

# CA SOLVE:Operations® Automation

## Installation Guide

Release 11.9

This documentation, which includes embedded help systems and electronically distributed materials, (hereinafter referred to as the "Documentation") is for your informational purposes only and is subject to change or withdrawal by CA at any time.

This Documentation may not be copied, transferred, reproduced, disclosed, modified or duplicated, in whole or in part, without the prior written consent of CA. This Documentation is confidential and proprietary information of CA and may not be disclosed by you or used for any purpose other than as may be permitted in (i) a separate agreement between you and CA governing your use of the CA software to which the Documentation relates; or (ii) a separate confidentiality agreement between you and CA.

Notwithstanding the foregoing, if you are a licensed user of the software product(s) addressed in the Documentation, you may print or otherwise make available a reasonable number of copies of the Documentation for internal use by you and your employees in connection with that software, provided that all CA copyright notices and legends are affixed to each reproduced copy.

The right to print or otherwise make available copies of the Documentation is limited to the period during which the applicable license for such software remains in full force and effect. Should the license terminate for any reason, it is your responsibility to certify in writing to CA that all copies and partial copies of the Documentation have been returned to CA or destroyed.

TO THE EXTENT PERMITTED BY APPLICABLE LAW, CA PROVIDES THIS DOCUMENTATION "AS IS" WITHOUT WARRANTY OF ANY KIND, INCLUDING WITHOUT LIMITATION, ANY IMPLIED WARRANTIES OF MERCHANTABILITY, FITNESS FOR A PARTICULAR PURPOSE, OR NONINFRINGEMENT. IN NO EVENT WILL CA BE LIABLE TO YOU OR ANY THIRD PARTY FOR ANY LOSS OR DAMAGE, DIRECT OR INDIRECT, FROM THE USE OF THIS DOCUMENTATION, INCLUDING WITHOUT LIMITATION, LOST PROFITS, LOST INVESTMENT, BUSINESS INTERRUPTION, GOODWILL, OR LOST DATA, EVEN IF CA IS EXPRESSLY ADVISED IN ADVANCE OF THE POSSIBILITY OF SUCH LOSS OR DAMAGE.

The use of any software product referenced in the Documentation is governed by the applicable license agreement and such license agreement is not modified in any way by the terms of this notice.

The manufacturer of this Documentation is CA.

Provided with "Restricted Rights." Use, duplication or disclosure by the United States Government is subject to the restrictions set forth in FAR Sections 12.212, 52.227-14, and 52.227-19(c)(1) - (2) and DFARS Section 252.227-7014(b)(3), as applicable, or their successors.

Copyright © 2011 CA. All rights reserved. All trademarks, trade names, service marks, and logos referenced herein belong to their respective companies.

## CA Technologies Product References

This document references the following CA Technologies products:

- CA ACF2™ for z/OS
- CA Auditor for z/OS (CA Auditor)
- CA Common Services for z/OS
- CA Common Inventory Service
- CA Mainframe Connector for Linux on System z (CA Mainframe Connector)
- CA Mainframe Software Manager™ (CA MSM)
- CA SOLVE:Access™ Session Management (CA SOLVE:Access)
- CA SOLVE:Operations® Automation
- CA SYSVIEW® Performance Management (CA SYSVIEW)
- CA Top Secret® for z/OS

# Contact CA Technologies

## Contact CA Support

For your convenience, CA Technologies provides one site where you can access the information you need for your Home Office, Small Business, and Enterprise CA Technologies products. At <http://ca.com/support>, you can access the following:

- Online and telephone contact information for technical assistance and customer services
- Information about user communities and forums
- Product and documentation downloads
- CA Support policies and guidelines
- Other helpful resources appropriate for your product

## Providing Feedback About Product Documentation

If you have comments or questions about CA Technologies product documentation, you can send a message to [techpubs@ca.com](mailto:techpubs@ca.com).

If you would like to provide feedback about CA Technologies product documentation, complete our short customer survey, which is available on the CA Support website at <http://ca.com/docs>.

# Chapter 1: Overview

---

This guide describes how to install and implement CA SOLVE:Operations Automation.

This section contains the following topics:

[Audience](#) (see page 11)

[How the Installation Process Works](#) (see page 12)

[Purpose and Structure of This Guide](#) (see page 13)

## Audience

Readers of this book require knowledge in the following areas:

- Job control language (JCL)
- TSO/ISPF
- z/OS environment and installing software in this environment
- Your organization's IT environment, enterprise structure, and region structure

You work with the following personnel:

- Systems programmer for z/OS, VTAM, and TCP/IP definitions
- Security administrator, for library and started task access authority
- Storage Management Subsystem (SMS) or storage administrator, for direct access storage device (DASD) allocations

## How the Installation Process Works

CA Technologies has standardized product installations across all mainframe products. Installation uses the following process:

- Acquisition—Transports the software to your z/OS system.
- Installation using SMP/E—Optionally creates a new CSI environment and runs the RECEIVE, APPLY and ACCEPT steps. The software is untailed.
- Deployment—Copies the target libraries to another system or LPAR.
- Configuration—Creates customized load modules, bringing the software to an executable state.

CA MSM provides a web-based interface to make the standardized installation process easier. Using CA MSM, someone with limited knowledge of JCL and SMP/E can install a product.

**Note:** If you do not have CA MSM, you can download it from the Download Center at [the CA Support Online website](#). Follow the installation instructions in the CA Mainframe Software Manager documentation bookshelf on the CA Mainframe Software Manager product page. The standardized installation process can also be completed manually.

To install your product, do the following:

1. Prepare for the installation by [confirming that your site meets all installation requirements](#) (see page 15).
2. Use one of the following methods to acquire the product:
  - [Download the software from CSO using CA MSM](#) (see page 25).
  - Download the software from CSO using Pax-Enhanced Electronic Software Delivery (ESD).
  - Order a tape or a DVD.
3. Perform an SMP/E installation using one of the following methods:
  - If you used CA MSM to acquire the product, start the SMP/E step from the SMP/E Environments tab in CA MSM.
  - If you used ESD to acquire the product, you can install the product manually or use the Insert New Product option in CA MSM to complete the SMP/E install.
  - If you used a [tape](#) (see page 65) or DVD, install the product manually.

**Note:** If a CA Recommended Service (CA RS) package is published for your product, install it before continuing with deployment.

4. Deploy the target libraries using one of the following methods:
  - If you are using CA MSM, deployment is required; it is a prerequisite for configuration.
  - If you are using a manual process, deployment is an optional step.

**Note:** Deployment is considered part of starting your product.
5. Configure your product using CA MSM or manually.

**Note:** Configuration is considered part of starting your product.

## Purpose and Structure of This Guide

This guide contains step-by-step procedures to guide you through the installation, setup, migration, initialization, and maintenance of your product.

**Important!** This guide describes how to implement a generic version of your product. To configure your product to suit your site requirements, and set up specific features, such as enhancements associated with this release, you must review the remaining guides in the documentation set.

The guide describes how to perform the processes in the following sections.

### Preinstallation

During preinstallation, you perform the following tasks:

1. Check your hardware and software levels.
2. Check your security and access privileges.
3. Gather the information needed during installation.
4. Prepare your system for installation.

### Installation

During installation, you perform *one* of the following tasks:

- Use the CA MSM to install your product.
- Use the Install Utility to generate the installation JCL and then use the generated JCL to install your product.

## Configuration

During configuration or setup, you use the Install Utility to generate the setup JCL statements to build the regions required by your product.

## Product Preparation

During product preparation, you prepare the components that make up your product.

## Initial Migration Required for Upgrade

During initial migration, you perform the migration steps required before starting your product region for the first time.

**Note:** This process is required if you are upgrading.

## Startup

During startup, you start and log on to your product region for the first time.

## Customization

During customization, you perform initial customization in your product region.

## Complete Migration

During complete migration, you perform the migration steps required after you start your product region.

**Important!** To ensure the successful implementation of your product, you must complete all the tasks in this guide in the order presented.

**Note:** This process is required if you are upgrading.

# Chapter 2: Preparing for Installation

---

This section describes what you need to know and do before you install the product.

This section contains the following topics:

[Multiple Product Installation and Setup](#) (see page 15)

[Software Requirements](#) (see page 15)

[CA Common Services Requirements](#) (see page 17)

[Security Requirements](#) (see page 18)

[Storage Requirements](#) (see page 19)

[Worksheets](#) (see page 19)

[Migration Preparation](#) (see page 19)

## Multiple Product Installation and Setup

You can install multiple products in the CA SOLVE:Operations Automation family based on what you have purchased. You can also set up multiple products in one region.

Therefore, you can perform the steps in the *Installation Guides* for these products concurrently as you install and set them up.

## Software Requirements

You must verify your system is set with the requirements described in this section.

### Operating Environment

Ensure that you have the appropriate operating environment. Your system must have:

- A currently-supported version of z/OS.
- If you intend to implement Secure Sockets Layer (SSL) for the web interface:
  - SMP/E V3R5.0.
  - IBM's 31-bit SDK for z/OS, Java 2 Technology Edition for the libjvm.x side deck. IBM's 64-bit SDK is *not* supported.

## WebCenter Requirements

WebCenter users require the following minimum levels of third-party products installed on their PCs:

- Internet Explorer: 6.0 with SP1 *or* Firefox: 2.0
- Java Runtime Environment (JRE): Preferably a recent version such as JRE 1.6.0\_22 (JRE 1.6.0\_13 through JRE 1.6.0\_20 not supported)

**Notes:**

- If you are using WebCenter over an IPv6 network, your WebCenter users need at least JRE 1.5.0\_12.
- If you are using a 64-bit browser, review the JRE support and minimum system requirements for 64-bit browsers on the Sun Java website.

## Migration Mode

If you intend to use [migration mode](#) (see page 21) to link a new product region to a Version 5.0 product region (or environment), ensure you have applied the following Version 5.0 maintenance to your CA SOLVE:Operations Automation Version 5.0 product:

- NZ28508
- NZ28509
- RO12224
- RO29007

For r11, the following maintenance is required:

- RO12223
- RO29601

## CA Common Services Requirements

Your system must have a currently supported version of CA Common Services for z/OS. The CA Common Services load library must be accessible to the product address space and the SOLVE SSI address space through the JCL STEPLIB or system LNKLST.

**Note:** The latest version of CA Common Services for z/OS is included in your package.

The following CA Common Services are used with CA SOLVE:Operations Automation:

### **CA LMP of the CAIRIM Common Service**

Authorizes your product features. CA LMP provides a standardized and automated approach to the tracking of licensed software. The service uses common real-time enforcement software to validate the configuration. CA LMP reports on activities related to the license, usage, and financials of CA Technologies products.

### **CAICCI Common Service**

Provides cross-system communication. This service is required, for example, for communication with CA Service Desk.

### **CAISDI/soap**

Is the z/OS Simple Object Access Protocol (SOAP) client that communicates with CA Service Desk. The component manages the communication using TCP/IP to CA Service Desk and provides the basic mechanisms that allow CA Technologies products to open CA Service Desk tickets. This component is required for all CA Service Desk integration.

**Note:** If other CA Technologies products are installed at your site, some of these services are already installed.

**Note:** For more information about CA Common Services for z/OS components, see the CA Common Services for z/OS documentation on the [Technical Support web site](#) (see page 4).

## Security Requirements

When you prepare your z/OS task for startup, the following authorities are required on your system:

- If you plan to use ESD to download the product, you require access to UNIX System Services (USS).
- You have READ authority to data sets with a prefix of CAI.\*.
- You have UPDATE authority to the following data sets or libraries:
  - Started task PROCLIB that stores the run-time JCL job, for example, SYS1.PROCLIB
  - SYS1.PARMLIB
  - SYS1.VTAMLST or the library that stores VTAM application definitions and VTAM initialization parameters
  - SYS1.VTAMLIB for terminal mode table definitions
  - Master catalog, a requirement if you intend to define alias entries for data set prefixes
- You have authority to update the following initialization parameter data set members if necessary:
  - SYS1.PARMLIB(IEFSSNxx) to add subsystem IDs
  - SYS1.PARMLIB(IEAAPFxx) to APF-authorize your load libraries
  - SYS1.PARMLIB(CONSOLxx) if your system does not use extended MCS consoles
  - SYS1.PARMLIB(LPALSTxx) if you want to use the SOLVE SSI task as the PPI provider
  - SYS1.PARMLIB(PROGxx) if you want CA Auditor for z/OS or CA Common Inventory Service to know of your products for your auditors
- Ensure that the following conditions are met:
  - The user IDs associated with your started tasks have access to the run-time data sets created by the installation and setup processes (UPDATE authority required).
  - The user IDs associated with your started tasks have READ access to the PROCLIBs (required by Express Setup).
  - The user ID associated with the product region started task is authorized to issue system commands.
  - The user IDs associated with the product and SOLVE SSI region have authority to use USS.

## Storage Requirements

CA SOLVE:Operations Automation has the following 3390 DASD space requirements:

- If you are using CA MSM or ESD, the following z/OS UNIX file system space is required for the downloaded and unpacked files: 115 MB.
- For installation and setup, the following spaces are required:
  - Installation = 725 cylinders
  - IBM System Modification Program Extended (SMP/E) libraries = 30 cylinders
  - Setup = 190 cylinders
  - Setup temporary work area = 370 cylinders

## Worksheets

The [preparation worksheets](#) (see page 133) help you gather the required information before you install and configure (or set up) the product.

The [post-installation worksheet](#) (see page 143) lets you record the names of the data sets created by the installation and configuration process for future reference.

## Migration Preparation

Some migration tasks require actions on the region that you are migrating from. If you are planning to reuse resources for your new product region, such as access control block (ACB) name and started task name, make sure that you perform these tasks before you shut down your existing region for the last time.

**More information:**

[Performing Initial Migration](#) (see page 99)

[Completing Migration](#) (see page 121)

## Parameter Group Values

If you do not use a region initialization (INI) file and want to migrate your previous parameter group values to your new product region, record these values now. You use them to customize the product region.

## How to Migrate Your Initialization File

If you have an existing region INI file from r11 onwards, you can migrate the file for use in this release.

**Important!** Review and update the file to ensure that names such as ACBs, data sets, and interfaces are suitable for the new region.

The process of migrating your INI file consists of the following steps:

1. If you have not already generated your INI file, generate the INI file in the previous region.
2. Configure the file by updating the data set names used, and checking the ACB and various interface names. Alternatively, you can delete the configuration section for a whole parameter group to let the defaults for the new region be used.

**Note:** During region initialization, the INI file is applied by passing all parameter values to the INI file procedure and letting the procedure overwrite the values as needed. If you do not want to overwrite the settings for a parameter group or individual parameter, comment out or delete the statements in the INI file that contains the group or parameter. Setting the value of a parameter to null sets the parameter value to null, which may not be what you wanted.

3. Start the new region using the INI file by editing your RUNSYSIN.

After you start the region, you can check it and regenerate the INI if necessary.

**Important!** Generation of the INI file replaces custom code, such as code that includes MVS system symbols, with the actual values. If you regenerate the file, reapply the custom code.

**Note:** For more information about setting up the initialization file, see the *Administration Guide*.

## Knowledge Base

If you want to migrate your knowledge base, consider the following:

- To keep a copy of an old distributed ResourceView template (for example, you might have modified it), copy this template to a new template image version above 0009. You can copy a template image from the Template System Image List panel (/RADMIN.T.I).
- To keep a copy of an old distributed EventView rule set (for example, you might have modified it), make a copy of this rule set under a different name. (If the rule set is associated with a system image, update the association accordingly.) You can copy a rule set from the Ruleset List panel (/EADMIN.R.R).

## Multisystem Considerations

You cannot link and synchronize a new region with a region running an earlier release of the product.

## How Migration Mode Works

You can use migration mode to assist in the migration of an existing multisystem network.

Migration mode gives the new product region the same level of visibility as normal synchronization, but a slightly reduced command capability. The main difference between migration mode and normal synchronization is that the databases are not synchronized, and single point database maintenance is not possible in migration mode.

Migration mode works as follows:

1. You unlink an existing region from the multisystem network.
2. You migrate this region to the latest release.
3. You link the newly-migrated region back into the multisystem network.
4. After the new region is linked back, you can monitor all resources for all linked regions from the new region.
5. When the next region is unlinked and migrated to the latest release, it can be linked and synchronized in the standard way to the first migrated region.

Each region can be migrated as required without losing the benefits of multisystem monitoring.

### **More information:**

[Migration Mode](#) (see page 16)

## How to Prepare for Multisystem Network Migration

If you are upgrading multiple synchronized regions to this release, perform the following steps to plan for it.

1. Ensure that your existing multisystem network has at least two focal regions. If you have only one focal region, unlink a subordinate region and relink it as a focal region.
2. Choose a focal region and unlink it from the multisystem network.
3. Upgrade the focal region, and perform migration tasks.
4. After you have completed all of the steps in this guide, [link your new focal region in migration mode](#) (see page 128) to an existing focal region.
5. Select the next product region to upgrade and unlink it.
6. Upgrade this product region and then synchronize it to the focal region that you upgraded in Step 3.
7. Continue until all regions are upgraded.

### Notes:

- You only perform knowledge base migration for the first region because the focal knowledge base contains details of all linked regions.
- You only link the first new focal region in migration mode.

## Data Migration

If you are upgrading, you can migrate your site-specific data. The Install Utility helps you migrate some of this data. You can migrate other data manually.

The Install Utility helps you migrate the following types of site-specific data:

- NETINFO records
- PSPOOL Print Services Manager (PSM) spool data set
- UAMS USERIDS
- VFS Report Writer report schedules

You can migrate the following types of site-specific data manually:

- [Knowledge base](#) (see page 121)
- [Managed Object Development Services \(MODS\) data set](#) (see page 124)
- [Network Partitioning Facility \(NPF\) and System Authorization Facility \(SAF\) security members](#) (see page 99)
- [OSCNTL data set](#) (see page 128)
- [Panels](#) (see page 126)

# Chapter 3: Installing Your Product Using CA MSM

---

**Important!** During installation, use the CAIT71 target zone and the CAID71 distribution zone. The setup process requires that these zone names be used.

These topics provide information to get you started managing your product using CA MSM. You can use the online help included in CA MSM to get additional information.

Before using these topics, you must already have CA MSM installed at your site. If you do not have CA MSM installed, you can download it from the Download Center at [the CA Support Online website](#), which also contains links to the complete documentation for CA MSM.

**Note:** The information in this section applies to the latest version of CA MSM. If you are using an earlier version, see the appropriate bookshelf on the CA Mainframe Software Manager product page.

## How to Use CA MSM: Scenarios

In the scenarios that follow, imagine that your organization recently deployed CA MSM to simplify the installation of CA Technologies products and unify their management. You have also licensed a new CA Technologies product. In addition, you have a number of existing CSIs from previously installed products.

- The first scenario shows how you can use CA MSM to acquire the product.
- The second scenario shows how you can use CA MSM to install the product.
- The third scenario shows how you can use CA MSM to maintain products already installed in your environment.
- The fourth scenario shows how you can use CA MSM to deploy the product to your target systems.

## How to Acquire a Product

The *Product Acquisition Service (PAS)* facilitates the acquisition of mainframe products and the service for those products, such as program temporary fixes (PTFs). The PAS retrieves information about the products to which your site is entitled and records these entitlements in a software inventory maintained on your driving system.

You can use the PAS component of CA MSM to acquire a CA Technologies product.

**Follow these steps:**

1. Set up a CA Support Online account.

To use CA MSM to acquire or download a product, you must have a CA Support Online account. If you do not have an account, you can create one on [the CA Support Online website](#).

2. Determine the CA MSM URL for your site.

To [access CA MSM](#) (see page 29), you require its URL. You can get the URL from your site's CA MSM administrator and log in using your z/OS credentials. When you log in for the first time, you are prompted to create a CA MSM account with your credentials for [the CA Support Online website](#). This account enables you to download product packages.

3. Log in to CA MSM and go to the Software Catalog page to locate the product that you want to manage.

After you log in to CA MSM, you can see the products to which your organization is entitled on the Software Catalog tab.

If you cannot find the product you want to acquire, update the catalog. CA MSM refreshes the catalog through [the CA Support Online website](#) using the site IDs associated with your credentials for [the CA Support Online website](#).

4. Download the product installation packages.

After you find your product in the catalog, you can download the product installation packages.

CA MSM downloads (acquires) the packages (including any maintenance packages) from the CA FTP site.

After the acquisition process completes, the product is ready for you to install or maintain.

## How to Install a Product

The *Software Installation Service (SIS)* facilitates the installation and maintenance of mainframe products in the software inventory of the driving system, including browsing downloaded software packages, managing SMP/E consolidated software inventories (CSIs) on the driving system, and automating installation tasks.

You can use the SIS component of CA MSM to install a CA Technologies product.

**Follow these steps:**

1. Initiate product installation and review product information.
2. Select an installation type.
3. Review installation prerequisites if any are presented.

4. Do *one* of the following to select a CSI:
  - Create a new CSI:
    - a. Set up the global zone.
    - b. Create a target zone.
    - c. Create a distribution zone.
  - Use an existing CSI from your working set:
    - a. Update the global zone.
    - b. Set up the target zone: either create a new target zone or use an existing target zone.
    - c. Set up the distribution zone: either create a new distribution zone or use an existing distribution zone.
5. Review the installation summary and start the installation.

After the installation process completes, the product is ready for you to deploy. You may have to perform other steps manually outside of CA MSM before beginning the deployment process.

## How to Maintain Existing Products

If you have existing CSIs, you can bring those CSIs into CA MSM so that you can maintain all your installed products in a unified way from a single web-based interface.

You can use the PAS and SIS to maintain a CA Technologies product.

### Follow these steps:

1. Migrate the CSI to CA MSM to maintain an existing CSI in CA MSM.  
During the migration, CA MSM stores information about the CSI in the database.
2. Download the latest maintenance for the installed product releases from the Software Catalog tab.

If you cannot find a release (for example, because the release is old), you can add the release to the catalog manually and then update the release to download the maintenance.

3. Apply the maintenance.

**Note:** You can also install maintenance to a particular CSI from the SMP/E Environments tab.

After the maintenance process completes, the product is ready for you to deploy. You may have to perform other steps manually outside of CA MSM before beginning the deployment process.

## How to Deploy a Product

The *Software Deployment Service (SDS)* facilitates the deployment of mainframe products from the software inventory of the driving system to the target system, including deploying installed products that are policy driven with a set of appropriate transport mechanisms across a known topology.

You can use the SDS component of CA MSM to deploy a CA Technologies product that you have already acquired and installed.

### Follow these steps:

1. Set up the system registry:
  - a. Determine the systems you have at your enterprise.
  - b. Set up remote credentials for those systems.
  - c. Set up the target systems (Non-Sysplex, Sysplex or Monoplex, Shared DASD Cluster, and Staging), and validate them.
  - d. Add FTP information, including data destination information, to each system registry entry.
2. Set up methodologies.
3. Create the deployment, which includes completing each step in the New Deployment wizard.

After creating the deployment, you can save it and change it later by adding and editing systems, products, custom data sets, and methodologies, or you can deploy directly from the wizard.

**Note:** If you must deploy other products to the previously defined systems using the same methodologies, you must create a separate deployment.

4. Deploy the product, which includes taking a snapshot, transmitting to target, and deploying (unpacking) to your mainframe environment.

After the deployment process completes, the product is ready for you to configure. You may have to perform other steps manually outside of CA MSM before beginning the configuration process.

## Access CA MSM Using the Web-Based Interface

You access CA MSM using the web-based interface. Obtain the URL of CA MSM from the CA MSM administrator.

### Follow these steps:

1. Start your web browser, and enter the access URL.

The login page appears.

**Note:** If the Notice and Consent Banner appears, read the information provided, and click the link to confirm it.

2. Enter your z/OS login user name and password, and click the Log In button.

The initial page appears. If you log in for the first time, you are prompted to define your account on [the CA Support Online website](#).

**Note:** For more information about the interface, click the Help link at the top right corner of the page.

3. Click New.

You are prompted for the credentials to use on [the CA Support Online website](#).

**Important!** The account to which the credentials apply *must* have the Product Display Options set to BRANDED PRODUCTS. You can view and update your account preferences by logging into [the CA Support Online website](#) and clicking My Account. If you do not have the correct setting, you are not able to use CA MSM to download product information and packages.

4. Specify the credentials, click OK, and then click Next.

You are prompted to review your user settings.

**Note:** These settings are available on the User Settings page.

5. Change the settings or keep the defaults, and then click Finish.

A dialog shows the progress of the configuration task. You can click Show Results to view the details of the actions in a finished task.

**Important!** If your site uses proxies, review your proxy credentials on the User Settings, Software Acquisition page.

# Chapter 4: Installing Your Product from Pax-Enhanced ESD

---

This section contains the following topics:

[How to Install a Product Using Pax-Enhanced ESD](#) (see page 31)

[Allocate and Mount a File System](#) (see page 37)

[Copy the Product Pax Files into Your USS Directory](#) (see page 40)

[Create a Product Directory from the Pax File](#) (see page 45)

[Copy Installation Files to z/OS Data Sets](#) (see page 46)

[Install Utility](#) (see page 47)

[Unload the Install Utility](#) (see page 48)

[Installation JCL](#) (see page 48)

[Clean Up the USS Directory](#) (see page 51)

[Maintenance](#) (see page 52)

**Note:** When you have completed the procedures in this section, go to Configuring Your Product.

## How to Install a Product Using Pax-Enhanced ESD

This section describes the Pax-Enhanced ESD process. We recommend that you read this overview and follow the entire procedure the first time you complete a Pax-Enhanced ESD installation. For experienced UNIX users, the *Pax-Enhanced ESD Quick Reference Guide* has sufficient information for subsequent installations.

**Important!** Downloading pax files for the SMP/E installation as part of the Pax-Enhanced ESD process requires write authority to the UNIX System Services (USS) directories used for the ESD process.

If you prefer not to involve all CA Technologies product installers with z/OS UNIX System Services, assign a group familiar with USS to perform Steps 1 through 4 and provide the list of the unpacked MVS data sets to the product installer. USS is not required for the actual SMP/E RECEIVE of the product or for any of the remaining installation steps.

To install files using Pax-Enhanced ESD, use the following process:

1. Allocate and mount the file system. This process requires a USS directory to receive the pax file and to perform the unpack steps. We recommend that you allocate and mount a file system dedicated to Pax-Enhanced ESD and create the directory in this file system. Ensure that all users who will be working with pax files have write authority to the directory.

2. Copy the product pax files into your USS directory. To download files, choose one of the following options:

- Download a zip file from CA Support Online to your PC, unzip the file, and then upload the product pax files to your USS file system.
- FTP the pax files from CA Support Online directly to your USS directory.

**Note:** Perform Steps 3 through 6 for each pax file that you upload to your USS directory.

3. Create a product directory from the pax file. Set the current working directory to the directory containing the pax file, and create a new directory in your USS directory by entering the following command:

```
pax -rvf pax-filename
```

4. Use the SMP/E GIMUNZIP utility to create z/OS installation data sets. The file UNZIPJCL in the directory created by the pax command in Step 3 contains a sample job to GIMUNZIP the installation package. Edit and submit the UNZIPJCL job.
5. Proceed with product installation. Consult product-specific documentation, including AREADME files and installation notes to complete the product installation.
6. (Optional) Clean up the USS directory. Delete the pax file, the directory created by the pax command, all of the files in it, and the SMP/E RELFILES, SMPMCS, and HOLDDATA data sets.

**More Information:**

[USS Environment Setup](#) (see page 36)

[Allocate and Mount a File System](#) (see page 37)

[Copy the Product Pax Files into Your USS Directory](#) (see page 40)

[Create a Product Directory from the Pax File](#) (see page 45)

[Copy Installation Files to z/OS Data Sets](#) (see page 46)

## How the Pax-Enhanced ESD Download Works

**Important!** To download pax files for the SMP/E installation as part of the Pax-Enhanced ESD process, you must have write authority to the UNIX System Services (USS) directories used for the ESD process and available USS file space before you start the procedures in this guide.

Use the following process to download files using Pax-Enhanced ESD:

1. Log in to <https://support.ca.com/>, and click Download Center.

The CA Support Online web page appears.

2. Under Download Center, select Products from the first drop-down list, and specify the product, release, and genlevel (if applicable), and click Go.

The CA Product Download window appears.

3. Download an entire CA Technologies product software package or individual pax files to your PC or mainframe. If you download a zip file, you must unzip it before continuing.

For both options, [The ESD Product Download Window](#) (see page 33) topic explains how the download interface works.

**Note:** For traditional installation downloads, see the *Traditional ESD User Guide*. Go to <https://support.ca.com/>, log in, and click Download Center. A link to the guide appears under the Download Help heading.

4. Perform the steps to install the product based on the product-specific steps.

The product is installed on the mainframe.

## ESD Product Download Window

CA Technologies product ESD packages can be downloaded multiple ways. Your choices depend on the size of the individual files and the number of files you want to download. You can download the complete product with all components or you can select individual pax and documentation files for your product or component.

The following illustration shows sample product files. It lists all components of the product. You can use the Download Cart by checking one or more components that you need or check the box for Add All to cart. If you prefer to immediately download a component, click the Download link.

Clicking the link for an individual component takes you to the Download Method page.

**Download Method**

---

Please choose a download method to complete your download request. [Learn More](#)

---

**HTTP via Download Manager**  
This is the CA recommended method for download. The Download Manager allows you to download your files faster and more efficiently.  
[Download](#)

---

**HTTP via Internet Browser**  
If Download Manager cannot be used or fails to start you may access your file(s) via your internet browser.  
[View File Link\(s\)](#)

---

**FTP**  
This method allows you to download your file(s) via FTP from CA's content delivery network or via native FTP servers.  
**Note:** Processing is required and an email notification will be sent when your request is ready for downloading.  
[FTP Request](#)

Depending on the size and quantity of product files ordered, the Download Method screen could also have these options:

**Note:** For mainframe downloads using this HTTP method, click the Learn More link.

**Download Method**

---

Please choose a download method to complete your download request. [Learn More](#)

---

**HTTP via Download Manager**  
This is the CA recommended method for download. The Download Manager allows you to download your files faster and more efficiently.  
[Download](#)

---

**Create a Zip File**  
This method allows you to bundle your download files into one or more zip files of up to 3.5 GB each. These zip files can then be downloaded via HTTP or FTP.  
**Note:** Processing is required and an email notification will be sent when your request is ready for downloading.  
[Create Zip](#)

The HTTP method lets you start downloading immediately. The FTP method takes you to the Review Orders page that displays your order, first in a Pending status changing to Ready when your order has been processed.

Preferred FTP uses the new content delivery network (CDN). Alternate FTP uses the CA Technologies New York-based FTP servers.

The Create a Zip File option first creates the zip, and when ready, offers the options shown by the Zip Download Request examples in the next screen.

**Review Download Requests**

Below is a list of the FTP and large HTTP downloads that have been requested by your site. When status is set to 'Ready' a link will appear.

- For FTP requests, click on the FTP link to view the path information for your download. For more information view our [FTP Help document](#)
- For HTTP requests, click on the HTTP link to initiate your download.
- To view the details of your request, click on the desired order number.

**Today's Downloads**

## USS Environment Setup

You need a UNIX System Services (USS) directory and a file system with adequate space to perform the following tasks:

- Receive product pax files from CA Support Online.
- Perform utility functions to unpack the pax file into MVS data sets that you can use to complete the product installation.

We recommend that you allocate and mount a file system dedicated to Pax-Enhanced ESD. The amount of space that you need for the file system depends on the following variables:

- The size of the pax files that you intend to download.
- Whether you plan to keep the pax files after unpacking them. We do not recommend this practice.

We recommend that you use one directory for downloading and unpacking pax files. Reusing the same directory minimizes USS setup. You need to complete the USS setup only one time. You reuse the same directory for subsequent downloads. Alternatively, you can create a new directory for each pax download.

**Important!** Downloading pax files for the SMP/E installation as part of the Pax-Enhanced ESD process requires write authority to the UNIX System Services (USS) directories used for the ESD process. In the file system that contains the ESD directories, you also need free space approximately 3.5 times the pax file size to download the pax file and unpack its contents. For example, to download and unpack a 14 MB pax file, you need approximately 49 MB of free space in the file system hosting your ESD directory.

## Allocate and Mount a File System

You can use the zSeries File System (zFS) or hierarchical file system (HFS) for ESD downloads.

This procedure describes how to perform the following tasks:

- Allocate a zFS or an HFS.
- Create a mount point in an existing maintenance USS directory of your choice.
- Mount the file system on the newly created mount point.  
**Note:** You must have SUPERUSER authority to do this.
- Optionally, permit write access to anyone in the same group as the person who created the directory.

**Important!** USS commands are case-sensitive.

**Follow these steps:**

1. Allocate the file system by customizing one of the following samples to your site's requirements:

- On a zFS, use the following sample:

```
//DEFINE EXEC PGM=IDCAMS
//SYSPRINT DD SYSOUT=*
//SYSUDUMP DD SYSOUT=*
//AMSDUMP DD SYSOUT=*
//SYSIN DD *
  DEFINE CLUSTER ( +
    NAME(your_zFS_dataset_name) +
    STORAGECLASS(class) +
    LINEAR +
    CYL(primary secondary) +
    SHAREOPTIONS(3,3) +
  )
/*
//FORMAT EXEC PGM=IOEAGFMT,REGION=0M,
// PARM=(' -aggregate your_zFS_dataset_name -compat')
//SYSPRINT DD SYSOUT=*
//SYSUDUMP DD SYSOUT=*
//STDOUT DD SYSOUT=*
//STDERR DD SYSOUT=*
//CEEDUMP DD SYSOUT=*
/*
```

- On an HFS, use the following sample:

```
//ALCHFS EXEC PGM=IEFBR14
//CAESD DD DSN=yourHFS_dataset_name,
// DISP=(NEW,CATLG,DELETE),UNIT=3390,
// DSNTYPE=HFS,SPACE=(CYL,(primary,secondary),1)
```

The file system is allocated.

**Note:** Ensure that the zFS or HFS data set name that you use conforms to your data set naming conventions for USS file systems. If the allocation of the file system data set fails, it is because of environmental settings not allowing for the allocation. On an HFS, try using the ISPF 3.2 Data Set Utility to allocate your HFS data set.

2. Create a mount point for the file system. This example shows how to create a /CA/CAESD directory in an existing directory, /u/maint. From the TSO OMVS shell, enter the following commands:

```
cd /u/maint/  
mkdir CA  
cd CA  
mkdir CAESD
```

**Note:** This document refers to this structure as *yourUSSESDdirectory*.

The mount point is created.

3. Mount the file system by customizing one of the following samples to your site's requirements:

- On a zFS, use the following sample:

```
MOUNT FILESYSTEM('your_zFS_dataset_name')  
MOUNTPOINT('yourUSSESDdirectory')  
TYPE(ZFS) MODE(RDWR)  
PARM(AGGRGROW)
```

- On an HFS, use the following sample:

```
MOUNT FILESYSTEM('your_HFS_dataset_name')  
MOUNTPOINT('yourUSSESDdirectory')  
TYPE(HFS) MODE(RDWR)
```

The file system is mounted.

4. (Optional) Set security permissions for the directory. You can use the chmod command to let other users access the ESD directory and its files. For example, to allow write access to the ESD directory for other users in your USS group, from the TSO OMVS shell, enter the following command:

```
chmod -R 775 /yourUSSESDdirectory/
```

Write access is granted.

**Note:** For more information about the chmod command, see the IBM *z/OS UNIX System Services User Guide (SA22-7802)*.

## Copy the Product Pax Files into Your USS Directory

To begin the CA Technologies product installation procedure, copy the product's pax file into the USS directory you set up. Use one of the following methods:

- Download the product pax files directly from the CA Support Online FTP server to your z/OS system.
- Download the product pax file from the CA Support Online FTP server to your PC, and upload it to your z/OS system.
- Download the product file from CA Support Online to your PC. If your download included a zip file, unzip the file, and upload the unzipped pax files to your z/OS system.

This section includes a sample batch job to download a product pax file from the CA Support Online FTP server directly to a USS directory on your z/OS system and sample commands to upload a pax file from your PC to a USS directory on your z/OS system.

**Important!** The FTP procedures vary due to local firewall and other security settings. Consult your local network administrators to determine the appropriate FTP procedure to use at your site.

Ensure that sufficient free space is available in the USS file system you are using for Pax-Enhanced ESD to hold the product pax file. If you do not have sufficient free space, error messages similar to the following appear:

```
EZA1490I Error writing to data set  
EZA2606W File I/O error 133
```

When the download finishes, the pax file size in your USS directory matches the value in the Size column for the corresponding pax file on the CA Technologies Products Download window.

### More Information:

[How the Pax-Enhanced ESD Download Works](#) (see page 33)  
[ESD Product Download Window](#) (see page 33)

## Download Using Batch JCL

Use this process to download a pax file from the CA Support Product Downloads window by running batch JCL on the mainframe. Use the sample JCL attached to the PDF file as CAt>Mainframe.txt to perform the download.

**Important!** To simplify the Pax-Enhanced ESD process, the PDF version of this guide includes a sample JCL job that you can copy directly to the mainframe. To access this job, click the paper clip icon in the lower left corner of the PDF reader. This opens a window displaying attachments. Double-click the file to view the sample JCL.

**Note:** We recommend that you follow the preferred method as described on CA Support Online. This procedure is our preferred download method; however, we do include the procedure to download to the mainframe through a PC in the next section.

### Follow these steps:

1. Supply a valid JOB statement.
2. Replace *yourTCPIP.PROFILE.dataset* with the name of the TCP/IP profile data set for your system. Consult your local network administrators, if necessary.

The job points to your profile.

3. Replace *YourEmailAddress* with your email address.

The job points to your email address.

4. Replace *yourUSSESDdirectory* with the name of the USS directory that you use for ESD downloads.

The job points to your USS directory.

5. Locate the product component to download on the CA Support Product Download window.

You have identified the product component to download.

6. Click Download for the applicable file.

**Note:** For multiple downloads, add files to a cart.

The Download Method window opens.

7. Click FTP Request.

The Review Download Requests window displays any files that you have requested to download.

**Note:** We send you an email when the file is ready to download or a link appears in this window when the file is available.

8. Select one of the following methods:

**Preferred FTP**

Uses CA Technologies worldwide content delivery network (CDN). If you are not able to download using the Preferred FTP method, check the security restrictions for all servers that company employees can download from that are outside of your corporate network.

**Host Name:** ftp://ftpdnloads.ca.com

**Alternate FTP**

Uses the original download servers that are based on Long Island, New York.

**Host Name:** ftp://scftpd.ca.com for product files and download cart files and ftp://ftp.ca.com for individual solution files.

Both methods display the host, user name, password, and FTP location, which you then can copy into the sample JCL.

**Note:** For details regarding FTP, see the FTP Help document link in the Review Download Requests window and the Learn More link available in the Download Methods window.

9. Submit the job.

**Important!** If your FTP commands are incorrect, it is possible for this job to fail and still return a zero condition code. Read the messages in the job DDNAME SYSPRINT to verify the FTP succeeded.

After running the JCL, the pax file resides in the mainframe USS directory that you supplied.

**Example: CAtoMainframe.txt, JCL**

The following text appears in the attached CAtoMainframe.txt JCL file:

```
//GETPAX JOB (ACCOUNTNO),'FTP GET ESD PACKAGE',
//      MSGCLASS=X,CLASS=A,NOTIFY=&SYSUID
//*****
/* This sample job can be used to download a pax file directly from *
/* CA Support Online to a USS directory on your z/OS system.      *
/*                                                                *
/* When editing the JCL ensure that you do not have sequence numbers *
/* turned on.                                                    *
/*                                                                *
/* This job must be customized as follows:                        *
/* 1. Supply a valid JOB statement.                               *
/* 2. The SYSTCPD and SYSFTPD JCL DD's statements in this JCL maybe *
/* optional at your site. Remove the statements that are not    *
/* required. For the required statements, update the data set   *
/* names with the correct site specific data set names.         *
/* 3. Replace "Host" based on the type of download method.      *
/* 4. Replace "YourEmailAddress" with your email address.       *
/* 5. Replace "yourUSSESDdirectory" with the name of the USS    *
/* directory used on your system for ESD downloads.             *
/* 6. Replace "FTP Location" with the complete path              *
/* and name of the pax file obtained from the FTP location     *
/* of the product download page.                                *
//*****
//GETPAX EXEC PGM=FTP,REGION=0K
//SYSTCPD DD DSN=yourTCPIP.PROFILE.dataset,DISP=SHR
//SYSFTPD DD DSN=yourFTP.DATA.dataset,DISP=SHR
//SYSPRINT DD SYSOUT=*
//OUTPUT DD SYSOUT=*
//INPUT DD *
Host
anonymous YourEmailAddress
lcd yourUSSESDdirectory
binary
get FTP location
quit
```

## Download Files to Mainframe through a PC

If you download pax or zip files from CA Support Online to your PC, use this procedure to upload the pax file from your PC to your z/OS USS directory.

### Follow these steps:

1. Follow the procedures in How the Pax-Enhanced ESD Download Works to download the product pax or zip file to your PC. If you download a zip file, first unzip the file to use the product pax files.

The pax or zip file resides on your PC.

2. Open a Windows command prompt.

The command prompt appears.

3. Customize and enter the FTP commands with the following changes:

- a. Replace *mainframe* with the z/OS system's IP address or DNS name.
- b. Replace *userid* with your z/OS user ID.
- c. Replace *password* with your z/OS password.
- d. Replace *C:\PC\folder\for\thePAXfile* with the location of the pax file on your PC.
- e. Replace *yourUSSESDdirectory* with the name of the USS directory that you use for ESD downloads.
- f. Replace *paxfile.pax.Z* with the name of the pax file to upload.

The pax file is transferred to the mainframe.

### Example: FTP Commands

This list is a sample of FTP commands to upload the pax file from your PC to your USS Pax-Enhanced ESD directory:

```
ftp mainframe
userid
password
bin
lcd C:\PC\folder\for\thePAXfile
cd /yourUSSESDdirectory/
put paxfile.pax.Z
quit
exit
```

## Create a Product Directory from the Pax File

Use the sample job attached to the PDF file as `Unpackage.txt` to extract the product pax file into a product installation directory.

**Important!** To simplify the Pax-Enhanced ESD process, the PDF version of this guide includes a sample JCL job that you can copy directly to the mainframe. To access this job, click the paper clip icon in the lower left corner of the PDF reader. This opens a window displaying attachments. Double-click the file to view the sample JCL.

### Follow these steps:

1. Supply a valid JOB statement.
2. Replace *yourUSSESDdirectory* with the name of the USS directory that you use for ESD downloads.

The job points to your specific directory.

3. Replace *paxfile.pax.Z* with the name of the pax file.

The job points to your specific pax file.

4. Submit the job.

The job runs and creates the product directory.

**Note:** After making the changes noted in the job, if the `PARM=` statement exceeds 71 characters, uncomment and use the second form of `UNPAXDIR` instead. This sample job uses an X in column 72 to continue the `PARM=` parameters to a second line.

## Sample Job to Execute the Pax Command (Unpackage.txt)

The following text appears in the attached Unpackage.txt JCL file:

```
//ESDUNPAX JOB (ACCOUNTNO),'UNPAX ESD PACKAGE ',
// MSGCLASS=X,CLASS=A,NOTIFY=&SYSUID
//*****
//* This sample job can be used to invoke the pax command to create  *
//* the product-specific installation directory.                      *
//*                                                                    *
//* This job must be customized as follows:                          *
//* 1. Supply a valid JOB statement.                                  *
//* 2. Replace "yourUSSESDdirectory" with the name of the USS        *
//*    directory used on your system for ESD downloads.              *
//* 3. Replace "paxfile.pax.Z" with the name of the pax file.       *
//* NOTE: If you continue the PARM= statement on a second line, make *
//*    sure the 'X' continuation character is in column 72.         *
//*****
//UNPAXDIR EXEC PGM=BPXBATCH,
// PARM='sh cd /yourUSSESDdirectory/; pax -rvf paxfile.pax.Z'
//*UNPAXDIR EXEC PGM=BPXBATCH,
//* PARM='sh cd /yourUSSESDdirectory/; pax                            X
//*          -rvf paxfile.pax.Z'
//STDOUT DD SYSOUT=*
//STDERR DD SYSOUT=*
```

## Copy Installation Files to z/OS Data Sets

Use this procedure to invoke the SMP/E GIMUNZIP utility to create MVS data sets from the files in the product-specific directory.

### Follow these steps:

1. Locate and read the product readme file or installation notes, if applicable, which resides in the product-specific directory that the pax command created. This file contains product-specific details you need to complete the installation procedure.

You have identified product-specific installation details.

2. Use ISPF EDIT or TSO ISHELL to edit the UNZIPJCL sample job. You can perform this step in one of the following ways:
  - Use ISPF EDIT. Specify the full path name of the UNZIPJCL file.
  - Use TSO ISHELL. Navigate to the UNZIPJCL file and use the E line command to edit the file.

The job is edited.

3. Change the SMPDIR DD PATH to the product-specific directory created by the pax command.

Your view is of the product-specific directory.

4. If ICSF is not active, perform the following steps:
  - a. Change the SMPJHOME DD PATH to your Java runtime directory. This directory varies from system to system.
  - b. Perform one of the following steps:
    - Change the SMPCPATH DD PATH to your SMP/E Java application classes directory, usually /usr/lpp/smp/classes/.
    - Change HASH=YES to HASH=NO on the GIMUNZIP parameter.

One of the following occurs: ICSF is active or you are using Java.

5. Change all occurrences of *YourHLQ* to the high-level qualifier (HLQ) for z/OS data sets used by the installation process. We suggest that you use a unique HLQ for each expanded pax file to uniquely identify the package. Do not use the same value for *yourHLQ* as you will use for the SMP/E RELFILES.

All occurrences of *YourHLQ* are set to your high-level qualifier for z/OS data sets.

6. Submit the UNZIPJCL job.

The UNZIPJCL job completes with a zero return code. Messages GIM69158I and GIM48101I in the output and IKJ56228I in the JES log are acceptable.

GIMUNZIP creates z/OS data sets with the high-level qualifier you specified in the UNZIPJCL job. You use these data sets to perform the product installation. The pax file and product-specific directory are no longer needed at this point.

**Note:** For more information, see the IBM Reference Manual, *SMP/E for z/OS Reference (SA22-7772)*.

## Install Utility

The Install Utility guides the installation. The Install Utility installs the product into an IBM System Modification Program Extended (SMP/E) environment. The utility collects your site-specific values such as data set prefixes, DASD volume serial numbers, and JCL parameter values. It then uses these values to generate the jobs necessary to perform the installation of your product.

## Unload the Install Utility

The installation utility software lets you generate and run the JCL required to install your product. The installation utility software is delivered electronically with ESD.

The installation software unloads into the *dsnpref.CAI.OPB9.CC2DJCL* data set; *dsnpref* is a prefix you specify for your product data sets.

After you unzip the data sets, do *one* of the following:

- Rename *dsnpref.CAI.OPB9.CC2DJCL* to *dsnpref.OPB9.CC2DJCL*
- Copy the members in *dsnpref.CAI.OPB9.CC2DJCL* into *dsnpref.OPB9.CC2DJCL*

## Installation JCL

The installation process creates the *dsnpref.OPB9.INSTDB* database to store details of each installation that you perform. If you are also installing other products in the CA SOLVE:Operations Automation family of products, this database manages those installations. These details include the products you install and the installation values that you specify.

**Note:** During this task, the INSTALLATION JCL Library Creation panel lets you specify your installation JCL library. The default library name is *dsnpref.OPB9.INSTALL.JCL*, where *dsnpref* is the same data set prefix you used for the *dsnpref.OPB9.CC2DJCL* data set.

If your installation JCL library exists, do *one* of the following:

- Specify a new data set name at that panel.
- Delete the existing library by issuing a TSO DELETE command.

**Note:** If you leave the Install Utility at any stage, you can return to it from the ISPF/PDF TSO Command Shell prompt. Execute the following command:

```
EXEC 'dsnpref.OPB9.CC2DJCL(INSTALL)'
```

## Additional Features

The Install Utility provides an option to install SSL support.

## Generate the Installation JCL

During the installation process, you provide the [site-specific installation information that you previously collected](#) (see page 133). This information is used to generate the installation JCL.

### Follow these steps:

1. At the ISPF/PDF TSO Command Shell prompt, execute the following command:

```
EXEC 'dsnpref.0PB9.CC2DJCL(INSTALL)'
```

The Install Utility panel appears.

**Note:** On each of the Install Utility panels, you can use the following keys:

- Enter to proceed to the next panel
- F1 to display online help
- F3 to return to the previous panel
- F4 to exit and return to the main menu

2. Press Enter.

The Install Utility Primary Menu panel appears.

3. Enter **1** (Set Installation Parameters).

The Software Delivery Method panel appears.

4. Complete each of the panels as they open. Press Enter at the completion of each panel.

You must complete all five parameter panels before you can install the product. You can take the default options or specify site-specific values.

**Note:** For information about the fields, press F1 (Help).

5. Enter **2** (Install Products).

The INSTALLATION Primary Menu panel appears.

6. Enter **1** (Select Products to Install).

The INSTALLATION Product Selection panel appears with previously installed products unavailable.

7. Enter **S** next to the product name and press Enter.

The INSTALLATION Product Confirmation panel appears, confirming your selections.

If you have already installed another product in the product family, the INSTALLATION Components Already Installed panel appears, confirming your selections.

**Note:** You can enter S next to multiple products to install multiple products at one time. You must be licensed for any products you install.

8. Press Enter to confirm your selection, and complete each of the INSTALLATION panels as they open.

You must complete all the panels before you can set up your regions. You can take the default options or specify site-specific values.

9. Record the data set name into which the JCL was generated in your [post-installation worksheet](#) (see page 143).

You can submit the jobs from the panel or directly from this data set after exiting the panel.

10. Submit and run the following installation jobs in sequence. Do not proceed with any job until the previous job has completed successfully.

**I01ALLOC**

Allocates the data sets.

The I01ALLOC member allocates CC2DLOAD as a load library of the PDS type. Do not change it to a PDS/E type because the type is not supported.

**I02INSMP**

Initializes the SMP/E data sets.

**I03RCSMP**

Performs an SMP/E RECEIVE.

**I04AKSMP**

Performs an SMP/E APPLY CHECK. This job is listed only if maintenance exists for previously installed products.

**I05RSSMP**

Performs an SMP/E RESTORE. This job is listed only if maintenance exists for previously installed products.

**I06APSMP**

Performs an SMP/E APPLY.

**I07ACSMP**

Performs an SMP/E ACCEPT.

11. If you selected SSL Support as an additional feature to install, the following jobs are also generated. Submit and run them in sequence as for the previous jobs.

- I21ALLME
- I22INIME
- I23RECME
- I26APPME
- I27ACCME

**Notes:**

- If you installed and set up your regions without SSL support, and then later install SSL support, add the installed *dsnpref.OPB9.CC2DPLD* data set to the region's STEPLIB or in the system LNKLST.
- You must have SMP/E V3R5.0 to implement SSL.

12. Press F3.

You are returned to the Primary Menu panel.

## Clean Up the USS Directory

**Important!** This procedure is optional. Do not use this procedure until you complete the entire installation process.

To free file system disk space for subsequent downloads after downloading and processing the pax files for your CA Technologies product, we recommend removing the files from your USS directory and deleting unnecessary MVS data sets. You can delete the following items:

- Pax file
- Product-specific directory created by the pax command and all of the files in it
- SMP/E RELFILEs, SMPMCS, and HOLDDATA MVS data sets

These data sets have the HLQ that you assigned in the UNZIPJCL job.

**Note:** Retain non-SMP/E installation data sets such as *yourhlq*.INSTALL.NOTES for future reference.

**Follow these steps:**

1. Navigate to your Pax-Enhanced ESD USS directory.

Your view is of the applicable USS directory.

2. Delete the pax file by entering the following command:

```
rm paxfile
```

***paxfile***

Specifies the name of the CA Technologies pax file that you downloaded.

The pax file is deleted.

3. Delete the product-specific directory by entering the following command:

```
rm -r product-specific-directory
```

***product-specific-directory***

Specifies the product-specific directory created by the pax command.

The product-specific directory is deleted.

**Note:** You can also use TSO ISHELL to navigate to the pax file and product-specific directory, and delete them using the D line command.

## Maintenance

Maintenance includes program temporary fixes (PTFs) that supersede all authorized program analysis reports (APARs) that were created up to that time. Details of the superseded APARs are available as comments within the PTFs.

## Product Maintenance

**Important!** The *dsnpref.OPB9.CC2DLINK* data set must be in your system LNKLIST before you start maintenance. You can also create a STEPLIB to the data set name (DSN) in your TSOPROC (that is, allocate it to ISPLLIB). If you installed the product using CA MSM, you must use CA MSM to apply maintenance.

Product maintenance is provided as system modification program (SMP) fixes. The fixes consist of PTFs applied using the IBM System Modification Program Extended (SMP/E) tool.

**Note:** If an installed SMP fix contains maintenance for the VSAM data sets, you must update those data sets for each region you have set up.

RAMDB maintenance is provided as SMP/E PTFs. However, this is only the delivery and recordkeeping methodology. You must apply the maintenance using \$RMDB04D.

---

## Apply Maintenance

This section describes how to apply individual SMP fixes using the Install Utility.

**Note:** Individual SMP fixes are only available from the [CA Technical Support site](#) (see page 4).

When you receive SMP fixes, unload them into one of the following:

- A sequential data set
- A member of a partitioned data set

Multiple SMP fixes can be appended into a single data set or member.

**Follow these steps:**

1. Access the ISPF/PDF Primary Menu.
2. Select the COMMAND option.  
The ISPF Command Shell panel appears.
3. At the command prompt, enter the following command:  

```
EXEC 'dsnpref.0PB9.CC2DJCL(INSTALL)'
```
4. At the Install Utility title panel, press Enter.  
The Install Utility Primary Menu panel appears.
5. At the Install Utility Primary Menu panel, enter **8** (Maintain Products).  
The MAINTENANCE Primary Menu panel appears.
6. Enter **3** (Apply individual SMP fixes from a DASD data set).  
The MAINTENANCE DASD Fixes Dataset Name panel appears.
7. Enter the data set name that contains the SMP fixes to be applied and press Enter.
8. Complete the fields on the following MAINTENANCE panels as they open.

9. At the MAINTENANCE JCL Library Creation panel, review your fix JCL library.

The default library name is:

*dsnpref*.0PB9.FIX.DASD.JCL

***dsnpref***

The same data set prefix you used for the *dsnpref*.0PB9.CC2DJCL data set.

**Note:** Each time you apply maintenance, use a new output data set. A new data set ensures that the only jobs in your maintenance JCL library are the jobs required for the maintenance you are installing now. To use a new data set:

- Delete the library by issuing a TSO DELETE command and the library name, at the command prompt.
- Specify a new data set name.

10. Press Enter to proceed with the generation of the maintenance JCL.

When the JCL generation is complete, a list of generated jobs and a description of what each member does appears.

11. Note the name of the data set into which the JCL was generated.

12. Submit and run the following jobs in sequence. Do not proceed with any job until the previous job has completed successfully.

Each job must complete with return code 0 unless otherwise indicated.

**Important!** If there is maintenance for additional features, the SMP/E apply job must be run on a system that has the z/OS UNIX file system used during installation and mounted for read/write access.

**F11RCSMP**

SMP/E receives maintenance and lists existing HOLDDATA and SOURCEIDs that are already applied. If a job step returns condition code 04, there is no HOLDDATA present.

Review the information. For any held APARs that you want to apply, add the correct BYPASS HOLDx operands to the corresponding APPLY control statement for those APARs. Add the operands by manually editing the F12APSMP job that contains the SMP control statements.

**Note:** For information about the BYPASS HOLDx operands, see IBM's *SMP/E Commands* guide.

**F12APSMP**

SMP/E applies maintenance.

13. Press F3.

The Install Utility Primary Menu panel appears.

If the fix contains maintenance for VSAM data sets (as indicated by HOLDDATA), continue with the procedure to update the VSAM data sets for the regions you have set up. Otherwise, you have finished applying the fix.

## HOLDDATA

When you apply maintenance, you typically encounter SMP/E HOLDDATA. We use HOLDDATA to notify your SMP/E system of SYSMODs that have errors or special conditions. We support system and external HOLDDATA.

## System HOLDDATA

System HOLDDATA indicates data that is an in-stream part of the SYSMOD, informing you of special conditions. The following reasons are used with SYSTEM HOLDDATA for CA SOLVE:Operations Automation:

### **ACTION**

Indicates that you must perform special processing before or after you apply this SYSMOD.

### **AO**

Affects automated operations. It changes either the message identifier or the displacement of a field inside the message.

### **DB2BIND**

Indicates that DBRMs have changed and packages need to be rebound.

### **DDDEF**

Indicates that data sets and DDDEFs are being added or modified.

### **DELETE**

Deletes the SYSMOD load module. You cannot reverse this type of SYSMOD with the SMP/E RESTORE command.

### **DEP**

Indicates a dependency for this SYSMOD that you must externally verify.

### **DOC**

Indicates a documentation change with this SYSMOD.

### **SYSMOD**

Indicates that some or all of the elements delivered by this SYSMOD are to be downloaded to a workstation.

**DYNACT**

Describes the steps to dynamically activate this fix without performing an IPL.

**ENH**

Introduces a small programming enhancement. The hold contains the instructions to implement the enhancement. If no action is needed to implement the enhancement, give a summary of the enhancement.

**EXIT**

Indicates that changes delivered by this SYSMOD require reassembly of user exits.

**EXRF**

Indicates that the SYSMOD must be installed in both the Active and Alternate Extended Recovery Facility Systems.

**MULTSYS**

Apply this SYSMOD to multiple systems for either pre-conditioning, coexistence, or exploitation.

**RESTART**

Indicates that after applying this SYSMOD, the site must perform a special restart as opposed to a routine restart.

Code a bypass operand on your APPLY command to install SYSMODs that have internal holds. Code the bypass operand only after you have performed the required action, or if you are performing the action after the APPLY, if that is appropriate.

## External HOLDDATA

External HOLDDATA is not part of the PTF. It resides in a separate file. It is commonly used for SYSMODs that have been distributed and later are discovered to cause problems.

Download the external HOLDDATA from CA Support to a DASD file, and allocate the file to the SMPHOLD DD statement. To take care of the external HOLDDATA, receive it into your SMP/E environment. SMP/E receives the HOLDDATA from CA-supplied jobs.

If a SYSMOD has an unresolved hold error, SMP/E does not install it unless you add a bypass to your APPLY command. You can bypass an error hold in situations that are not applicable to you. Error holds that are not applicable to you can include a problem that happens only with a hardware device that you do not have or in a product feature that you do not use.

When CA publishes a SYSMOD that resolves the hold, the resolving SYSMOD supersedes the hold error. This action lets you apply the original SYSMOD in conjunction with the fixing SYSMOD.

A special HOLDDATA class called ERREL exists. We have determined that the problem fixed by the SYSMOD is more important than the one that it causes. We recommend that you apply these SYSMODs.

The only manual task is running a REPORT ERRSYSMODS. This report identifies the following:

- Any held SYSMODs already applied to your system.
- Any resolving SYSMODs that are in RECEIVE status.

SMP/E identifies the SYSMOD to apply to correct the situation.

## Update VSAM Data Sets

If an installed SMP fix contains maintenance for the VSAM data sets, maintenance option V of the Install Utility becomes available. To complete maintenance, select the option to update the data sets for the regions you have set up.

### Follow these steps:

1. Access the ISPF/PDF Primary Menu, and select the COMMAND option.  
The ISPF Command Shell panel appears.
2. At the command prompt, execute the following command:  

```
EXEC 'dsnpref.0PB9.CC2DJCL(INSTALL)'
```

  
The Install Utility title panel appears.
3. Press Enter.  
The Install Utility Primary Menu panel appears.
4. Enter **8** (Maintain Products).  
The MAINTENANCE Primary Menu panel appears.

5. Enter **V** (Update MODS, PANELS, OSCNTL and NETINFO data sets with installed maintenance).

The MAINTENANCE Shared Region Data Sets panel appears.

6. Review the information, and press Enter.
7. At the MAINTENANCE JOBCARD Information panel, specify your JOBCARD details and press Enter.
8. At the MAINTENANCE JCL Library Creation panel, review your fix JCL library. The default library name is:

*dsnpref.OPB9.FIX.VSAMUPD.JCL*

***dsnpref***

The same data set prefix used for the *dsnpref.OPB9.CC2DJCL* data set.

**Note:** Each time you apply maintenance, use a new output data set. The new data set helps ensure that the only jobs in your maintenance JCL library are the jobs required for the maintenance you are installing. To use a new data set, take *one* of the following actions:

- Delete the library by issuing a TSO DELETE command and the library name, at the command prompt.
- Specify a new data set name.

9. Press Enter to proceed with the generation of the maintenance JCL.
10. Submit and run the job F21RFRSH to update the VSAM data sets.

**Note:** The utility also generates the following jobs: F22DUMP and F23REST. If a shared DASD is not available, the jobs help you deploy those updates to a target system. The F22DUMP job creates backup data set that include the updated VSAM data sets, which you deploy to the target system. This backup data set is *dsnpref.DFDSS.SHARED*. The F23REST job, when submitted on the target system, restores the updated VSAM data sets from the backup data sets.

11. Press F3.

The Install Utility Primary Menu panel appears.

12. Press F4 to exit the Install Utility Primary Menu panel and return to the ISPF Command Shell panel, or continue with the other options.

## Individual RAMDB Maintenance

**Note:** Individual RAMDB maintenance is also available from the [CA Technical Support site](#) (see page 4).

This section describes how to apply maintenance to the RAMDB and details the command syntax of the \$RAMDB04D maintenance utility. You apply this maintenance in an active region.

**Important!** The RAMDB data set must not be updated with individual replacement records using the IDCAMS REPRO command.

You use `$RMDB04D OPT=APPLY` (see page 61) to apply maintenance. When applying maintenance, you can use the DIFF operand to display details of what differences are being added, replaced, or deleted by the maintenance.

## Create Backup RAMDB

As a safety precaution, create a backup of your RAMDB (herein referred to RAMDBd) before applying maintenance.

### Follow these steps:

1. Allocate RAMDBd in the same way that RAMDB was allocated.  
The cluster definition is in `dsnpref.OPB9.rname.JCL(S01LCALC)`.
2. Stop the product region.
3. Copy the data from RAMDB to RAMDBd using IDCAMS REPRO command.  
**Note:** For information, see the example in `dsnpref.OPB9.rname.JCL(S04LDVSM)`.
4. Restart the product region.

## Apply Maintenance to RAMDB

You can apply maintenance directly to your RAMDB. The maintenance can then propagate to all connected regions, if any. If necessary, you can restore the maintenance using your RAMDBd as input (if the maintenance has not yet been applied to RAMDBd).

### Follow these steps:

1. Log on to your product region and enter CMD.  
The command entry panel appears.
2. Apply-check the RAMDB fix by entering the following command:

```
$RMDB04D OPT=APPLY FIX=fix-name CHECK=YES
```

#### *fix\_name*

Is RAM@UPDT for published solutions or TZ*dddd* for test fixes.

When the APPLY CHECK finishes, a report appears. The report shows whether an APPLY of the fix will be successful, and also exactly what changes will result from the APPLY.

**Note:** Perform this step for the following reasons:

- To see what happens if a fix is applied to a RAMDB
- To see whether a fix has been applied to a RAMDB

3. Apply the RAMDB fix by entering the following command:

```
$RMDB04D OPT=APPLY FIX=fix_name
```

**Note:** If a RAMDB fix does not apply correctly or if you want to restore a fix, [restore the RAMDB maintenance](#) (see page 60).

## Restore RAMDB Maintenance

**Note:** This step is optional.

The RESTORE option can be used to remove an applied fix from the RAMDB by using RAMDBd as input. The fix is effectively reversed, that is, any added objects are deleted and any deleted or replaced objects are copied from RAMDBd back to the RAMDB.

To restore the fix, enter the following command:

```
$RMDB04D OPT=RESTORE FIX=fix_name DDBDSN=?RAMDBd-dataset-name DDB=?RAMDBd
```

**?*RAMDBd***

Specifies the ddname for the backup RAMDB.

**?*RAMDBd-dataset-name***

Specifies the full data set name of the backup RAMDB.

## RAMDB Maintenance Utility Syntax

This section describes the syntax of the RAMDB maintenance utility.

## \$RMDB04D OPT=APPLY

Use this procedure to apply a fix to a RAMDB or check a fix against a RAMDB.

This procedure has the following format:

```
$RMDB04D OPT=APPLY
      FIX=fix-number
      [DDNAME=ddname | DATASET=dataset-name]
      [CHECK={NO | YES}]
      [DIFF={YES | NO}]
      [FORCE={NO | YES}]
      [CONFIRM={YES | NO}]
      [DB=file-id [DBDSN=db-dataset-name]]
```

### **OPT=APPLY**

Specifies that a fix is being applied to a RAMDB.

### **FIX=*fix-number***

Specifies the fix number. This number is used as the member name of the input partitioned data set.

### **[DDNAME=*ddname* | DATASET=*dataset-name*]**

Specifies the DDNAME parameter if the data set containing the fix is already allocated to the system, or the DATASET parameter if the data set containing the fix is to be allocated and freed after the fix has been retrieved. These two parameters are mutually exclusive and, therefore, you cannot specify both of them. If neither is specified, the COMMANDS DD concatenation in the region is used.

### **[CHECK={NO | YES}]**

Specifies whether the fix is checked. If you specify YES, the fix is checked only for compatibility with the database and is not applied to the database. The check phase is always performed regardless of the value specified. However, this parameter determines whether the check phase is the only phase to be performed.

### **[DIFF={YES | NO}]**

Specifies whether differences are displayed. If you specify YES (the default), the differences between the target objects and the new objects contained in the fix are displayed for each updated object. This applies to any SET (update) and CREATE (add) actions in the fix member where the target objects already exist.

### **[FORCE={NO | YES}]**

Specifies whether the fix is applied regardless of the success or failure of the check phase. However, if CHECK=YES is specified, the FORCE parameter has no effect.

**[CONFIRM={YES | NO}]**

Specifies whether the fix is retrieved and the syntax checked before being presented as a panel for browsing. The panel enables you to view the fix and confirm the application. After you confirm, the fix is applied, and the message log displays another panel for browsing. If you specify NO, the fix is applied without presenting any confirmation panel and the message log is written to the terminal rather than being displayed as a panel.

The message log is always written to the activity log regardless of the options specified.

**[DB=*file-id* [DBDSN=*db-dataset-name*]]**

Specifies the DB parameter to apply the fix to a database other than the currently allocated RAMDB. This parameter specifies the file ID of the target database. If you also specify the DBDSN parameter, the specified data set is allocated a ddname that is the same as the specified file ID, and is opened and started. The database is not freed after the fix is applied. If the database is already allocated, the specified data set name is verified as allocated to the ddname (that is the same as the specified file ID) and opened to the same file ID.

**\$RMDB04D OPT=RESTORE**

Use this procedure to reverse the effect of a fix.

This procedure has the following format:

```
$RMDB04D OPT=RESTORE
      FIX=fix-number
      [DDNAME=ddname | DATASET=dataset-name]
      [CONFIRM={YES | NO}]
      [TDB=target-file-id [TDBDSN=target-dataset-name]]
      [DDB=source-file-id [DDBDSN=source-dataset-name]]
```

**OPT=RESTORE**

Specifies that a fix, which has been applied to the target RAMDB, is being reversed.

**FIX= *fix-number***

Specifies the fix number to back out of the RAMDB. This number is used as the member name of the fix data set and is verified against the contents of the member for the correct fix.

**[DDNAME=*ddname* | DATASET=*dataset-name*]**

Specifies the DDNAME parameter if the data set containing the fix is already allocated to the system, or the DATASET parameter if the data set containing the fix is to be allocated and freed after the fix has been retrieved. These two parameters are mutually exclusive and, therefore, you cannot specify both of them. If neither is specified, the COMMANDS DD concatenation in the region is used.

**[CONFIRM={YES | NO}]**

Specifies whether the fix is retrieved and the syntax checked before being presented as a panel for browsing. The panel lets you view the fix and confirm the restoration process. After you confirm, the fix is removed and the original data restored. The message log is presented as another panel for browsing. If you specify NO, the restoration process proceeds without presenting any confirmation panel, and the message log is written to the terminal rather than being displayed as a panel.

The message log is always written to the activity log regardless of the options specified.

**[TDB=*target-file-id* [TDBDSN=*target-dataset-name*]]**

Reverses a fix in a database other than the currently allocated RAMDB. This parameter specifies the file ID of the target database. If you also specify the TDBDSN parameter, the specified data set is allocated a ddname that is the same as the specified file ID, and is opened and started. The database is not freed after the restoration process. If the database is already allocated, the specified data set name is verified as allocated to the ddname (that is the same as the specified file ID) and opened to the same file ID.

**[DDB=*source-file-id* [DDBDSN=*source-dataset-name*]]**

Specifies the file ID of the source database.

**Note:** Restoration requires the specification of the distribution (source) database through the DDB parameter.

The source database must be a copy of the original database. If you also specify the DDBDSN parameter, the specified data set is allocated a ddname that is the same as the specified file ID, and is opened and started. The database is not freed after the restoration process. If the database is already allocated, the specified data set name is verified as allocated to the ddname (that is the same as the specified file ID) and opened to the same file ID.

# Chapter 5: Installing Your Product from Tape

---

This section contains the following topics:

[Install Utility](#) (see page 65)

[Unload the Install Utility](#) (see page 65)

[Installation JCL](#) (see page 68)

[Maintenance](#) (see page 71)

**Note:** When you have completed the procedures in this section, go to Configuring Your Product.

## Install Utility

The Install Utility guides the installation. The Install Utility installs the product into an IBM System Modification Program Extended (SMP/E) environment. The utility collects your site-specific values such as data set prefixes, DASD volume serial numbers, and JCL parameter values. It then uses these values to generate the jobs necessary to perform the installation of your product.

## Unload the Install Utility

The installation utility software lets you generate and run the JCL required to install your product. The installation utility software is delivered on tape.

The installation software unloads into the *dsnpref.OPB9.CC2DJCL* data set; *dsnpref* is a prefix you specify for your product data sets.

To unload the install utility, do *one* of the following:

- If *dsnpref.OPB9.CC2DJCL* does not exist and you are installing from tape, [unload into a new data set from tape](#) (see page 66).
- If *dsnpref.OPB9.CC2DJCL* exists from a previous installation and you are installing from tape at the current release level, [unload into an existing data set from tape](#) (see page 67).

## Unload into a New Data Set from Tape

If *dsnpref.OPB9.CC2DJCL* does not exist and you are installing from tape, you must unload the installation software from tape on to your DASD and into a new data set.

### Follow these steps:

1. Create an unload job by copying the following JCL:

```
//jobname JOB .....
//STEP1 EXEC PGM=IEBCOPY
//SYSPRINT DD SYSOUT=*
//SYSUT1 DD DSN=CAI.SAMPJCL,
//          DISP=OLD,UNIT=?device-in,VOL=SER=?tapeser,
//          LABEL=(1,SL,EXPDT=98000)
//SYSUT2 DD DSN=?dsnpref.OPB9.CC2DJCL,
//          DISP=(NEW,CATLG,DELETE),
//          UNIT=?device-out,VOL=SER=?volser,
//          SPACE=(CYL,(10,1,120)),
//          DCB=(RECFM=FB,LRECL=80,BLKSIZE=0)
//SYSIN DD DUMMY
```

**Important!** The *SYSUT2* data set name must end with *OPB9.CC2DJCL*.

2. Replace the statements prefixed with a question mark (?) with your own values as follows:

#### **?device-in**

Specifies the tape drive unit to mount the tape.

#### **?tapeser**

Specifies the tape volume serial number in the form C2D71x. The value for this release is C2D710.

#### **?dsnpref**

Specifies the data set prefix that will be used for the installation, maintenance, and Install Utility data sets. Do not include the name of your planned product region in the prefix; *?dsnpref* can be up to 29 characters long. If the data set high level qualifiers you are using do not exist, define an alias entry in the master catalog.

#### **?device-out**

Specifies the type of the DASD device where you want to place the installation software.

#### **?volser**

Specifies the volume serial number of the DASD.

If allocation is controlled by SMS, replace *UNIT=* and *VOL=SER=* with *STORCLAS=?storclass*.

3. Submit and run the job.
4. Check that the job successfully completed.

## Unload into an Existing Data Set from Tape

If *dsnpref.OPB9.CC2DJCL* exists from a previous installation at the current release level, unload the installation software from tape into the existing data set.

### Follow these steps:

1. Create an unload job by copying the following JCL:

```
//jobname JOB .....
//STEP1 EXEC PGM=IEBCOPY
//SYSPRINT DD SYSOUT=*
//SYSUT1 DD DSN=CAI.SAMPJCL,
//          DISP=OLD,UNIT=?device-in,VOL=SER=?tapeser,
//          LABEL=(1,SL,EXPDT=98000)
//SYSUT2 DD DSN=?dsnpref.OPB9.CC2DJCL,
//          DISP=OLD
//SYSIN DD *
COPY I=((SYSUT1,R)),0=SYSUT2
COPY I=((SYSUT2,R)),0=SYSUT2
/*
```

2. Replace the statements prefixed with a question mark (?) with your own values as follows:

#### **?device-in**

Specifies the tape drive unit to mount the tape.

#### **?tapeser**

Specifies the tape volume serial number in the form C2D71x. The value for this release is C2D710.

#### **?dsnpref**

Specifies the data set prefix in the previous installation.

3. Submit and run the job.
4. Verify that the job successfully completed.

## Installation JCL

The installation process creates the *dsnpref.OPB9.INSTDB* database to store details of each installation that you perform. If you are also installing other products in the CA SOLVE:Operations Automation family of products, this database manages those installations. These details include the products you install and the installation values that you specify.

**Note:** During this task, the INSTALLATION JCL Library Creation panel lets you specify your installation JCL library. The default library name is *dsnpref.OPB9.INSTALL.JCL*, where *dsnpref* is the same data set prefix you used for the *dsnpref.OPB9.CC2DJCL* data set.

If your installation JCL library exists, do *one* of the following:

- Specify a new data set name at that panel.
- Delete the existing library by issuing a TSO DELETE command.

**Note:** If you leave the Install Utility at any stage, you can return to it from the ISPF/PDF TSO Command Shell prompt. Execute the following command:

```
EXEC 'dsnpref.OPB9.CC2DJCL(INSTALL)'
```

## Additional Features

The Install Utility provides an option to install SSL support.

## Generate the Installation JCL

During the installation process, you provide the [site-specific installation information that you previously collected](#) (see page 133). This information is used to generate the installation JCL.

### Follow these steps:

1. At the ISPF/PDF TSO Command Shell prompt, execute the following command:

```
EXEC 'dsnpref.0PB9.CC2DJCL(INSTALL)'
```

The Install Utility panel appears.

**Note:** On each of the Install Utility panels, you can use the following keys:

- Enter to proceed to the next panel
- F1 to display online help
- F3 to return to the previous panel
- F4 to exit and return to the main menu

2. Press Enter.

The Install Utility Primary Menu panel appears.

3. Enter **1** (Set Installation Parameters).

The Software Delivery Method panel appears.

4. Complete each of the panels as they open. Press Enter at the completion of each panel.

You must complete all five parameter panels before you can install the product. You can take the default options or specify site-specific values.

**Note:** For information about the fields, press F1 (Help).

5. Enter **2** (Install Products).

The INSTALLATION Primary Menu panel appears.

6. Enter **1** (Select Products to Install).

The INSTALLATION Product Selection panel appears with previously installed products unavailable.

7. Enter **S** next to the product name and press Enter.

The INSTALLATION Product Confirmation panel appears, confirming your selections.

If you have already installed another product in the product family, the INSTALLATION Components Already Installed panel appears, confirming your selections.

**Note:** You can enter S next to multiple products to install multiple products at one time. You must be licensed for any products you install.

8. Press Enter to confirm your selection, and complete each of the INSTALLATION panels as they open.

You must complete all the panels before you can set up your regions. You can take the default options or specify site-specific values.

9. Record the data set name into which the JCL was generated in your [post-installation worksheet](#) (see page 143).

You can submit the jobs from the panel or directly from this data set after exiting the panel.

10. Submit and run the following installation jobs in sequence. Do not proceed with any job until the previous job has completed successfully.

**I01ALLOC**

Allocates the data sets.

The I01ALLOC member allocates CC2DLOAD as a load library of the PDS type. Do not change it to a PDS/E type because the type is not supported.

**I02INSMP**

Initializes the SMP/E data sets.

**I03RCSMP**

Performs an SMP/E RECEIVE.

**I04AKSMP**

Performs an SMP/E APPLY CHECK. This job is listed only if maintenance exists for previously installed products.

**I05RSSMP**

Performs an SMP/E RESTORE. This job is listed only if maintenance exists for previously installed products.

**I06APSMP**

Performs an SMP/E APPLY.

**I07ACSMP**

Performs an SMP/E ACCEPT.

11. If you selected SSL Support as an additional feature to install, the following jobs are also generated. Submit and run them in sequence as for the previous jobs.

- I21ALLME
- I22INIME
- I23RECME
- I26APPME
- I27ACCME

**Notes:**

- If you installed and set up your regions without SSL support, and then later install SSL support, add the installed *dsnpref.OPB9.CC2DPLD* data set to the region's STEPLIB or in the system LNKLST.
- You must have SMP/E V3R5.0 to implement SSL.

12. Press F3.

You are returned to the Primary Menu panel.

## Maintenance

Maintenance includes program temporary fixes (PTFs) that supersede all authorized program analysis reports (APARs) that were created up to that time. Details of the superseded APARs are available as comments within the PTFs.

### Product Maintenance

**Important!** The *dsnpref.OPB9.CC2DLINK* data set must be in your system LNKLST before you start maintenance. You can also create a STEPLIB to the data set name (DSN) in your TSOPROC (that is, allocate it to ISPLLIB). If you installed the product using CA MSM, you must use CA MSM to apply maintenance.

Product maintenance is provided as system modification program (SMP) fixes. The fixes consist of PTFs applied using the IBM System Modification Program Extended (SMP/E) tool.

**Note:** If an installed SMP fix contains maintenance for the VSAM data sets, you must update those data sets for each region you have set up.

RAMDB maintenance is provided as SMP/E PTFs. However, this is only the delivery and recordkeeping methodology. You must apply the maintenance using \$RMDB04D.

## Apply Maintenance

This section describes how to apply individual SMP fixes using the Install Utility.

**Note:** Individual SMP fixes are only available from the [CA Technical Support site](#) (see page 4).

When you receive SMP fixes, unload them into one of the following:

- A sequential data set
- A member of a partitioned data set

Multiple SMP fixes can be appended into a single data set or member.

**Follow these steps:**

1. Access the ISPF/PDF Primary Menu.
2. Select the COMMAND option.  
The ISPF Command Shell panel appears.
3. At the command prompt, enter the following command:  

```
EXEC 'dsnpref.0PB9.CC2DJCL(INSTALL)'
```
4. At the Install Utility title panel, press Enter.  
The Install Utility Primary Menu panel appears.
5. At the Install Utility Primary Menu panel, enter **8** (Maintain Products).  
The MAINTENANCE Primary Menu panel appears.
6. Enter **3** (Apply individual SMP fixes from a DASD data set).  
The MAINTENANCE DASD Fixes Dataset Name panel appears.
7. Enter the data set name that contains the SMP fixes to be applied and press Enter.
8. Complete the fields on the following MAINTENANCE panels as they open.

- At the MAINTENANCE JCL Library Creation panel, review your fix JCL library.

The default library name is:

*dsnpref*.0PB9.FIX.DASD.JCL

### ***dsnpref***

The same data set prefix you used for the *dsnpref*.0PB9.CC2DJCL data set.

**Note:** Each time you apply maintenance, use a new output data set. A new data set ensures that the only jobs in your maintenance JCL library are the jobs required for the maintenance you are installing now. To use a new data set:

- Delete the library by issuing a TSO DELETE command and the library name, at the command prompt.
- Specify a new data set name.

- Press Enter to proceed with the generation of the maintenance JCL.

When the JCL generation is complete, a list of generated jobs and a description of what each member does appears.

- Note the name of the data set into which the JCL was generated.
- Submit and run the following jobs in sequence. Do not proceed with any job until the previous job has completed successfully.

Each job must complete with return code 0 unless otherwise indicated.

**Important!** If there is maintenance for additional features, the SMP/E apply job must be run on a system that has the z/OS UNIX file system used during installation and mounted for read/write access.

### **F11RCSMP**

SMP/E receives maintenance and lists existing HOLDDATA and SOURCEIDs that are already applied. If a job step returns condition code 04, there is no HOLDDATA present.

Review the information. For any held APARs that you want to apply, add the correct BYPASS HOLDx operands to the corresponding APPLY control statement for those APARs. Add the operands by manually editing the F12APSMP job that contains the SMP control statements.

**Note:** For information about the BYPASS HOLDx operands, see IBM's *SMP/E Commands* guide.

### **F12APSMP**

SMP/E applies maintenance.

13. Press F3.

The Install Utility Primary Menu panel appears.

If the fix contains maintenance for VSAM data sets (as indicated by HOLDDATA), continue with the procedure to update the VSAM data sets for the regions you have set up. Otherwise, you have finished applying the fix.

## HOLDDATA

When you apply maintenance, you typically encounter SMP/E HOLDDATA. We use HOLDDATA to notify your SMP/E system of SYSMODs that have errors or special conditions. We support system and external HOLDDATA.

## System HOLDDATA

System HOLDDATA indicates data that is an in-stream part of the SYSMOD, informing you of special conditions. The following reasons are used with SYSTEM HOLDDATA for CA SOLVE:Operations Automation:

### **ACTION**

Indicates that you must perform special processing before or after you apply this SYSMOD.

### **AO**

Affects automated operations. It changes either the message identifier or the displacement of a field inside the message.

### **DB2BIND**

Indicates that DBRMs have changed and packages need to be rebound.

### **DDDEF**

Indicates that data sets and DDDEFs are being added or modified.

### **DELETE**

Deletes the SYSMOD load module. You cannot reverse this type of SYSMOD with the SMP/E RESTORE command.

### **DEP**

Indicates a dependency for this SYSMOD that you must externally verify.

### **DOC**

Indicates a documentation change with this SYSMOD.

### **SYSMOD**

Indicates that some or all of the elements delivered by this SYSMOD are to be downloaded to a workstation.

**DYNACT**

Describes the steps to dynamically activate this fix without performing an IPL.

**ENH**

Introduces a small programming enhancement. The hold contains the instructions to implement the enhancement. If no action is needed to implement the enhancement, give a summary of the enhancement.

**EXIT**

Indicates that changes delivered by this SYSMOD require reassembly of user exits.

**EXRF**

Indicates that the SYSMOD must be installed in both the Active and Alternate Extended Recovery Facility Systems.

**MULTSYS**

Apply this SYSMOD to multiple systems for either pre-conditioning, coexistence, or exploitation.

**RESTART**

Indicates that after applying this SYSMOD, the site must perform a special restart as opposed to a routine restart.

Code a bypass operand on your APPLY command to install SYSMODs that have internal holds. Code the bypass operand only after you have performed the required action, or if you are performing the action after the APPLY, if that is appropriate.

## External HOLDDATA

External HOLDDATA is not part of the PTF. It resides in a separate file. It is commonly used for SYSMODs that have been distributed and later are discovered to cause problems.

Download the external HOLDDATA from CA Support to a DASD file, and allocate the file to the SMPHOLD DD statement. To take care of the external HOLDDATA, receive it into your SMP/E environment. SMP/E receives the HOLDDATA from CA-supplied jobs.

If a SYSMOD has an unresolved hold error, SMP/E does not install it unless you add a bypass to your APPLY command. You can bypass an error hold in situations that are not applicable to you. Error holds that are not applicable to you can include a problem that happens only with a hardware device that you do not have or in a product feature that you do not use.

When CA publishes a SYSMOD that resolves the hold, the resolving SYSMOD supersedes the hold error. This action lets you apply the original SYSMOD in conjunction with the fixing SYSMOD.

A special HOLDDATA class called ERREL exists. We have determined that the problem fixed by the SYSMOD is more important than the one that it causes. We recommend that you apply these SYSMODs.

The only manual task is running a REPORT ERRSYSMODS. This report identifies the following:

- Any held SYSMODs already applied to your system.
- Any resolving SYSMODs that are in RECEIVE status.

SMP/E identifies the SYSMOD to apply to correct the situation.

## Update VSAM Data Sets

If an installed SMP fix contains maintenance for the VSAM data sets, maintenance option V of the Install Utility becomes available. To complete maintenance, select the option to update the data sets for the regions you have set up.

### Follow these steps:

1. Access the ISPF/PDF Primary Menu, and select the COMMAND option.  
The ISPF Command Shell panel appears.
2. At the command prompt, execute the following command:  

```
EXEC 'dsnpref.0PB9.CC2DJCL(INSTALL)'
```

  
The Install Utility title panel appears.
3. Press Enter.  
The Install Utility Primary Menu panel appears.
4. Enter **8** (Maintain Products).  
The MAINTENANCE Primary Menu panel appears.

5. Enter **V** (Update MODS, PANELS, OSCNTL and NETINFO data sets with installed maintenance).

The MAINTENANCE Shared Region Data Sets panel appears.

6. Review the information, and press Enter.
7. At the MAINTENANCE JOBCARD Information panel, specify your JOBCARD details and press Enter.
8. At the MAINTENANCE JCL Library Creation panel, review your fix JCL library. The default library name is:

*dsnpref*.OPB9.FIX.VSAMUPD.JCL

***dsnpref***

The same data set prefix used for the *dsnpref*.OPB9.CC2DJCL data set.

**Note:** Each time you apply maintenance, use a new output data set. The new data set helps ensure that the only jobs in your maintenance JCL library are the jobs required for the maintenance you are installing. To use a new data set, take *one* of the following actions:

- Delete the library by issuing a TSO DELETE command and the library name, at the command prompt.
- Specify a new data set name.

9. Press Enter to proceed with the generation of the maintenance JCL.
10. Submit and run the job F21RFRSH to update the VSAM data sets.

**Note:** The utility also generates the following jobs: F22DUMP and F23REST. If a shared DASD is not available, the jobs help you deploy those updates to a target system. The F22DUMP job creates backup data set that include the updated VSAM data sets, which you deploy to the target system. This backup data set is *dsnpref*.DFDSS.SHARED. The F23REST job, when submitted on the target system, restores the updated VSAM data sets from the backup data sets.

11. Press F3.

The Install Utility Primary Menu panel appears.

12. Press F4 to exit the Install Utility Primary Menu panel and return to the ISPF Command Shell panel, or continue with the other options.

## Individual RAMDB Maintenance

**Note:** Individual RAMDB maintenance is also available from the [CA Technical Support site](#) (see page 4).

This section describes how to apply maintenance to the RAMDB and details the command syntax of the \$RAMDB04D maintenance utility. You apply this maintenance in an active region.

**Important!** The RAMDB data set must not be updated with individual replacement records using the IDCAMS REPRO command.

You use `$RMDB04D OPT=APPLY` (see page 61) to apply maintenance. When applying maintenance, you can use the DIFF operand to display details of what differences are being added, replaced, or deleted by the maintenance.

## Create Backup RAMDB

As a safety precaution, create a backup of your RAMDB (herein referred to RAMDBd) before applying maintenance.

### Follow these steps:

1. Allocate RAMDBd in the same way that RAMDB was allocated.  
The cluster definition is in `dsnpref.OPB9.rname.JCL(S01LCALC)`.
2. Stop the product region.
3. Copy the data from RAMDB to RAMDBd using IDCAMS REPRO command.  
**Note:** For information, see the example in `dsnpref.OPB9.rname.JCL(S04LDVSM)`.
4. Restart the product region.

## Apply Maintenance to RAMDB

You can apply maintenance directly to your RAMDB. The maintenance can then propagate to all connected regions, if any. If necessary, you can restore the maintenance using your RAMDBd as input (if the maintenance has not yet been applied to RAMDBd).

### Follow these steps:

1. Log on to your product region and enter CMD.  
The command entry panel appears.
2. Apply-check the RAMDB fix by entering the following command:

```
$RMDB04D OPT=APPLY FIX=fix-name CHECK=YES
```

#### ***fix\_name***

Is RAM@UPDT for published solutions or TZ*dddd* for test fixes.

When the APPLY CHECK finishes, a report appears. The report shows whether an APPLY of the fix will be successful, and also exactly what changes will result from the APPLY.

**Note:** Perform this step for the following reasons:

- To see what happens if a fix is applied to a RAMDB
- To see whether a fix has been applied to a RAMDB

3. Apply the RAMDB fix by entering the following command:

```
$RMDB04D OPT=APPLY FIX=fix_name
```

**Note:** If a RAMDB fix does not apply correctly or if you want to restore a fix, [restore the RAMDB maintenance](#) (see page 60).

## Restore RAMDB Maintenance

**Note:** This step is optional.

The RESTORE option can be used to remove an applied fix from the RAMDB by using RAMDBd as input. The fix is effectively reversed, that is, any added objects are deleted and any deleted or replaced objects are copied from RAMDBd back to the RAMDB.

To restore the fix, enter the following command:

```
$RMDB04D OPT=RESTORE FIX=fix_name DDBDSN=?RAMDBd-dataset-name DDB=?RAMDBd
```

**?*RAMDBd***

Specifies the ddname for the backup RAMDB.

**?*RAMDBd-dataset-name***

Specifies the full data set name of the backup RAMDB.

## RAMDB Maintenance Utility Syntax

This section describes the syntax of the RAMDB maintenance utility.

## **\$RMDB04D OPT=APPLY**

Use this procedure to apply a fix to a RAMDB or check a fix against a RAMDB.

This procedure has the following format:

```
$RMDB04D OPT=APPLY
      FIX=fix-number
      [DDNAME=ddname | DATASET=dataset-name]
      [CHECK={NO | YES}]
      [DIFF={YES | NO}]
      [FORCE={NO | YES}]
      [CONFIRM={YES | NO}]
      [DB=file-id [DBDSN=db-dataset-name]]
```

### **OPT=APPLY**

Specifies that a fix is being applied to a RAMDB.

### **FIX=*fix-number***

Specifies the fix number. This number is used as the member name of the input partitioned data set.

### **[DDNAME=*ddname* | DATASET=*dataset-name*]**

Specifies the DDNAME parameter if the data set containing the fix is already allocated to the system, or the DATASET parameter if the data set containing the fix is to be allocated and freed after the fix has been retrieved. These two parameters are mutually exclusive and, therefore, you cannot specify both of them. If neither is specified, the COMMANDS DD concatenation in the region is used.

### **[CHECK={NO | YES}]**

Specifies whether the fix is checked. If you specify YES, the fix is checked only for compatibility with the database and is not applied to the database. The check phase is always performed regardless of the value specified. However, this parameter determines whether the check phase is the only phase to be performed.

### **[DIFF={YES | NO}]**

Specifies whether differences are displayed. If you specify YES (the default), the differences between the target objects and the new objects contained in the fix are displayed for each updated object. This applies to any SET (update) and CREATE (add) actions in the fix member where the target objects already exist.

### **[FORCE={NO | YES}]**

Specifies whether the fix is applied regardless of the success or failure of the check phase. However, if CHECK=YES is specified, the FORCE parameter has no effect.

**[CONFIRM={YES | NO}]**

Specifies whether the fix is retrieved and the syntax checked before being presented as a panel for browsing. The panel enables you to view the fix and confirm the application. After you confirm, the fix is applied, and the message log displays another panel for browsing. If you specify NO, the fix is applied without presenting any confirmation panel and the message log is written to the terminal rather than being displayed as a panel.

The message log is always written to the activity log regardless of the options specified.

**[DB=*file-id* [DBDSN=*db-dataset-name*]]**

Specifies the DB parameter to apply the fix to a database other than the currently allocated RAMDB. This parameter specifies the file ID of the target database. If you also specify the DBDSN parameter, the specified data set is allocated a ddname that is the same as the specified file ID, and is opened and started. The database is not freed after the fix is applied. If the database is already allocated, the specified data set name is verified as allocated to the ddname (that is the same as the specified file ID) and opened to the same file ID.

**\$RMDB04D OPT=RESTORE**

Use this procedure to reverse the effect of a fix.

This procedure has the following format:

```
$RMDB04D OPT=RESTORE
      FIX=fix-number
      [DDNAME=ddname | DATASET=dataset-name]
      [CONFIRM={YES | NO}]
      [TDB=target-file-id [TDBDSN=target-dataset-name]]
      [DDB=source-file-id [DDBDSN=source-dataset-name]]
```

**OPT=RESTORE**

Specifies that a fix, which has been applied to the target RAMDB, is being reversed.

**FIX= *fix-number***

Specifies the fix number to back out of the RAMDB. This number is used as the member name of the fix data set and is verified against the contents of the member for the correct fix.

**[DDNAME=*ddname* | DATASET=*dataset-name*]**

Specifies the DDNAME parameter if the data set containing the fix is already allocated to the system, or the DATASET parameter if the data set containing the fix is to be allocated and freed after the fix has been retrieved. These two parameters are mutually exclusive and, therefore, you cannot specify both of them. If neither is specified, the COMMANDS DD concatenation in the region is used.

**[CONFIRM={YES | NO}]**

Specifies whether the fix is retrieved and the syntax checked before being presented as a panel for browsing. The panel lets you view the fix and confirm the restoration process. After you confirm, the fix is removed and the original data restored. The message log is presented as another panel for browsing. If you specify NO, the restoration process proceeds without presenting any confirmation panel, and the message log is written to the terminal rather than being displayed as a panel.

The message log is always written to the activity log regardless of the options specified.

**[TDB=*target-file-id* [TDBDSN=*target-dataset-name*]]**

Reverses a fix in a database other than the currently allocated RAMDB. This parameter specifies the file ID of the target database. If you also specify the TDBDSN parameter, the specified data set is allocated a ddname that is the same as the specified file ID, and is opened and started. The database is not freed after the restoration process. If the database is already allocated, the specified data set name is verified as allocated to the ddname (that is the same as the specified file ID) and opened to the same file ID.

**[DDB=*source-file-id* [DDBDSN=*source-dataset-name*]]**

Specifies the file ID of the source database.

**Note:** Restoration requires the specification of the distribution (source) database through the DDB parameter.

The source database must be a copy of the original database. If you also specify the DDBDSN parameter, the specified data set is allocated a ddname that is the same as the specified file ID, and is opened and started. The database is not freed after the restoration process. If the database is already allocated, the specified data set name is verified as allocated to the ddname (that is the same as the specified file ID) and opened to the same file ID.

# Chapter 6: Configuring Your Product

---

You use the Install Utility to set up the regions required by this product.

**Important!** You must put the *dsnpref.OPB9.CC2DLINK* data set in your system LNKLST before you start setting up regions. You can also create a STEPLIB to the data set name (DSN) in your TSOPROC (that is, allocate it to ISPLLIB).

This section contains the following topics:

[How Region Setup Works](#) (see page 83)

[Region Contents](#) (see page 84)

[SOLVE SSI as Common Component](#) (see page 84)

[Specify the SOLVE SSI Region](#) (see page 85)

[Specify the Product Region](#) (see page 86)

[Create VTAM Definitions and Tables](#) (see page 89)

## How Region Setup Works

You can have more than one region on a system. Each region runs as a started task.

The Install Utility uses the [site-specific information you collected during preinstallation](#) (see page 133) to generate the jobs that build the regions. If you need additional regions, you can reuse the Install Utility to create them.

**Important!** After you have run a setup job, you cannot alter the results using the setup software. You can use the setup software to create a region, or you can manually customize the JCL for the existing region.

## Region Contents

Your product is comprised of the following regions:

### **SOLVE Subsystem Interface (SOLVE SSI) Region**

Provides communication between the product region and other software on a system. One SOLVE SSI can serve multiple product regions.

### **Product Region**

Specifies where you log in and use your product. You can have more than one product region on a system.

Your region can also use the following optional service:

### **Hardware Interface Service**

Provides communication between the product region and the Base Control Program internal interface (BCPii) on a system. The service enables the product region to process messages about system hardware.

**Note:** For information about how to implement the service, see the *Hardware Interface Service Component Guide*.

## SOLVE SSI as Common Component

The SOLVE SSI is a common component for multiple CA product families and can serve multiple product regions on a system. The following methods are available:

- One shared SSI to serve all product families.
- A separate SSI for each product family (CA Mainframe Network Management, CA SOLVE:Operations Automation, and CA SOLVE:Access).
- A mix of the first two methods, for example, CA SOLVE:Access has its own SSI and CA Mainframe Network Management and CA SOLVE:Operations Automation share an SSI.

**Note:** If your site has any CA Mainframe Network Management product installed, and you have a SOLVE SSI running on a supported release of that product, you can share that SOLVE SSI region.

## Specify the SOLVE SSI Region

Use this procedure to provide communication between the product region and other software on a system.

**Follow these steps:**

1. At the ISPF/PDF TSO Command Shell prompt, execute the following command:

```
EXEC 'dsnpref.0PB9.CC2DJCL(INSTALL)'
```

The Install Utility panel appears.

**Note:** On each of the Install Utility panels, you can use the following keys:

- Enter to proceed to the next panel
- F1 to display the online help
- F3 to return to the previous panel
- F4 to exit and return to the main menu

2. Press Enter.

The Install Utility Primary Menu panel appears.

3. (Optional) If you have installed the product using CA MSM, perform the following steps:

- a. Enter **1**.

The Software Delivery Method panel appears.

- b. Complete the panel:

- Enter **S** next to CA MSM.
- Specify the name of the CSI data set used during product installation in the SMP/E CSI Used field.

- c. Press Enter.

4. Enter **4**.

A panel appears listing several approaches to implement your SOLVE SSI environment.

**Note:** For more information, press F1 (Help).

5. Press Enter.

The SETUP SOLVE SSI Primary Menu panel appears.

6. Enter **1** (Add a Region).

The SETUP Specify SOLVE SSI Name panel appears.

7. Enter the name (*ssiname*) and description of the SOLVE Subsystem Interface region you are setting up.

The setup software uses the name to generate the started task JCL. For example, if the name is SOLVESSI, your started task JCL is named SOLVESSI.

8. Complete each of the SETUP panels as they appear. Accept the default values, or specify site-specific values.

**Note:** Install Utility lets you configure a SOLVE SSI to work with other products, enabling the SSI to be shared.

The Install Utility generates a series of setup jobs into the *dsnpref.OPB9.ssiname.JCL* library.

9. Record the name of the data set into which the JCL was generated in your [post-installation worksheet](#) (see page 143).

**Note:** If you are setting up a new SSI, continue with these steps. Otherwise, skip the remaining steps in this procedure, verify that the required SSI parameters are present in your existing shared SSI, and update them as necessary.

10. Submit and run the following:

**S01SSIAL**

Allocates the SOLVE SSI data sets if the value in the Enable the Packet Analyzer field on the SETUP Region Parameters panel is set to YES.

**S02SSILD**

Copies the PDS members to *dsnpref.OPB9.SSIPARM*.

**S03MIGRT**

Copies data from earlier releases.

This job is only generated if the value in the Enable the Packet Analyzer field on the SETUP Region Parameters panel is set to YES.

11. Press F3.

The Install Utility Primary Menu panel appears.

## Specify the Product Region

The Install Utility lets you set up a region with the products you installed. If you need additional product regions, you can reuse the Install Utility to create them.

**Follow these steps:**

1. At the ISPF/PDF TSO Command Shell prompt, execute the following command:

```
EXEC 'dsnpref.OPB9.CC2DJCL(INSTALL)'
```

The Install Utility panel appears.

**Note:** On each of the Install Utility panels, you can use the following keys:

- Enter to proceed to the next panel
- F1 to display online help
- F3 to return to the previous panel
- F4 to exit and return to the main menu

2. Press Enter.

The Install Utility Primary Menu panel appears.

3. Enter **5** (Setup a NetMaster/SOLVE Product Region).

The SETUP Product Region Primary Menu panel appears.

4. Enter **1** (Add a Region).

The SETUP Specify Product Region Name panel appears.

**Note:** If you want to add this product to an existing region, enter **4** (Add Products and Additional Features to a Region) and select the appropriate region.

5. Enter the name (*rname*) and description of the region you are setting up.

The Install Utility uses the name that you entered to generate local data set names and the started task JCL. For example, if you enter REGION01 as the region name, your started task JCL is REGION01 and a local region file, such as the Virtual File System (VFS), is *dsnpref.REGION01.VFS*.

The SETUP Product Selection panel appears.

6. Enter **S** next to the products you are licensed to include in the region.

7. Complete each of the SETUP panels as they open. Accept the default values, or specify site-specific values.

**Note:** For information about the fields, press F1 (Help).

**Note:** On the SETUP Region Information panel, ensure that the value of the Subsystem Interface Identifier matches the value of the SOLVE SSI you intend to use.

The setup software generates a series of setup jobs in the *dsnpref.OPB9.rname.JCL* library.

8. Record the name of the data set into which the JCL was generated in your [post-installation worksheet](#) (see page 143).

9. Submit and run the following jobs in sequence. Do not proceed with any job until the previous job has completed successfully.

**S01LCALC**

Allocates the region-specific (local) data sets. If you are upgrading and have increased the size of a particular file, modify the JCL to increase the space allocation as required.

**S02SHALC**

Allocates the shared run-time data sets.

**S03LDVIP**

Populates the MODS, PANELS, and OSCNTL files.

**S04LDVSM**

Populates the other VSAM files.

**S05LDPDS**

Copies some PDS members to *dsnpref.rname*.TESTEXEC or *dsnpref*.PARMLIB for use by the product region. If this product is being added to an existing region, the RUNSYSIN and IIAPARMS are overwritten.

**Note:** The member names for IIAPARMS and SXPARMS include the domain ID, so they appear as *IIAdmid* and *SXPdmid*.

**S06MIGRT**

Copies site-specific VSAM data from an earlier release.

**Note:** The utility also generates the following two jobs to help you deploy the configuration files for your region to a target system if a shared DASD is not available: S10DUMP and S11REST. The S10DUMP job creates a backup data set that includes the configuration files for the region, which you deploy to the target system. The S11REST job, when submitted on the target system, restores the configuration files from the backup data set. In addition to deploying the configuration files, you also need to deploy the target libraries. CA MSM can help you with this deployment.

**Note:** After your product is installed, it monitors the size of your VSAM data sets. For more information about tuning VSAM data sets, see the *Reference Guide*.

10. Press F3.

The Install Utility Primary Menu panel appears.

## Create VTAM Definitions and Tables

The Create VTAM Definitions and Tables facility builds the VTAM major node, which contains application definition statements for all ACBs required by your product regions. Perform this task initially when all product regions have been set up. If changes are made to any regions or if additional regions are added later, perform the task again.

**Note:** You use the major node that you create in this procedure to [activate your VTAM applications](#) (see page 98).

**Follow these steps:**

1. At the ISPF/PDF TSO Command Shell prompt, execute the following command:

```
EXEC 'dsnpref.OPB9.CC2DJCL(INSTALL)'
```

The Install Utility Primary Menu panel appears.

2. Enter **7** (Create VTAM Definitions and Tables).

The VTAM Primary Menu panel appears.

3. Enter **1** (Create VTAM Definitions and Tables).

The VTAM Data Sets panel appears.

4. Enter the VTAM major node name (*vtamname*) and data set names of the requested IBM data sets.

The VTAM NetMaster/SOLVE ACBs panel appears and displays the prefix for External Interface Package (EIP) ACBs and the names of all product regions and the ACBs associated with them.

**Note:** If >>> appears, you can use F10 (right) to display all ACBs.

5. Enter the prefix for EIP ACBs.
6. Complete each of the remaining panels as they appear. Accept the default values, or specify site-specific values.

**Note:** For information about the fields, press F1 (Help).

The Install Utility generates a series of jobs in the *dsnpref.OPB9.VTAM.JCL* library.

7. Record the name of the data set into which the JCL was generated in your [post-installation worksheet](#) (see page 143).

8. Submit and run the following jobs in sequence:

**V01LDVTM**

Copies major node into SYS1.VTAMLST.

**V02ASMOD**

Assembles VTAM MODE table.

This job is required only if you want to provide users with access to external applications. Your product uses VTAM mode tables that are assembled and linked into a load library available to VTAM, and the tables lets users access external applications.

Each job should return condition code 0 unless otherwise indicated.

9. Press F3.

The Install Utility Primary Menu panel appears.

10. Enter X.

The Install Utility closes.

**Note:** Press F1 (Help) for information about any panel.

# Chapter 7: Preparing to Start Your Product

---

Before CA SOLVE:Operations Automation can be started and used, preparation tasks are required.

This section contains the following topics:

[Started Task JCL Setup](#) (see page 91)

[Subsystem Identifier Setup](#) (see page 96)

[Load Libraries](#) (see page 96)

[Assign Consoles](#) (see page 97)

[License the Product](#) (see page 97)

[Activate VTAM Applications](#) (see page 98)

[Enable Auditing by CA Auditor](#) (see page 98)

## Started Task JCL Setup

The Install Utility places the following SYSIN and parameter members into default data sets:

- SSIPARMS and SSISYSIN—for SOLVE SSI
- RUNSYSIN—for the product region

If you move these members into a more secure data set, update the started task JCL and SYSIN members to point to the new data set.

## TESTEXEC Data Set

The install utility populates the TESTEXEC data set based on the values entered during the installation and setup process.

Review the members in TESTEXEC to:

- Ensure that they meet your site-specific requirements
- Reapply any previous customization that is still required

Review the following members in *dsnpref.rname*.TESTEXEC:

### **NMREADY**

Is the NCL procedure that is executed as part of system initialization after the VTAM ACBs have been opened successfully.

### **NMINIT**

Is the NCL procedure that is executed as part of system initialization before the VTAM ACBs are opened.

Do not:

- Code any SYSPARMS commands in the NMINIT or NMREADY procedures.
- Activate or modify links, or use commands such as DEFLINK, DEFTRANS, and ISR in NMINIT or NMREADY. In a multisystem network, the region uses link definitions during initialization. Defining DEFLINK, DEFTRANS, and ISR in these procedures can interfere with region linkage.

## Started Task Product Region Parameter Member

The Install Utility generates the RUNSYSIN member based on the values entered during the installation and setup process.

RUNSYSIN specifies the product region parameters.

Review RUNSYSIN to:

- Ensure that it meets your site-specific requirements
- Reapply any previous customization that is still required

If you have set SUBS=YES in the member, you can update the RUNSYSIN started task members to use z/OS static system symbols. System symbols assist in the planning of future deployment.

Review the following parameters in *dsnpref.rname*.TESTEXEC(RUNSYSIN):

### **PPREF='XOPT=SDUMP'**

Specifies that ABEND dumps are written to the SYS1.DUMP data set.

If you do not want SYS1.DUMP data sets for dumps, remove the parameter and add the SYSMDUMP DD statement to the generated task in *dsnpref.OPB9.rname*.JCL(*rname*).

### **PPREF='INIFILE=????????'**

Specifies the INI file used for parameter customizations.

To use a migrated INI file, uncomment the parameter and replace the question marks with the name of the INI file.

## SOLVE SSI Started Task Parameter Member

The Install Utility generates the SSIPARM data set based on the values entered during the installation and setup process.

SSIPARM specifies the SOLVE SSI started task parameters.

Review the data set to:

- Ensure that the members meet your site-specific requirements
- Reapply any previous customization that is still required

Review the following members in *dsnpref.OPB9.SSIPARM*:

### SSISYSIN

(Optional) (If you are using an existing shared SOLVE SSI region, you do not have to review this member.)

If SUBS=YES is set, you can update the SSISYSIN started task member to use z/OS static system symbols. System symbols assist in the planning of future deployment.

### SSIPARMS

(Optional) (If you are using an existing shared SOLVE SSI region, you do not have to review this member.)

This member is present only if you created it when you specified the SOLVE SSI region.

Parameters can be shared with any other products using this SOLVE SSI. Review these parameters, and ensure that they are set correctly for the products (these parameters can be in SSISYSIN or SSIPARMS).

**Note:** For more information about sharing a SOLVE SSI, see the *SOLVE Subsystem Interface Guide*.

## Review and Copy the SOLVE SSI Started Task

The Install Utility generates a SOLVE SSI started task that you must review to ensure that it meets your site-specific requirements; if necessary, reapply any previous customization that is still required.

**Note:** If you are using an existing shared SOLVE SSI region, skip this procedure.

Use this procedure to review, update, and copy the SOLVE SSI started task to a procedure library.

**Note:** To assist you in the planning of future deployment, you can update the SOLVE SSI started task to use z/OS static system symbols.

**Follow these steps:**

1. Review and update the DD statements in the SOLVE SSI started task member *dsnpref.OPB9.ssiname.JCL(ssiname)* for your site-specific requirements.
2. Copy the reviewed member to SYSx.PROCLIB.

## Review and Copy the Product Region Started Task

The Install Utility generates a product region started task that you must review to ensure that it meets your site-specific requirements; if necessary, reapply any previous customization that is still required.

Use this procedure to review, update, and copy the started task to a procedure library.

**Note:** To assist you in the planning of future deployment, you can update the product region started task to use z/OS static system symbols.

**Follow these steps:**

1. Review and update the DD statements in the product region started task member *dsnpref.OPB9.rname.JCL(rname)* for your site-specific requirements.
2. Copy the reviewed member to SYSx.PROCLIB.

## Subsystem Identifier Setup

The setup of your product environment usually requires the following subsystem identifier (SSID) values that were defined during the [setup process](#) (see page 83):

- An SSID value for the subsystem identifier for the SOLVE SSI—The SOLVE SSI started task automatically identifies this SSID value to the system.
- An SSID value to enable the use of z/OS commands and messages—This SSID is named the AOM subsystem interface ID (AOM SSID). The product region started task automatically identifies this SSID value to the system.

If you want the SSID values to be set permanently and available at system IPL time, you can set them in the SYS1.PARMLIB(IEFSSNxx) member. If you use this member, ensure that you add the AOM SSID for the region first (after JES) in the list of subsystem names, because the first region listed in the SYS1.PARMLIB(IEFSSNxx) member controls the processing of messages by the subsystem interface.

## Load Libraries

Most products have their own load library but also require the load libraries of supporting services. The following load libraries must be APF-authorized:

- CC2DLOAD
- CC2DPLD (If SSL is installed)

## Authorization of the Load Libraries

To APF-authorize your load libraries, add the run-time load libraries to the SYS1.PARMLIB(IEAAPFxx) APF list.

To dynamically APF-authorize the load libraries, issue the following z/OS command:

```
SETPROG APF,ADD,DSNAME=?loadLib,VOLUME=?volser
```

### **?loadlib**

Specifies the name of the load library.

### **?volser**

Specifies its volume serial number.

To dynamically APF-authorize load libraries controlled by SMS, issue the following z/OS command:

```
SETPROG APF,ADD,DSNAME=?loadLib,SMS
```

## Assign Consoles

Your product needs a pool of consoles (either JES or extended MCS consoles) to issue system commands. As delivered, this product uses extended MCS consoles that are dynamically defined.

To use JES consoles instead of the default MCS consoles, define at least six consoles that are *not* used by other products.

**Follow these steps:**

1. Open the SYS1.PARMLIB(CONSOLxx) member.
2. Add the following statement for each console you want to define:

```
CONSOLE DEVNUM(SUBSYSTEM) . . .
```

An IPL is required to activate the updated CONSOLxx member. To start using JES consoles, you must also update the \$RM CONSOLES [Customizer parameter group](#) (see page 107).

## License the Product

You code CA Common Services CA License Management Program (LMP) statements to license this product on each system that uses this product.

**Follow these steps:**

1. Ensure that CA Common Services CA Resource Initialization Manager (CAIRIM) is installed on the system.
2. Add product license LMP codes from the product's Key Certificate as CA LMP statements in the CAIRIM KEYS member.

**Note:** For more information, see the *CA Common Services for z/OS Administration Guide*.

3. Start the CAS9 procedure at the next IPL. Alternatively, if you do not want to wait for the next IPL, do the following:
  - a. Create a special CAS9 procedure under a different name with the following settings:
    - PARMLIB and AUTOCMDSD DD statements set to DUMMY
    - KEYS DD statement set to the KEYS member with the newly added LMP key statements
  - b. Start the special procedure.

The product is licensed on the system.

## Activate VTAM Applications

You must activate VTAM applications for your regions. The Create VTAM Definitions and Tables facility builds a VTAM major node that contains APPL definitions for all product regions. The member V01LDVTM copies *vtamname* to SYS1.VTAMLST, which is the VTAM library that contains all the major node and application definitions used by your product.

**Follow these steps:**

1. Add *vtamname* to the startup list in SYS1.VTAMLST(ATCCONxx).
2. Activate the VTAM major node by entering the following VTAM command:

```
V NET,ACT,ID=vtamname
```

3. Check that all of the applications are defined to VTAM after the activation. To do this, display the major node by entering the following VTAM command:

```
D NET,ID=vtamname,E
```

## Enable Auditing by CA Auditor

If your auditors require CA Auditor or CA Common Inventory Service to know of this product running on your system, put a load module in your system LNKLST.

To define the load module to the system LNKLST, include the library *dsnpref.OPB9.CC2DLINK* in the system LNKLST SYS1.PARMLIB(PROGxx), for example:

```
LNKLST ADD NAME(LNKLST00) DSNAME(dsnpref.OPB9.CC2DLINK)
```

**Note:** Common load modules are used for all CA SOLVE:Operations Automation products. You only need to include one copy of this *dsnpref.OPB9.CC2DLINK* library in the system LNKLST.

# Chapter 8: Performing Initial Migration

---

When you specify your regions, the Install Utility migrates some of your data from the earlier release. You perform some additional migration tasks before you start your product region.

This section contains the following topics:

[NPF and SAF Security Members](#) (see page 99)

**More information:**

[Migration Preparation](#) (see page 19)

**Note:** If you are migrating from a release earlier than r11, [contact Technical Support](#) (see page 4).

## NPF and SAF Security Members

The Install Utility generates Network Partitioning Facility (NPF) and System Authorization Facility (SAF) security members. If you have previously customized any of these security members, update the regenerated members with your changes.

# Chapter 9: Starting Up

---

This section contains the following topics:

[Start the SOLVE SSI Region](#) (see page 101)

[Restart the SOLVE SSI Region](#) (see page 102)

[Start the Product Region](#) (see page 102)

[Perform the Initial Logon](#) (see page 103)

[Add the Initial Administrator User ID](#) (see page 103)

[Perform Subsequent Logon](#) (see page 104)

**Note:** If you want to run other products in the CA SOLVE:Operations Automation family in this region, before proceeding, complete the tasks described in the *Installation Guide* for the other products.

## Start the SOLVE SSI Region

You perform this procedure only if you use a new SOLVE SSI region.

**Notes:**

- If you are using an existing shared SOLVE SSI region and did not make any changes when [specifying the SOLVE SSI region](#) (see page 85), skip this procedure.
- If you are using an existing shared SOLVE SSI region and have made changes, skip this procedure and proceed to [restarting the SOLVE SSI region](#) (see page 102).

To start the SOLVE SSI region, issue the following command from the MVS console:

```
S ssiname,REUSASID=YES
```

*ssiname* is the name you specified for the SOLVE SSI during the setup process.

**Note:** If you use cross memory services but do *not* specify REUSASID=YES, and SOLVE SSI terminates, the address space ID is not available until after the next IPL.

To stop the SOLVE SSI started task, issue the following command from the MVS console:

```
P ssiname
```

## Restart the SOLVE SSI Region

You perform this procedure only if you are using an existing shared SOLVE SSI region and made changes when [specifying the SOLVE SSI region](#) (see page 85).

### Follow these steps:

1. Stop the SOLVE SSI started task, issue the following command from the MVS console:
2. Start the SOLVE SSI region, issue the following command from the MVS console:

```
P ssiname
```

```
S ssiname,REUSASID=YES
```

**Note:** If you use cross memory services but do *not* specify REUSASID=YES, and SOLVE SSI terminates, the address space ID is not available until after the next IPL.

## Start the Product Region

To start the product region, issue the following command:

```
S rname,REUSASID=YES
```

*rname* is the name you specified for the region during the setup process.

**Note:** If you use cross memory services but do *not* specify REUSASID=YES, and the region terminates, the address space ID is not available until after the next IPL.

**Note:** To stop the started task, issue the following command from the MVS console:  
P *rname*.

## Perform the Initial Logon

**Note:** If your region is using an existing UAMS data set, you will already have an administrator user ID available for the region. You can use that ID to log on to the region.

**Follow these steps:**

1. Log on to the product region. You can use the VTAM logon command:

```
LOGON APPLID(priacbnm)
```

*priacbnm* is the name of the primary VTAM ACB application nominated in the *PPREF='PRI=*priacbnm*'* command in *dsnpref.rname.TESTEXEC(RUNSYSIN)*.

The region logon panel appears.

2. Enter the user ID **INSTALL** and password **99999999**, and press Enter.

The UAMS : Primary Menu appears.

The INSTALL 99999999 is a special user ID and password combination that can be used once only, and is accepted if the USERID data set is empty. The only functions that the INSTALL user ID can perform are those associated with user ID maintenance.

## Add the Initial Administrator User ID

The only functions that the INSTALL user ID can perform are those functions associated with user ID maintenance. Therefore, you must add an initial administrator user ID.

**Note:** If you are using a full security exit, user authorities are not specified through UAMS. Specify these authorities as structured fields in your security exit. For more information, see the *Security Guide*.

**To define an initial user with full authority to UAMS**

1. At the UAMS : Primary Menu, type the initial administrator user ID in the User field, **USER** in the Definition Type field, and select the **A – Add User Definition** option.

The UAMS : User Details panel appears.

2. Type the initial password and user details for this initial user ID.

**Important!** The user must change the password again at first logon.

3. Go to the UAMS definition panels and ensure that you give full authority to this initial user to perform future administration tasks. Set the following minimum values:

**User Authorities panel, page 2**

Authority Level: 255

APPC Access Key: ALL

APPC Access Lock: ALL

**Access Authorities panel, page 3**

Set all fields to Y.

**AOM MVS Details panel, page 11**

Console Authority: M

**Print Services Manager Details panel, page 12**

For all fields, set the maximum authority (1 through 4).

**Report Writer Details panel, page 13**

For all fields, set the maximum authority (1 through 4).

4. Press F3.

The user definition is saved.

## Perform Subsequent Logon

You are now ready to log on to your product and begin using it as an authorized user.

**Follow these steps:**

1. Press F3 to log off the product region.
2. Log on using your new initial administrator user ID and password.
3. If necessary, change your password by typing **U.P**, confirm your change, and press F3 (File) to save the change.

**Notes:**

- If you set SEC=PARTSAF or SEC=NMSAF in the RUNSYSIN member, you are not required to change your password.
- (Optional) To enable users to logon to the product from TSO, add the:
  - *dsprefix.OPB9.CC2DLMD0* data set to LNKLST or STEPLIB concatenation for the appropriate TSO procedure
  - *dsprefix.OPB9.CC2DSAMP* data set to the SYSHELP concatenation for the appropriate TSO procedure

# Chapter 10: Customizing Your Product

---

**Note:** After completing customization, you can use product system variables and z/OS static system symbols to help you plan future deployment to multiple regions. You generate an initialization (INI) file where you can use these variables and symbols. For information about setting up the INI file, see the *Administration Guide*.

This section contains the following topics:

[Initial Customization Requirements](#) (see page 107)

[Additional Parameter Groups](#) (see page 113)

[Web Browser Settings](#) (see page 114)

[Discover System Resources](#) (see page 114)

[Load a System Image](#) (see page 116)

[Set Up the System Image to Load on Restart](#) (see page 117)

[Initialization Failures](#) (see page 117)

[Perform Additional Customization](#) (see page 119)

## Initial Customization Requirements

You must set various parameters for your site-specific requirements. Use Customizer to review and update the parameter groups in your product region.

**Note:** Customizer is used to set the majority of your region parameters. If you need to permanently change any SYSPARMS values that are not handled by Customizer, [contact Technical Support](#) (see page 4).

**Important!** Setting certain SYSPARMS to values other than the defaults can render certain product features inoperable.

Customization can only be performed by a user with [UAMS maintenance authority](#) (see page 103). That user's UAMS definition should have an APPC Access Key and Lock value of ALL.

## Customizer Setup Types

From the Customizer : System Parameters panel, you can select the following options:

### **Fast Setup**

Customizes the required parameter groups and quickly implements your region. It provides default values wherever possible, but lets you review all the required parameter groups to ensure that they match your installation standards. You can customize other parameters at a later time.

**Note:** You must review all the parameter groups in this option for the region to become operational.

### **Custom Setup**

Customizes the required parameter groups and additional file and data set names, to bring the system operation closer to your installation standards. This option quickly implements your region and still lets you perform some extra customization. It provides some default values, lets you specify names for certain files and data sets, and lets you review the required parameter groups (which are highlighted).

### **Complete Setup**

Customizes all initialization and customization parameters.

## Customize Parameter Values

You can use the provided default values or customize the parameter values to suit the requirements of your site.

**Note:** All parameters have default values.

**Follow these steps:**

1. Enter **U** next to the parameter group that you want to review, and make the necessary changes for your site.
2. Press F6 (Action) to apply the change immediately. You can view the results by pressing F5 (ILog).

**Note:** The F6 option is not available for some parameters.

3. Press F3 (File) to save your changes and indicate that you have reviewed the group.

The value you assign to a parameter is associated with one or more actions, such as setting SYSPARMS or allocating data sets. You can action some parameter groups as soon as you enter appropriate values on the parameter panel. However, when you change the value of some parameters, for example, MODS file names, these parameter values can only be applied by restarting the product region.

**Note:** If you change a parameter, perform an action, and then cancel that action, the new value will be in effect for that action; but when you restart, the value will return to the last saved value. In addition, you can change a value and save it without applying it to have it take effect on the next startup.

## Interrupted Customization

If you exit the customization process before reviewing all required parameter groups, you are presented with a confirmation panel. You can log off and continue with the customization later. Alternatively, another authorized user can log on and complete the customization process. Users cannot access the region until all the required parameter groups have been reviewed.

## Update and Review the Fast Setup Customization Parameters

To begin the process of updating and reviewing the Fast Setup Customization parameters, select the Fast Setup Customization Parameters option. The Customizer : Fast Setup panel appears.

## Implement System Identification Parameters

Use this procedure to implement system identification parameters.

### Follow these steps:

1. Enter **U** next to the System Identifications parameter group.  
The SYSTEMID - System Identifications panel appears. The parameter group has two panels.
2. Complete the fields on the panels. For information about the fields, press F1 (Help).
3. Press F6 (Action) to action the entries.
4. Press F3 (File) to save your settings.  
The Customizer : Fast Setup panel appears with the Reviewed column marked Yes for the parameter group.

**Note:** The system ID does not take effect until the next system initialization.

## Implement Operating System Identifiers Parameters

Use this procedure to implement the operating system identifiers.

### Follow these steps:

1. Enter **U** next to the Operating System Identifiers parameter group.  
The OPSYSIDS - Operating System Identifiers panel appears.  
Complete the fields on this panel. If the system uses the JES3 job entry subsystem, ensure that information about the job entry subsystem is updated.  
**Note:** Press F1 (Help) for more information.
2. Press F6 (Action) to action the entries.
3. Press F3 (File) to save your settings.  
The Customizer : Fast Setup panel appears with the Reviewed column marked Yes for the parameter group.

## Implement the TCP/IP Sockets Interface Parameters

The SOCKETS parameter group configures the TCP/IP sockets interface. If you enable Linux management for the region, the parameter group appears on the Fast Setup panel. If Linux management is not enabled, you can update the group after Fast Setup.

Use this procedure to enable TCP/IP support.

Access to sockets interfaces requires [UNIX System Services authorization](#) (see page 145) provided by an OMVS segment security definition.

**Follow these steps:**

1. Enter **U** next to the TCP/IP Sockets Interface parameter group.  
The first SOCKETS - TCP/IP Sockets Interface panel appears.
2. Tab to the TCP/IP Software Type input field, and enter the required value.  
Only one type of TCP/IP software can be configured as the sockets interface in each region.
3. Complete the remaining fields on the first panel.  
**Note:** For more information, press F1 (Help).  
The Inbound Connections Port field contains a default port number. If another region on this system is already using that number, tab to the field and change it.  
**Important!** The port number must be unique on a system.
4. Press F8.  
The second panel for this parameter group appears.
5. Complete the fields on the panel.  
Specify the details of the TCP/IP software as follows:
  - If you are using the IBM Communications Server, enter your TCPIP.DATA data set name in the TCPIP.DATA DSN field and review the Domain Name Resolution fields.
  - If you are using CA TCPaccess CS, tab to the CA TCPaccess CS SSID field and enter the required SSID. If you are unsure of the CA TCPaccess CS subsystem ID, access the CA TCPaccess CS startup procedure and check the value of the SSN parameter.
6. Press F6 (Action) to set the specified values and start the interface.
7. Press F3 (File).  
Your settings are saved.

If you enabled TCP/IP support using CA TCPaccess CS, see the following section.

## Ensure CA TCPAccess CS DNR Members Translate Subsystem Name

Use this procedure to enable your CA TCPAccess CS Domain Name Resolver (DNR) members translate the CA TCPAccess CS subsystem name into an IP address and a fully qualified host name.

### Follow these steps:

1. Enable translation from subsystem name to fully qualified domain name.

For example, if your CA TCPAccess CS subsystem name is ACSS and its fully qualified domain name is MVS.SITE1.COM, enter a line like the following into your DNRALCxx member:

```
ACSS MVS.SITE1.COM.
```

**Note:** Specify the domain name (rather than an IP address), and end it with a period (.).

2. Enable local translation of the fully qualified host name to an IP address.

For example, if the IP address of MVS.SITE1.COM. is 172.16.140.117, enter a line like the following into your DNRHSTxx member:

```
MVS.SITE1.COM. 172.16.140.117
```

**Note:** This DNR configuration is recommended in the *CA TCPAccess CS Customization Guide*, which contains further details about the DNR members of the CA TCPAccess CS PARM data set. Ensure that the HOSTTABLE statement in the DNRCFGxx member points to the correct DNRHSTxx member. You do not need to restart CA TCPAccess CS to introduce changes to the DNR tables. You can restart DNR, for example:

```
F TCPICS,STOP DNR  
F TCPICS,START DNR
```

## Implement Linux Connector Interface Parameters

If you enable Linux management for the region, the LINUXCONNECT parameter group appears on the Fast Setup panel.

### Follow these steps:

1. Enter **U** next to the Linux Connector Interface parameter group.

The LINUXCONNECT - Linux Connector Interface panel appears.

Complete the fields on this panel. Ensure that the port values match those values specified for CA Mainframe Connector. By default, these values match.

**Note:** Press F1 (Help) for more information.

2. Press F6 (Action) to action the entries.
3. Press F3 (File) to save your settings.

The Customizer : Fast Setup panel appears with the Reviewed column marked Yes for the parameter group.

## Additional Parameter Groups

Depending on which product features you want to implement, you may want to review other parameter groups and add any values that you saved from your old product region.

You can review these parameter groups now or later, as follows:

- **Now**—Select the Complete Setup Customization Parameters option to list all parameter groups and review the relevant groups. When you complete the review, exit the list and the Customizer : System Parameters panel.
- **Later**—Exit the Customizer : System Parameters panel. (When you are ready to review these parameter groups, enter **/PARMS** to list the groups.)

## Implement the WebCenter Parameters

Use this procedure to implement access to the WebCenter interface.

**Follow these steps:**

1. Enter **U** next to the WebCenter Web Interface parameter group.  
The WEBCENTER - WebCenter Web Interface panel appears.
2. Tab to the Web Interface Port input field, and enter a unique value.
3. Complete the fields on the panel.  
**Note:** For more information, press F1 (Help).
4. To use SSL to encrypt WebCenter traffic, press F11.  
The panel that sets SSL parameters appears.
5. When you have completed all the fields, press F6 (Action) to set the specified values.  
If you specified a WebCenter port number, note the generated WebCenter Access URL because you use this URL to access your product region using WebCenter.
6. Press F3 (File) to save your settings.  
The Customizer : Complete Setup panel appears with the Reviewed column marked Yes for the WebCenter web interface parameters.
7. Press F3 (Exit).  
You are returned to the Customizer : System Parameters panel, and the WebCenter parameters are implemented.

## Web Browser Settings

If you are using WebCenter, instruct all users to take the following actions:

- Clear the cache of their web browser to prevent them from getting a mix of old and new web files.
- Disable pop-up blocker, or define WebCenter as an allowed website.

## Discover System Resources

You can discover your system resources using Express Setup or Auto Populate.

## Auto Populate Compared to Express Setup

Express Setup starts an automated resource definition procedure; Auto Populate starts an assisted resource definition procedure.

The Auto Populate facility performs similar tasks to Express Setup, but is interactive. The facility presents you with lists of resource classes, from which you can select the resources that you want included in the system image. Unlike Express Setup, it does not establish relationships between resources; you add relationship information manually.

## Run Express Setup

Express Setup discovers resources and stores their definitions in a system image. Express Setup starts after initial customization has completed.

### Follow these steps:

1. Exit from the Customizer : System Parameters panel if you have not already done so.

The AutoAssist Setup panel appears.

2. Select Express Setup.

The Confirm Express Setup panel appears.

3. Specify values in the System Image and Version fields. These values default to the local z/OS system name and the next available version number.

4. (Optional) Configure the \$RMEXPRn control member. Perform the following steps:

- a. Copy *dsnpref.OPB9.CC2DEXEC(\$RMEXPRn)* into *dsnpref.rname.TESTEXEC*.
- b. Update the *dsnpref.rname.TESTEXEC(\$RMEXPRn)* specifications. (For example, comment out the resources you do not need to discover.)
- c. Rename \$RMEXPRn, and use this name in the Control Member field.

The \$RMEXPRn Control Member defaults to discover all of your resources.

5. Set Load Image? to **YES**.

This system image is loaded after the discovery has completed.

6. Press F6 (Action).

The Automation Services : Express Setup Status panel appears. This panel reports the progress of the resource discovery and the number of resources successfully discovered.

**Note:** The time taken to complete this process is determined by your site's configuration.

## Access Express Setup After Logon

To access Express Setup after your first logon, enter **/RADMIN.AD.E** at the command prompt.

**Note:** For information about reviewing and administering the resources discovered by Express Setup, see the *Administration Guide*.

## Run Auto Populate

If you select this option immediately after completing the initialization procedure, the Auto Populate Menu appears.

### Follow these steps:

1. Select an Auto Populate Menu option.  
A panel appears prompting you to create a system image definition.
2. Add and define a system image.  
**Note:** For information about adding a system image, see the *Reference Guide*.
3. After you define the image, you can use the Auto Populate facility to add definitions of selected resources to the image.

If you have exited the initial System Parameters Customization dialog, enter **/RADMIN.AD.A** to access this facility.

**Note:** For more information, see the *Administration Guide*.

## Resource Definition Updates

When you finish with the Auto Populate facility, you can exit to the Resource Administration menu, which lets you select the **R** - Resources option and update resource definitions.

**Note:** For information about how to update resource definitions and parameter values, see the *Reference Guide*.

## Load a System Image

**Note:** If you loaded the system image using Express Setup, you do not need to perform this task.

After you have created a system image, make it available to the region so that the region can follow the operations policies and methods contained in the image.

You make an image available to the region by loading the image.

**Follow these steps:**

1. Enter **/RADMIN.I** to access the system image definitions.
2. When you have displayed the list of images, enter **L** next to the required image to load it.

## Set Up the System Image to Load on Restart

Use this procedure to ensure that a system image is loaded during initialization.

**Follow these steps:**

1. Enter **/PARMS** at the command prompt.  
The Customizer : Parameter Groups panel appears.
2. Enter **U** next to the \$RM AUTOIDS parameter group.  
The AUTOIDS - Automation Identifiers panel appears.
3. Enter **?** in the System Image Name field.  
The ResourceView : System Image List panel appears.
4. Select the System Image and Version you specified during Express Setup.
5. Press F6 (Action) if the system image is not already loaded.  
**Important!** F6 (Action) replaces the currently loaded system image. If you do not want to load the system image now, skip this step.
6. Press F3 (File).  
The system image loads each time the product region starts.

## Initialization Failures

Fatal errors occur (for example, you are unable to log on) if either or both of the following are unavailable:

- Panel libraries
- MODS control files

**Note:** If the Panel libraries are missing, the system may display the N59005 message, which says that the \$MHMENU panel is not found. To retry, press F3, or to log off, press F4.

A Customizer parameter group always produces initialization log messages. The messages are echoed to the activity log. If a parameter group fails to initialize and you cannot log on to the region to display error messages, use CA SYSVIEW, SDSF, or an equivalent utility to display the activity log SYSOUT DD. The ddnames are LOG1 through to LOG9.

## Resolve Initialization Failures

If you log on to a region where the initialization of a parameter group has failed, Customizer displays the System Initialization In Progress dialog. This dialog indicates progress and assists you with identifying and rectifying any problems by displaying the current initialization status and whether actions associated with parameter groups have failed.

**Follow these steps:**

1. Enter **S** next to List Only Failed Parameters.
2. Enter **L** next to a failed parameter group to view its log and look for error messages.
3. Use the message online help and the full activity log to determine the cause of the failure.
4. Make the necessary changes to the parameter group and press F6.  
The parameter group changes are applied.
5. Press F3 to save the changes.

## Parameter Group Actions

You can apply the following actions to listed parameter groups:

- **S** or **B** (Browse) to browse parameter group details.
- **H** (Help) to view the online help for a parameter group.
- **U** (Update) to update parameter group details.
- **AC** (Action) to action a parameter group.
- **L** (Log) to view the associated initialization and customization log.
- **I** (Ignore) to tell the system to ignore a failed parameter group and proceed to run dependent parameter groups. This action is not available when initializing for the first time.

**Important!** Ignoring parameter groups is not recommended. Consider carefully before applying this action.

- **SD** (Set Default) to reset the parameter group values to the default values.

**Note:** Press F1 (Help) for more information.

An action can only be performed against an already completed parameter group or a failed parameter group.

When you correct an error by updating an incorrect parameter group record, you must action that parameter group before processing can continue (unless you apply the Ignore action). To action the parameter group, do *one* of the following:

- Press F6 (Action) when you finish updating the parameter group.
- Apply **AC** (Action) to the listed parameter group.

## Perform Additional Customization

You have now completed the initial customization tasks for your product.

The *Administration Guide* describes other ways that you can customize your product.

# Chapter 11: Completing Migration

---

The process to complete the migration includes tasks that you perform after you start your new product region.

This section contains the following topics:

[Knowledge Base Migration](#) (see page 121)

[MODS Migration](#) (see page 124)

[Panel Migration](#) (see page 126)

[OSCNTL File Migration](#) (see page 128)

[Region Links to a Multisystem Network](#) (see page 128)

[Scenario: Run Your Old Region in Parallel with the New Region](#) (see page 132)

**Note:** If you are migrating from a release earlier than r11, [contact Technical Support](#) (see page 4).

## Knowledge Base Migration

The knowledge base is where you store your resource definitions. System images, in which you define the resources a region manages, are part of the knowledge base.

**Note:** For more information about the knowledge base, see the *Reference Guide*.

As part of region setup, a knowledge base is created, comprising the following data sets:

- RAMDB
- ICOPANL

Migrate any existing data that you want to keep to this knowledge base.

**Important!** The IDCAMS REPRO command must never be used to manage the definitions in the knowledge base.

## Migrate Your Existing Knowledge Base

If you are migrating multiple synchronized regions, you only perform this task for the first focal region. You do not have to perform this task when migrating subsequent regions because when you link the regions, the knowledge base is synchronized.

**Important!** Keep the old knowledge base until your new product regions are performing correctly.

### Follow these steps:

1. Shut down the region using your existing knowledge base.
2. From the new product region, enter **/RAMUTIL.M**.  
The RAMDB Migration Utility panel appears.
3. Perform the following steps:
  - a. Specify the data set name for your existing RAMDB in the Old RAMDB Data Set Name field.  
The data set name is *dsnpref.rname*.RAMDB.
  - b. Specify **NO** in the Selective Migration field to migrate all definitions.  
The utility migrates only customized definitions from the old knowledge base to the knowledge base in the new product region. Definitions that are not migrated are listed for further action.
  - c. Press F6 (Action) to display the Migration Statistics panel.
4. After migration has completed, perform the following steps:
  - a. Look for the components that have a non-zero value in the Not Copied column. (The utility does not copy a component if the component exists in the new knowledge base.)  
You might have customized some of these components and want to copy them.
  - b. Enter **R** next to the components that you want to copy, and copy the records.  
The copying options depend on whether a component contains [multiple objects](#) (see page 123), such as a system image, or is the [object itself](#) (see page 123), such as a user profile definition.
5. After you have copied the components, exit the migration utility.

**Note:** If you do not want to move directly from your established regions to the new product regions, you can run the two releases in parallel.

## How to Copy Multi-Object Components

**Important!** The products use template images \$TEMPLAT 0001 through 0009 for the distribution of new and updated template definitions. Do not overwrite or replace them in the knowledge base.

If a component contains multiple objects, you operate on the component as a whole. You can perform the following actions:

- Merge the component in the old knowledge base into the component in this knowledge base. Only objects that do not exist in this knowledge base are migrated. Existing objects are unchanged.
- Overwrite the existing objects in this knowledge base with the objects in the old knowledge base. This operation does not affect any objects that are not in the old knowledge base.
- Replace the component in this knowledge base with the component in the old knowledge base.

**Note:** To migrate specific objects, see the activity log and use the RMMUAD05 messages to determine which objects have not been copied. You can then delete the appropriate objects and redo the migration by merging (to list only the RMMUAD05 messages in the log, enter **TEXT RMMUAD05**).

## How to Copy Single-Object Components

For a component that is the object, do *one* of the following:

- Rename the component to create a copy of the component in this knowledge base using a different name.
- Overwrite the existing component in this knowledge base with the component in the old knowledge base.

## Apply Updated Templates

After you have migrated your knowledge base, review the distributed templates.

**Note:** For information about changes to the distributed knowledge base, see the *Release Notes*.

**Follow these steps:**

1. Review the new templates to determine whether they are suitable for your requirements.
2. Enter **/RADMIN.T**.  
The Template Definition menu appears.
3. Select the appropriate option to list the definitions you want to review.
4. If you use any template image except the default (as specified in the OPSYSIDS parameter group), copy the required definitions to your working template images.

**Important!** When you copy definitions from the distributed template images to your working template images, you can replace your working definition with a distributed definition of the same name. If you want to retain your working definition, make a copy of the definition beforehand.

If you want to copy all the new definitions, perform the following steps:

- a. Copy the template image (enter **/RADMIN.T.I**).
- b. Enter **C** next to the distributed image to merge the distributed template image with the target image.
- c. Specify **YES** in the Enter 'YES' to OVERLAY Like-named Components field.

If you want to copy changed definitions, copy them one by one.

5. If you want to apply a new template to all the resource definitions (in one or more system images) that use it, use the **AP** (Apply Template) action code. Specify **RESET** and **REPLACE** to ensure that the template is applied in full. If you want to retain an old definition, make a copy of the definition before you apply the template.

## MODS Migration

**Note:** If you have not created your own MODS file, or individual MODS entities, do not perform this step.

## MODS File

The format of the MODS file is unchanged. If you have a MODS file containing only user-defined MODS entities that you want to keep, copy the entire file to the file for the new region using the IDCAMS REPRO command.

**Note:** The MODSFILES parameter group in Customizer controls the allocation of MODS data sets. For more information, enter **/PARMS** on any panel, select \$NM MODSFILES, and press F1 (Help).

## Copy MODS Definitions

The following entities are stored in the MODS file:

- Application definitions
- Command definitions
- Criteria definitions
- Help definitions
- List definitions
- Menu definitions
- Message definitions
- Print Services definitions
- Report definitions
- Table definitions

**Note:** Help alias entities are no longer supported. If you have installation-defined help aliases, convert them to a help page, and code the .cp macro to copy the original member. For more information about help macros, see the *Managed Object Development Services Guide*.

### To copy MODS entities from your previous MODS file to your current one

**Important!** Copy only installation-defined entities. Do not copy distributed entities.

1. Enter **/MODSADE** from any panel.  
The MODS : Entity Administration Menu appears.
2. Type **C** at the prompt, specify the information to copy your entities from the MODSUSR data set used by the old region to the MODSUSR data set used by this region, and press Enter.  
The MODS : Entity List panel appears.
3. Select the entities that you want to copy, and press Enter.

## Panel Migration

**Note:** If you have not created your own panel file, or individual panel entities, do not perform this step.

### Installation-Defined Panel Library

The format of the panel library is unchanged. If you have a panel library that contains only user-defined panel definitions that you want to keep, copy the entire file to the file for the new region. Use the IDCAMS REPRO command to copy the file.

**Notes:**

- You do not need to migrate installation-defined icon panels in the ICOPANL file. These panels are recreated during the knowledge base migration.
- The PANELLIBS parameter group in Customizer controls the allocation of panels data sets. For more information, enter **/PARMS** from any panel, select \$NM PANELLIBS, and press F1 (Help).

### Individual Panels

If you have installation-defined panel definitions in the same panel library as distributed panel definitions, you can copy the individual panel definitions to a panel library for the new region.

**Important!** Only copy installation-defined panel definitions. Do not copy distributed panel definitions.

## Copy Panel Definitions

You must copy the required panel definitions to the panel library in your new product region.

### Follow these steps:

1. Define a temporary panel library for your old panels using the following steps:
  - a. Enter **/MODSAD.P**.  
The MODS : Panel Library Maintenance Menu appears.
  - b. Select **L - Library Definitions**.  
The MODS : Library Definition Menu appears.
  - c. Select **A - Allocate, Open, and Define Library**, and specify a library name (for example, OLDPANLS) and the data set name where your old panels are located. Optionally, specify a description.  
A temporary panels library is defined.
  - d. Press F3 (Exit) to return to the MODS : Panel Library Maintenance Menu.
2. Copy the panels using the following steps:
  - a. Select **C - Copy Panel(s)**, and specify the From library as the library name you just defined (for example OLDPANLS) and the To library as the target panels library name.  
If you leave the Panel Name field empty, the MODS : Panel Copy List appears, showing the panels in the From library.
  - b. Use the **C** (Copy) or **R** (Replace) action against the panels you want to copy.  
**Note:** For more information, press F1 (Help).
  - c. When all requested panels have been copied, press F3 (Exit) to return to the MODS : Panel Library Maintenance Menu.
3. Delete the temporary panel library definition using the following steps:
  - a. Select **L - Library Definitions**.  
The MODS : Library Definition Menu appears.
  - b. Select **U - Remove Library Definition, Close and Unallocate**, and specify the library name (for example OLDPANLS).  
The temporary panels library definition is removed.

**Note:** For more information about the MODS Panel Library Maintenance facility, see the *Managed Object Development Services Guide*.

## OSCNTL File Migration

The format of the OSCNTL file is unchanged. If your existing OSCNTL file contains installation-defined ASN.1 maps, recompile them in the new product region.

Add the data set containing the map source to the COMMANDS concatenation in your new region. To compile a map, use the Compile Map option of Mapping Services. To access the Mapping Services Primary Menu, enter **/MAPMENU** from any panel.

**Note:** For more information about Mapping Services, see the *Managed Object Development Services Guide*.

## Region Links to a Multisystem Network

If the region you are migrating is to be [synchronized with other regions](#) (see page 21), review the sections that follow.

**Important!** Unlink your existing region from the multisystem network before upgrading it. Then, relink the upgraded region to the multisystem network.

## Important Considerations Prior to Linking

Consider the following before linking:

- The first region linked in migration mode must be used to perform all monitoring, command, and control functions across the entire multisystem environment.
- Migration mode does not support database synchronization between the old and new product regions. We recommend that you do not perform database maintenance while operating in migration mode.
- If database maintenance is unavoidable, make changes in an old region, and again in a new region so that all linked regions have the changes propagated to them.

## Link in Migration Mode

You can link your first migrated product region to your existing product regions in migration mode.

Migration mode lets you migrate your existing product regions in an orderly fashion while maintaining visibility and control of your entire multisystem environment.

### Notes:

- Apply the relevant maintenance to your product region, including checking [software requirements](#) (see page 15) and [multisystem network migration](#) (see page 22).
- If you have specified the NMSUP parameter in the RUNSYSIN member for your existing product region, specify this parameter in the RUNSYSIN member for your new product region. The NMSUP parameter can be used to decrease the number of unique background user IDs that must be defined if you are using an external security package.

**Note:** For more information, see the *Security Guide*.

### Follow these steps:

1. Enter `=/MADMIN.MM` in the new product region.
2. Specify the name of an existing focal region in your multisystem network.
3. Press F6 (Action).

## Migrate Subsequent Regions

When a subsequent product region is migrated to the new release, you can use this procedure to link it to the first migrated product region.

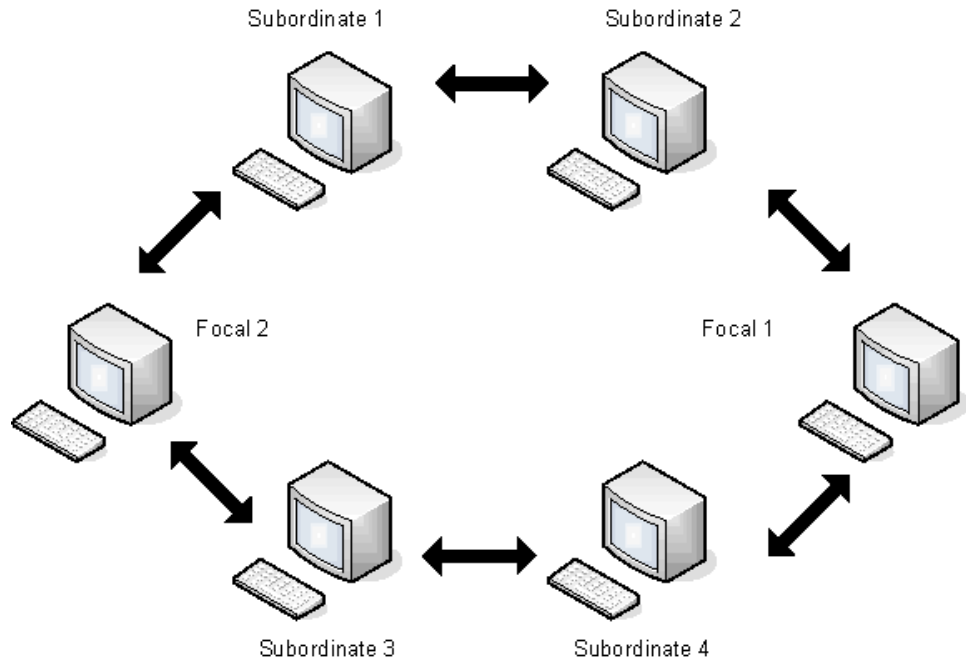

### Follow these steps:

1. Enter `=/MADMIN.SD`.
2. Specify the first Release 11.9 product region as the remote region.
3. Specify the role for this region (focal or subordinate).
4. Press F6 (Action).
5. Repeat these steps for all of the remaining subordinate and focal regions. Migrate is the focal region that you first linked using migration mode last.

This migration sequence retains the visibility to the multisystem network throughout the migration process.

## A Multisystem Network Migration Example

The following diagram shows a multisystem network with two focal regions and four subordinate regions:

### To migrate a multisystem network

1. Unlink Focal 2 from the existing multisystem network, as shown in the following diagram:

2. Upgrade Focal 2 to Release 11.9.

3. Link Focal 2 to Focal 1 in migration mode, as shown in the following diagram:

4. Unlink Subordinate 1 from the multisystem network and upgrade it to Release 11.9.

5. Link and synchronize Subordinate 1 to Focal 2, as shown in the following diagram:

6. Repeat Steps 4 and 5 for Subordinates 2-4 and Focal 1.

## Scenario: Run Your Old Region in Parallel with the New Region

If your existing region uses global mode AUTOMATED to perform desired state management, you can ease your new product regions into production as described in this section.

If you do not want to move directly from your existing regions to the new regions, you can do the following:

1. Create an equivalent region for each of your existing regions, so that you have a mirrored pair on each system.
2. Initially, have the existing region performing automation, and the new region running in the global mode of MANUAL (that is, merely monitoring) but using the same data.
3. Gradually, reverse the global mode of operation between the mirrored pairs until the new regions are performing automation.

This suggested scenario provides you with a hot backup, letting you instantly swap from a new region to the established region if you experience any problems. You can then correct the problem before swapping back to try the new region again.

# Appendix A: Worksheets

---

This section contains the following topics:

[Preparation Worksheets](#) (see page 133)

[Post-installation Worksheet](#) (see page 143)

## Preparation Worksheets

During the installation and setup process, you enter values that are used to do the following:

- Allocate data sets.
- Set initial parameters.
- Prepare for the use of your product.

You can print out the worksheets in this section to record the values needed for your site when installing the product.

## Installation

This worksheet helps you gather information required for installation.

## Job Information

Gather the following job information:

### Batch job class

Record the value that your site uses here:

Class = \_\_\_\_\_

**Default:** A

### Batch job class for tape mounts

(Tape only) Record the value that your site uses here:

Class = \_\_\_\_\_

### Instructions to operator

Record any instructions here:

\_\_\_\_\_  
\_\_\_\_\_  
\_\_\_\_\_

## ESD

If you plan to use ESD to download the product, gather the following information:

### USS directory

Is where you download the product archive file into.

\_\_\_\_\_

**Example:** .../CA/CAESD/

### Data set prefix

Is the prefix (*dsnpref*) of the data sets to which you copy the retrieved product files. The data set names have the following format: *dsnpref.CAI.data\_set\_type*.

\_\_\_\_\_

## Tape Unloading

If you are installing from tape, gather the following information related to tape unloading:

### Tape unit

Record the value that your site uses for UNIT=*?device\_in* here:

UNIT = \_\_\_\_\_

**Example:** CART

### Tape volume serial number

Record the value that your site uses for VOL=SER=*?tapeser* here:

VOL=SER = \_\_\_\_\_

**Example:** C2D710

### Tape expiry date

Record the values that your site uses here:

Expiry Date = \_\_\_\_\_

**Example:** 98000

Gather the following information related to the DASD to which the software is unloaded:

### Data set prefix

Do not include the name of your planned product region.

**Limits:** Maximum 29 characters

Record the value that your site uses here:

*?dsnpref* = \_\_\_\_\_

### DASD unit

Record the value that your site uses here:

*?device\_out* = \_\_\_\_\_

### DASD volume serial number

Record the value that your site uses here:

*?volser* = \_\_\_\_\_

### Storage Management Subsystem (SMS) storage class

(If using SMS) Record the value that your site uses here:

*?storclas* = \_\_\_\_\_

## Installation Parameters

Gather the following information related to installation parameters:

### Allocation Parameters

Use these prefixes for high-level qualifiers for the different data set groups.

Record the values that your site uses here:

#### SMP/E Target

Data Set Prefix = \_\_\_\_\_

Management class = \_\_\_\_\_

Storage class = \_\_\_\_\_

Volume serial number = \_\_\_\_\_

Unit = \_\_\_\_\_

#### SMP/E Distribution

Data Set Prefix = \_\_\_\_\_

Management class = \_\_\_\_\_

Storage class = \_\_\_\_\_

Volume serial number = \_\_\_\_\_

Unit = \_\_\_\_\_

#### SMP/E Libraries

Data Set Prefix = \_\_\_\_\_

Management class = \_\_\_\_\_

Storage class = \_\_\_\_\_

Volume serial number = \_\_\_\_\_

Unit = \_\_\_\_\_

#### SMP/E CSI

Data Set Prefix = \_\_\_\_\_

Management class = \_\_\_\_\_

Storage class = \_\_\_\_\_

Volume serial number = \_\_\_\_\_

#### SMPTLIB

Data Set Prefix = \_\_\_\_\_

Volume serial number = \_\_\_\_\_

Unit = \_\_\_\_\_

**Language Environment Parameters**

Record these language environment values:

**Language Environment link-edit input 2**

Record the value that your site uses here:

SCEEBND2 = \_\_\_\_\_

**Default:** CEE.SCEEBND2

**Language Environment link-edit input**

Record the value that your site uses here:

SCEELIB = \_\_\_\_\_

**Default:** CEE.SCEELIB

**Language Environment library**

Record the value that your site uses here:

SCEELKED = \_\_\_\_\_

**Default:** CEE.SCEELKED

**IBM macros**

Record the value that your site uses here:

MODGEN = \_\_\_\_\_

**Default:** SYS1.MODGEN

**Data set that contains the GIMZPOOL member**

Record the value that your site uses here:

\_\_\_\_\_

**Default:** SYS1.MACLIB

## Region Setup

This worksheet helps you gather information required for region setup.

## SOLVE Subsystem Interface Region

Gather the following information related to the SOLVE Subsystem Interface region:

**Name of the SOLVE SSI started task (*ssiname*)**

Record the value that your site uses here:

\_\_\_\_\_

**Default:** SOLVESSI

**Name of the SOLVE SSI SYSIN member**

This member contains control statements for starting the SOLVE SSI.

Record the value that your site uses here:

SYSIN = \_\_\_\_\_

**Default:** SSISYSIN

**Name of the optional SOLVE SSI parameter member**

This member contains startup parameters for the SOLVE SSI. If omitted, startup parameters are included in the SOLVE SSI SYSIN member previously described.

Record the value that your site uses here:

PARAMETER = \_\_\_\_\_

**Subsystem ID for a SOLVE SSI started task**

Record the value that your site uses here:

SSID = \_\_\_\_\_

**Default:** SOLV

**Prefix for SOLVE SSI data sets**

Record the value that your site uses here:

\_\_\_\_\_

**Default:** *dsnpref*

## Product Region

Gather the following information related to the product region:

**Product region started task name (*rname*)**

Record the value that your site uses here:

\_\_\_\_\_

**Default:** NM

**Product region SYSIN member name**

Record the value that your site uses here:

SYSIN = \_\_\_\_\_

**Default:** RUNSYSIN

**Primary VTAM ACB name for the product region**

Record the value that your site uses here:

PRI = \_\_\_\_\_

**Default:** NM

**Mixed case passwords**

Specifies whether case is preserved (YES) or forced to uppercase (NO):

\_\_\_\_\_

**Default:** NO

**Security exit setting (NO|PARTSAF|NMSAF|Imname)**

Record the value that your site uses here:

SEC = \_\_\_\_\_

**Default:** NO

**Note:** For more information about setting your security exit, see the *Security Guide*.

**SYSOUT**

Specifies SYSOUT subparameters. You can specify a class, a writer, and a form.

\_\_\_\_\_

**Default:** \*

**Linux Management**

Specifies whether you want to manage Linux on System z resources. You require CA Mainframe Connector for this feature. If you disable this feature, you can enable the feature later by adding the following statement to your RUNSYSIN member:

PPREF='PROD=LINUXMGMT'

\_\_\_\_\_

**Default:** NO

**Prefix for VSAM data sets local to the product region**

Record the value that your site uses here:

\_\_\_\_\_

**Default:** *dsnpref.rname*

**Prefix for sequential data sets local to the product region**

Record the value that your site uses here:

\_\_\_\_\_

**Default:** *dsnpref.rname*

**Prefix for TESTEXEC**

Record the value that your site uses here:

\_\_\_\_\_

**Default:** *dsnpref.rname*

**Prefix for UAMS or full name of existing UAMS**

Record the value that your site uses here:

\_\_\_\_\_

**Default:** *dsnpref*

**Prefix for shareable VSAM data sets**

Record the value that your site uses here:

\_\_\_\_\_

**Default:** *dsnpref.OPB9*

**Prefix for shareable PARMLIB data sets**

Record the value that your site uses here:

\_\_\_\_\_

**Default:** *dsnpref.OPB9.PARMLIB*

**AOM subsystem interface ID**

Record the value that your site uses here:

AOMSSID = \_\_\_\_\_

**Default:** Domain ID of the region

**Note:** Verify that this value does not conflict with other subsystems. The AOM subsystem interface enables system message flow to the region.

**AOM message suppression character**

Record the value that your site uses here:

\_\_\_\_\_

**Default:** /

**AOM SSI command prefix string**

Record the value that your site uses here:

\_\_\_\_\_

**Default:** *domain\_id*>

**Note:** If you use a command string prefix for other tasks, verify that this value is not in conflict with them.

**External application ACB pool names**

**Full-screen terminal prefix**

Record the value that your site uses here:

\_\_\_\_\_

**Default:** NMMAF

**LU1 terminal prefix**

Record the value that your site uses here:

\_\_\_\_\_

**Default:** NMMAV

## VTAM Definitions

Gather the following information related to VTAM definitions:

### **VTAM major node name**

Record the value that your site uses here:

\_\_\_\_\_

**Default:** VTAMAPPL

### **System macro library**

Record the value that your site uses here:

\_\_\_\_\_

**Default:** SYS1.MACLIB

### **VTAM network definitions library**

Record the value that your site uses here:

\_\_\_\_\_

**Default:** SYS1.VTAMLST

### **VTAM macro library**

Record the value that your site uses here:

\_\_\_\_\_

**Default:** SYS1.SISTMAC1

### **VTAM load library**

Record the value that your site uses here:

\_\_\_\_\_

**Default:** SYS1.VTAMLIB

### **(Optional) External Interface Package (EIP) ACB Prefix**

Record the value that your site uses here:

\_\_\_\_\_

**Default:** NMTSO

## Startup Tasks

This worksheet helps you gather information related to the startup tasks.

### Initial administrator user ID

Record the value that your site uses here:

\_\_\_\_\_

### Initial administrator password

Record the value that your site uses here:

\_\_\_\_\_

### Port number for WebCenter

Record the value that your site uses here:

\_\_\_\_\_

**Default:** NONE

## Post-installation Worksheet

After you have completed the installation and setup processes, you can record the data set names generated by the Install Utility for future reference.

You can print out the following worksheet now, and record this information as you progress through this guide.

### Installation data set

Record the value generated by the Install Utility here:

\_\_\_\_\_

**Default:** *dsnpref.OPB9.CC2DJCL*

### Installation JCL data set

Record the value generated by the Install Utility here:

\_\_\_\_\_

**Default:** *dsnpref.OPB9.INSTALL.JCL*

### SOLVE SSI setup JCL data set

Record the value generated by the Install Utility here:

\_\_\_\_\_

**Default:** *dsnpref.OPB9.ssiname.JCL*

**Product region setup JCL data set**

Record the value generated by the Install Utility here:

\_\_\_\_\_

**Default:** *dsnpref.OPB9.rname.JCL*

**VTAM JCL data set**

Record the value generated by the Install Utility here:

\_\_\_\_\_

**Default:** *dsnpref.OPB9.VTAM.JCL*

# Appendix B: Defining UNIX System Services Authorization

---

This section contains the following topics:

[USS Authorization Requirements](#) (see page 145)

[Set Up OMVS Segment](#) (see page 145)

## USS Authorization Requirements

To complete this task you must have the following:

- Administrative access to your security package
- OMVS shell write privileges

To authorize a user, you can use one of the following:

- Default OMVS segment
- Specific OMVS segment

## Set Up OMVS Segment

Use this procedure to set up an OMVS segment.

**Follow these steps:**

1. Assign an OMVS UID number to each user ID. Your security administrator may have a policy for assigning OMVS UID numbers. If not, use a unique number.

**Note:** For more information about OMVS UID numbers, see IBM's *UNIX System Services Planning* guide.

2. Define the OMVS segment for the user. For a user ID *uuuuuuu* and UID number *nnn*, enter the following commands:

- For CA ACF2 for z/OS systems, enter the following commands:

```
SET PROFILE(USER) DIV(OMVS)
INSERT uuuuuuu UID(nnn) HOME(/) PROGRAM(/bin/sh)
```

- For CA Top Secret for z/OS systems, enter the following commands:

```
TSS ADD(uuuuuuu) HOME(/) OMVSPGM(/bin/sh) UID(nnn)
GROUP(OMVSGRP)
```

- For RACF systems, enter the following command:

```
ALU uuuuuuu OMVS(UID(nnn) HOME(/) PROGRAM(/bin/sh))
```

**Note:** The OMVS segment must contain the following:

- A home directory (HOME)
- A login shell (PROGRAM or OMVSPGM)

3. Complete this process for each user ID that you want to authorize. To confirm the contents of the OMVS segment enter the following commands:

- For CA ACF2 for z/OS systems, enter the following commands:

```
SET PROFILE(USER) DIV(OMVS)
LIST uuuuuuu
```

- For CA Top Secret for z/OS systems, enter the following command:

```
TSS LIS(uuuuuuu) DATA(ALL)
```

- For RACF systems, enter the following command:

```
LISTUSER uuuuuuu OMVS NORACF
```

4. Assign a home directory to each user ID, and ensure that it exists and that the UID has at least READ access to it.

You can use the UNIX root directory (/) as shown in Step 2, or you can use a customized home directory name.

For example, to set up a directory named /u/name for UID*nnn*, issue the following commands in the OMVS UNIX shell:

```
mkdir /u/name
chown nnn /u/name
chmod 777 /u/name
```

5. Confirm the owner and access to the directory by using the following command:

```
ls -ld /u/name
```

The following result appears:

```
drwxrwxrwx  2 user  group 8192 Sep 31 14:58 /u/name
```

6. If you have previously installed this product and have authorized the UNIX shell, remove the previous authorization by using the following command:

```
extattr -a/bin/sh
```

# Appendix C: Tape Format

---

The following topics provide information about the function modification identifiers (FMIDs) and details about the format of the tapes that you receive to install your product.

**Note:** The tapes contain all files for all products in the CA SOLVE:Operations Automation family of products. Only some of the files apply to your product, and therefore, only the files necessary to install your product are unloaded.

This section contains the following topics:

[FMID Descriptions](#) (see page 149)

[Format of Cartridge VOLSER C2D710](#) (see page 150)

## FMID Descriptions

This product has the following FMIDs, which are codes that identify the release levels of a product:

### **CC2D710**

Is the FMID for Management Services (MS).

### **CC2D71E**

Is the FMID for PDSE Services (ME).

### **CC2D71H**

Is the FMID for Health Checker (HC).

### **CC2HB90**

Is the FMID for Operations Services (SS).

## Format of Cartridge VOLSER C2D710

This table lists the file sequence numbers, data set names, and data set contents for the first tape.

Files	DSN	Contents
1	CAI.SAMPJCL	Installation and maintenance JCL members
2	CAI.SMPMCS	Modification control statements (MCSs) containing functions and all published SYSMODs for those functions
3	CAI.CC2D710.F1	JCLIN for CC2D710
4	CAI.CC2D710.F2	NCAL-linked MODS for CC2D710
5	CAI.CC2D710.F3	++MAC for CC2D710 (RECFM=FB)
6	CAI.CC2D710.F4	++DATA for CC2D710 (RECFM=VB)
7	CAI.CC2D71H.F1	JCLIN for CC2D71H
8	CAI.CC2D71H.F2	NCAL-linked MODS for CC2D71H
9	CAI.CC2D71H.F3	Installation and maintenance JCL members
10	CAI.CC2D71E.F1	JCLIN for CC2D71E
11	CAI.CC2D71E.F2	NCAL-linked MODS for CC2D71E
12	CAI.CC2HB90.F1	++MAC for CC2HB90 (RECFM=FB)
13	CAI.CC2HB90.F2	++DATA for CC2HB90 (RECFM=VB)
14	CAI.CC2HB90.F3	XML data for CA MSM
15	CAI.CDHDB9.F1	JCLIN for CDHDB90
16	CAI.CDHDB9.F2	NCAL-linked MODS for CDHDB90
17	CAI.CDHDB9.F3	++MAC for CDHDB90 (RECFM=FB)
18	CAI.CDHDB9.F4	++DATA for CDHDB90 (RECFM=VB)
19	CAI.CDHDB9.F5	XML data for CA MSM
