTEST), and investigate any errors.

RMEXPR38**IPv6 subnet *P1* not processed****Reason:**

During Express Setup IPNODE discovery, IPv6 subnet *P1* was found in a routing table. Express Setup does not process IPv6 subnets because IPv6 subnets can be very large and the amount of time required to check each address would be excessive.

System Action:

Processing continues, skipping subnet *P1*.

User Action:

If there are addresses in this subnet that you want to monitor, you can add an IPNODE definition manually after Express Setup completes.

RMEXPR39

Address *P1* bypassed. Type *P2* not in NODETYPES list

Reason:

Address *P1* was found during Express Setup IPNODE discovery. Its node type is *P2*. No resource was build for this address because the node type does not match the list of types specified in the NODETYPES statement in the Express Setup control member.

System Action:

Processing continues.

User Action:

To monitor this address, add an IPNODE definition manually after Express Setup completes, or change the control member and rerun Express Setup.

RMEXPR40

SmartTrace parameter Group updated by Express Setup

Reason:

As part of the Express Setup process, some values are added to the list of TCP Port to Protocol Associations in the SmartTrace parameter group. Values were added based on listener ports discovered for known applications.

System Action:

None.

User Action:

None.

RMEXPR69**P1****Reason:**

This is an IP node discovery trace message issued during Express Setup. The message text is variable and indicates the actions that IP node discovery is performing.

System Action:

None.

User Action:

If the trace messages are requested by Technical Support, then ensure that a copy of all the messages are sent to them, including other messages whose message ID begins with RMEXPR.

RMFI0001**INVALID PARAMETERS: P1****Reason:**

The parameters passed to the procedure to build filter boolean expressions are invalid.

System Action:

Processing is terminated.

User Action:

Correct the parameters in the calling procedure and rerun the exec call.

RMFI0002**P1****Reason:**

The procedure to build filter boolean expressions found an invalid boolean expression. *P1* is the sysmsg returned.

System Action:

Processing is terminated.

User Action:

Correct the incorrect boolean expression in the filter.

RMFI0003

UNBALANCED PARENTHESES - LEFT P1 RIGHT P2

Reason:

The parentheses in the filter are unbalanced. *P1* identifies the number of left parentheses and *P2* identifies the number of right parentheses.

System Action:

Processing is terminated.

User Action:

Correct the unbalanced parentheses in the filter.

RMFI0004

BOOLEAN VALUE NEEDED ON LINE P1

Reason:

No boolean value was found on the line *P1*.

System Action:

Processing is terminated.

User Action:

Correct the boolean value on the line identified.

RMFT0001

INVALID TRANSACTION TYPE - TYPE(P1) DATA(P2)

Reason:

The transaction request from remote conversation partner is not recognized.

System Action:

This transaction is not processed any further.

User Action:

Contact Technical Support.

RMFT0002**P1 FAILED - RC(P2) FDBK(P3) SYSMSG(P4)****Reason:**

An APPC error was detected attempting APPC verb *P1* . The return code is *P2* , the feedback code is *P3* , and the associated error message is *P4* .

System Action:

Processing terminated in error.

User Action:

Determine whether the remote system is still available. Contact your system administrator.

RMFT0102**P1 FAILED - RC(P2) FDBK(P3) SYSMSG(P4)****Reason:**

Processing of the *P1* APPC verb failed. The return code is *P2* , the feedback code is *P3* , and the associated error message is *P4* .

System Action:

Processing terminated in error.

User Action:

Determine whether the link to the remote system has failed. If the link has failed, the region will try to recover the link. Otherwise, contact Technical Support.

RMIC0101**INVALID PARAMETERS: P1****Reason:**

Invalid parameters were passed to Procedure \$RMIC01D.

System Action:

The Procedure terminates.

User Action:

Contact your support representative.

RMIC0102

PANEL(~P1) BEING UPDATED BY ~P2

Reason:

The panel, P1, you have chosen to be displayed as a graphical monitor is currently being updated by the user identified by P2.

System Action:

Request rejected.

User Action:

Use another panel or wait until the user currently updating the panel is finished with it.

RMIC0103

RESOURCE GROUP (~p1) CONTAINS NO RESOURCES

Reason:

The Resource Group you have elected to Zoom to does not contain any resources.

System Action:

The Zoom request is rejected.

User Action:

Check that the Resource Group definition is correct, and that all links between Service/View Regions are up.

RMIC0104

INVALID PANEL NAME(P1)

Reason:

The panel name *P1* is not a valid panel name.

System Action:

Request rejected.

User Action:

Specify a valid panel name.

RMIC0105**INVALID COMMAND(~P1) ISSUED AGAINST ICON(~P2)****Reason:**

The command identified by P1, issued against the Icon identified by P2 was not a valid Icon command.

System Action:

Request rejected.

User Action:

Enter a valid Icon command

RMIC0106**COMMAND P1 AGAINST GROUP P2 IS BLOCKED BY GLOBAL SETTING****Reason:**

The command P1 is not allowed to be issued against resource group P2 because it appears in *the* list of restricted commands contained in GLOBAL variable \$RM\$GCBL.

System Action:

Command is rejected.

User Action:

If it is required to be able to issue this command then remove it from the GLOBAL variable \$RM\$GCBL in the system startup parameters.

RMIC0107**COMMAND(S) SUBMITTED SUCCESSFULLY****Reason:**

The requested command(s) were successfully submitted.

System Action:

None.

User Action:

None.

RMIC0108

ERROR ZOOMING TO RESOURCE GROUP(P1). MSG(P2)

Reason:

There was an error encountered Zooming to a Resource Group panel. *P1* is the resource group being ZOOMed to and *P2* is the error message returned.

System Action:

The Zoom is terminated.

User Action:

Check to see if the Zoomed Panel or Resource Group are invalid.

RMIC0109

INVALID COMMAND (P1)

Reason:

The specified Command is Invalid.

System Action:

None.

User Action:

Enter a "?" in the field to get a list of Valid Commands.

RMIC0110

COMMAND(&#RM\$WKP1) INVALID AGAINST PANEL TYPE GROUP(&#RM\$WKP2)

Reason:

Resource commands cannot be issued against an icon which contains a resource group which points to another icon panel. You must first Zoom the lower level panel and issue resource commands at that level, if possible.

System Action:

Command is rejected.

User Action:

Zoom on the icon to reveal the panel below. If the icons on this subsequent panel point directly to resources then commands may be issued against them.

RMIC0111**ERROR IN PANEL(*P1*). PANEL MAY HAVE CHANGED. REFER TO LOG****Reason:**

An error occurred while displaying the indicated panel. The panel may have changed since it was last displayed. The activity log contains more information about the panel error.

System Action:

The displaying operation is terminated.

User Action:

See the activity log for more information about the panel error.

RMIC0112**'~P1' COMMAND ISSUED****Reason:**

The specified command has been issued.

System Action:

The command will be processed.

User Action:

None

RMIC0201**INVALID KEYWORD VALUE SPECIFIED FOR KEYWORD P1 VALUE= P2****Reason:**

An invalid keyword value was passed to the Graphical Resource Monitor service procedure. The keyword was P1 and the invalid value was P2.

System Action:

Request is rejected.

User Action:

Correct the keywords value and retry the request.

RMIC0202

INVALID COMMAND

Reason:

The command specified was invalid.

System Action:

Command field is set in error.

User Action:

Enter a valid command.

RMIC0203

COMMAND REQUEST CANCELLED

Reason:

A request to execute a command against all the resources represented by an Icon was cancelled by the user.

System Action:

None.

User Action:

None.

RMIM0001

VARIABLE ALLOCATION FAILED. FDBK: P1 TYPE: P2 NAME: P3 SCOPE: P4

Reason:
